

CHECKING LANDS (7)

No.	Name	Function
B-1	WLB-CTRL	DC-DC converter-control terminal
B-2	WLB-12V	DC-DC converter 12V output
B-3	WLB-5V	DC-DC converter 5.5V output
B-4	WLB-VCC1	DC-DC converter input
B-5	WLB-GND	DC-DC converter GND
B-6	ASB-PCGND	GND for photo coupler
B-7	ASB-PCOA	Aperture photo interrupter output
B-8	ASB-PC3V	3.3V for photo coupler
B-9	ASB-APMG	Aperture Mg signal
B-10	ASB-APGND	GND for aperture Mg
B-n	ASB-AP3V	3.3V for aperturellg
B-12	ASB- AEL	AE LOCK SW
B-13	ASB-PULSE	Mech. pulse output
B-14	ASB-TV	Tvdial output
B-15	ASB-HOSEI	Compensation dial output
B-16	ASB-TVVREF	Ref. voltage for dial resistor
B-17	ASB-TVAGND	GND for dial resistor
B-18	ASB- ILLUMISW	Illuminator SW output
B-19	ASB-PSAM	Mode dial output
B-20	ASB-TVSELFLED	Self-timer LED cathode terminal
B-21	ASB-TVPC3V	3.3V for Mech. pulse
B-22	ASB-MCHARGE	Charge completion switch output
B-23	ASB-COUNTER	Counter SW output
B-24	ASB-MAKISW	Film advance SW output
B-25	ASB-TV3V	3.3V for self -timer LED
B-26	ASB-TAJYU	Not in use
B-27	ASB-R1	R1 switch output

Charging completion switch

Halts the shutter charging motor when the mechanical charging operation such as shutter and mirror charging has been completed. The switch goes ON during mechanical charging and goes OFF when completed.

Film advance complete switch

Completes film advance operation. Spool motor rotates when the switch is turned ON during shutter release operation and the motor stops when the switch is turned OFF.

Frame counter

Stops the blank exposure operation when the frame counter advances to frame "1".

Shutter release switch

Releases shutter.

Shutter pre-release switch

Activates power circuit. Shutter pre-release timer is activated when the shutter pre-release switch is depressed. Then AE and AF operations start.

Power

Supplies and breaks the path of power.

Film advance mode selector switch

Selects film advance modes (CH, CL, CS, S). Self-timer switch is also included.

EE sensor switch

Identifies lens mounted.

H/R switch

Cable release switch. When the switch is depressed, the shutter is pre-released in the first step, and then the shutter is released in the second step.

Rear curtain switch

Activates mechanical charging operation such as shutter and mirror charging to start. This switch becomes ON when the rear curtain runs and becomes OFF during mechanical charging operation.

Filter switch 1

AF filter identification switch. When a standard filter is incorporated, filter switch 1 is ON.

Filter switch 2

AF filter identification switch. When an active illuminator filter is employed, filter switch 2 is ON.

Sync contact switch

Turns semiconductor switch for firing flash ON and starts integration in TTL mode. This switch goes ON when the front curtain moves and it goes OFF during mechanical charging operation.

R2 switch

Film rewind switch.
Starts rewinding film automatically. (the power rewind starts when both R1 and R2 switches are turned on.) If shutter pre-release timer is OFF while rewinding film, the shutter pre-release timer is activated by turning the switch R2 ON.

TC

Identifies lens mounted.

fmm switch

Identifies lens mounted.

Illuminator switch

Turns illuminator ON and OFF.

R1 switch

Film rewind switch.
Recognizes that sprocket becomes free to rotate.

Film detection switch

Detects film is loaded. The switch is ON when film is not loaded, and it is OFF when film is loaded.

Focus lock switch

Locks focus.

AE lock switch

Locks exposure values stored in the memory.

Camera back switch

Recognizes that camera back is closed. The switch is ON when the camera back is opened, and it is OFF when the camera back is closed.

Lens release switch

Recognizes that lens is mounted. The switch becomes OFF when lens release button is pressed and AF mode turns to be AF-M mode.

AF switch 1

Focus mode selector switch.
The switch is ON when in AF-S mode.

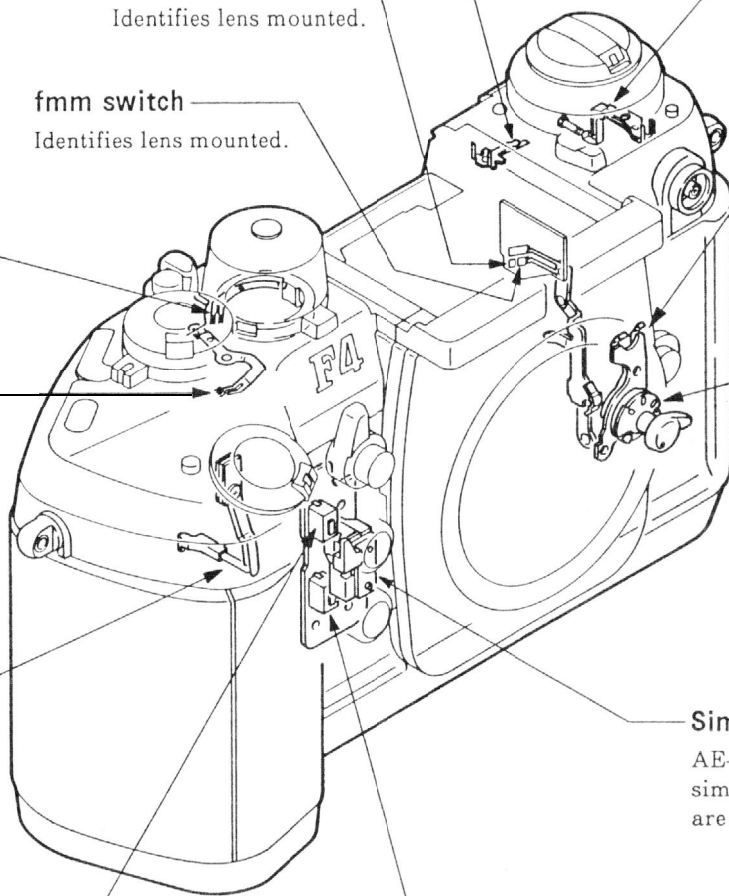

AF switch 2

Focus mode selector switch.
The switch is ON when in AF-C mode.

*Both AF switches are OFF when in AF-M mode.

Simultaneous lock switch

AE-L and AF-L are locked when the simultaneous lock switch and AF-L switch are ON.

Fixed data : Do not change the data except address 8.

Initial data of Main FPC unit for repair parts :

Fixed data and roughly data are written in FPC assembling.

Standard data : These are general data. Data are not yet decided.

Note : Do not change the data address 52 to 127.

* Meaning of address 30 flag data (different from old type CPU)

- | |
|---|
| <p>128 : Power voltage falls below DC/DC converter guaranteed voltage level.
64 : Closing curtain SW fails to turn on even if closing curtain Mg turns off.
8 : Mechanical pulse fails to be output 255ms during charging.
4 : X contact is closed without T setting.
2 : Correct pulses are not output while aperture control is carried.
1 : 40 or more aperture pulses are generated after aperture Mg turns on.</p> |
|---|

If the above number is written in the address 30 of EEPROM, it means that the mentioned trouble happened in the camera. If two or more troubles have happened, added number is shown. For example, If the number in address 30 is 192, troubles mentioned in '128 and 64' in the past.

Note : 1. If the shutter is released while depth-of-field preview button is depressed, the number "2" is written in address 30. The actual trouble did not necessarily occur.

2. After repair, be sure to change the number in address 30 to "0".

* EEPROM list of Multi Photomic Finder

- 0 : Compensation value at center (five-part SPD) 1/8EV per 1LSB
- 1 : Compensation value at upper-left (five-part SPD) 1/8EV per 1LSB
- 2 : Compensation value at upper-right (five-part SPD) 1/8EV per 1LSB
- 3 : Compensation value at lower-left (five-part SPD) 1/8EV per 1LSB
- 4 : Compensation value at lower-right (five-part SPD) 1/8EV per 1LSB
- 5 : Not in use.
- 6 : Not in use.
- 7 : Not in use.

Note : If a customer request You to change the meter characteristic to over or under exposure, change the value in address 0 to 4 by the same degree.
