

New High-Resolution ADC Development for HL-LHC

“HPM-7177”

Nikolai Beev
TE-EPC-HPM
26.04.2017

ADC Selection

- Preliminary study: tens of commercial ADCs considered (≥ 24 bits)
- EDMS 1845562 v.1 - extended report
- conference paper to be presented on 14.05.2018 at I2MTC (Houston, TX)
- short list – SAR ADCs by Linear (LTC23xx), AD7177-2
- Ongoing tests in a dedicated high-resolution ADC tester

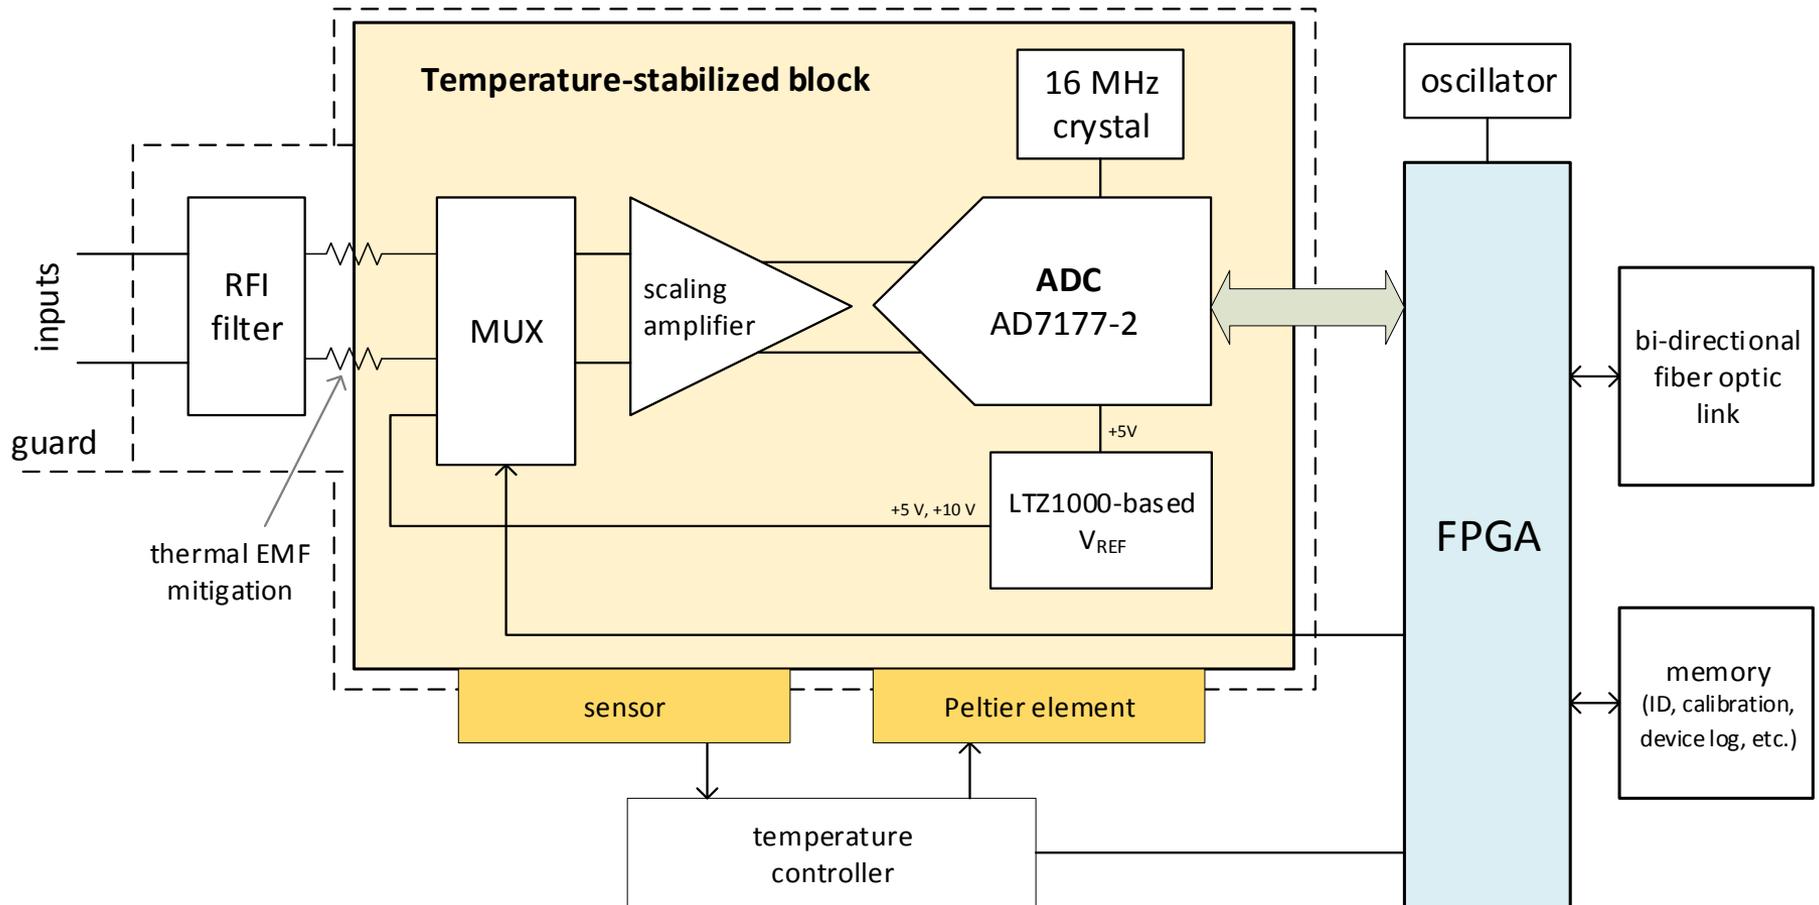

Very good agreement so far

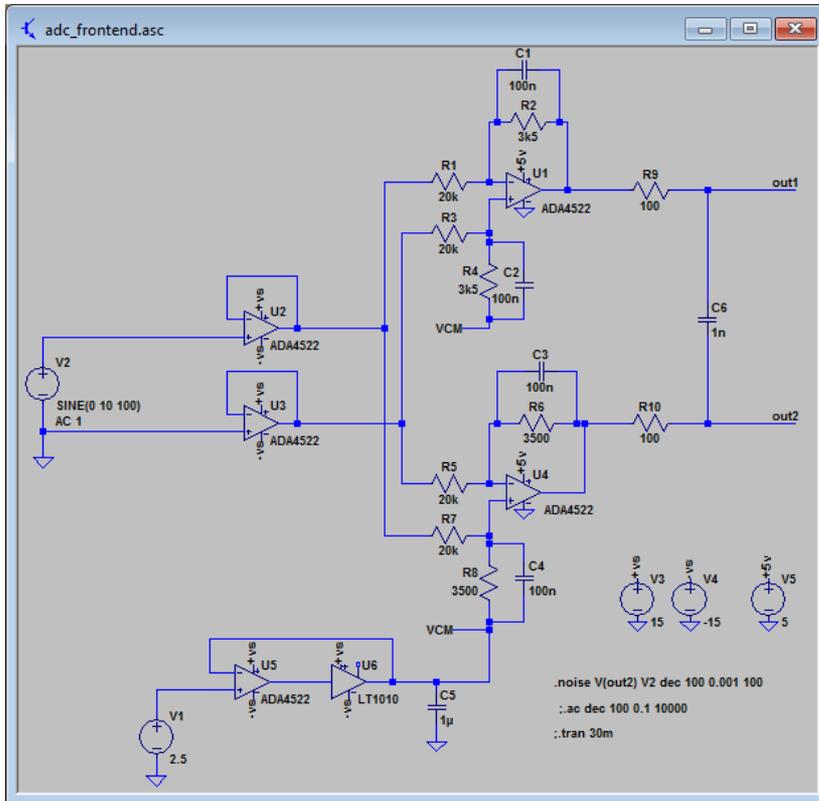

Concept

- Compact ADC mezzanine module
- Commercial ADC – AD7177-2
- Precision scaling amplifier built of ADA4522 and Vishay hermetic R array
- Balanced differential inputs for high CMRR
- LTZ1000 voltage reference with improved conditioning circuit (Vishay R array)
- Excellent thermal management – temperature stabilization at the mK level. Drift $\ll 0.1$ ppm/°C
- Local FPGA, bi-directional optical link to FGC
- ID, Self-check, diagnostics and self-calibration

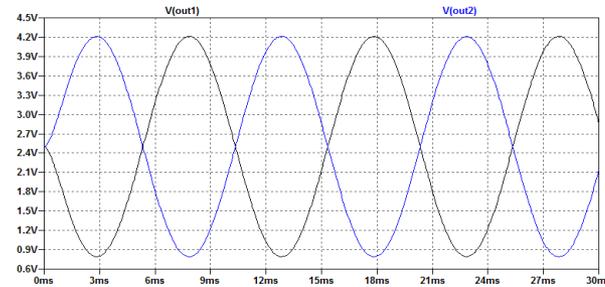

Block diagram

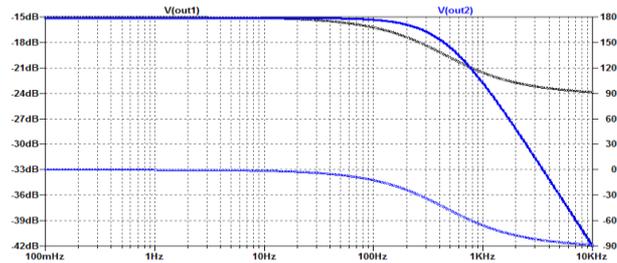

Simulations – Scaling amplifier

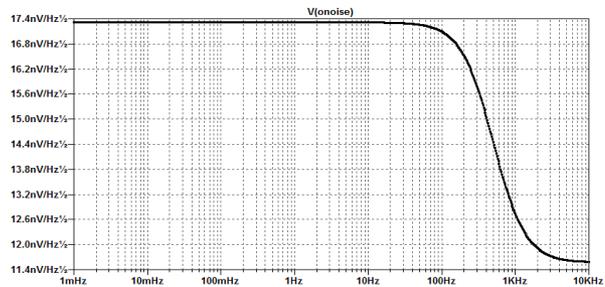

The most symmetric circuit possible –
FDA built of separate amplifiers

Differential
input range
 ± 13.4 V

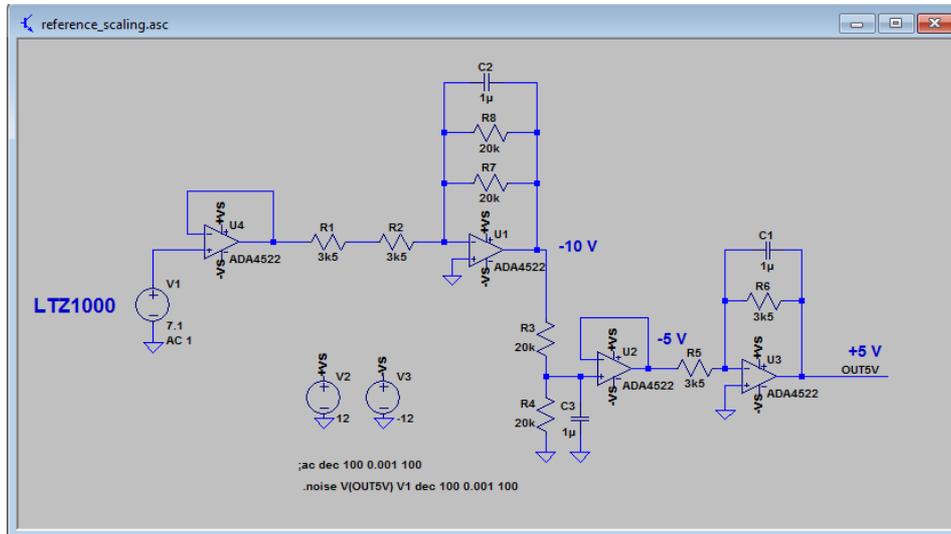

-3 dB BW
500 Hz

White noise
 ≈ 25 nV Hz^{-1/2}
(at differential ADC input)
 ≈ 70 nV Hz^{-1/2} RTI (diff.)

lower than ADC noise

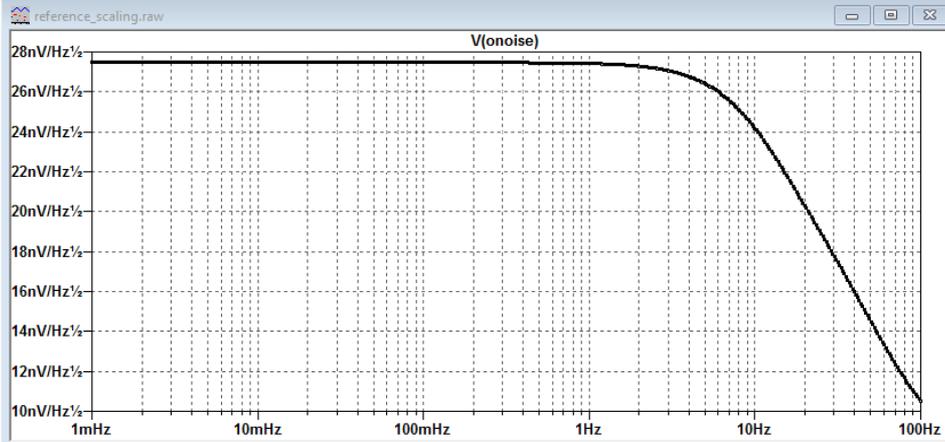

Simulations – Reference scaling

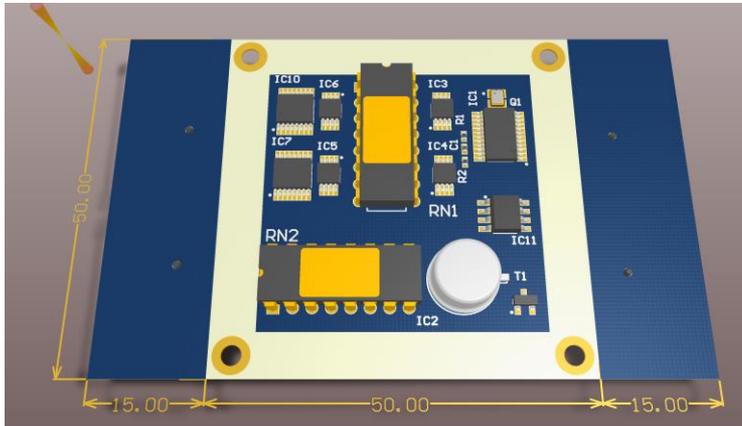

This circuit uses exactly the same resistor array (3K5-20K) for scaling the LTZ1000 Zener voltage.

It generates +5V, -5V and -10 V that can be used for self-calibration at ± 5 and ± 10 V

Output noise is lower than the ADC noise; 1/f will be entirely due to the LTZ1000.

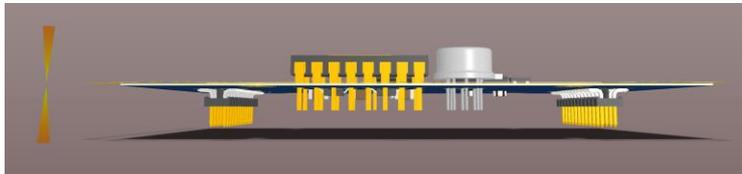

Mock-up design

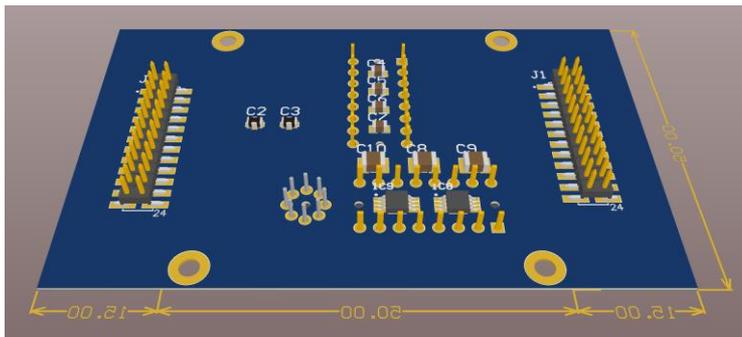

Top side

- ADC, op amps
- 2x resistor arrays – Vishay 1446
- LTZ1000
- Temperature sensor (not shown)
- Lid/enclosure (not shown)

Side view

R arrays, LTZ1000 and temperature sensor - top surfaces should be flat

Bottom side

More real estate for components;
maybe a low-profile shielding lid

Comparison against DS22 (*preliminary*)

	DS22 (improved)	HPM-7177
PCB size	82x145 mm	50x70 mm
Number of components	>220	<80
Idle tones	<130 dBFS around 0V	none
Inputs	Pseudo-differential, non-balanced	Fully differential, balanced
Offset/gain drift	<0.1 ppm/°C	<0.01 ppm/°C
RTI noise (>10 Hz)	200 nV Hz ^{-1/2}	140 nV Hz ^{-1/2}
RTI noise (<1 Hz)	300 nV Hz ^{-1/2}	140 nV Hz ^{-1/2}
Self-calibration, remote diagnostics, etc.	no	yes
Design documentation	CERN only	open under CERN OHL
