If of interest:

A circuit diagram for the METCAL SP200 SP-PW1-10 soldering station is attached. Some components still need to be identified and measured values to help of repairs.

Hello Gerhard,

do you also have pictures of the interior of the station? I would interested.

Regards,

Chris

Hi Chris,

Yes! But not here. But can upload it tonight.

Regards,
Gerhard

Hi Chris,

here are some pictures from the open ward.

Greeting,
Gerhard

Thanks Gerhard. Yes, there is not much in it;)

Regards,

Chris

Here is a revised version of the schematic with the measured (LARU) inductance values of the coils and a few new ones Component value entries.

However, I do not understand the purpose of the resistors at the OUTA (R17 / R18). Any ideas?

That will be because there is no OUTA and OUTB on the chip, but only OUT on pin 14. Pin 11 is IlimRef, so for the Current limitation. Data sheet for the UC3823 :

<http://pdf.datasheetcatalog.com/datasheet2/8/0uza3o862dx-f0j7k7sxwfg9xag3y.pdf>

Regards,

Chris

Hello Chris,

now I understand. Digi-Key's TI datasheets are different.

<http://www.ti.com/lit/ds/symlink/uc3825a.pdf>

I got the wrong data sheet. Then there is no need this question. The UC3823 BN is not the same as the one used. Man never stops learning ...

Greeting,
Gerhard

Hi, thank you for this schematic. I built it and got it working very well. There is a small mistake, pin 4 of UC3823n should not be connected. In the schematic it is connected to ground.

It is very interesting in how it works - the UC3823n generates a low frequency in the region of 40 kHz, which excites the RC circuit and it rings at the desired ~ 450 kHz frequency. When the set current is reached, the 40kHz is decreased accordingly.
