GENERAL DESCRIPTION

The DAC-12QZ is a low-cost/high performance 12-bit digital-to-analog converter designed for general purpose OEM applications. The completely self-contained module includes weighted resistor networks, monolithic μ DAC current switches, temperature compensated reference and an externally programmable output amplifier. Performance specifications include ½LSB linearity error, 5 μ s settling time for full scale conversion, 30ppm/°C temperature coefficient and 20ppm/% power supply rejection.

μ DAC DESIGN

This outstanding cost/performance ratio has been achieved by utilizing the popular AD550 μ DAC current switches. The use of monolithic quad current switches offers close inherent matching of switch characteristics and excellent temperature tracking as well as reasonably fast conversion speed. A hybrid resistor assembly of matched precision resistors and a thick film network is used in conjunction with the μ DAC switches. Resistors provided include not only the weighting resistors but also the inter-quad attenuators, amplifier feedback resistors, etc. to assure close temperature tracking.

INPUT CODING

The internal μ DAC switches of the binary and BCD models are driven directly by complementary input codes without need of a strobe. The complementary codes for each model are:

MODEL	-F.S.	Zero	+F.S.
DAC-12QZ/BIN	1111 1111 1111	0000 0000 0000	0000 0000 0000
	1111 1111 1111	0111 1111 1111	0000 0000 0000
DAC-12QZ/BCD		1111 1111 1111	0110 0110 0110
	1111 1111 1111	1010 1111 1111	0110 0110 0110

OUTPUT PROGRAMMING

The scale factor is programmed by connecting external jumpers between module pins. With either model, the user can select any one of five output ranges, including bipolar outputs. The choices are:

- Unipolar 0 to +5V, 0 to +10V
- Bipolar ±2.5V, ±5V, ±10V

The external jumpers at the module pins determine the output amplifier feedback resistance, allowing use of one 5k resistor, or both, either in series to provide 10k, or parallel to provide 2.5k. Offset of exactly one-half full scale for bipolar applications is provided by connecting another jumper to the summing junction of the output amplifier. To maintain constant load on the reference zener, the bipolar offset output should be grounded when using the module in a unipolar mode.
