## EPM Series Power Meters

### E-Series and 8480 Series Power Sensors

#### Consistent Results and Greater Capability

Data Sheet

## Do more with new-generation EPM power meters

- Get up to four channels<sup>1</sup> to speed and simplify RF average power measurements
- Measure faster with improved measurement speed of 400 readings/sec with the Keysight Technologies, Inc. E-Series sensors
- View test results more easily with the industry’s first color LCD readout in an average power meter
- Go beyond GPIB with USB and LAN/LXI-C interfaces
- Automate frequency/power sweep measurements with the optional external trigger in/out feature
- Confirm battery power with a single-button push<sup>2</sup>—and get extra operating time with the optional spare battery
- Easily replace existing 436A, 437B and 438A meters with optional 43x code compatibility<sup>3</sup>
- Enhance manufacturing test by connecting a large external monitor with the unique VGA output option

1. Additional two optional USB channels available (see Ordering Information, page 10)

2. Only applicable for models with battery option (see Ordering Information, page 10)

3. N1913A is backward compatible with the 436A and 437B, while N1914A is compatible with 438A

As signals become more complex, it becomes more difficult to make fast, accurate power measurements. For years, you’ve depended on Keysight’s EPM Series power meters. Today, the Keysight N1913A and N1914A EPM power meters are versatile, user-friendly replacements for the E4418B/19B EPM Series. Best of all, you get these extras for about the same price as the EPM Series. Get consistent results and greater capability—with the new EPM power meters.

## Essential specifications

- Frequency range: 9 kHz to 110 GHz
- Power range: –70 dBm to +44 dBm (100 pW to 25 W, depending on the attached power sensor)
- Measurement speed: Up to 400 readings/sec with E-Series sensors
- Absolute accuracy:  $\pm 0.02$  dB logarithmic,  $\pm 0.5\%$  linear
- Relative accuracy:  $\pm 0.04$  dB logarithmic,  $\pm 1\%$  linear

## N1913A/14A EPM Series Power Meters Performance Characteristics

Specifications describe the instrument's warranted performance and apply after a 30 minute warm-up. These specifications are valid over its operating/environmental range unless otherwise stated and after performing a zero and calibration procedure.

Supplemental characteristics (shown in italics) are intended to provide additional information, useful in applying the instrument by giving typical (expected), but not warranted performance parameters. These characteristics are shown in italics or labeled as "typical", "nominal" or "approximate".

Compatible power sensors	Keysight 8480 Series Keysight E9300 E-Series Keysight E4410 E-Series Keysight N8480 Series Keysight U2000 Series
Frequency range	9 kHz to 110 GHz, sensor dependent
Power range	-70 dBm to +44 dBm (100 pW to 25 W), sensor dependent
Single sensor dynamic range	90 dB maximum (Keysight E-Series power sensors) 50 dB maximum (Keysight 8480 Series power sensors) 55 dB maximum (Keysight N8480 Series power sensors) 80 dB maximum (Keysight U2000 Series USB power sensors)
Display units	Absolute: Watts or dBm Relative: Percent or dB
Display resolution	Selectable resolution of: 1.0, 0.1, 0.01 and 0.001 dB in logarithmic mode, or 1, 2, 3 and 4 significant digits in linear mode
Default resolution	0.01 dB in logarithmic mode or three digits in linear mode

### Accuracy

Absolute accuracy	$\pm 0.02$ dB (Logarithmic) or $\pm 0.5\%$ (Linear). Please add the corresponding power sensor linearity percentage from Tables 6, 9 and 10 (for the E-Series sensors), Table 14 (for the 8480 series sensors) and Table 16 (for N8480 sensors) to assess the overall system accuracy.
Relative accuracy	$\pm 0.04$ dB (Logarithmic) or $\pm 1.0\%$ (Linear). Please add the corresponding power sensor linearity percentage from the mentioned tables above to assess the overall system accuracy.
Zero set (digital settability of zero)	Power sensor dependent (refer Table 1), this specification applies when zeroing is performed with the sensor input disconnected from the POWER REF.
Zero drift of sensors	This parameter is also called long term stability and is the change in the power meter indication over a long time (within one hour) at a constant temperature after a 24-hour warm-up of the power meter. Sensor dependent, refer to Table 1. For E9300 sensors, refer to Table 11 for complete data.

### Measurement noise

Sensor dependent, refer to Tables 1 and 2. For E9300 sensors, refer to Table 11 for complete data.	
Effects of averaging on noise	Averaging over 1 to 1024 readings is available for reducing noise. Table 1 provides the measurement noise for a particular power sensor with the number of averages set to 16 for normal mode and 32 for x2 mode. Use the "Noise Multiplier" for the appropriate mode (normal or x2) and number of averages to determine the total measurement noise value.  For example: For a Keysight 8481D power sensor in normal mode with the number of averages set to 4, the measurement noise is equal to: $(<45 \text{ pW} \times 2.75) = <124 \text{ pW}$

Connector type	Type-N (f), $50\ \Omega$

Measurement speed	
Using remote interface (over the GPIB, USB or LAN), three measurement speed modes are available as shown, along with the typical maximum measurement speed for each mode.	
With N1913A power meter	<ul style="list-style-type: none"> <li>– Normal: 20 readings/second</li> <li>– x2: 40 readings/second</li> <li>– Fast: Fast: 400 readings/second, for Keysight E- Series power sensors only</li> </ul>
With N1914A power meter	The measurement speed is reduced, for example, with both channels in FAST mode, the typical maximum measurement speed is 200 readings/second.
Fast mode is for Keysight E-Series power sensors only.	
Maximum measurement speed is obtained using binary output in free run trigger mode.

Power meter functions	
Accessed by key entry	Either hard keys, or soft key menu, and programmable
Zero	Zeros the meter. (Power reference calibrator is switched off during zeroing.)
Cal	Calibrates the meter using internal (power reference calibrator) or external source. Reference cal factor settable from 1% to 150%, in 0.1% increments.
Frequency	Entered frequency range is used to interpolate the calibration factors table. Frequency range from 1 kHz to 999.9 GHz. Also settable in 1 kHz steps.
Cal factor	Sets the calibration factor for the meter. Range: 1% to 150%, in 0.1% increments.
Relative	Displays all successive measurements relative to the last displayed value
Offset	Allows power measurements to be offset by -100 dB to +100 dB, settable in 0.001 dB increments, to compensate for external loss or gain
Save/recall	Store up to 10 instrument states via the save/recall menu
dBm/W	Selectable units of either Watts or dBm in absolute power; or percent or dB for relative measurements
Filter (averaging)	Selectable from 1 to 1024. Auto-averaging provides automatic noise compensation.
Duty cycle	Duty cycle values between 0.001% to 99.999%, in 0.001% increments, can be entered to display a peak power representation of measured power. The following equation is used to calculate the displayed peak power value: peak power = measured power/duty cycle.
Sensor cal tables	Selects cal factor versus frequency tables corresponding to specified sensors
Limits	High and low limits can be set in the range -150.000 dBm to +230.000 dBm, in 0.001 dBm increments
Preset default values	dBm mode, rel off, power reference off, duty cycle off, offset off, frequency 50 MHz, AUTO average, free run, AUTO range (for E-Series sensors and N8480 Series)
Display	Color display with selectable single and split screen formats are available. A quasi-analog display is available for peaking measurements. The dual channel power meter can simultaneously display any two configurations of A, B, A/B, B/A, A-B, B-A and relative. With the optional USB ports, additional dual channel (C & D), adds up to total 4-channels measurement display.

## E-Series Power Sensor Specifications

The E-Series of power sensors have their calibration factors stored in EEPROM and operate over a wide dynamic range. They are designed for use with the EPM Series of power meters and two classes of sensors are available:

- CW power sensors (E4412A and E4413A)
- Average power sensors (E9300 sensors)

## E-Series CW Power Sensor Specifications

Widest dynamic range: 100 pW to 100 mW (–70 dBm to +20 dBm)

## E-Series CW Power Sensor Specifications (continued)

### Calibration factor (CF) and reflection coefficient (Rho)

Calibration factor and reflection coefficient data are provided at 1 GHz increments on a data sheet included with the power sensor. This data is unique to each sensor. If you have more than one sensor, match the serial number on the data sheet with the serial number on the power sensor you are using. The CF corrects for the frequency response of the sensor. The EPM power meter automatically reads the CF data stored in the sensor and uses it to make the corrections. For power levels greater than 0 dBm, add 0.5%/dB to the calibration factor uncertainty specification.

Reflection coefficient (Rho) relates to the SWR according to the following formula:

$$SWR = 1 + Rho / 1 - Rho.$$

Maximum uncertainties of the CF data are listed in Table 5a, for the E4412A power sensor, and Table 5b for the E4413A power sensor. The uncertainty analysis for the calibration of the sensors was done in accordance with the ISO/TAG4 Guide. The uncertainty data reported on the calibration certificate is the expanded uncertainty with a 95% confidence level and a coverage factor of 2.

Figure 1. Relative mode power measurement linearity with EPM Series power meter/E-Series CW power sensor at 25 °C ± 5 °C (typical)

The chart in Figure 1 shows the typical uncertainty in making a relative power measurement, using the same power meter channel and the same power sensor to obtain the reference and the measured values. Example A illustrates a relative gain (amplifier measurement). Example B illustrates a relative loss (insertion loss measurement). This chart assumes negligible change in frequency and mismatch occur when transitioning from the power level used as the reference to the power level being measured.

**Example A:**

$$P = 10(P)/10 \times 1 \text{ mW}$$

$$P = 10 \text{ dB}/10 \times 1 \text{ mW}$$

$$P = 3.98 \text{ mW}$$

$$3\% \times 3.98 \text{ mW} = 119.4 \text{ } \mu\text{W}$$

**Example B:**

$$P = 10 (P)/10 \times 1 \text{ mW}$$

$$P = 10 \text{ } -35/10 \times 1 \text{ mW}$$

$$P = 316 \text{ nW}$$

$$3\% \times 316 \text{ nW} = 9.48 \text{ nW}$$

where

P = power in Watts

and

(P) = power in dBm

## E-Series E9300 Average Power Sensor Specifications

The E-Series E9300 wide dynamic range, average power sensors are designed for use with the EPM family of power meters. These specifications are valid ONLY after proper calibration of the power meter and apply for CW signals unless otherwise stated.

Specifications apply over the temperature range 0 °C to 55 °C unless otherwise stated, and specifications quoted over the temperature range 25 °C ±10 °C, conform to the standard environmental test conditions as defined in TIA/EIA/ IS-97-A and TIA/EIA/IS-98-A.

The E-Series E9300 power sensors have two independent measurement paths (high and low power paths) as shown in Table 7.

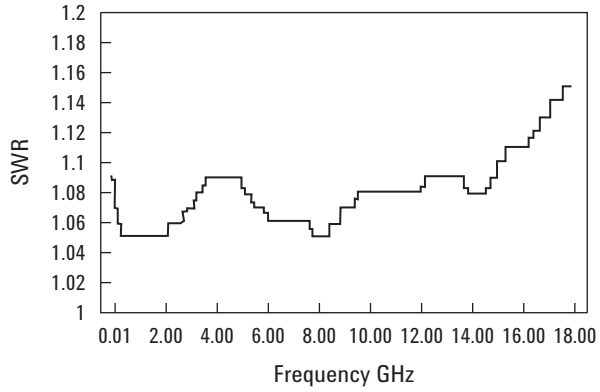

Table 7. E9300 Series two-path specification

### Effects of change in temperature on linearity

Note: If the temperature changes after calibration and you choose not to re-calibrate the sensor, the following additional power linearity error should be added to the linearity specs in Table 9.

For small changes in temperature:  
The typical maximum additional power linearity error due to small temperature change after calibration is  $\pm 0.15\%/^{\circ}\text{C}$  (valid after zeroing the sensor).

For large changes in temperature:  
Refer to Table 10.

Table 10. Typical maximum additional power linearity error due to temperature change (valid after zeroing the sensor)

### Switch point data

The E9300 power sensors have two paths as shown in Table 7. The power meter automatically selects the proper power level path. To avoid unnecessary switching when the power level is near the switch point, switching point hysteresis has been added.

E9300 “A” suffix sensors example:

Hysteresis causes the low power path to remain selected until approximately  $-9.5$  dBm as the power level is increased, above this power the high power path will be selected. The high power path will remain selected until approximately  $-10.5$  dBm is reached as the signal level decreases, below this power the low power path will be selected.

Switching point linearity:

Typically =  $\pm 0.5\%$  (=  $\pm 0.02$  dB)

Switching point hysteresis:

0.5 dB typical

### Calibration factor (CF) and reflection coefficient (Rho)

Calibration factor and reflection coefficient data are provided at frequency intervals on a data sheet included with the power sensor. This data is unique to each sensor. If you have more than one sensor, match the serial number on the certificate of calibration (CoC) with the serial number on the power sensor you are using. The CF corrects for the frequency response of the sensor. The EPM Series power meter automatically reads the CF data stored in the sensor and uses it to make the corrections.

Reflection coefficient (Rho) relates to the SWR according to the following formula:

$$\text{SWR} = (1 + \text{Rho}) / (1 - \text{Rho})$$

Maximum uncertainties of the CF data are listed in Tables 12a and 12b. As the E-Series E9300 power sensors have two independent measurement paths (high and low power paths), there are two calibration factor uncertainty tables. The uncertainty analysis for the calibration of the sensors was done in accordance with the ISO Guide. The uncertainty data reported on the calibration certificate is the expanded uncertainty with a 95% confidence level and a coverage factor of 2.

## N8480 Series Thermocouple Power Sensor Specifications

The N8480 Series power sensors (excluding Option CFT) measure power levels from  $-35$  dBm to  $+44$  dBm (316 nW to 25.1 W), at frequencies from 100 kHz to 50 GHz and have two independent power measurement range (upper and lower range).

Meanwhile, the N8480 sensors with Option CFT only measure power levels from  $-30$  dBm to  $+44$  dBm (1  $\mu$ W to 25.1 W) in single range. Similar to the E-Series power sensors, the N8480 Series power sensors are also equipped with EEPROM to store sensor's characteristics such as model number, serial number, linearity, temperature compensation, calibration factor, and so forth.

This feature ensures the correct calibration data is applied by any compatible power meter connected with N8480 Series power sensor, and to ensure the accuracy of the measurements.

1. At 25 °C  $\pm$  10 °C

2. The N8480 Series power sensors' linearity is negligible except for the power range specified in the table

3. For N8480 Standard (excluding the CFT option)

## N8480 Series Thermocouple Power Sensor Specifications (*continued*)

### Switch point data

Switching point is applicable for standard N8480 Series power sensors only.

The N8480 Series power sensors have two power measurement ranges; a lower range and upper range. The power meter automatically selects the proper power range. To avoid unnecessary switching when the power level is near switching point, a **Switching Point Hysteresis** has been added.

Switching point hysteresis:

**0.5 dB typical**

Example of switching point hysteresis on N8481/2H power sensors, this hysteresis causes the lower range to remain selected until approximately 17.5 dBm as the power level is increased, above this power the upper range is selected.

The upper range remains selected until approximately 16.5 dBm as the signal level decreases, below this power the lower range is selected.

For more detailed specifications, refer to *Keysight N8480 Series Thermocouple Power Sensors*, data sheet (5989-9333EN).

## U2000 Series USB Power Sensor Specifications

The U2000 Series USB power sensors are true average, wide-dynamic-range RF/microwave power sensors, based on a dual-sensor diode pair/attenuator/diode pair topology.

The U2000 Series USB power sensors can be operated on N1913A/14A via the USB host port (options).

### Frequency and power ranges

Table 17. U2000 Series USB sensors frequency and power ranges

Model	Frequency range	Power range	Maximum power
U2000A	10 MHz to 18 GHz		
U2001A	10 MHz to 6 GHz	-60 dBm to +20 dBm	+25 dBm avg, 20 VDC +33 dBm pk, <10 $\mu$ s
U2002A	50 MHz to 24 GHz		
U2004A	9 kHz to 6 GHz	-60 dBm to +20 dBm	+25 dBm avg, 5 VDC +33 dBm pk, <10 $\mu$ s
U2000B	10 MHz to 18 GHz		
U2001B	10 MHz to 6 GHz	-30 dBm to +44 dBm	+45 dBm avg, 20 VDC +47 dBm pk, 1 $\mu$ s
U2000H	10 MHz to 18 GHz		
U2001H	10 MHz to 6 GHz	-50 dBm to +30 dBm	+33 dBm avg, 20 VDC +50 dBm pk, 1 $\mu$ s
U2002H	50 MHz to 24 GHz	-50 dBm to +30 dBm	+33 dBm avg, 10 VDC +50 dBm pk, 1 $\mu$ s

### Power accuracy

Table 18. U2000 Series USB sensors power accuracy

Model	Power range	Accuracy <sup>1</sup> (25 °C $\pm$ 10 °C)	Accuracy <sup>1</sup> (0 °C to 55 °C)
U2000/1/2/4A	-60 dBm to +20 dBm	$\pm$ 3.0%	$\pm$ 3.5%
U2000/1/2H	-50 dBm to +30 dBm	$\pm$ 4.0%	$\pm$ 5.0%
U2000/1B	-30 dBm to +44 dBm	$\pm$ 3.5%	$\pm$ 4.0%

Specifications valid with the following conditions:

- After zeroing
- Number of averages = 1024
- After 30 minutes of power-on warm-up

1. This accuracy is essentially a combination of linearity, instrumentation accuracy, and traceability to absolute accuracy at 50 MHz, 0 dBm.

Note: Mismatch uncertainty, calibration factor uncertainty, and power level dependent terms (zero set, drift, and noise) are excluded in this specification.
