MANUAL CHANGES

MANUAL IDENTIFICATION

Model Number: 8477A
 Date Printed: Apr. 77, Feb. 84
 Part Number: 08477-90003

This supplement contains important information for correcting manual errors and for adapting the manual to instruments containing improvements made after the printing of the manual.

To use this supplement:

Make all ERRATA corrections

Make all appropriate serial number related changes indicated in the tables below.

Serial Prefix or Number	Make Manual Changes
1146A00561 to 00710	1
1146A00711 and above	1, 2
1827A, 1832A	1, 2, 3

Serial Prefix or Number	Make Manual Changes
1922A	1-4

NEW ITEM

ERRATA

Page 2, Table 1:

Replace the Power specification with the following:

Power: 115 or 230 volts $\pm 10\%$, 48-66 Hz, approximately 3 watts.

Page 11, Table 5:

Under "Para. Ref." 421, change the Max. meter indication to 3.103.

Page 14-15, Table 7:

A1Q3-7, 9, 14-16, 21-23, 25, 26. The recommended replacement for A1Q3-7, 9, 14-16, 21-23, 25, 26, if they

fail, is found in Change 4.

Change the parts list as follows:

A1R27 0698-3430 RESISTOR 21.5Q 1% .125W F TC = 0 \pm 100.
 A1R32 0757-0289 RESISTOR 13.3K 1% .125W F TC = 0 \pm 100.
 A1R41 0698-4037 RESISTOR 46.4 1% .125W F TC = 0 \pm 100.
 A1R46 0698-3451 RESISTOR 133K 1% .125W F TC = 0 \pm 100.

Page 16, Table 7:

Change XF1 to 2110-0470, 1, Fuseholder Exer Post 20A 200V UL/IEC.
 Add the following immediately after XF1:

2110-0465, 1, Fuseholder - Extr Post UL/IEC 0.25 x 1.25 Fuse
 2110-0467, 1, Nut Single Chamfer 1/2-28 thread
 1400-0090, 1, Washer, Rubber 5/8 OD.

NOTE

Manual change supplements are revised as often as necessary to keep manuals as current and accurate as possible. Hewlett-Packard recommends that you periodically request the latest edition of this supplement. Free copies are available from all HP offices. When requesting copies quote the manual identification information from your supplement, or the model number and print date from the title page of the manual.

ERRATA (Cont'd)

Page 25, Figure 13, Service Sheet 2:

Change the wire color connecting A3S1 to S3 from 927 to 923.

Change the following component values as indicated:

AIR27 to 21.5

AIR32 to 13.3k

AIR41 to 46.4

AIR46 to 133k.

Page 27, Figure 16 (Service Sheet 3):

Change AIQ2 to 1854-0039.

Service Sheet 2, Figure 12:

Change referenced R36, located between Q21 and Q22, to R41.

Page 27, Figure 16, Service Sheet 3:

Replace the power line portion of the schematic with the partial schematic in this supplement.

P/O Figure 16. Power Supply Circuits (P/O Change 4)

SAFETY CONSIDERATIONS

GENERAL - This is a Safety Class I instrument (provided with terminal for protective earthing).

OPERATION - BEFORE APPLYING POWER

Verify that the power transformer primary is matched to the available line voltage, the correct fuse is installed, and Safety Precautions are taken (see the following warnings). In addition, note the instrument's external markings which are described under "Safety Symbols."

WARNINGS

Service instructions are for use by service-trained personnel only. To avoid dangerous electric shock, do not perform any servicing unless qualified to do so.

BEFORE SWITCHING ON THE INSTRUMENT

The protective earth terminal of the instrument must be connected to the protective conductor of the (main) power cord. The main plug shall only be inserted in a socket outlet provided with a non-rotate earth contact. The protective action must not be negated by the use of an extension cord (power cable) without a protective conductor (grounding). Grounding one conductor of a two conductor cable is not sufficient protection. If the instrument is to be energized via an auto-transformer (or voltage reduction) make sure the common terminal is connected to the neutral (that is, the grounded side of the mains supply).

Any interruption of the protective (grounding) conductor (inside or outside the instrument) or disconnecting the protective earth terminal will create a potential shock hazard that could result in personal injury.

Whenever it is likely that the operation has been repaired, the instrument must be made non-operative and be secured against any unintended operation.

Only fuses with the required rated current, voltage and specified type (normal blow, time delay, etc.) should be used. Do not use repaired fuses or short-circuited fuses. To do so could cause a shock or fire hazard.

Do not operate the instrument in the presence of flammable gases or fumes. Operation of any electrical instrument in such an environment constitutes a definite safety hazard.

Do not install substitute parts or perform any unauthorized modification to the instrument.

SAFETY SYMBOLS

Adjustments described in the manual are performed with power supplied to the instrument while protective covers are removed. Energy available at many points may, if contacted, result in personal injury.

Any adjustment, maintenance, and repair of the opened instrument under voltage should be avoided as much as possible, and when inevitable, should be carried out only by a skilled person who is aware of the hazard involved.

Capacitors inside the instrument may still be charged even if the instrument has been disconnected from its source of supply.

Instruction manual symbol: the product will be marked with this symbol when it is necessary for the user to refer to the instruction manual in order to protect against damage to the product.

Indicates hazardous voltages.

Earth terminal (sometimes used in manual to indicate circuit common connected to grounded chassis).

WARNING

The WARNING sign denotes a hazard. It calls attention to a procedure, practice, or the like, which, if not correctly performed or adhered to, could result in personal injury. Do not proceed beyond a WARNING sign until the indicated conditions are fully understood and met.

CAUTION

The CAUTION sign denotes a hazard. It calls attention to an operating procedure, practice, or the like, which, if not correctly performed or adhered to, could result in damage to or destruction of part or all of the product. Do not proceed beyond a CAUTION sign until the indicated conditions are fully understood and met.

For calibrators with serial prefixes not listed, a
"Manual Changes" insert is included with this
manual.

SERIAL PREFIXES NOT LISTED

This manual applies directly to calibrators with
the serial number prefixes listed above.

SERIALS PREFIXED: 848-, 963-

CALIBRATOR 8477A

1. DESCRIPTION

2. The HP Model 8477A Calibrator is a precision instrument designed to calibrate HP 432 series Power Meters. It supplies voltages to check and adjust the power meter bridge circuits; provision is made to calibrate a 432 for operation with either 100 ohm or 200 ohm thermistor mount resistances.

3. INSTRUMENTS COVERED BY MANUAL

4. Each instrument carries a two-section serial number. The first section is a prefix. The contents of this manual apply directly to instruments which have the same serial number prefix as listed after "Serials Prefixed" on the inside title page. Revisions required to adapt this manual to other serial number prefixes are contained in a yellow "Manual Changes" insert supplied with the manual. For information about instruments with serial prefixes not listed on the title page or in the insert, contact the nearest Hewlett-Packard office.

5. INITIAL INSPECTION

6. Mechanical Check

7. If damage to the shipping carton is evident, ask the carrier's agent to be present when the

instrument is unpacked. Inspect the instrument for mechanical damage. Also check the cushioning material for signs of severe stress.

8. Performance Check

9. The electrical performance of the instrument should be verified upon receipt. Performance checks suitable for incoming inspection are given in paragraphs 41 through 44.

10. Claims for Damage

11. If the instrument is mechanically damaged in transit, notify the carrier and the nearest Hewlett-Packard field office immediately. A list of field offices is contained in the back of this manual. Retain the shipping carton and padding material for the carrier's inspection. The field office will arrange for replacement or repair of your instrument without delay for claim settlements against the carrier. Before shipment, this instrument was inspected and found free of mechanical and electrical defects. If there is any deficiency, or if electrical performance is not within specifications, notify your nearest Hewlett-Packard Sales and Service office.

Table 1. Specifications, HP 8477A Calibrator

<p>Calibration Function: Output voltages corresponding to meter readings of: 0.01, 0.03, 0.1, 0.3, 1, 3, and 10 milliwatts.</p> <p>Calibration Uncertainty: ±0.5% on 0.01 and 0.03 mW ranges (+20°C to +30°C), ±0.2% on 0.1 to 10 mW ranges (+20°C to +30°C).</p> <p>RFI: Meets all conditions specified in MIL-I-6181D.</p> <p>Power: 115 or 230 volts ±10%, 50 — 400 Hz, approximately 3 Watts.</p> <p>Weight: Net, 4 lbs, 8 oz. --	---

12. PREPARATION FOR USE**13. Power Requirements**

14. The Model 8447A operates from 115 or 230 volts ac line voltage. Line frequency may vary from 50 to 400 Hz. A slide switch on the rear panel is moved to the correct position for the line voltage available. Before operating the equipment, ensure that the fuse installed in the instrument corresponds to the value marked on the panel for the line voltage available.

15. Power Cable

16. To protect operating personnel, the National Electrical Manufacturers Association (NEMA) recommends that the instrument panel and cabinet be grounded. All Hewlett-Packard instruments are equipped with a three-conductor power cable which, when plugged into an appropriate receptacle, grounds the instrument. The offset pin on the power cable three-prong connector is the ground wire.

17. To preserve the protection feature when operating the instrument from a two-conductor outlet, use a three-prong to two-prong adapter and connect the green pigtail on the adapter to ground.

18. The power cord and power input connector meet the specifications established by the International Electrotechnical Commission (IEC).

19. Bench Mounting

20. The instrument is equipped with plastic feet and a tilt stand, ready for use on a bench.

21. Rack Mounting

22. The instrument can be rack mounted by using an adapter frame. The adapter frame is a rack frame that accepts several combinations of submodular units. For additional information, address inquiries to your nearest Hewlett-Packard office.

23. STORAGE AND SHIPMENT**24. Original Packaging**

25. The same containers and materials used in Hewlett-Packard factory packaging can be obtained through the Hewlett-Packard Sales and Service offices listed at the rear of this manual.

26. If the instrument is being returned to Hewlett-Packard for servicing, attach a tag indi-

cating the type of service required, return address, model number and full serial number. Also mark the container FRAGILE to assure careful handling.

27. In any correspondence refer to the instrument by model number and full serial number.

28. Other Packaging Materials

29. The following general instructions should be used for repackaging with commercially available materials.

a. Wrap the instrument in heavy paper or plastic. (If shipping to a Hewlett-Packard Service Office or center, attach a tag indicating the type of service required, return address, model number and full serial number.)

b. Use a strong shipping container. A double-wall carton made of 200 pound test material is adequate.

c. Use enough shock-absorbing material (three to four inch layer) around all sides of the instrument to provide firm cushion and prevent movement inside the container. Protect the control panel with cardboard.

d. Seal the shipping container securely.

e. Mark the shipping container FRAGILE to assure careful handling.

30. OPERATING INSTRUCTIONS

31. The front and rear panel controls, connectors and indicators are explained in Figure 1. The descriptions are keyed to corresponding items indicated on the figure. For further information regarding the various settings and uses of the controls and connectors, see the performance tests and adjustment procedures in the appropriate 432 manual.

32. OPERATOR MAINTENANCE

33. Operator maintenance is limited to replacement of the front panel LINE switch light and the rear panel fuse.

34. Fuse Replacement

35. To replace the rear panel fuse, remove the rear panel fuse knob and replace the fuse with a 0.25 amp slow-blow fuse.

CONTROLS AND CONNECTORS

- 1 ZERO-TEST — Adjust 8477A output so 432 meter reads zero.
- 2 TEST — Applies correct dc voltages to 432.
- 3 FUNCTION — Controls 8477 mount resistance and the operation for checking gain of the 432 bridge amplifiers.
- 4 SET — Used to adjust offset of 432 bridge amplifiers to zero.
- 5 CHECK — Applies dc voltage to 432 bridge amplifiers to check gain.
- 6 100Ω — Provides 100Ω to complete 432 bridges.
- 7 200Ω — Provides 200Ω to complete 432 bridges.
- 8 POWER (mW) — Sets output voltage levels that correspond to the 432 Power Meter ranges.
- 9 LINE — Lamp lights when switch is in LINE ON position.
- 10 VRF — Connects VRF from 432 to 8477A.
- 11 VCOMP — Connects VCOMP from 432 to 8477A.
- 12 Connects 8477A to 432 through thermistor cable; completes 432 bridge circuits through 8477A.
- 13 Line voltage — Selects 115- or 230-volt line operation.
- 14 FUSE — Use value shown (mA/T means milliamp slo-blow).
- 15 AC power — Power cable receptacle (offset pin connected to 8477A Calibrator chassis).

Figure 1. 8477A Front and Rear Panel Controls and Connectors

36. Lamp Replacement

37. To replace the front panel line switch lamp (DSL), proceed as follows:

- a. Disconnect cord from rear panel receptacle.
- b. Pull the white cover portion of this switch from the instrument and then remove the lamp from inside the cover.
- c. Replace old lamp with a new lamp (see parts list for part number of DSL).
- d. Place white cover into switch receptacle.

38. MAINTENANCE

39. Test equipment and accessories required to perform maintenance are listed in Table 2. Equipment other than recommended models can be used provided the critical specifications are satisfied. Figure 10 on Service Sheet 1 shows the location of the test points and adjustments referred to in the following procedures. In the Calibrator, Test Point 3 is equivalent to the VRF jack and Test Point 7 is equivalent to the V_{comp} jack. The instrument can be checked and adjusted using either the test points or the front panel connectors.

Table 2. Recommended Test Equipment and Accessories

Instrument Type	Critical Specifications	Recommended HP Model	Use (See Note)
Oscilloscope	Bandwidth: dc to 400 KHz Sensitivity: 1 mV/cm	140A with 1400A and 1422A Plug-in units	A
DC Standard Differential Voltmeter	Accuracy: ±0.0005% of reading ±0.004% of range ±1 μ V	740B	P
Input Cable Assembly	Supplied with 740B	11054A	P
Digital Voltmeter	Range: 0.5 to 50 Vdc Accuracy: ±0.05% Input Impedance: 10 megohm Floating Resolution: Three or more digits	3440 with 3443 Plug-in Unit	P,A,T
Power Meter		432 Series	P,A,T
Thermistor Mount Cable	Supplied with power meter	8120-1082	P,A,T
Cable Assemblies	Male BNC — 48 inches long	10503A	P,A,T
Cable Assemblies	BNC Male to dual banana	11001A	P,A,T
Isolation Resistors	1K 1% 1/8 watt	0757-0280	P
Cable Assembly	Dual Banana to test clips	11002A	P,A,T

Note
P = Performance Test; A = Adjustments; T = Troubleshooting

41. Zero Range

- a. After at least one-half hour warmup, remove top cover of the 8477A.
- b. Connect the equipment as shown in Figure 2. Connect the low side of the digital voltmeter to Test Point 7 with a 1K resistor in series with the test lead. The high side of the DVM is connected to BNC jack on the front panel of the 8477A and TP3 at TP7. TP7 is also available at the V_{comp} BNC jack on the front panel of the 8477A and TP3 at the VRF jack. Use BNC tees on these connectors to monitor the test point voltages there, if desired. Except for the different voltmeters used, the equipment setup is identical to Figure 4.
- c. Make the following equipment settings:

8477A:
 POWER (mW) 0.1 mW
 FUNCTION 200
 ZERO/TEST ZERO

432:
 RANGE 10.0 mW
 CALIBRATION FACTOR 100%
 MOUNT RESISTANCE 200
 A2S1 OPERATE/CALIBRATE SWITCH
 (on A2 logic board of 432 with
 Serial 931-01751
 and above) CALIBRATE

Figure 2. Zero Range Test Setup

3440A/3443A:
 RANGE AUTO

- d. Rotate the 8477A ZERO control full counterclockwise. The DVM should indicate greater than +500 μ V.
- e. Rotate the 8477A ZERO control full clockwise. The DVM should indicate less than -500 μ V.

42. V_{comp}

- a. Make the following equipment settings:

8477A:
 POWER (mW) 0.1 mW
 FUNCTION 200 ohms
 ZERO/TEST TEST

740B:
 FUNCTION Δ VM
 VOLTMEETER SENSITIVITY X10
 VOLTAGE SET 0 (all set ccw)

- b. Connect Input Cable Assembly (HP 11054A) to the INPUT receptacle of the 740B. Set INPUT Z switch to ∞ .

PERFORMANCE TESTS

42. V_{comp} (Cont)

c. Short the + and - inputs of the 1154A with a shorting wire. Carefully zero the 740B as follows:

1. Ensure that all VOLTAGE SET controls are set to zero (fully ccw).

2. Depress $X10^4$ SENSITIVITY.

3. Adjust ZERO control for zero meter indication.

d. Remove the shorting wire from the input terminals of the 11054A. Change the 740B RANGE to 10V.

e. Connect the equipment as shown in Figure

f. Check the +5.9V (200 ohm) reference as follows:

3.

1. Depress the $X1$ SENSITIVITY and adjust its VOLTAGE SET to 5.

2. Push the $X10$ VOLTMEETER SENSITIVITY and adjust its VOLTAGE SET to 9.

3. Push the $X10^2$ VOLTMEETER SENSITIVITY and adjust the VOLTAGE SET to zero.

4. Push the $X10^3$ VOLTMEETER SENSITIVITY and adjust the VOLTAGE SET to zero. The 740B meter should indicate within plus-minus three major divisions of zero.

g. Remove the voltmeter lead from TP7; set 3.100 volts on the 740B using the VOLTAGE SET controls (VOLTMEETER SENSITIVITY set to $X10^2$).

h. Turn the POWER (mW) control on the 8477A to 10 mW position.

i. Return the test lead from the differential voltmeter to TP7 in the calibrator. It should indicate zero plus-minus three major divisions (3 mV).

j. Again remove the test lead from TP7 in the 8477A. Using the VOLTAGE SET controls, set 2.200 volts on the 740B.

k. Set the 8477B FUNCTION switch and the 432A MOUNT RESISTANCE switch to 100 ohms; replace the voltmeter test lead on TP7. The 740B meter should indicate zero plus-minus three major divisions (3 mV).

Figure 3. V_{comp} Check Test Setup

PERFORMANCE TESTS

43. Range Accuracy

a. After making the following instrument settings, connect equipment as shown in Figure 4.

432:	RANGE	10 mW	MOUNT RESISTANCE	200 ohms
8477A:	FUNCTION	200 ohms	ZERO/TEST	ZERO
740B:	FUNCTION	ΔVM	VOLTMETER SENSITIVITY	X1
	RANGE	1 mV	VOLTAGE SET	0

Figure 4. Range Accuracy Test Setup

Note

The heavy capacitive loading of the differential voltmeter may cause the 8477A-432 bridge loops to oscillate. An off-scale meter reading on the 432 is an indication of loop oscillations and can be verified by observing the signal inside the loop with an oscilloscope. If oscillations occur, connect a 1K resistor in series with the low side of the 740B Differential Voltmeter.

b. Set the 740B VOLTMETER SENSITIVITY to $X10^2$ and adjust the 8477A ZERO control for 0.000 ± 0.2 major division on the 740B meter.

PERFORMANCE TESTS

43. Range Accuracy (Cont)

c. Set the 740B VOLTMETER SENSITIVITY to X1 and the 8477A ZERO/TEST control to TEST. Measure the calibrator voltage as follows:

1. Turn X1 VOLTAGE SET knob to 6.

2. Push X10 VOLTMETER SENSITIVITY and adjust its VOLTAGE SET to 7.

3. Push X10² VOLTMETER SENSITIVITY and adjust its VOLTAGE SET to 8. The 740B meter should indicate within plus-minus three major divisions of zero (± 3 mV).

d. Return the 740B VOLTMETER SENSITIVITY to X1 and change its RANGE to 10 mV. Set the 8477A POWER (mW) switch to .03. Referring to Table 3 and using the procedures given in steps b and c, set the correct voltages and check the remaining 200 ohm ranges.

Note

It is not necessary to vary the RANGE switch of the 432 in the steps of the 8477A RANGE accuracy steps.

e. Using the procedure outlined above, check the 100 ohm range accuracies to the specifications listed in Table 4.

POWER (mW)	Voltage (mV) TP3 to TP7 Tolerance (\pm)
10.0	0.678 0.003 μ V
3.0	2.034 0.009
2.0	6.784 0.010
1.0	20.370 0.031
0.3	68.190 0.100
0.1	137.200 0.200
0.03	207.000 0.310
0.01	1831.000 2.700

Table 3. Range Accuracy Readings (200 Ω)

POWER (mW)	Voltage (mV) TP3 to TP7 Tolerance (\pm)
10.0	0.909 0.004 μ V
3.0	2.729 0.012
2.0	9.110 0.014
1.0	27.440 0.041
0.3	92.870 0.138
0.1	190.000 0.284
0.03	292.100 0.438
0.01	1283.500 1.920

Table 4. Range Accuracy Readings (100 Ω)

PERFORMANCE TESTS

44. SET and CHECK Functions

a. This check verifies that the 8477A is operating properly in the SET and CHECK functions. Connect the equipment as shown in Figure 5. Set the instrument controls as follows:

8477A: FUNCTION SET

432: RANGE 10 mW
 MOUNT RESISTANCE 200 ohms

b. The voltmeter should indicate +5.9 volts \pm .01 volt.

c. Change the FUNCTION switch to CHECK. The voltmeter should now read 2.2 volts \pm .01 volt.

d. Connect the positive probe of the voltmeter to TP3 (negative lead to chassis).

e. Set the 8477A FUNCTION switch to SET. The voltmeter should read 5.9 volts \pm .01 volt.

f. Move the FUNCTION switch to the CHECK position. The voltmeter should read 2.2 volts \pm .01 volt.

g. Return the OPERATE/CALIBRATE switch A2S1 on the 432 A2 Logic Board to OPERATE if set in this position in step 41 c.

44b	Meter Indication	Vdc		_____	
44c	Meter Indication	Vdc	2.190	_____	2.210
44e	Meter Indication	Vdc	5.890	_____	5.910
44f	Meter Indication	Vdc	2.190	_____	2.210

45. CHECKS AND ADJUSTMENTS

46. Power Supplies

- a. Connect the DVM and the oscilloscope in parallel to TP4. This power supply is nominally +18V; the voltage should be between +17V and +20V. Maximum ripple is 5.6 mV p-p (2 mVrms).
- b. Connect the scope and DVM to TP5. This supply is nominally -7V; its value should fall between -5.8V and -7.8V. Maximum ripple is 2.8 mV p-p (1.0 mVrms).
- c. Refer to the troubleshooting information on Service Sheets 1 thru 3 if either power supply fails to meet the above specifications.

47. 5.900 Volt Adjustment

- a. Set up the test equipment as shown in Figure 3. Connect the positive lead of the voltmeter to TP13. Set the instrument controls as follows:

8477A:	FUNCTION	200 ohms	ZERO/TEST	ZERO
	POWER (mW)	3 mW	ZERO CONTROL	Centered
432:	RANGE	3 mW	MOUNT RESISTANCE	200 ohms
			CAL FACTOR	100%
740B:	FUNCTION	ΔVM	VOLTMETER SENSITIVITY	X1
	RANGE	10V	VOLTAGE SET	0

- b. Zero the 740B meter (refer to V_{comp} check in Performance Test for procedure).
- c. Set the 740B to 5.900 volts using its VOLTAGE SET controls and adjust AIR21 for a 740B meter indication of zero ±1 major division. If AIR21 cannot be adjusted to the above value, the value of AIR22 should be changed to make the adjustment possible.

48. Amplifier Balance Adjustment

- a. Connect a DVM between TP6 and TP7 with a 1K resistor in series with the negative lead and set R24 (OFFSET ADJUST) for a DVM reading of 0.000 ±0.002V.
- b. Move the DVM leads to TP2 and TP3 with the 1K resistor in series with the negative lead. Set R37 (ZERO ADJUST) for a DVM reading of 0.000 ±0.002V.

49. REPLACEMENT PARTS

50. Ordering Information

51. To obtain replacement parts, address order or inquiry to your local Hewlett-Packard field office (see list at rear of this manual for addresses). Identify parts by their Hewlett-

- a. Instrument model number.
- b. Instrument serial number.
- c. Description of the part.
- d. Function and location of the part.

Packard part numbers. To obtain a part that is not listed, include:

REFERENCE DESIGNATORS

A	= assembly	F	= fuse	P	= plug
B	= motor	FL	= filter	Q	= transistor
BT	= battery	J	= jack	R	= resistor

Table 8. Code List of Manufacturers

The following numbers are from the Federal Supply Code for Manufacturers Cataloging Handbooks H4-1 (Name to Code) and H4-1 (Code to Name) and their latest supplements.	
Code No.	Manufacturer Address
02660	Amphenol Corp. . . . Broadview, Ill. 60153
04009	Arrow, Hart and Hegeman Electric Co. . . . Hartford, Conn. 06106
04713	Motorola Semiconductor Division . . . Phoenix, Ariz. 85008
07263	Fairchild Camera and Instrument Corp. Semiconductor Division . . . Mountain View, Cal. 94040
28480	Hewlett-Packard Co. . . Palo Alto, Cal. 94304
56289	Sprague Electric Co. . . . N. Adams, Mass. 01247
70903	Belden Corp. . . . Chicago, Ill. 60644
71400	Bussman Mfg. Division McGraw-Edison Co. . . . St. Louis, Mo. 63017
75915	Littelfuse Inc. . . . DesPlaines, Ill. 60016
80131	Electronic Industries Association . . . Washington, D.C. 20006
82389	Switchcraft Inc. . . . Chicago, Ill. 60630
87034	Marcooak Industries, Inc. . . . Anaheim, Cal. 92803
92418	Radio Materials Co. . . Chicago, Ill. 60646
98978	International Electric Research Corp. . . Burbank, Cal. 91502

52. Backdating Information

53. The front and rear panels on instruments with serial prefixes prior to 963 are not active for replacement. To replace one of these front panels, order and install the following current parts.

- a. Front Panel 08477-00004
- b. S1 3101-1248 Pushbutton Power Switch
- c. R2 0757-0458 51.1K Ohm Resistor.

To replace one of these rear panels, order and install the following:

- a. Rear Panel 08477-00005
- b. W1 8120-1248 Power Cable
- c. F1 2110-0318 1/8 ASB Fuse.

54. TROUBLESHOOTING AND SCHEMATIC DIAGRAMS

55. Introduction

56. Schematic presentations in this manual show electrical circuit operation and are not intended to serve as wiring diagrams. Table 9 lists notes which apply to the schematic diagrams.

57. Some switch and circuit board assemblies are shown in part on different pages. To find a specific instrument component, refer to the "REF-

ERENCE DESIGNATIONS" box which appears on each schematic diagram. Reference designations within assemblies are abbreviated. The full designation includes the assembly on which the component is mounted, and the individual component designation. For example, resistor R1 mounted on assembly AI has the complete reference designation of AI.R1. Certain parts are not included on assemblies, and are classified as chassis parts. Chassis parts are assigned only the reference designation shown on the schematic diagram.

58. An asterisk indicates a factory selected part; the component value shown is the typical or most commonly selected value.

59. Component procurement information and specific component descriptions are included in Table 7.

60. Test Conditions

61. For most tests of circuit operation when troubleshooting the instrument, the troubleshooting charts call out control settings. In special cases, notes on the schematics indicate control settings required to measure voltage levels in circuits. Generally, the following control settings should be selected, and changed only as the troubleshooting procedures indicate:

- FUNCTION 200Ω
- POWER (mW) 01 mW
- ZERO/TEST ZERO

Figure 8. A2 Power Switch Assembly, Component Locations

A 432 Power Meter derives its meter readings from two voltages, V_{RF} and V_{comp}, generated by two bridge circuits. Each bridge has two legs, one in the power meter and one external leg in a thermistor mount. (See the 432 manual.)

When the 8447A Calibrator is connected to a power meter, it forms the external legs of the bridge circuits, and the calibrator controls V_{RF} and V_{comp}. The calibrator can set V_{RF} and V_{comp} to various voltage levels to simulate operation of thermistor mounts operating at several different power levels. This makes it possible to quickly test and adjust a 432 Power Meter.

The calibrator can also be used to check that a power meter's bridge circuitry is operating properly and that the bridge amplifiers have sufficient open loop gain for accurate power measurement. Because the calibrator's output amplifiers are current limited, it is possible for it to compensate for slight bridge unbalance in the power meter but not for gross unbalance due to faulty components.

Block Diagram

Figure 10 is a block diagram of the 8477A Calibrator, showing connections to the 432 Power Meter. The 8447A is connected to the 432 through the thermistor cable and two BNC cables. The BNC cables connect the V_{comp} and V_{RF} voltages to the 8477A and the thermistor cable completes the bridge circuits.

The V_{comp} reference voltage divider provides the V_{comp} reference voltage for the V_{comp} amplifier. The V_{comp} reference voltage depends on the settings of FUNCTION and POWER (mW) switches. Table 10 lists the reference voltages and switch positions.

The V_{comp} amplifier compares V_{comp} with the V_{comp} reference voltage. Any difference that exists is amplified and used to send a corrective current into the 432 compensation bridge at the V_{comp}/2 point. This current changes the input voltage to the compensation bridge amplifier. This change in input causes the V_{comp} voltage to change until its value equals the V_{comp} reference

voltage. The output current of the V_{comp} amplifier is limited to 1 mA.

The V_{RF} reference voltage divider is a precision resistor network which divides V_{comp} to produce the V_{RF} reference voltage. The V_{RF} reference voltage depends on the setting of the POWER (mW) switch.

The V_{RF} amplifier compares V_{RF} to the V_{RF} reference voltage. The difference is amplified and used to send a corrective current into the 432 RF bridge at the V_{RF}/2 point. This current changes the input voltage to the RF bridge amplifier. This change in input causes the V_{RF} voltage to regulate to its correct value. The output current of the V_{RF} amplifier is limited to 100 μA.

With the ZERO/TEST switch in the ZERO position, the V_{RF} reference voltage is connected to V_{comp}, and the offset of the V_{RF} amplifier is set by the ZERO control to compensate for offsets in the 432.

With the FUNCTION switch in the SET position, both the V_{RF} and V_{comp} reference voltages are +5.9 volts. The operator sets the offset of the 432 bridge amplifiers to zero in the SET position, and then switches to CHECK. In the CHECK position, both the V_{RF} and V_{comp} reference voltages (and hence the bridge voltages) are +2.2 volts. This change in the output voltages of the 432 bridge amplifiers means that a proportional change in the input voltages of these amplifiers must have taken place. If this change is sufficiently small (less than 0.4 mW), the 432 bridge amplifiers have enough gain for proper operation.

Table 10. V_{comp} Reference Voltages

POWER (mW)	FUNCTION	REFERENCE VOLTAGE
0.01 - 3	200	+5.9V
10	200	+3.1V
0.01 - 10	100	+2.2V
	SET	+5.9V
	CHECK	+2.2V

SERVICE SHEET 2

Introduction

The voltage amplifiers control the bridge voltages, VRF and Vcomp, coming from the power meter.

With A2 Function Switch Assembly and A3 Power Switch Assembly set as shown, Vcomp is referenced to an internal, calibrator reference and VRF is referenced to Vcomp.

To troubleshoot the amplifiers, connect the calibrator to a 432 Power Meter: connect VRF to VRF and Vcomp to Vcomp with BNC cables, and connect the instruments' front panel connectors together using the thermistor mount cable supplied with the power meter. Follow the procedures outlined in the troubleshooting tree.

Equipment:

- Power Meter HP 432 series
- Thermistor Mount Cable HP 8120-1082
- Cable Assembly (2) HP 10503A
- Digital Voltmeter HP 3440/3443
- Cable Assembly HP 11002A

VRF Reference Voltage Divider

With the FUNCTION switch set to 100 or 200 ohms, A2R4 through A2R20 divide Vcomp to produce a reference voltage for the VRF amplifier. The division ratio is set by the POWER switch.

VRF Differential Amplifier

Q18A/B, Q19 and Q20 compare VRF to the VRF reference voltage from the voltage divider. Q26 is the current source for the amplifier. R37 is the coarse offset adjust and R1, used to zero the 432 meter, is the fine offset adjust. CR13

and CR14 prevent Q18A/B from becoming back biased. R52, R53, C15 and C16 filter out high frequency interference.

VRF Amplifier and Current Limited Amplifier

Q21 amplifies the difference voltage and drives Q22. Q24 is a 100 μ A current source. Q22 and Q23 form an amplifier limited to 200 μ A maximum. The result is an output capable of delivering no more than 100 μ A to the 432 bridge.

Vcomp Reference Voltage Divider

A2R1 through A2R3 provide the reference voltage for the Vcomp amplifier. The division ratio is set by the FUNCTION and RANGE switches.

Vcomp Differential Amplifier

Q11A/B, Q12 and Q13 compare Vcomp to the Vcomp reference voltage. Q25 is the current source for the amplifier. R24 controls the offset of Q11A/B. CR11 and CR12 prevent Q11A/B from becoming back biased. R50, R52, C11 and C12 filter out high frequency interference.

Vcomp Amplifier and Current Limited Amplifier

Q14 amplifies the difference voltage and drives Q15. Q17 is a 1 mA current source. Q15 and Q16 form an amplifier limited to 2 mA maximum. The result is an output capable of delivering no more than 1 mA to the 432 bridge.

Bridge Resistors

A3R1 through A3R4 complete the 432 thermistors for bridges for a mount resistance of 200 ohms. A3R2 and A3R4 complete the bridges for a mount resistance of 100 ohms.

SERVICE SHEET 3

Introduction

To troubleshoot the power supply, connect the calibrator to a 432 Power Meter; connect V_{RF} to V_{RF} and V_{comp} to V_{comp} with BNC cables, and connect the instruments' front panel connectors together using the thermistor mount cable supplied with the power meter. Follow the procedures outlined in the troubleshooting tree.

Equipment

- Power Meter HP 432 Series
- Thermistor Mount Cable HP 8120-1082
- Cable Assembly (2) HP 10503A
- Digital Voltmeter HP 3440/3443
- Cable Assembly HP 11002A

Current Source

Q1 provides collector current for Q5 and base drive for Q3.

Series Regulator

Q5 drives series regulator Q2 through emitter follower Q3.

Current Limiter

Q4 prevents accidental overloads from damaging the power supply. If the voltage drop across R6 exceeds 0.6V, Q4 turns on. This tends to turn Q3 and Q2 off until the overload is removed.

Differential Amplifier

Q5 and Q6 compare the +18V (nominal) with the +6.2V reference through R3 and R4. Any difference is amplified by Q5 and fed to Q3 to correct the output voltage of the series regulator.

Reference Voltage

CR6, a stable, low noise zener diode, provides the reference voltage for the power supply and the V_{comp} reference voltage divider.

Amplifier and Shunt Regulator

Q9 is driven by Q8 and controls the -6.8 volt supply. If the supply goes more negative, the bias on Q8 increases. This causes Q9 to conduct more, pulling the voltage back to -6.8 volts.
