6.8 St	ate behavior	
6.8.1	Introduction to state diagrams used in Chapter 6	
6.8.2	State Operation	
6.8.3	BIST Operation	
6.8.4	List of Protocol Layer States	
7. Pov	ver Supply	226
7.1 Se	ource Requirements	
7.1.1	Behavioral Aspects	
7.1.2	Source Bulk Capacitance	
7.1.3	Types of Sources	
7.1.4	Positive Voltage Transitions	
7.1.5	Negative Voltage Transitions	
7.1.6	Response to Hard Resets	
7.1.7	Changing the Output Power Capability	
7.1.8	Safe Operating Considerations	
7.1.9	Output Voltage Tolerance and Range	
7.1.10	Charging and Discharging the Bulk Capacitance on $V_{\mbox{\tiny BUS}}$	
7.1.11	Swap Standby for Sources	
7.1.12	Source Peak Current Operation	
7.1.13	BFSK over V _{BUS} Considerations for Sources	
7.2 Si	nk Requirements	
7.2.1	Behavioral Aspects	
7.2.2	Sink Bulk Capacitance	
7.2.3	Sink Standby	
7.2.4	Suspend Power Consumption	
7.2.5	Zero Negotiated Current	
7.2.6	Transient Load Behavior	
7.2.7	Swap Standby for Sinks	
7.2.8	Sink Peak Current Operation	
7.2.9	BFSK over V _{BUS} Considerations for Sinks	
7.3 T	ransitions	
7.3.1	Increasing the Current	
7.3.2	Increasing the Voltage	
USB Powe	r Delivery Specification Revision <u>+2</u> .0 <u>. Version 1.0</u>	Page 15

7.3.3	Increasing the Voltage and Current	
7.3.4	Increasing the Voltage and Decreasing the Current	
7.3.5	Decreasing the Voltage and Increasing the Current	
7.3.6	Decreasing the Current	
7.3.7	Decreasing the Voltage	
7.3.8	Decreasing the Voltage and the Current	
7.3.9	Sink Requested Power Role Swap	
7.3.1	0 Source Requested Power Role Swap	
7.3.1	1 GotoMin Current Decrease	
7.3.1	2 Source Initiated Hard Reset	
7.3.1	3 Sink Initiated Hard Reset	
7.3.1	4 New Source Initiates Hard Reset and New Sink Receives Hard Reset Signaling	
7.3.1	5 New Source Initiates Hard Reset and New Sink Does Not Receive Hard Reset Signaling	
7.3.1	6 New Sink Initiates Hard Reset and New Source Receives Hard Reset Signaling	
7.3.1	7 New Sink Initiates Hard Reset and New Source Does Not Receive Hard Reset Signaling	
7.3.1	8 Type-A to Type-B Dead Battery Operation	
7.3.1	9 No change in Current or Voltage	
7.4	Electrical Parameters	
7.4.1	Source Electrical Parameters	
7.4.2	Sink Electrical Parameters	
7.4.3	Common Electrical Parameters	
8. D	evice Policy	297
8.1	Overview	
8.2	Device Policy Manager	
8.2.1	Capabilities	
8.2.2	System Policy	
8.2.3	Control of Source/Sink	
8.2.4	Cable Detection	
8.2.5	Managing Power Requirements	
8.2.6	Use of "Externally Powered" bit with Batteries and AC supplies	
8.2.7	Interface to the Policy Engine	
8.3	Policy Engine	
8.3.1	Introduction	

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

8.3.2	Message Sequence Diagrams	
8.3.3	State Diagrams	
9. Sys	tem Policy	494
9.1 C	verview	
9.1.1	PDUSB Device and Hub Requirements	
9.1.2	Mapping to USB Device States	
9.1.3	PD Software Stack	
9.1.4	PDUSB Device Enumeration	
9.2 P	D Class Specific Descriptors	
9.2.1	USB Power Delivery Capability Descriptor	
9.2.2	Battery Info Capability Descriptor	
9.2.3	PD Consumer Port Capability Descriptor	
9.2.4	PD Provider Port Capability Descriptor	
9.3 P	D Class Specific Requests and Events	
9.3.1	Class-specific Requests	
9.3.2	PDUSB Hub Event Reporting	
9.4 P	DUSB Hub and PDUSB Peripheral Device Requests	
9.4.1	ClearPortPDFeature (PDUSB Hub)	
9.4.2	GetBatteryStatus (PDUSB Hub/Peripheral Device)	
9.4.3	GetPortPartnerPDObjects (PDUSB Hub)	
9.4.4	GetPortPDStatus (PDUSB Hub)	
9.4.5	SetPDFeature (PDUSB Hub/Peripheral Device)	
9.4.6	SetPortPDFeature (PDUSB Hub)	
9.4.7	SetPortPDOs (PDUSB Hub)	
9.4.8	GetVDM (PDUSB Hub)	
9.4.9	SendVDM (PDUSB Hub)	
A. Po	wer Profiles	519
A.1 P	rofile Definitions	
A.2 V	oltage Selection Rationale

1. Introduction

USB has evolved from a data interface capable of supplying limited power to a primary provider of power with a data interface. Today many devices charge or get their power from USB ports contained in laptops, cars, aircraft or even wall sockets. USB has become a ubiquitous power socket for many small devices such as cell phones, MP3 players and other hand-held devices. Users need USB to fulfill their requirements not only in terms of data but also to provide power to, or charge, their devices simply, often without the need to load a driver, in order to carry out "traditional" USB functions.

There are however, still many devices which either require an additional power connection to the wall, or exceed the USB rated current in order to operate. Increasingly, international regulations require better energy management due to ecological and practical concerns relating to the availability of power. Regulations limit the amount of power available from the wall which has led to a pressing need to optimize power usage. <u>ItThe USB Power Delivery</u> <u>Specification</u> has the potential to minimize waste as it becomes a standard for charging devices that are not satisfied by *[BC1.2]*.

Wider usage of wireless solutions is an attempt to remove data cabling but the need for "tethered" charging remains. In addition, <u>industryindustrial</u> design requirements drive wired connectivity to do much more over the same connector.

USB Power Delivery is designed to enable the maximum functionality of USB by providing more flexible power delivery along with data over a single cable. Its aim is to operate with and build on the existing USB ecosystem; increasing power levels from existing USB standards, for example Battery Charging, <u>enablesenabling</u> new higher power use cases such as USB powered Hard Disk Drives (HDDs) and printers.

With USB Power Delivery the power direction is no longer fixed. This enables the product with the power (Host or Peripheral) to provide the power. For example, a display with a supply from the wall can power, or charge, a laptop. Alternatively, USB power bricks or chargers are able to supply power to laptops and other battery powered devices through their, traditionally power providing, USB ports.

USB Power Delivery enables hubs to become the means to optimize power management across multiple peripherals by allowing each device to take only the power it requires, and to get more power when required for a given application. For example battery powered devices can get increased charging current and then give it back temporarily when the user's HDD requires to spin up. Optionally the hubs can communicate with the PC to enable even more intelligent and flexible management of power either automatically or with some level of user intervention.

Finally, USB Power Delivery allows Low Power cases such as headsets to negotiate for only the power they require. This provides a simple solution that enables USB devices to operate at their optimal power levels.

The Power Delivery Specification, in addition to providing mechanisms to negotiate power also can be used as a sideband channel for standard and vendor defined messaging. Power Delivery enables alternative modes of operation by providing the mechanisms to discover, enter and exit Modes. The specification also enables discovery of cable capabilities such as supported speeds and current levels.

1.1 Overview

This specification defines how USB Devices may negotiate for more current and/or higher or lower voltages over the USB cable (<u>using V_{BUS} or CC</u> wire as the communications channel) than are defined in the [USB2.0], [USB3.1], [USBType-C1.0] or [BC1.2]-specifications. It allows Devices with greater power requirements than can be met with today's specification to get the power they require to operate from V_{BUS} and negotiate with external power sources (e.g. wall warts). In addition, it allows a Source and Sink to swap <u>power</u> roles such that a Device could supply power to the Host. For example, a display could supply power to a notebook to charge its battery.

The USB Power Delivery Specification is guided by the following principles:

- 1) Works seamlessly with legacy USB Devices
- 2) Compatible with existing spec-compliant USB cables
- 3) Minimizes potential damage from non-compliant cables (e.g. 'Y' cables etc.)

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

4) Optimized for low-cost implementations

This specification defines mechanisms to discover, enter and exit Modes defined either by a standard or by a particular vendor. These Modes can be supported either by the Port Partner or by a cable connecting the two Port Partners.

The specification defines mechanisms to discover the capabilities of cables which can communicate using Power Delivery signaling.

For Type-C Connectors this specification adds a mechanism to swap the data roles such that the upstream facing Port becomes the downstream facing Port and vice versa. It also enables a swap of the end supplying V_{CONN} to a powered cable.

1.2 Purpose

The USB Power Delivery specification defines a power delivery system covering all elements of a USB system including: Hosts, Devices, Hubs-and, Chargers and cable assemblies. This specification describes the architecture, protocols, power supply behavior, connectors and cabling necessary for managing power delivery over USB at up to 100W. This specification is intended to be fully compatible and extend the existing USB infrastructure. It is intended that this specification will allow system OEMs, power supply and peripheral developers adequate flexibility for product versatility and market differentiation without losing backwards compatibility.

USB Power Delivery is designed to operate independently of the existing USB bus defined mechanisms currently-used to negotiate power which are:

- [USB2.0], [USB3.1] in band requests for high power interfaces.
- [BC1.2] mechanisms for supplying higher power-<u>(not mandated by this specification).</u>
 [USBType-C1.0] mechanisms for supplying higher power

Initial operating conditions remain the default-USB statesDefault Operation as defined in [USB2.0], [USB3.1], [USBType-C1.0] or [BC1.2].

- The Downstream port<u>DFP</u> sources vSafe5V over V_{BUS}.
- The Upstream portUFP consumes power from V_{BUS}.

1.3 Scope

This specification is intended as an extension to the existing [USB2.0], [USB3.1].[USBType-C1.0] and [BC1.2] specifications. It addresses only the elements required to implement enhanced power delivery over V_{BUS}-USB Power Delivery. It is targeted at power supply vendors, manufacturers of [USB2.0], [USB3.1].[USBType-C1.0] and [BC1.2] Platforms and, Devices.—and cable assemblies.

Normative information is provided to allow interoperability of components designed to this specification. Informative information, when provided, may illustrate possible design implementation.

1.4 Conventions

1.4.1 Precedence

If there is a conflict between text, figures, and tables, the precedence shall be tables, figures, and then text.

1.4.2 Keywords

The following keywords differentiate between the levels of requirements and options.

.

1.4.2.1 Conditional Normative

Conditional Normative is a keyword used to indicate a feature that is mandatory when another related feature has been implemented. Designers are mandated to implement all such requirements, when the dependent features have been implemented, to ensure interoperability with other compliant Devices.

1.4.2.2 Deprecated

Deprecated is a keyword used to indicate a feature, supported in previous releases of the specification, which is no longer supported.

1.4.2.3 Ignored

Ignored is a keyword indicating messages or message fields which, when received, shall result in no action by the receiver, aside from returning a **GoodCRC** message to acknowledge message receipt.

1.4.2.4 May

May is a keyword that indicates a choice with no implied preference.

1.4.2.5 N/A

N/A is a keyword that indicates that a field or value is not applicable and has no defined value and shall not be checked or used by the recipient.

1.4.2.6 **Optional/Optionally/Optional Normative**

Optional, Optionally and **Optional Normative** are equivalent keywords that describe features not mandated by this specification. However, if an **Optional** feature is implemented, the feature shall be implemented as defined by this specification.

1.4.2.7 Reserved

Reserved is a keyword indicating reserved bits, bytes, words, fields, and code values that are set-aside for future standardization. Their use and interpretation may be specified by future extensions to this specification and shall not be utilized or adapted by vendor implementation. A **Reserved** bit, byte, word, or field shall be set to zero by the sender and shall be ignored by the receiver. **Reserved** field values shall not be sent by the sender and shall be ignored by the receiver.

1.4.2.8 Shall/Normative

Shall and *Normative* are equivalent keywords indicating a mandatory requirement. Designers are mandated to implement all such requirements to ensure interoperability with other compliant Devices.

1.4.2.9 Should

Should is a keyword indicating flexibility of choice with a preferred alternative. Equivalent to the phrase "it is recommended that".

1.4.3 Numbering

Numbers that are immediately followed by a lowercase "b" (e.g., 01b) are binary values. Numbers that are immediately followed by an uppercase "B" are byte values. Numbers that are immediately followed by a lowercase "h" (e.g., 3Ah) are hexadecimal values. Numbers not immediately followed by either a "b", "B", or "h" are decimal values.

1.6 Terms and Abbreviations

This section defines terms used throughout this document. For additional terms that pertain to the Universal Serial Bus, see Chapter 2, "Terms and Abbreviations," in *[USB2.0]*, *[USB3.1]*, *[USB3.1*

Term	Description
Active Cable	A cable with a USB Plug on each end at least one of which is a Cable Plug supporting SOP', that also incorporates data bus signal conditioning circuits. The cable supports the Structured VDM Discover Identity to determine its characteristics in addition to other Structured VDM Commands (Electronically Marked Cable see [USBType-C1.0]).
<u>Alternate</u> <u>Mode</u>	As defined in [USBType-C1.0] . Equivalent to Mode in the PD Specification.
<u>Alternate</u> <u>Mode Adapter</u> <u>(AMA)</u>	<u>A PDUSB Device which supports Alternate Modes as defined in [USBType-C1.0]. Note that since an AMA is a PDUSB Device it has a single UFP that is only addresseable by SOP Packets.</u>
Attached	USB Power Delivery ports which are mechanically joined with USB cable.
<u>Binary</u> <u>Frequency</u> <u>Shift Keying</u> (<u>BFSK)</u>	 BFSK uses a pair of discrete frequencies to transmit binary (0s and 1s) information. In the Power Delivery BFSK system: Logic 0 is indicated by a frequency <i>fCarrier - fDeviation</i>. Logic 1 is indicated by a frequency <i>fCarrier + fDeviation</i>.
<u>Biphase Mark</u> <u>Coding (BMC)</u>	Modification of Manchester coding where each zero has one transition and a one has two transitions (see [IEC60958-1]).
BIST	Built In Self Test – Power Delivery testing mechanism for the PhyPHY Layer.
<u>Cable Plug</u>	Term used to describe a PD Capable element in a Multi-Drop system addressed by SOP'/SOP" Packets. Logically the Cable Plug is associated with a USB plug at one end of the cable. In a practical implementation the electronics may reside anywhere in the cable.
<u>Cable Reset</u>	This is initiated by <i>Cable Reset</i> signaling from either the Source or DFP. It restores the Cable Plugs to their default, power up condition and resets the PD communications engine to its default state. It does not reset the Port Partners.
Cold Socket	A downstream port <u>DFP</u> receptacle that does not apply $vSafe5V$ on V_{BUS} until a plug insertion is detected.
Page 34	USB Power Delivery Specification Revision <u>2.0. Version</u> 1.0 <u>.</u>

Table 1-1 Terms and Abbreviations

Term	Description
<u>Command</u>	Request and response pair defined as part of a Structured Vendor Defined Message (see Section 6.4.4.2]
<u>Configuration</u> <u>Channel (CC)</u>	Single wire used by the BMC PHY Layer signaling (see [USBType-C1.0]).
Connected	USB Power Delivery ports which are actively communicating using the USB Power Delivery protocol.
Consumer	The capability of a PD Port (typically a Device's upstream port<u>UFP</u>) to sink power from the power conductor (e.g. V_{BUS}). <u>This corresponds to a Type-B Port or a Type-C Port with R_d asserted on its CC Wire.</u>
Consumer/Pro vider	A Consumer with the additional capability to act as a Provider. <u>This corresponds to a Dual-Role</u> <u>Type-B Port or a Dual-Role Type-C Port with R_d asserted on its CC Wire.</u>
Contract	An agreement on both power level and direction reached between a Port Pair. A contract <u>Contract</u> may be explicitly negotiated between the Port Pair or may be an implicit <u>Implicit</u> power level defined by the current state. While operating in Power Delivery mode there will always be either an explicit <u>Explicit</u> or implicit contract <u>Implicit Contract</u> in place. The contract <u>Contract</u> may only be altered in the case of a (re-)negotiation, <u>Power Role</u> <u>Swap</u> , <u>Data Role</u> Swap, Hard Reset or failure of the Source.
<u>Data Role</u> <u>Swap</u>	Process of exchanging the DFP (Host) and UFP (Device) roles between Port Partners using the [USBType-C1.0] connector.
Dead Battery	A device has a Dead Battery when the battery in a device is unable to power its functions.
Device	When lower cased (device), it refers to any USB product, either device<u>USB Device</u> or <u>host.USB</u> <u>Host. When in upper case refers to a USB Device (Peripheral or Hub).</u>
Device Policy Manager	Module running in a Provider or Consumer that applies Local Policy to each port<u>Port</u> in the Device via the Policy Engine.
<u>Discovery</u> <u>Process</u>	<u>Command sequence using Structured Vendor Defined Messages resulting in identification of the</u> <u>Port Partner, its supported SVIDs and Modes.</u>
Downstream <u>Facing</u> Port <u>(DFP)</u>	EitherTypically a port in the Host or the portsType-A Port on a Device as defined in [USB2.0], [USB3.1] or Type-C Port as defined in [USBType-C1.0] The default Host and Source.
Dual-Role Device	A product containing one or more Dual-Role Ports that are capable of operating as either a Source or a Sink.
Dual-Role Port	A Consumer/Provider or Provider/Consumer capable port<u>Port</u> that is a <u>portPort</u> capable of operating as either a Source or Sink.
End of Packet (EOP)	K-code marker used to delineate the end of a packet.
<u>Enter Mode</u> <u>Process</u>	<u>Command sequence using Structured Vendor Defined Messages resulting in the Port Partners</u> <u>entering a Mode.</u>
<u>Exit Mode</u> <u>Process</u>	Command sequence using Structured Vendor Defined Messages resulting in the Port Partners exiting a Mode.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Term	Description
Explicit Contract	An agreement reached between a Port Pair as a result of the Power Delivery negotiation process. An explicit contractExplicit Contract is established (or continued) when a ProviderSource sends an Accept message in response to a Request message sent by a ConsumerSink. The explicit contractExplicit Contract may be altered through the the renegotiation process. All portPort pairs, except for those involving low power devices, are required to make an explicit contractExplicit Contract.
<u>Frame</u>	<u>Generic term referring to an atomic communication transmitted by PD such as a Packet, Test</u> <u>Frame or Signaling.</u>
Hard Reset	This is initiated by <i>Hard Reset</i> signaling from either Port Partner. It restores V _{BUS} to the default condition <u>USB Default Operation</u> and resets the PD communications engine to its default state <u>in</u> both Port Partners as well as in any attached Cable Plugs.
HDD	A Hard Disk Drive.
<u>Initiator</u>	The initial sender of a Command request in the form of a query.
Implicit Contract	An agreement on power levels between a Port Pair which occurs, not as a result of the Power Delivery negotiation process, but as a result of the current state e.g.during a <u>swapPower Role</u> <u>Swap</u> or <u>dead batteryDead Battery</u> operation, or on detection of a low power device. Implicit <u>contractsContracts</u> , except for those involving low power devices, are temporary since the <u>portPort</u> pair is required to immediately negotiate an <u>explicit contractExplicit Contract</u> .
IR Drop	The voltage drop across the cable and connectors between the Source and the Sink. It is a function of the resistance of the ground <u>and power</u> wire in the cable plus the contact resistance in the connectors times the current flowing over the path.
<u>K-code</u>	<u>Special symbols provided by the 4b5b coding scheme. K-codes are used to signal Hard Reset</u> and Cable reset, and delineate Packet boundaries.
Local Policy	Every DevicePD Capable device has its own Policy, called the Local Policy, that is executed by its Policy Engine to control its power delivery behavior. The Local Policy at any given time may be the default policy, hard coded or modified by changes in operating parameters or one provided by the system Host or some combination of these. The Local Policy optionally may be changed by a System Policy Manager.
Low Power	Mode in which Sources powered by e.g. a single cell Li battery that want to minimize the power they output over V_{BUS} without the requirement to fully support the PD negotiation process.
Low Power Device	Devices which can be powered e.g. by a single cell Li battery without the requirement to fully support the PD negotiation process.
<u>Modal</u> <u>Operation</u>	State where one or more Modes are active. Modal Operation ends when there are no longer any active Modes.
Message	The packet payload consisting of a header for control messages and a header and data for data messages as defined in Section 5.6.1.2.5.
Messaging	Communication in the form of messages as defined in Chapter 5.9.9.
<u>Mode</u>	Operation defined by a Vendor or Standard's organization, which is associated with a SVID, whose definition is outside the scope of USB-IF specifications. Entry to and exit from the Mode uses the Enter Mode and Exit Mode Processes. Modes are equivalent to "Alternate Modes" as described in [USBType-C1.0] .
<u>Multi-Drop</u>	Refers to a Power Delivery system with one or more Cable Plugs where communication is to the Cable Plugs rather than the Port Partner. Multi-Drop systems share the Power Delivery communication channel with the Port Partners.

Term	Description
Negotiation	This is the PD process whereby:
	1. The Source advertises its capabilities.
	2. The Sink requests one of the advertised capabilities.
	3. The Source acknowledges the request and alters its output to satisfy the request.
	The result of the negotiation is a contract <u>Contract</u> for power delivery/consumption between the Port Pair.
Packet	One entire unit of PD communication including a preamble <u>Preamble</u> , <u>SOP*;</u> , payload, CRC and EOP as defined in Section 5.6.
Passive Cable	<u>Cable with a USB Plug on each end at least one of which is a Cable Plug supporting SOP' that</u>
	does not incorporate data bus signal conditioning circuits. Supports the Structured VDM
	Discover Identity to determine its characteristics (Electronically Marked Cable see [USBType- C1.0]). Note this specification does not discuss Passive Cables which are not Electronically
	Marked Cables.
PD	USB Power Delivery
PD Capable	A port<u>Port</u> that supports USB Power Delivery.
PD Connection	A Port Pair with an established contract that are Connected i.e. actively communicating.
PDUSB	USB Device Port or USB Host Port that is <u>both P</u> D capable <u>and capable of USB Communication.</u> <u>See also PDUSB Host, PDUSB Device and PDUSB Hub</u> .
PDUSB Device	A USB Device with a PD Capable UFP. A PDUSB Device is only addressed by SOP Packets.
<u>PDUSB Host</u>	<u>A USB Host which is PD Capable on at least one of its DFPs. A PDUSB Host is only addressed by SOP Packets.</u>
<u>PDUSB Hub</u>	<u>A port expander USB Device with a UFP and one or more DFPs which is PD Capable on at least</u> one of its Ports. A PDUSB Hub is only addressed by SOP Packets.
<u>PDUSB</u> <u>Peripheral</u>	<u>A USB Device with a PD Capable UFP which is not a PDUSB Hub. A PDUSB Peripheral is only addressed by SOP Packets.</u>
PhyPHY Layer	The Physical Layer responsible for sending and receiving messages across <u>either V_{BUS} or CC</u> between a Port Pair.
Policy	Policy defines the behavior of PD capable parts of the system and defines the capabilities it advertises, requests made to (re)negotiate power and the responses made to requests received.
Policy Engine	The Policy Engine interprets the Device Policy Manager's input in order to implement Policy for a given port<u>Port</u> and directs the Protocol Layer to send appropriate messages.
Port	An interface typically exposed through an A, B or AB<u>a</u> receptacle, or via a plug on the end of a hard-wired captive cable. USB Power Delivery defines the interaction between a Port Pair.
Port Pair	Two attached PD <u>Capable</u> Ports.
Port Partner	The USB Power Delivery contract <u>A Contract</u> is negotiated between a Port Pair connected by a USB cable. These ports are known as Port Partners.
Power Conductor	The wire delivering power from the Source to Sink. For example USB's $V_{\mbox{\scriptsize BUS}}$
Power Consumer	See Consumer

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Term	Description
Power Delivery Mode	Operation after a Contract has initially been established between a port <u>Port</u> pair. This mode persists during normal Power Delivery operation, including after a swapPower Role Swap. Power Delivery mode can only be exited by detaching the ports, applying a Hard Reset or by the Source removing power (except when power is removed during the swapPower Role Swap procedure).
Power Provider	See Provider
<u>Preamble</u>	Start of a transmission which is used to enable the receiver to lock onto the carrier. The Preamble consists of a 64-bit sequence of alternating 0s and 1s starting with a "0" and ending with a "1" which is not 4b5b encoded.
Protocol Error	An unexpected or unknown message, that cannot be handled by a given implementation.
Protocol Layer	The entity that forms the messages used to communicate information between Port Partners.
Provider	A capability of a PD Port (typically a Host, Hub, or Wall Wart downstream port<u>DFP</u>) to source power over the power conductor (e.g. V_{BUS}). <u>This corresponds to a Type-A Port or a Type-C Port</u> with R_p asserted on its CC Wire.
Provider/Cons umer	A Provider with the additional capability to act as a Consumer. <u>This corresponds to a Dual-Role</u> <u>Type-A Port or a Dual-Role Type-C Port with R_p asserted on its CC Wire.</u>
Re-negotiation	A process wherein one of the Port Partners wants to alter the negotiated contractContract.
<u>Power</u> Reserve	Power which is kept back by a ProviderSource in order to ensure that it can meet total power requirements of attached Consumers<u>Sinks</u> on at least one port<u>Port</u>.
<u>Power Role</u> <u>Swap</u>	Process of exchanging the Source and Sink roles between Port Partners.
<u>Responder</u>	The receiver of a Command request sent by an Initiator that replies with a Command response.
Safe Operation	Sources must have the ability to tolerate <i>vSafe5V</i> 5¥ applied by both Port Partners.
Signalling	An <u>A Preamble followed by an</u> ordered set of four K-codes used to indicate a particular line symbol e.g. <i>Hard Reset</i> as defined in Section 5.4.
Single-Role Port	A port<u>Port</u> that is a <u>portPort</u> only capable of operating as a Source or Sink, but not both.
Sink	The $\frac{PortPort}{Port}$ consuming power from V _{BUS} ; most commonly a Device.
Soft Reset	A process that resets the PD communications engine to its default state.
<u>Start of Packet</u> (<u>SOP)</u>	<u>K-code marker used to delineate the start of a packet. Three start of packet sequences are</u> <u>defined: <i>SOP</i>, <i>SOP'</i> and <i>SOP"</i>, with <i>SOP</i>* used to refer to all three in place of <i>SOP/SOP'/SOP"</i>.</u>
<u>SOP</u> <u>Communicatio</u> <u>n</u>	Communication using SOP Packets, also implies that a message sequence is being followed.
<u>SOP'</u> <u>Communicatio</u> <u>n</u>	<u>Communication with a Cable Plug using SOP' Packets, also implies that a message sequence is</u> <u>being followed.</u>
<u>SOP"</u> <u>Communicatio</u> <u>n</u>	<u>Communication with a Cable Plug using SOP" Packets, also implies that a message sequence is being followed.</u>

Page **38**

Term	Description
<u>SOP*</u> <u>Communicatio</u> <u>n</u>	<u>Communication with a Cable Plug using SOP* Packets, also implies a message sequence is being</u> <u>followed.</u>
<u>SOP Packet</u>	Any Power Delivery Packet which starts with an SOP.
<u>SOP' Packet</u>	Any Power Delivery Packet which starts with an SOP' used to communicate with a Cable Plug.
<u>SOP" Packet</u>	Any Power Delivery Packet which starts with an SOP " used to communicate with a Cable Plug when SOP' Packets are being used to communicate with the other Cable Plug.
<u>SOP* Packet</u>	<u>A term referring to any Power Delivery Packet starting with either SOP, SOP' or SOP".</u>
Source	A role a port<u>Port</u> is currently taking to supply power over V_{BUS}; most commonly a Host or Hub downstream port<u>DFP</u>.
<u>Standard ID</u> (SID)	<u>16-bit unsigned value assigned by the USB-IF to a given industry standard.</u>
<u>Standard or</u> <u>Vendor ID</u> (<u>SVID)</u>	<u>Generic term referring to either a VID or a SID. SVID is used in place of the phrase "Standard or Vendor ID".</u>
System Policy	Overall system policy generated by the system, broken up into the policies required by each Port Pair to affect the system policy. It is programmatically fed to the individual Devices<u>devices</u> for consumption by their Policy Engines.
System Policy Manager	Module running on the USB Host. It applies the System Policy through communication with PD capable Consumers and Providers that are also connected to the Host via USB.
Tester	The Tester is assumed to be a piece of test equipment that manages the BIST testing process of a PD UUT.
<u>Test Frame</u>	Frame consisting of a Preamble, SOP*, followed by test data (See Section 5.9).
<u>Test Pattern</u>	Continuous stream of test data in a given sequence (See Section 5.9)
<u>Type-A</u>	Term used to refer to any A plug or receptacle including Micro-A plugs and Standard-A plugs and receptacles, including the PD and non-PD versions. Micro-AB receptacles are assumed to be a combination of Type-A and Type-B.
<u>Type-B</u>	Terms used to refer to any B-plug or receptacle including Micro-B plugs and Standard-B plugs and receptacles, including the PD and non-PD versions. Micro-AB receptacles are assumed to be a combination of Type-A and Type-B.
<u>Type-C</u>	Term used to refer to the Type-C connector plug or receptacle as defined in [USBType-C1.0].
<u>Unit Interval</u> (UI)	The time to transmit a single data bit on the wire.
Unit Under Test (UUT)	The PD device that is being tested by the Tester and responds to the initiation of a particular BIST test sequence.
Upstream <u>Facing</u> Port <u>(UFP)</u>	Typically a B port<u>Port</u> on a Device as defined in <i>[USB2.0], [USB3.1]<u>or Type-C Port as defined in</u> [USBType-C1.0] The default Device and Sink.</i>
USB Attached State	SynonomousSynonymous with the [USB2.0]] and [USB3.1] definition of the attached state

1.7 Parameter Values

The parameters in this specification are expressed in terms of absolute values. For details of how each parameter is measured in compliance please see *[USBPDCompliance]*.

Page **40**

2. Overview

This section contains no normative requirements.

2.1 Introduction

In USB Power Delivery, pairs of directly attached ports negotiate voltage, current and/or direction of power flow over the power conductor (USB cable, using V_{BUS} - or the CC wire as the communications channel. The mechanisms used, operate independently of other USB methods used to negotiate power. Type-C connectors can support the CC wire as the communications channel and in addition can support V_{BUS} communication but not concurrently. Type-A and Type-B connectors can only support V_{BUS} communication.

<u>USB Power Delivery also acts as a side-band channel enabling support for Standard or Vendor defined Modal</u> <u>Operation. Modes are associated with a Standard or Vendor ID (SVID). Power Delivery Structured VDM messages can</u> <u>be used to discover supported SVIDs and Modes and then to enter and exit Modes as required. Multiple Modes can</u> <u>also be in operation at the same time.</u>

Any contract<u>Contract</u> negotiated using this specification, supersedes any and all previous power contracts established whether from standard [USB2.0], [USB3.1]. [USBType-C1.0] or [BC1.2] mechanisms. While in Power Delivery Mode there will be a contract<u>Contract</u> in place (either explicit<u>Explicit</u> or implicit<u>Implicit</u>) determining the power level available and the direction of that power. The port pair<u>Port Pair</u> remains in Power Delivery mode until the port pair<u>Port Pair</u> is detached, there is a Hard Reset or the Source removes power (except during a swap<u>Power Role Swap</u> when the initial Source removes power in order to for the new Source to apply power).

An explicit contractExplicit Contract is negotiated by the process of the Source sending a set of Capabilities, from which the Sink is required to request a particular capability and then the Source accepting this request.

An <u>implicit contractImplicit Contract</u> is the specified level of power allowed in particular states (i.e. during and after a <u>role swapPower Role Swap</u>, in dead battery operation or when operating with a low power device). Except for the case of low power devices, <u>implicit contractsImplicit Contracts</u> are temporary; <u>port pairsPort Pairs</u> are required to immediately <u>negotiationnegotiate</u> an <u>explicit contract.Explicit Contract</u>. In the low power device case the <u>implicit contractEmplicit Contract</u> persists for as long as the <u>port pairPort Pair</u> remains attached and the Source continues to supply power.

Each Provider has a Local Policy, governing power allocation to its **portsPorts**. Sinks also have their own Local Policy governing how they draw power. A System Policy can be enacted over USB that allows modification to these local policies and hence management of overall power allocation in the system.

When PD Devices Capable devices are attached to each other, the downstream DFPs and upstream ports UFPs initially default to standard USB operation. Default Operation. The downstream portDFP supplies vSafe5V5V and the upstream portUFP draws current in accordance with the rules defined by [USB2.0], [USB3.1].[USBType-C1.0] or [BC1.2] specifications pecifications. After Power Delivery negotiation has taken place power can be supplied at higher, or lower, voltages and higher currents than defined in these specifications. It is also possible to swapperform a Power Role Swap to exchange the power supply roles such that the downstream portDFP receives power and the upstream portUFP supplies power. For a Type-C connector it is possible to perform a Data Role Swap such that the DFP becomes the UFP and vice-versa and to perform a V_{CONN} Swap to change the end supplying V_{CONN} to the cable.

Prior to an Explicit Contract the Source can discover the capabilities of the attached cable assembly. This is important for **[USBType-C1.0]** where 5A cabling is marked as well as other details of the cable assembly such as the supported speed. Cable discovery occurs on initial attachment of a Port Pair, before an Explicit Contract has been established where the DFP is the Source. It is also possible to carry out cable discovery after a Power Role Swap prior to establishing an Explicit Contract, where the UFP is the Source and an Implicit Contract is in place.

Once an Explicit Contract is in place only the DFP is permitted to communicate with the attached cable assembly. This communication can consist of discovering capabilities but may also include discover of SVIDs. Modes and the entering/exiting of Modes supported by the cable assembly.

2.2 Section Overview

This specification contains the following sections:

Section 1	Introduction, conventions used in the document, list of terms and abbreviations, references and details of parameter usage.
Section 2	Overview of the document including a description of the operation of PD and the architecture.
Section 3	Mechanical and electrical characteristics of the cables and connectors used by PD.
Section 4	Electrical requirements for dead battery Dead Battery operation and cable detection.
Section 5	Details of the PD physical layer<u>PHY Layer</u> requirements
Section 6	Protocol Layer requirements including the messages, timers, counters and state operation.
Section 7	Power supply requirements for both Providers and Consumers.
Section 8	Device Policy Manager requirements. Policy Engine message sequence diagrams and state diagrams
Section 9	USBPD Device requirements including mapping of V _{BUS} to USB states. System Policy Manager requirements including descriptors, events and requests.
Appendix A	Details of PD Power Profiles.
Appendix B	Example CRC calculations.
Appendix C	Considerations for Power Supplypower supply implementations.
Appendix D	Mating illustrations for the Standard-A.
Appendix E	Information relating to PHY Layer implementations.
Appendix F	Scenarios illustrating Device Policy Manager operation.
Appendix G	Examples of Structured VDM usage.

2.3 USB Power Delivery Capable Devices

Some examples of USB Power Delivery capable <u>Devicesdevices</u> can be seen in Figure 2-1 (a Host, a Device, a Hub, and a Charger). These are given for reference only and do not limit the possible configurations of products that can be built using this specification.

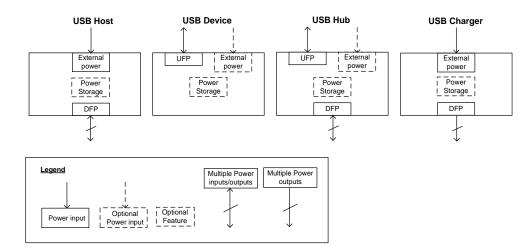

Figure 2-1 Logical Structure of USB Power Delivery Capable Devices

Each USB Power Delivery capable <u>Devicedevice</u> is assumed to be made up of at least one <u>portPort</u>. Providers are assumed to have a Source and Consumers a Sink. Each <u>Devicedevice</u> contains one, or more, of the following components:

• Upstream ports<u>UFPs</u> that:

- Sink power (a Consumer).
- Optionally source power (a Consumer/Provider).
- o Optionally communicate via USB.
- <u>Downstream portsCommunicate using SOP Packets.</u>
- **<u>DFPs</u>** that:
 - Source power (a Provider).
 - Optionally Sink power (a Provider/Consumer).
 - Optionally communicate via USB.
 - o Communicate using SOP Packets

Optionally Communicate using SOP* Packets.

- A Source that may be:
 - An external power source e.g. AC.
 - Power Storage (e.g. battery).
 - Derived from another portPort (e.g. bus-powered Hub).
- A power sink<u>Sink</u> that may be:
 - Power Storage (e.g. a battery).
 - Used to power internal functions.
 - \circ $\:$ Used to power devices attached to other devices (e.g. a bus-powered Hub).

2.4 SOP* Communication with Cable Plugs

2.4.1 SOP' Communication

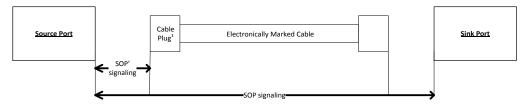

SOP' Communication is recognized by electronics in one Cable Plug (which may be attached to either the UFP or DFP). SOP Communication between the Port Partners is not recognized by the Cable Plug. Note: that the term Cable Plug in the SOP' Communication case is used to represent a logical entity in the cable which is capable of PD Communication and which may or may not be physically located in the plug. Figure 2-2 outlines the usage of SOP' Communications between a Source and a Cable Plug. Figure 2-3 outlines the usage of SOP' Communication between DFP and a Cable Plug.

Both SOP Communication and SOP' Communication take place over a single wire (either V_{BUS} or CC). This means that the SOP* Communication periods must be coordinated to prevent important communication from being blocked. For a product which does not recognize SOP' Packets, this will look like a non-idle channel, leading to ignored packets and retries. Communications between the Port Partners take precedence meaning that communications with the Cable Plug can be interrupted, but will not lead to error recovery steps such as Hard Reset.

When no Explicit Contract or an Implicit Contract is in place (e.g. after a Power Role Swap) the Source (either the DFP or UFP) can communicate with the Cable Plug using SOP' Packets in order to determine its characteristics (see Figure 2-2). During this phase all communication with the Cable Plug is initiated and controlled by the Source which acts to prevent conflicts between SOP* Packets. The Sink does not communicate with the Cable Plug, even if it is the DFP, and ignores any SOP' Packets received.

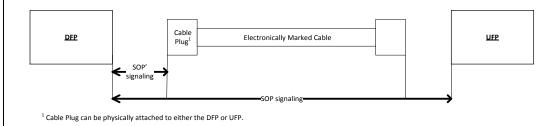

When an Explicit Contract is in place the DFP (either the Source or the Sink) can communicate with the Cable Plug using SOP' Packets (see Figure 2-3). During this phase all communication with the Cable Plug is initiated and controlled by the DFP which acts to prevent conflicts between SOP* Packets. The UFP does not communicate with the Cable Plug, even if it is the Source and ignores any SOP' Packets received.

Figure 2-2 SOP' signaling between Source and Cable Plug with no Explicit Contract or an Implicit Contract

¹ Cable Plug can be physically attached to either the Source or Sink Port.

Figure 2-3 SOP' signaling between DFP and Cable Plug with PD Explicit Contract

Page **44**

2.4.2 SOP" Communication

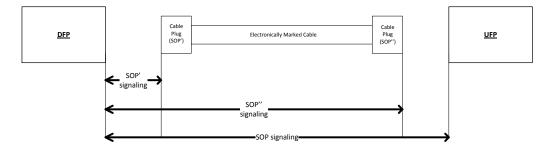

SOP' Packets are recognized by electronics in one Cable Plug attached to the DFP and are not recognized by the UFP or the other Cable Plug. Similarly SOP" Packets are recognized by electronics in one Cable Plug attached to the UFP and are not recognized by the UFP or the other Cable Plug. Communication between the Port Partners uses SOP Packets which is not recognized by either Cable Plug. Note: that the term Cable Plug in the SOP'/SOP" Communication case is used to represent a logical entity in the cable which is capable of PD Communication and which may or may not be physically located in the plug but is physically associated with the plug. Figure 2-4 outlines the usage of SOP" Communication between a DFP and a Cable Plug.

SOP* Communication takes place over a single wire (either V_{BUS} or CC). This means that the SOP* Communication periods must be coordinated to prevent important communication being blocked. For a product which does not recognize SOP'/SOP" Packets, this will look like a non-idle channel, leading to ignored packets and retries. Cable Plugs are forbidden from communicating with each other and can only respond to a Command request. Communications between the Port Partners take precedence meaning that communications with the Cable Plug can be interrupted, but do not lead to error recovery steps such as Hard Reset.

When no Explicit Contract or an Implicit Contract is in place (e.g. after a Power Role Swap), no SOP" communication takes place.

When an Explicit Contract is in place the DFP (either the Source or the Sink) can communicate with the Cable Plugs using SOP'/SOP" Packets (see Figure 2-3). During this phase all communication with the Cable Plugs is initiated and Controlled by the DFP which acts to prevent conflicts between SOP* Packets. The UFP does not communicate with the Cable Plug, even if it is the Source, and ignores any SOP'/SOP" Packets received.

Figure 2-4 SOP" Communication with the attached Cable Plugs

2.42.5 Operational Overview

A USB Power Delivery <u>portPort</u> supplying power is known as a Source and a <u>portPort</u> consuming power is known as a Sink. There is only one Source Port and one Sink Port in each PD connection between Port Partners. Where USB products support USB Power Delivery protocols a USB <u>downstream portDFP</u> is initially a Source and a USB <u>upstream</u> <u>portUFP</u> is initially a Sink, although USB Power Delivery also enables <u>theseboth the Source/Sink roles and DFP/UFP</u> roles to be swapped; <u>DPF/UFP roles can only be swapped on the Type-C connector</u>.

The following sections describe the high level operation of ports taking on the roles of DFP. UFP. Source and Sink.

For details of how PD maps to USB states in a PDUSB device<u>Device</u> see Section 9.1.2.

2.4.12.5.1 Source DFP Operation

The Source Port<u>DFP</u> operates differently depending on attachment status:

• FollowingAt Attach (no PD Connection or Contract):

USB Power Delivery Specification Revision <u>12</u>.0. Version <u>1.0</u>

Page 45

- The Source Port<u>DFP</u> can detect attachment of an A plug or detect Sink attachment via a C-Plug.
- The Source Port<u>DFP</u> typically sets V_{BUS} to vSafe5V.
- Before PD Connection (no PD Connection or PD Contract):
 - Prior to sending Source Capabilities The Source Port's output voltage on V_{BUS} will be at the USB default of either or .

messages the DFP detects the type of cabling attached and may alter its advertised capabilities depending on the type of cable detected.

- For an A-plug or B-plug, plug detection will be carried out to determine the current carrying capabilities of the cable.
- For a C-plug the default capability is 3A, but SOP' Communication can be used to determine other capabilities of the cable. The DFP can attempt to communicate with one of the Cable Plugs using SOP' Packets. If the Cable Plug responds then communication takes place.
- o The Source Port<u>DFP</u> periodically advertises its capabilities by sending Source Capabilities messages.
- The DFP does not generate SOP" Packets, is not required to detect SOP" Packets and will ignore them.
- Establishing PD Connection (no PD Connection or Contract):
 - Presence of a Port Partner is detected either:
 - By receiving a *GoodCRC* message in response to a *Source Capabilities* message.
 By receiving *Hard Reset* signaling.
 - <u>The DFP does not generate SOP' or SOP'' Packets, is not required to detect SOP' or SOP'' Packets and</u> will ignore them.
- Establishing Explicit Contract (PD Connection but no Explicit Contract or Implicit Contract after a Power Role
 Swap):
 - <u>A DFP acting as a Source receives a *Request* message from the UFP and responds with an *Accept* message, if this is a valid request, followed by a *PS_RDY* message when its power supply is ready to source power at the agreed level. At this point an Explicit Contract has been agreed.
 </u>
 - A DFP acting as a Sink receives a Source Capabilities message from the UFP and responds with a Request message. If this is a valid request the DFP receives an Accept message followed by a PS_RDY message when its power supply is ready to source power at the agreed level. At this point an Explicit Contract has been agreed.
 - <u>A DFP does not generate SOP' or SOP'' Packets, is not required to detect SOP' or SOP'' Packets and will</u> ignore them.
- During PD Connection (normal PD operation)Explicit Contract):
 - The Source Port detects the type of cabling attached and may alter its advertised capabilities depending on the type of cable detected.
 - The <u>DFP processes and responds (if a response is required) to all messages received and sends</u> appropriate messages whenever its Local Policy requires.
 - The DFP can communicate with a Cable Plug using SOP' or SOP'' Communication at any time it is not engaged in any other SOP Communications.
 - If SOP Packets are received by the DFP, during SOP' or SOP'' Communication, the SOP' or SOP'' Communication is immediately terminated (the Cable Plug times out and does not retry)
 - If the DFP needs to initiate an SOP Communication during an ongoing SOP' or SOP"
 <u>Communication (e.g. for a Capabilities change) then the SOP' or SOP"</u>
 <u>Communications will be interrupted.</u>
 - DFP acting as a Source:

USB Power Delivery Specification Revision 2.0, Version 1.0.

Page 46

- <u>A DFP acting as a</u> Source informs the <u>UFP acting as a</u> Sink whenever its capabilities change, by sending a *Source Capabilities* message.
- Whether a PD contract is negotiated or not, the Source Port processes and responds to all messages received.

- The Source Port sends appropriate messages whenever its Local Policy requires.

- <u>TheA DFP acting as a</u> Source-<u>Port</u>, after a period of *tSourceActivity*, sends out *Ping* messages if no other messages are being sent. <u>messages are optional when the</u> <u>Source port is operating at .</u>
 - **Ping** messages are optional when the Source Port is operating at vSafe5V and are not needed at all if a **[USBType-C1.0]** connector is being used.
- A DFP using the *[USBType-C1.0]* connector and acting as a Source will always have R_p.asserted on its CC wire.
- DFP acting as a Sink (Power Role Swapped):
 - A DFP acting as a Sink whose power needs have changed indicates this to the Source with a new *Request* message. The Sink Port may request one of the capabilities previously offered by the Source, even if this is the *vSafe5V* output offered by [*USB2.0*]_[*USB3.1*]_[*USBType-C1.0*] or [*BC1.2*], in order to enable future power negotiation.
 - <u>A DFP acting as a Sink not requesting any capability with a *Request* message results in an error.
 </u>
 - <u>A DFP acting as a Sink unable to fully operate at the offered capabilities</u> requests an offered capability but indicates a capability mismatch i.e. that it would prefer another power level also providing a physical indication of the failure to the End User (e.g. using an LED).
 - If a DFP acting as a Sink does not receive any messages within *tSinkActivity*, it will issue Hard Reset signaling.
 - <u>A DFP acting as a Sink using the [USBType-C1.0] connector does not run the</u> SinkActivityTimer and therefore does not time out on messages since it uses the detach detection mechanisms on this connector instead.
 - A DFP using the **[USBType-C1.0]** connector and acting as a Sink will always have R_d asserted on its CC wire.

DFP which is a Type-C DRP

 A DFP using the *[USBType-C1.0]* connector may initiate or receive a request for an exchange of data roles. After a Data Role Swap the DFP (Host) becomes a UFP (Device). The direction of power and Source of VCONN remain unchanged.

Detach or Communications Failure Detach or Communications Failure

There are twoseveral ways to detect Detach

 FailureA DFP acting as a Source detects the failure to receive a GoodCRC message in response to a Ping message or other message within tReceive leads to a Soft Reset, within tSoftReset of the CRCReceiveTimer expiring followed by a Hard Reset within tHardReset of the CRCReceiveTimer expiring to begin restoring V_{BUS} to default operation within ~50ms. Receiving no response to further attempts at communication is interpreted by the Source Port as a detach eventUSB Default Operation within ~50ms.

- A Sink not requesting any capability (e.g. responding with a message) when the present negotiated power level is still valid results in the retention of the present negotiated power level.
- A Sink not requesting any capability if the presently negotiated power level is no longer valid, results in an error.
 - A Sink unable to fully operate at the offered capabilities requests the default capability but indicates that it would prefer another power level and provide a physical indication of the failure to the end user (e.g. using an LED).

During PD Connection (normal PD operation)

- The Sink Port processes and respond (if a response is required) to all messages received.
- The Sink Port sends appropriate messages whenever its Local Policy requires.
- A Sink whose power needs have changed indicates this to the Source with a new message. The Sink
 Port may request one of the capabilities previously offered by the Source, even if this is the output
 offered by, or, in order to enable future power negotiation.
 - A Sink not requesting any capability (e.g. responding with a message) when the present negotiated power level is still valid results in the retention of the present negotiated power level.
 - A Sink not requesting any capability if the presently negotiated power level is no longer valid, results in an error.
 - A Sink unable to fully operate at the offered capabilities requests the default capability but indicates that it would prefer another power level and provide a physical indication of the failure to the End User (e.g. using an LED).
- If the Sink Port does not receive any messages within , then it will assume a PD disconnect and issue signaling. This applies unless the Sink Port is operating at since messages are optional in this case.
- Removal of V_{BUS}
 - o The Sink Port detects the removal of V_{BUS} and interpret this as the end of the PD Connection.
 - If the Sink Port is part of a Provider/Consumer the Sink Port stops sinking current and returns to its default behavior as an unattached Source Port.
- Error handling
 - Minor protocol errors are handled by a *Soft Reset* message issued by either Port Partner, that resets counters, timers and states, but does not change the negotiated voltage and current or the port'sPort's role (e.g. Source or Sink)-) and does not cause an exit from Modal Operation.
 - <u>Serious errors are handled by *Hard Reset* signaling issued by either Port Partner, that resets protocol as for a Soft Reset but also returns the power supply to USB Default Operation (</u>

vSafe0V	Safe operating voltage at "zero volts <mark>".</mark>	0		0. <u>8</u>	v	Section 7.1.6

If goes to the been

2.5.2 UFP Operation

The UFP operates differently depending on attachment status:

- V_{BUS} Unpowered (no PD Connection or Contract):
 - The UFP monitors V_{BUS} for the presence of vSafe5V.
- V_{BUS} Powered (no PD Connection or Contract):
 - <u>The UFP detects the presence of vSafe5V on V_{BUS} and waits for a Source Capabilities message</u> indicating the presence of a PD capable Source.
 - If the UFP does not receive a Source Capabilities message within
 - *tSinkWaitCap/<u>tTypeCSinkWaitCap</u> then it issues <i>Hard Reset* signaling in order to cause the Source <u>Port to send a</u> *Source Capabilities* message if the Source Port is PD capable.
 - The UFP does not generate SOP' or SOP" Packets, is not required to detect SOP' or SOP" Packets and will ignore them.
- Establishing PD Connection (no PD Connection or Contract):
 - o The UFP receives a Source Capabilities message and responds with a GoodCRC message.
 - <u>The UFP does not generate SOP' or SOP" Packets, is not required to detect SOP' or SOP" Packets and</u> will ignore them.
- <u>Establishing Explicit Contract (PD Connection but no Explicit Contract or Implicit Contract after a Power Role</u> <u>Swap</u>):
 - o UFP acting as Sink:

 A UFP acting as a Sink receives a *Source Capabilities* message from the DFP and responds with a *Request* message. If this is a valid request the UFP receives an *Accept* message followed by a *PS_RDY* message when its power supply is ready to source power at the agreed level. At this point an Explicit Contract has been agreed.
 The Sink Port may request one of the capabilities offered by the Source over if this.

- The Sink Port may request one of the capabilities offered by the Source, even if this is the vSafe5V output offered by [USB2.0].[USB3.1].[USBType-C1.0] or [BC1.2].in order to enable future power negotiation.
 - For Sinks using an A-plug or B-plug the request will be limited by the type of cabling detected. Plug detection will be carried out to determine the current carrying capabilities of the cable.
 - For Sinks using a C-plug the request is made from any capabilities offered by the Source.
 - A Sink not requesting any capability with a *Request* message results in an error.
- A Sink unable to fully operate at the offered capabilities requests the default capability but indicates that it would prefer another power level and provide a physical indication of the failure to the end user (e.g. using an LED).
- <u>A UFP does not generate SOP' or SOP'' Packets, is not required to detect SOP' or SOP'' Packets</u>
 <u>and will ignore them.</u>
- o UFP acting as Source:
 - Prior to sending Source Capabilities messages a UFP acting as a Source detects the type of cabling attached and may alter its advertised capabilities depending on the type of cable detected.
 - For an A-plug or B-plug, plug detection will be carried out to determine the current carrying capabilities of the cable.

Page 50

- For a C-plug the default capability is 3A, but SOP' Communication can be used to determine other capabilities of the cable. The DFP can attempt to communicate with one of the Cable Plugs using SOP' Packets. If the Cable Plug responds then communication takes place.
- A UFP acting as a Source receives a *Request* message from the DFP and responds with an
 Accept message if this is a valid request followed by a *PS_RDY* message when its power
 supply is ready to source power at the agreed level. At this point an Explicit Contract has
 been agreed.
- <u>A UFP does not generate SOP" Packets, is not required to detect SOP" Packets and will ignore them.</u>
- During PD Connection (Explicit Contract *Ready* state)
 - The UFP processes and responds (if a response is required) to all messages received and sends appropriate messages whenever its Local Policy requires.
 - UFP acting as a Sink:
 - A UFP acting as a Sink whose power needs have changed indicates this to the Source with a new.*Request* message. The Sink Port may request one of the capabilities previously offered by the Source, even if this is the vSafe5V output offered by [USB2.0].[USB3.1].[USBType-C1.0] or [BC1.2], in order to enable future power negotiation.
 - A UFP acting as a Sink not requesting any capability with a *Request* message results in an error.
 - A UFP acting as a Sink unable to fully operate at the offered capabilities requests an offered capability but indicates a capability mismatch i.e. that it would prefer another power level also providing a physical indication of the failure to the End User (e.g. using an LED).
 - If the UFP acting as a Sink does not receive any messages within *tSinkActivity*, will issue *Hard Reset* signaling.
 - A UFP acting as a Sink using the **[USBType-C1.0]** connector does not run the SinkActivityTimer_and therefore does not time out on messages since it uses the detach detection mechanisms on this connector instead.
 - A UFP using the **[USBType-C1.0]** connector and acting as a Sink will always have R_d asserted on its CC wire.
 - DFP which is a Type-C DRP
 - o UFP acting as a Source (Power Role Swapped):
 - The UFP acting as a Source informs the DFP acting as a Sink whenever its capabilities change, by sending a Source Capabilities message.
 - The UFP acting as a Source, after a period of tSourceActivity, sends out Ping messages if no other messages are being sent.
 - **Ping** messages are optional when the Source Port is operating at vSafe5V and are not needed at all if a **[USBType-C1.0]** connector is being used.
 - A UFP using the [USBType-C1.0] connector and acting as a Source will always have R_p asserted on its CC wire.
 - The UFP does not generate SOP' or SOP" Packets, is not required to detect SOP' or SOP" Packets and will ignore them.
 - A UFP which is a Type-C DRP:
 - A UFP, using the [USBType-C1.0] connector, may initiate or receive a request for an exchange of data roles. After a Data Role Swap the UFP (Device) becomes a DFP (Host). The direction of power and Source of VCONN remain unchanged.

- If the Cable Plug responds then communication takes place.
- Establishing PD Connection (no Contract):
 - The DFP does not generate SOP' Packets, is not required to detect SOP' Packets and will ignore them.
- Establishing Explicit Contract (PD Connection but no Explicit Contract or Implicit Contract after a Power Role Swap):
 - The DFP or UFP operating as a Source can attempt to communicate with one of the Cable Plugs using SOP' Packets
 - If the Cable Plug responds then communication takes place.
- During PD Connection (Explicit Contract):
 - <u>The DFP can communicate with a Cable Plug, using SOP' Packets or SOP'' Packets, at any time it is not</u> engaged in any other SOP Communications.
 - If SOP Packets are received by the DFP, during SOP' or SOP" Communication, the SOP' or SOP"
 - <u>Communication is immediately terminated (the Cable Plug times out and does not retry)</u>
 - If the DFP needs to initiate an SOP Communication during an ongoing SOP' or SOP" Communication (e.g. for a Capabilities change) then the SOP' or SOP" Communications will be interrupted.
- Detach or Communications Failure:
 - There is no communication timeout scheme between the DFP and Cable Plug since communications may be interrupted at any time.
- Error handling:
 - The Cable Plug can detect *Hard Reset* signaling to determine that the DFP and UFP have been reset and will need to reset itself (equivalent to a power cycle).
 - The Cable Plug cannot generate Hard Reset signaling itself.
 - A Cable Plug can detect *Cable Reset* signaling to determine that it will need to reset itself (equivalent to a power cycle).

2.52.6 Architectural Overview

This logical architecture is not intended to be taken as an implementation architecture. An implementation architecture is, by definition, a part of product definition and is therefore outside of the scope of this specification.

This section outlines the high level logical architecture of USB Power Delivery referenced throughout this specification. In practice various implementation options are possible based on many different possible types of PD device. PD devices may have many different configurations e.g. USB or non-USB communication, single versus multiple ports, dedicated power supplies versus supplies shared on multiple ports, hardware versus software based implementations etc. The architecture outlined in this section is therefore provided only for reference in order to indicate the high level logic model used by the PD specification. This architecture is used to identify the key concepts and also to indicate logical blocks and possible links between them.

The USB Power Delivery architecture in each USB Power Delivery capable Device is made up of a number of major components.

The communications stack seen in Figure 2-5 consists of:

- A **Device Policy Manager** (see Section 8.2) that exists in all **Devices** and manages USB Power Delivery resources within the **Devicedevice** across one or more ports based on the Device's Local Policy.
- A Policy Engine (see Section 8.3) that exists in each USB Power Delivery portPort implements the Local Policy for that portPort.
- A Protocol Layer (see Chapter 5.9.9) that enables messages to be exchanged between a Source Port and a Sink Port.

USB Power Delivery Specification Revision <u>12</u>.0. Version <u>1.0</u>

Page **53**

• A **Physical Layer** (see Chapter 5) that handles transmission and reception of bits on the wire and handles data transmission.

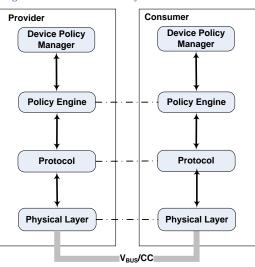

Figure 2-5 USB Power Delivery Communications Stack

Additionally USB Power Delivery devices which can operate as USB devices may communicate over USB (see Figure 2-6). An optional **System Policy Manager** (see Chapter 9) that resides in the USB Host communicates with the PD Device over USB, via the root <u>portPort</u> and potentially over a tree of USB Hubs. The **Device Policy Manager** interacts with the USB interface in each <u>Devicedevice</u> in order to provide and update PD related information in the USB domain. Note that a PD device is not required to have a USB device interface.

Page 54

Figure 2-6 USB Power Delivery Communication Over USB

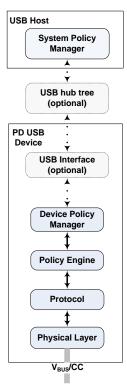

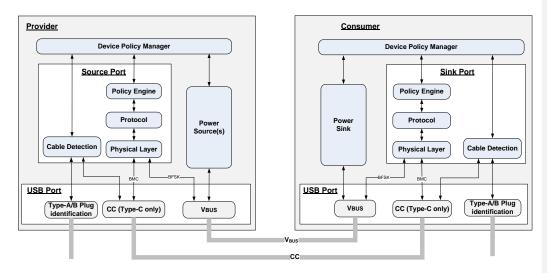

Figure 2-7 shows the logical blocks between two attached PD ports. In addition to the communication stack described above there are also:

- For a Provider or Dual-Role Device: one or more **Sources** providing power to one or more ports.
- For a Consumer or Dual-Role Device: a **Sink** consuming power.
- A Cable Detection module (see Section4.4) that:
 - $\circ \quad \text{Detects presence of } V_{\text{BUS}} \text{ for Sink Ports} \\$
 - Identifies the type of PD cable attached
- TheFor Type-A and Type-B PD Cabling (see is defined in Section 3) that carries both power and USB Power Delivery signaling over V_{BUS}. Type-C uses standard cabling defined in [USBType-C1.0].
- The **Device Policy Manager** talks to the communication stack, Source/Sink and the cable detection block in order to manage the resources in the Provider or Consumer.

Figure 2-7 illustrates a Provider and a Consumer. Dual-Role Devices such as Provider/Consumers or Consumer/Providers can be constructed by combining the elements of both Provider and Consumer into a single <u>Devicedevice</u>. Providers can also contain multiple Source Ports each with their own communications stack and cable detection.

Figure 2-7 High Level Architecture View

2.5.12.6.1 Policy

There are two possible levels of Policy:

- 1) System Policy applied system wide by the System Policy Manager across multiple Providers or Consumers.
- 2) Local Policy enforced on a Provider or Consumer by the Device Policy Manager.

Policy comprises several logical blocks:

- System Policy Manager (system wide).
- Device Policy Manager (one per Provider or Consumer).
- Policy Engine (one per Source or Sink Port).

2.5.1.12.6.1.1 System Policy Manager

Since the USB Power Delivery protocol is essentially - point to point, implementation of a System Policy requires communication by an additional data communication mechanism i.e. USB. The System Policy Manager monitors and controls System Policy between various Providers and Consumers connected via USB. The System Policy Manager resides in the USB Host and communicates via USB with the Device Policy Manager in each connected Device. Devices without USB data communication capability or are not data connected, will not be able to participate in System Policy.

The System Policy Manager is optional in any given system so USB Power Delivery Providers and Consumers can operate without it being present. This includes systems where the USB Host does not provide a System Policy Manager and may also include "headless" systems without any USB Host. In those cases where a Host is not present, USB Power Delivery is useful for charging purposes, or the powering of devices since useful USB functionality is not possible. Where there is a USB Host but no System Policy Manager, Providers and Consumers can negotiate power between themselves, independently of USB power rules, but are more limited in terms of the options available for managing power.

Page 56

2.5.1.22.6.1.2 Device Policy Manager

The Device Policy Manager provides mechanisms to monitor and control the USB Power Delivery system within a particular Consumer or Provider. The Device Policy Manager enables Local Policies to be enforced across the system by communication with the System Policy Manager. Local Policies are enacted on a per <u>portPort</u> basis by the Device Policy Manager's control of the Source/Sink Ports) and by communication with the Policy Engine and Cable Detection for that <u>portPort</u>.

2.5.1.32.6.1.3 Policy Engine

Providers and Consumers are free to implement their own Local Policies on their directly connected Source or Sink Ports. These will be supported by negotiation and status mechanisms implemented by the Policy Engine for that **portPort**. The Policy Engine interacts directly with the Device Policy Manager in order to determine the present Local Policy to be enforced. The Policy Engine will also be informed by the Device Policy Manager whenever there is a change in Local Policy (e.g. a capabilities change).

2.5.22.6.2 Message Formation and Transmission

2.5.2.12.6.2.1 Protocol Layer

The Protocol Layer forms the messages used to communicate information between a pair of ports. It is responsible for forming Capabilities messages, requests and acknowledgements. Additionally it forms messages used to Swapswap roles and maintain presence. It receives inputs from the Policy Engine indicating which messages to send and indicates the responses back to the Policy Engine.

The basic protocol uses a push model where the Provider pushes it capabilities to the Consumer that in turn responds with a request based on the offering. However, the Consumer may asynchronously request the Provider's present capabilities and may select another voltage/current.

2.5.2.22.6.2.2 Physical PHY Layer

The <u>PhysicalPHY</u> Layer is responsible for sending and receiving messages across <u>either the V_{BUS} or CC wire</u>. It consists of a transceiver that superimposes a signal <u>(BFSK on V_{BUS} or BMC on CC)</u> on the <u>V_{BUS} wire</u>. The <u>PhysicalPHY</u> Layer is responsible for managing data on the <u>V_{BUS} wire</u>. It tries to avoid collisions on the <u>V_{BUS} wire</u>, recovering from them when they occur. It also detects errors in the messages using a CRC.

2.5.32.6.3 Power supply

2.5.3.12.6.3.1 **Source**

Each Provider will contain one or more Sources that are shared between one or more ports. These Sources are controlled by the Local Policy. Sources start up in USB <u>default operationDefault Operation</u> where the <u>portPort</u> applies

vSafe0V Safe operating voltage at "zero volts <u>".</u>	0	(0. <u>8</u>	v	Section 7.1.6
--	---	---	-------------	---	---------------

or *vSafe5V* on V_{BUS} and return to this state on detach or after a Hard Reset. If the Source applies

vSafe0V Safe operating voltage at "zero volts <u>".</u>	0		0. <u>8</u>	V	Section 7.1.6
--	---	--	-------------	---	---------------

as their default, it monitors V_{BUS} to detect<u>detects</u> attach events and transitions its output to *vSafe5V* upon detecting an attach-event.

2.5.3.22.6.3.2 Sink

Consumers are assumed to have one Sink connected to a portPort. This Sink is controlled by Local Policy. Sinks start up in USB <u>default operationDefault Operation</u> where the <u>portPort</u> can operate at *vSafe5V* with USB default specified current levels and return to this state on detach or after a Hard Reset.

2.5.3.32.6.3.3 **Dual-Role Ports**

Dual-Role ports are found in Provider/Consumers or Consumer/Providers. A Provider/Consumer will have one or more ports that can operate as either a Source Port (default) or a Sink Port. A Consumer/Provider will have a portPort that can operate either as a Sink Port (default) or a Source Port.

Combination supplies that support Dual-Role ports follow the default rules as well as supporting a return to their own default role and state on a detach event or Hard Reset.

2.5.3.42.6.3.4 Dead Battery or Lost Power Detection

The USB Power Delivery specification defines a mechanismmechanisms intended to communicate with and charge a Provider/Consumer with a dead batteryDead Battery. A Provider/Consumer may also use this mechanism to get power when they are disconnected from their normal power source. All Consumer/Providers support this mechanism.

2.5.42.6.4 Cable and Connectors

2.5.4.12.6.4.1 Cable Detection

The Cable Detection block provides mechanisms to detect the type of cable attached. This information is provided to the Device Policy Manager. It adjusts the Local Policy accordingly and may also communicate cabling issues to the System Policy Manager for further action.

The USB Power Delivery specification assumes either certified USB cables as defined in this specification or in the [USB2.0] [USB3.1], or [USBType-C1.0] detectable PD cables. Both PD signaling specifications.

<u>For Type-A</u> and <u>power are delivered via V_{BUS}. The Type-B connectors the</u> existence of a large number of non-compliant legacy cables, particularly 'Y' and 'W' cables are problematic. These kinds of cables, in combination with the higher voltages that PD can deliver, have the potential to permanently damage the user's equipment. PD defines mechanisms to detect <u>Type-A and Type-B</u> PD capable cables.

For Type-C connectors, PD uses the certified USB cables and associated detection mechanisms as defined in **[USBType-C1.0]**.

2.5.4.22.6.4.2 Interactions between LegacyNon-PD, BC and PD Devicesdevices

In all cases, where either the Source Port or the Sink Port is part of a legacy Device, V_{BUS} operates as defined in the , and specifications respectively. There are two primary cases to consider:

- The Host (downstream port) is legacy and as such will not send any advertisements. An attached PD capable
- Device will not see any advertisements and operates using the rules defined in the , or specifications.
- The Device (upstream port) is legacy and as such will not see any advertisements and therefore will not respond. The Host (downstream port) will continue to supply to V_{BUS} as specified in the , or specifications.

USB Power Delivery only operates when two USB Power Delivery <u>Devicesdevices</u> are directly connected. When a Device finds itself a mixed environment, where the other <u>Devicedevice</u> does not support the USB Power Delivery Specification, the existing rules on supplying *vSafe5V* as defined in the *[USB2.0]*, *[USB3.1]_[BC1.2]* or *[USBType-C1.0]* specifications are applied.

There are two primary cases to consider:

Page 58

- The Host (DFP) is non-PD and as such will not send any advertisements. An attached PD capable Device will not see any advertisements and operates using the rules defined in the [USB2.0].[USB3.1].[BC1.2] or [USBType-C1.0] specifications.
- The Device (UFP) is non-PD and as such will not see any advertisements and therefore will not respond. The Host
 (DFP) will continue to supply vSafe5V to V_{BUS} as specified in the [USB2.0], [USB3.1], [BC1.2] or [USBType-C1.0]
 specifications.

2.5.4.32.6.4.3 **Power Profiles**

Power Profiles are used to define voltages and current ranges that may be offered by USB Power Delivery Sources. Although Profiles are defined for Sources, Sinks may refer to a Profile that will meet their power requirements. See Appendix A for further details.

3. <u>Type-A and Type-B</u>Cable Assemblies and Connectors

USB Power Delivery is designed to operate at voltages and currents outside the <u>specificiedspecified</u> ranges defined in *[USB2.0], [USB3.1]* and *[BC1.2]* specifications. For this reason it is critical to understand the characteristics of the USB Power Delivery cable assemblies and the connectors used. The following sections define the assumed characteristics of both <u>legacynon-PD Type-A and Type-B</u> cable assemblies (<u>unmarkednon-marked</u> cable assemblies) and USB Power Delivery cable assemblies designed to take advantage of the USB Power Delivery system (marked cable assemblies). Cable assemblies for use with Type-C connectors are defined in *[USBType-C1.0]*, and are not covered in this specification.

The considerable presence of non-compliant legacy cable assemblies presents an additional challenge to safely deliver voltages other than *vSafe5V*. 'Y' cable assemblies, for example, provide topologies and connections that are not included in the original USB specifications. As a result, there is a requirement to identify cable assemblies used in support of this specification that deliver more than *vSafe5V*.

The additional requirements for USB Power Delivery cable assemblies are defined in this section. Unlike typical USB philosophy, both the Device and the Host are responsible for detecting the insertion of a USB Power Delivery cable assembly and make requests for power accordingly.

3.1 Significant Features

This section identifies the significant features of the USB Power Delivery connectors and cable assemblies. This section references other parts of the document where further details can be found.

3.1.1 Connectors

The USB PD specification defines the following connectors:

- PD Standard-A plug and receptacle
- PD Standard-B plug and receptacle
- PD Micro-A plug
- PD Micro-AB receptacle
- PD Micro-B plug and receptacle

USB PD connectors are differentiated from their standard USB counterparts in their current carrying capability as well as electrical markings or physical features, while remaining mechanically compatible. The USB PD Micro connectors are mechanically identical to their non-PD counterparts. The USB PD Standard connector mechanical differences are specified in this chapter.

- PD Micro-A, PD Micro-AB, and PD Micro-B connectors shall be capable of carrying 3A current as specified in Section 3.6.5.1.
- PD Standard-A and PD Standard-B connectors shall be capable of carrying 5A current as specified in Section 3.6.5.2.

Refer to Section 3.4 for marking details. For details on the usage of the PD icon refer to Section 3.5.

Appendix D illustrates mating conditions of Standard-A connector combinations.

Table 3-1 lists the compatible plugs and receptacles and possible roles which may be supported in each case. Note that for AB receptacles it is not required that if the Provider/Consumer role is supported with an A-plug inserted, that the Consumer/Provider role is supported with a B-plug inserted or vice-versa. Standard, non-PD, receptacles used in USB Power Delivery capable products are limited to a nominal *vSafe5V* at 1.5A as defined in *[BC1.2]*.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Receptacle	Plugs Accepted	Possible Role

3.1.1.1 USB 2.0 PD Standard-A Connector

The USB 2.0 PD Standard-A connector is defined as the host connector. It has the same mating interface as the USB 2.0 Standard-A connector, but with mechanical differences to provide a means of detecting insertion and PD support. Refer to Section 3.2.3 for mechanical details, pin assignments, and descriptions.

A USB 2.0 PD Standard-A receptacle accepts a USB 2.0 PD Standard-A plug, a USB 2.0 Standard-A plug, a USB 3.1 PD Standard-A plug, or a USB 3.1 Standard-A plug. Similarly, a USB 2.0 PD Standard-A plug may be mated with a USB 2.0 PD Standard-A receptacle, a USB 2.0 Standard-A receptacle, a USB 3.1 PD Standard-A receptacle, or a USB 3.1 Standard-A receptacle.

3.1.1.2 USB 3.1 PD Standard-A Connector

The USB 3.1 PD Standard-A connector is defined as a host connector. It has the same mating interface as the USB 3.1 Standard-A connector, but with mechanical differences to provide a means of detecting insertion and PD support. Refer to Section 3.2.4 for mechanical details, pin assignments, and descriptions.

A USB 3.1 PD Standard-A receptacle accepts a USB 3.1 PD Standard-A plug, a USB 3.1 Standard-A plug, a USB 2.0 PD Standard-A plug, or a USB 2.0 Standard-A plug. Similarly, a USB 3.1 PD Standard-A plug may be mated with a USB 3.1 PD Standard-A receptacle, a USB 3.1 Standard-A receptacle, a USB 2.0 PD Standard-A receptacle, or a USB 2.0 Standard-A receptacle.

3.1.1.3 USB 2.0 PD Standard-B Connector

The USB 2.0 PD Standard-B connector is defined to facilitate deliver of up to 100 Watts. An ID pin supports PD identification. Refer to Section 3.2.5 for mechanical details, pin assignments, and descriptions.

A USB 2.0 PD Standard-B receptacle accepts either a USB 2.0 PD Standard-B plug or a USB 2.0 Standard-B plug. Inserting a USB 3.1 PD Standard-B plug, a USB 3.1 Standard-B plug, or a USB 3.1 Powered-B plug into a USB 2.0 PD Standard-B receptacle is physically disallowed. A USB 2.0 PD Standard-B plug may be mated with a USB 2.0 PD Standard-B receptacle, a USB 2.0 Standard-B receptacle, a USB 3.1 PD Standard-B receptacle, a USB 2.0 Standard-B receptacle, or a USB 3.1 Powered-B receptacle.

3.1.1.4 USB 3.1 PD Standard-B Connector

The USB 3.1 PD Standard-B connector is defined to facilitate delivery of up to 100 Watts. An ID pin supports PD identification. Refer to Section 3.2.6 for mechanical details, pin assignments, and descriptions.

A USB 3.1 PD Standard-B receptacle accepts a USB 3.1 PD Standard-B plug, a USB 3.1 Standard-B plug, a USB 3.1 Powered-B plug, a USB 2.0 PD Standard-B plug, or a USB 2.0 Standard-B plug. Inserting a USB 3.1 PD Standard-B plug or a USB 3.1 Standard-B plug into a USB 2.0 PD Standard-B receptacle or a USB 2.0 Standard-B receptacle is physically disallowed. A USB 3.1 PD Standard-B plug may be mated with a USB 3.1 PD Standard-B receptacle, a USB 3.1 Standard-B receptacle, or a USB 3.1 PD Standard-B receptacle.

3.1.2 Compliant Cable Assemblies

The USB Power Delivery Specification defines the following cable assemblies:

USB Power Delivery Specification Revision <u>12</u>.0. Version <u>1.0</u>

- USB 3.1 PD Standard-A plug to USB 3.1 PD Standard-B plug
- USB 3.1 PD Standard-A plug to USB 3.1 PD Micro-B plug
- USB 3.1 PD Micro-A plug to USB 3.1 PD Micro-B plug
- USB 3.1 PD Micro-A plug to USB 3.1 PD Standard-B plug
- USB 2.0 PD Standard-A plug to USB 2.0 PD Standard-B plug
- USB 2.0 PD Standard-A plug to USB 2.0 PD Micro-B plug
- USB 2.0 PD Micro-A plug to USB 2.0 PD Micro-B plug
- USB 2.0 PD Micro-A plug to USB 2.0 PD Standard-B plug

PD cable assemblies shall have one plug on each end. PD Cable assemblies with multiple connectors on either end are expressly prohibited due to the danger of back-powering USB ports with high voltages. Any cable combinations not explicitly defined in the list above shall not be permitted.

Connectors on each end of the PD cable assembly shall be labeled with the appropriate USB PD icon defined in Section 3.5.

3.1.3 USB Power Delivery Adapters (USB plug to USB receptacle)

This section has been deleted. Adapters from a USB plug to a USB receptacle are not supported by PD because their use may result in unacceptable $V_{GND_{c}DROP_{r}}$ restricting USB 2.0 signallingsignaling capability.

3.1.4 Hardwired Captive PD Cable

A hardwired captive PD cable assembly has a single PD plug at one end and a single hardwired (non -removable) connection at the other end. A hardwired captive PD cable assembly is PD compliant if it meets the requirements of this specification at the connector end cable marking or marking detection, negotiation capability, etc. and supports USB PD. A hardwired captive PD cable assembly may support USB signaling. The initial role of a **portPort** with a hardwired captive cable assembly may be either a Provider or a Consumer as determined by the type of plug.

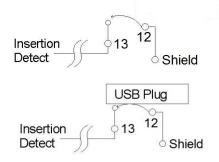

The connector on the hardwired captive PD cable assembly shall be labeled with the appropriate USB PD icon defined in Section 3.5.

3.1.5 Standard-A Insertion Detect

Insertion Detect is a feature added to the Standard-A receptacle to support cold socket<u>Cold Socket</u> capability. It may be implemented in a Standard-A receptacle or a PD Standard-A receptacle. Insertion Detect provides an open circuit condition on pin 13 when a plug is not detected in the Standard-A receptacle and a connection to the receptacle shield on pin 13 when a plug is present. Schematic representation is provided in Figure 3-1 to illustrate the electrical implementation of the detection mechanism if pin 12 is present. Implementation is vendor-specific. The Insertion Detect feature shall be implemented for cold socket<u>Cold Socket</u> Standard-A applications and optional for all other Standard-A implementations. See Section 3.2.1 for the mechanical requirements, and Sections 3.6.1, 3.6.2 and 4.1.2 for the electrical description.

Page 64

Figure 3-1 Standard-A Insertion Detect Schematic Representation

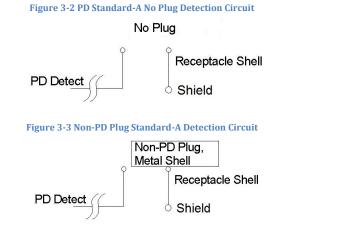

3.1.6 Standard-A PD Detect

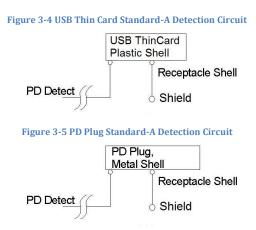

The PD Detect contact is a feature added to the PD Standard-A receptacle to detect the presence of a PD Standard-A cable plug. Implementation of PD Detect shall include either pin 10, pin 11, or both pin 10 and pin 11 in the PD Standard-A receptacle. If both pins 10 and 11 are present then both shall be connected to the PD Detect logic. Depending on the detection mechanism and location, two pins may be required to ensure PD Detect if the plug is skewed within the receptacle. If two pins are used for PD Detect, then a closed circuit to the shield on either pin is considered PD detected.

PD Detect shall be an open circuit when PD is not detected (refer to Figure 3-2, Figure 3-3 and Figure 3-4) and shall be connected to the receptacle shield when a PD Standard-A plug is present (Figure 3-5). PD Detect shall be a closed circuit to the shield when the PD plug is detected.

The PD Standard-A receptacle shall not connect PD Detect to the receptacle shield when a USB Thin Card is inserted, as shown in Figure 3-4.

Schematic representation is provided (Figure 3-5) to illustrate the electrical implementation of the detection mechanism when the implementation uses the PD Standard-A plug shield as a conductor to complete the detection circuit. The mechanics of the implementation are vendor-specific.

See Appendix D for mechanical details of different connector mating situations. See Section 3.6.1 and 3.6.2 for the electrical performance requirements.

3.1.7 Raw Cables

Attention should be given for the possibility of signal interference from V_{BUS} , especially at higher operating current and voltage, in PD cable assemblies that are capable of Hi-Speed or Enhanced SuperSpeed data communication. See Section 3.6.6 crosstalk requirements.

3.2 Connector Mating Interfaces

This section defines the connector mating interfaces, including the connector interface drawings, p in assignments and descriptions. All dimensions are in mm.

3.2.1 Standard-A Insertion Detect Mechanical Dimensions

The Insertion Detect feature is optional if <u>cold socketCold Socket</u> is not implemented. Figure 3-6 shows the mechanical dimensions for the zone where the Insertion Detect mechanism on the Standard-A and PD Standard-A receptacle shall activate when any type of Standard-A plug is inserted. This zone applies to any USB 2.0 or USB 3.1 versions of receptacles. The detection mechanism shall be designed such that the insertion detect electrical requirements are met, regardless of power being applied. Special consideration should be given to the location of shell features such as retention springs and cutout areas. The sample implementation shown in Figure 3-6 is for reference only.

Page 66

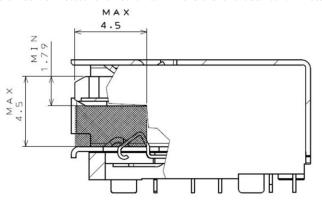

Figure 3-6 Insertion Detect Zone Mechanical Dimensions for the Standard-A Receptacle

3.2.2 USB PD Standard-A PD Detect Mechanical Requirement

Figure 3-7 shows the mechanical dimensions for the range where the PD Detect mechanism on the PD Standard-A receptacle shall indicate PD Detect when a PD Standard-A plug is inserted. The dimensions shall apply to planes parallel to Datum A and shall apply to both USB 2.0 and USB 3.1 versions of PD Standard-A receptacles. Implementation is vendor specific. The sample implementation in the Figure 3-7 is for reference only. PD detect electrical characteristics are defined in Section 3.1.6. The implementation shall also conform to the following requirements:

- The metal shell of the USB PD Standard-A plug is nominally 1.3 mm longer than the USB Standard-A plug to provide a means for PD Detect.
- The metal shell of the USB PD Standard-A plug shall be gold plated on the inner and outer surfaces a minimum of 1.6 mm from the leading edge.
- Contact for PD Detect shall occur on either the inner or the outer surface of the plug shell.
- The insertion of a USB ThinCard shall not indicate PD Detect.

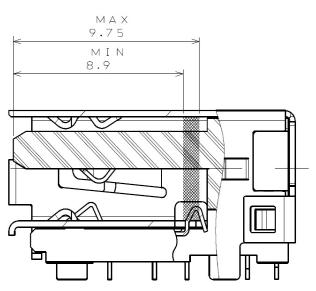

Figure 3-7 PD Detect Plane Location Range for PD Standard-A Receptacles

3.2.3 USB 2.0 PD Standard-A Connector

3.2.3.1 Interface Definition

Figure 3-8, Figure 3-9, and Figure 3-10 show the USB 2.0 PD Standard-A plug, the USB 2.0 PD Standard-A receptacle and a reference footprint for the USB 2.0 PD Standard-A receptacle, respectively.

Mechanical requirements governing mating interoperability of the USB 2.0 PD Standard-A receptacle and USB PD Standard-A plug are included in this specification. For the USB 2.0 PD receptacle, Datum A was moved from the front edge of the receptacle shell to the front of the tongue to be consistent with *[USB3.1]* and to provide proper dimensioning for PD Detect features. Similarly for the USB 2.0 PD Standard-A plug, Datum A was moved from the front edge of the plug shell to the back of the tongue.

Figure 3-8 defines the mechanical requirements that govern the mating interoperability that shall be followed for the USB 2.0 Standard-A plug. See Section 3.2.2 for additional USB PD Standard-A plug requirements.

Figure 3-9 defines the normative mechanical requirements the USB 2.0 PD Standard-A receptacle that govern the mating interoperability and informative dimensions for solder tail locations, a sample Insertion Detect implementation, and a sample PD Detect implementation. Dimensions associated with solder tails, the sample Insertion Detect feature, and the sample PD Detect features are not normative. The solder pin locations are vendor-specific and included in the drawings for reference only. See Section 3.2.1 and Section 3.2.2 for normative Insertion Detect and PD Detect mechanical requirements, respectively.

The through-hole footprint in Figure 3-10 is shown as an example. Other footprints are allowed.

General considerations:

- There may be some increase in the USB 2.0 PD Standard-A receptacle connector depth (into a system board) as compared to the USB 2.0 Standard-A receptacle to accommodate detection of the Standard-A plug's longer shell.
- Drawings for stacked USB 2.0 PD Standard-A receptacles are not shown in this specification. They are allowed, as
 long as they meet all the electrical requirements defined in [USB2.0] and the mating interoperability mechanical

Page 68

and electrical requirements defined in this specification. When designing stacked USB 2.0 PD Standard-A receptacles, PD Detect contacts shall be provided in all PD capable receptacles.

3.2.3.2 Pin Assignments and Description

The usage and assignments of the pins that shall be used in the USB 2.0 PD Standard-A connector are defined in Table 3-2.

Pin Number ¹	Signal Name	Description	Mating Sequence	
1	V _{BUS}	Power	Third	
2	D-	Differential pair as	Fourth	
3	D+	defined in [USB2.0]		
4	GND	Ground for power return	Third	
10 ²	PD DETECT 1	Contact in PD receptacle to detect a PD plug	Last	
112	PD DETECT 2	Contact in PD receptacle to detect a PD plug	Last	
12 ³ ,13 INSERTION DETECT		Receptacle only. Detects insertion of a plug into the receptacle. Optional except for cold socketCold Socket applications.	Second	
Shell	Shield	Connector metal shell	First	
 Note 1: Pin numbers not included in this table do not have contacts present. Pin numbering is consistent with location across multiple USB connector types. Note 2: Implementation of PD DETECT shall include: a) either pin 10 or pin 11. b) both pin 10 and pin 11. Note 3: Pin 12, if present, shall be connected to Shield. 				

Table 3-2 USB 2.0 PD Standard-A Connector Pin Assignments

The physical location of the pins in the connector is illustrated in Figure 3-9.

3.2.4 USB 3.1 PD Standard-A Connector

3.2.4.1 Interface Definition

Figure 3-11, Figure 3-12, and Figure 3-13 show the USB 3.1 PD Standard-A plug, the USB 3.1 PD Standard-A receptacle and a reference footprint for the USB 3.1 PD Standard-A receptacle, respectively.

Figure 3-11 defines the mechanical requirements of the USB 3.1 PD Standard-A plug that govern the mating interoperability that are different than the dimensions in the *[USB2.0]* and *[USB3.1]* specifications, that shall be followed, for the USB 3.1 Standard-A plug. See Section 3.2.1 for additional USB PD Standard-A plug requirements.

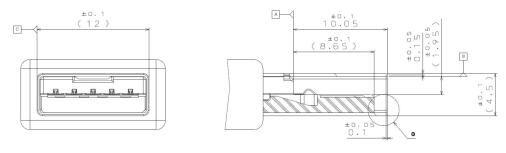

Figure 3-12 provides an informative example of a USB 3.1 PD Standard-A receptacle including dimensions for solder tail locations, a sample Insertion Detect implementation, and a sample PD Detect implementation. The dimensions in Figure 3-12 associated with solder tails, the sample Insertion Detect feature, and the sample PD Detect features are not normative. The solder pin locations are vendor-specific and included in the drawings for reference only. The USB 3.1 PD Standard-A receptacle mating interface shall comply with the dimensions defined in the *[USB2.0]* and *[USB3.1]* specifications for the USB 3.1 Standard-A receptacle. See Section 3.2.1 and Section 3.2.2 for normative Insertion Detect and PD Detect mechanical requirements, respectively.

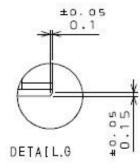

The through-hole footprint in Figure 3-13 is shown as an example. Other footprints are allowed.

General considerations:

• Drawings for stacked USB 3.1 PD Standard-A receptacles are not shown in this specification. They are allowed, as long as they meet all the electrical and mechanical requirements defined in *[USB2.0]*, *[USB3.1]*, and this specification. When designing a stacked USB 3.1 PD Standard-A receptacle, PD Detect contacts shall be provided in all PD capable receptacles.

Shell	Shield	Connector metal shell	First			
Note 1: Pin numbers not included in this table do not have contacts present. Pin numbering is consistent with location across multiple USB connector types. Note 2: Tx and Rx are defined from the device perspective.						
Note 2: 1X and KX are defined from the device perspective. Note 3: ID pin as defined in core USB specifications and extended by the USB Power Delivery specifications. See Section 3.4.3. Pin 11 was defined by [USB3.1] as the Ground Return for DPWR (power supplied by the device) for the USB 3.1 Powered-B connector.						

Table 3-5 USB 3.1 PD Standard-B Connector Pin Assignments

The physical locations of the pins in the connector are illustrated in Figure 3-16 and Figure 3-17.

3.3 Cable Assemblies

USB Power Delivery introduces the concept of an electronically marked cable assembly. The particular marking denotes the cable assembly's characteristics and is electronically detected. This provides <u>Devicesdevices</u> on each end of the cable assembly a means to detect and identify the cable assembly capabilities. The ID pin definition is extended to electronically mark cable assemblies. An ID pin has been added to the Standard-B Connectors to create PD Standard-B Connectors as defined in Section 3.2.5 and Section 3.2.6. <u>Since only the Device can detect the ID pin, the The B-</u>Device shall detect the cable assembly and make requests that are consistent with the cable assembly's capabilities. Similarly, the Standard-A Connector shell has been modified to create a PD Standard-A Connector to allow detection of cable insertion and to identify if the cable assembly is PD-capable. The combination of these PD cable assembly markings provide a robust system to safely deliver high power across the USB cable assembly.

The portion of this specification that allows the negotiation of voltages other than the default *vSafe5V* and currents in excess of 1.5A shall apply only to Devices with marked PD cable assemblies.

3.3.1 Non-marked Cable Assemblies

Limitations are placed on the use of legacy cable assemblies (i.e., ones not marked). Legacy cable assemblies include all cable assemblies with USB 2.0 or USB 3.1 Standard-A Connectors, USB 2.0 or USB 3.1 Standard-B Connectors, USB 3.1 Standard-B C

Page 84

3.1 Powered-B Connectors, and USB 2.0 or USB 3.1 Micro-B Connectors. Devices shall only use these <u>unmarkednon-marked</u> legacy cable assemblies at *vSafe5V* and up to 1.5A as described by *[USB2.0]*, *[USB3.1]* and *[BC1.2]*.

3.3.2 Marked Cable Assemblies

Marking allows the DevicePort Partners to detect the insertion of a USB Power Delivery cable assembly and its electrical characteristics. The DevicePort Partners shall not negotiate for currents in excess of the electrical characteristics indicated by the cable's marking.

3.3.3 PD Cable Assembly Overmold Requirements

It is strongly recommended that the PD cable assembly overmold dimensions conform to the requirements defined by *[USB2.0]* and *[USB3.1]*. Depending on the PD cable assembly current rating and length, the wire gauge to meet the IR drop defined in 3.6.9 may require a cable diameter that results in a larger overmold at the cable/connector interface. Table 3-6 and Figure 3-20 define the maximum allowed overmold dimensions for the PD cable assembly. PD cable assemblies using these larger limits may result in mechanical interferences (e.g., may block use of a connector slot in stacked connector configurations) therefore, the overmold dimensions should conform to requirements defined by *[USB2.0]* and *[USB3.1]* if possible.

Dimension	Connector Type	3A	5A
Z max	PD Standard-A	5.00	10.00
Z max	PD Micro	9.00	-
Y max	PD Standard-B	-	14.00
Z max	PD Standard-B	-	8.60

Table 3-6 USB PD Cable Assembly Overmold Maximum Dimensions

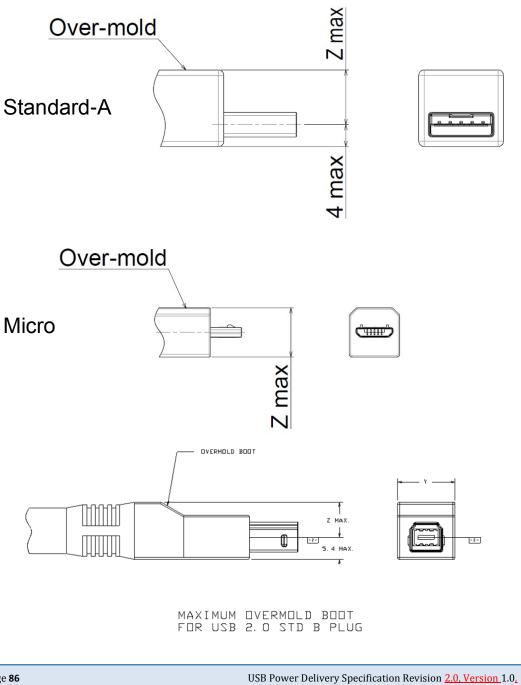

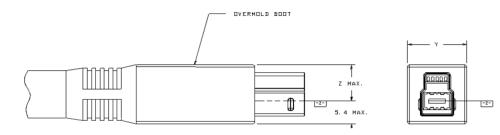

Figure 3-20 USB PD Cable Assembly Overmold Maximum Dimensions

MAXIMUM OVERMOLD BOOT FOR USB 3.0 STD B PLUG

3.4 PD Cable Assembly Marking

Paragraphs in this section described the markings for the plug connectors at each end of the PD cable assembly. References to cable assembly in this section apply to cable assemblies which include a PD plug connector. Component values are found in Table 3-7.

3.4.1 Marker for PD Standard-A Connectors

The PD Standard-A Connector shell is 1.3 mm longer than the shell of the legacy Standard-A Connector. The PD Standard-A Connector shell shall be detected by the <u>downstream DeviceDFP</u> connector using a PD Standard-A receptacle connector and associated marking detection circuitry to indicate that the cable assembly is a PD cable assembly. Marking detection circuitry is vendor specific.

3.4.2 Electronic Markers for Micro-A Plugs

In the standard cable assembly with a Micro-A plug, the ID-pin is grounded. The data and shield connections shall be made per the **[USB2.0]** and the **[USB3.1]** specifications.

3.4.2.1 Legacy Micro-A Plug

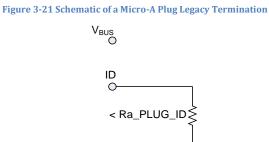

Figure 3-21 shows the schematic diagram of the Micro-A plug termination in a legacy cable assembly. Note the ID pin is connected to ground through an impedance of Ra_PLUG_ID (as defined in the Micro-USB Cables and Connectors specification v1.01 in *[USB2.0]*) to indicate that the plug is an A plug. For PD to remain backward compatible, the low

Ground

USB Power Delivery Specification Revision <u>42</u>.0<u>, Version 1.0</u>

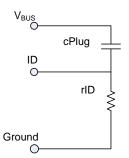

impedance to ground shall be maintained. However, any value less than *rID* is assumed to be interpreted by a legacy portPort as a Micro-A plug.

PD uses two new markers to allow the detection of a Low Power cable assembly and PD cable assembly in addition to the detection of a legacy cable.

3.4.2.2 Low Power Micro-A Plug

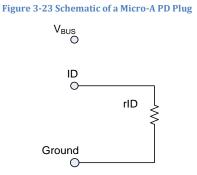

Devices with a hardwired captive cable with a Micro-A plug connector supporting a one cell Lithium battery as their power source or where very low power consumption is important may terminate the Micro-A Plug's ID pin to ground with *rID* and to V_{BUS} with *cPlug*. This termination may be detected electrically. See 4.4.4 for additional information regarding Low Power Device characteristics.

3.4.2.3 PD Micro-A Plug

PD cable assemblies with Micro-A plug connectors shall be marked with *rID* terminating the ID pin to ground. See Figure 3-23 for a schematic diagram of the connector termination in a PD cable assembly using a Micro-A plug.

3.4.3 Electronic Markers for PD Standard-B Plugs and Micro-B Plugs

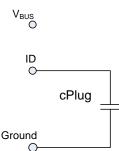

Electronic markers for PD cable assemblies with PD Standard-B plug connectors and Micro-B plug connectors are specified in this section. A legacy Micro-B connector's ID pin exhibits a very high resistance to ground. To maintain backward compatibility, capacitors are used as markers.

Note the 3A and 5A markers are mutually exclusive; hence both markers shall not be present at the same time.

3.4.3.1 **3A Capable PD B Plug**

The schematic diagram for a 3A-capable PD cable assembly detailing how a PD Standard-B plug connector or a Micro-B plug connector shall be marked is shown in Figure 3-24.

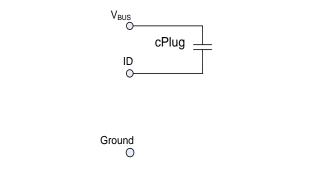

3.4.3.2 **5A Capable PD B Plug**

The schematic diagram for a 5A-capable PD cable assembly detailing how a PD Standard-B plug connector shall be marked is shown in Figure 3-25.

3.5 USB PD Icon

The USB PD cable assemblies shall display the USB icon appropriate for PD. A dimensioned drawing and allowable usage of the icon are supplied with the license from the USB-IF.

3.6 USB Power Delivery Cable Requirements

The methods used to mark the USB PD cable assemblies and USB PD cable adaptors are found in Section 3.4. The USB PD connector family shall conform to all requirements in Section 3, in addition to the requirements specified in the *[USB2.0], [USB3.1]* or *[BC1.2]* specifications. Test sequences shall conform to EIA-364-1000.001 as specified in the Environmental Requirements section of *[USB3.1]*.

Some USB PD cable assemblies may be designed for use as power only (i.e., no USB data communication). Requirements that relate to the transfer of USB data may not apply to these cables.

3.6.1 Low Level Contact Resistance (EIA 364-23B)

The power contacts of a 3A PD cable assembly shall conform to the following requirements:

- 20mΩ (Max) initial for V_{BUS} and GND contacts.
- Maximum change (delta) of +10mΩ after environmental stresses.
- Measure at 20mV (Max) open circuit at 100mA.

The power contacts of a 5A PD cable assembly shall conform to the following requirements:

- 20mΩ (Max) initial for V_{BUS} and GND contacts.
- Maximum change (delta) of $+10m\Omega$ after environmental stresses.
- Measure at 20mV (Max) open circuit at 100mA.

The following requirements shall apply, independent of power being applied, to the resistance of a PD Standard-A plug receptacle shell to the PD Standard-A receptacle PD DETECT contact with a PD Standard-A plug in the mated condition or to the resistance between the INSERTION DETECT contacts when a Standard-A plug is present in the Standard-A receptacle supporting Insertion Detect. For PD Detect, there are two contact interfaces to the plug shell included in series in this measurement:

- 200mΩ (Max) initial.
- Maximum change (delta) of 300mΩ after environmental stresses.
- Measure at 20mV (Max) open circuit at 100mA.

3.6.2 Open Circuit Resistance

The following requirements shall apply, independent of power being applied, to the resistance of the PD Standard-A receptacle shell to the PD Standard-A receptacle PD DETECT contact(s) when no PD Standard-A plug is inserted in the mated condition or a non-PD Standard-A plug is inserted in the mated condition or to the resistance between the INSERTION DETECT contacts of a Standard-A receptacle supporting Insertion Detect when a Standard-A plug is not inserted:

- $\geq 10M\Omega$ initial.
- ≥ 10MΩ after environmental stress.

3.6.3 Dielectric Strength (EIA 364-20)

No breakdown shall occur when 100VAC (RMS) is applied between adjacent contacts of unmated and mated connectors.

3.6.4 Insulation Resistance (EIA 364-21)

There shall be a minimum of $100 M \Omega$ insulation resistance between adjacent contacts of unmated and mated connectors.

3.6.5 Contact Current Rating

3.6.5.1 **3A PD Connector Mated Pair (EIA 364-70, Method 2)**

When a current of 3.0 A is applied to the V_{BUS} pin and its corresponding GND pin (i.e., pin 1 and pin 5 of the PD Micro-A Connector, PD Micro-AB Connector, or PD Micro-B Connector), the delta temperature shall not exceed +30°C at any point on the connectors under test, when measured at an ambient temperature of 25°C.

3.6.5.2 5A PD Connector Mated Pair (EIA 364-70, Method 2)

When a current of 5.0A is applied to the V_{BUS} pin and its corresponding GND pin (i.e., pin 1 and pin 4 of the PD Standard-B Connector or PD Standard-A Connector), the delta temperature shall not exceed +30°C at any point on the connectors under test, when measured at an ambient temperature of 25°C.

Page 90

3.6.6 Differential Crosstalk between V_{BUS} and the D+/D- Pair (EIA-360-90)

The differential, near-end, and far-end, crosstalk between the D+/D- pair and V_{BUS} shall be managed not to exceed the limit shown in Figure 3-26.

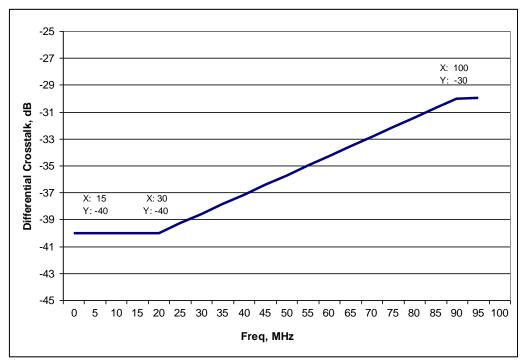

Figure 3-26 Differential Near-End and Far-End Crosstalk Requirement between the D+/D- Pair and V_{BUS}

3.6.7 PD Cable Assembly Shielding Connectivity

The shield conductor shall be attached to the connector shell at both ends of the cable and shall provide a resistance of no greater than 1.0Ω from end to end. The shield shall not be connected to ground within the cable.

3.6.8 PD Cable V_{BUS} Impedance

The cable impedance shall meet the requirements specified in <u>Table 5-</u>18.

3.6.9 PD Cable Insertion Loss

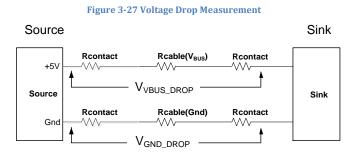

The insertion loss of the cable shall not exceed *aInsertionLoss*.

3.6.10 PD Cable IR Drop Considerations

The maximum voltage drop between the Source and Sink ports is defined to:

- Insure signal integrity of the USB 2.0 signal wires.
- Quantify the worst case voltage seen at the input of a Sink.

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

As shown in Figure 3-27, voltage drop across the cable is measured independently on both the GND and the V_{BUS} connections. It is inclusive of the cable and connectors at both ends.

3.6.10.1 Voltage Drop on the Ground

A PD cable assembly shall ensure V_{GND_DROP} does not exceed the maximum value listed in Table 3-7 for the signal ground reference between the Source's power source connection to the USB receptacle and the Sink's connection to its internal power conversion block, if present. V_{GND_DROP} shall be measured at *iCable* and measured either:

- At the receptacle's solder pad where it attaches to the printed circuit board
- Or where the captive cable is attached to the printed circuit board in the device.

*V*_{GND_DROP} shall include the effects of the following:

- 1) The mated contact resistance of both the A-side and the B-side (if present) connections for GND.
- 2) The series resistance of the cable's GND wire.
- 3) The rated current of the cable (*iCable*).

 V_{GND_DROP} for removable cables equals (2 * Rcontact + Rcable(GND)) * *iCable*. V_{GND_DROP} for captive cables equals (1 * Rcontact + Rcable(GND)) * *iCable*.

The only variable in the above equations is Rcable(GND). The wire size and its length are the major contributors to V_{GND_DROP} . The ground wire size shall be selected so that V_{GND_DROP} at a current of *iCable* does not exceed the maximum value listed in Table 3-7.

3.6.10.2 Overall IR Drop between a Source and a Sink

A PD cable assembly shall provide a maximum voltage drop of *vIRDrop_Cable* for V_{BUS} to GND at the Sink end of the cable. The V_{BUS} to GND voltage drop shall include V_{VBUS_DROP} plus V_{GND_DROP} .

VVBUS_DROP shall be measured at a current of *iCable* and measured either:

- At the receptacle's solder pad where it attaches to the printed circuit board
- Or where the captive cable is attached to the printed circuit board in the device.

V_{VBUS_DROP} shall include the effects of the following

- The mated contact resistance of both the A-side and B-side (if present) connections for V_{BUS}.
- The series resistance of cable's V_{BUS} wire.
- The rated current of the cable (*iCable*).

 V_{VBUS_DROP} for removable cables equals (2 * Rcontact + Rcable (V_{BUS})) * *iCable*. V_{VBUS_DROP} for captive cables equals (1 * Rcontact + Rcable (V_{BUS})) * *iCable*.

The only variable in the above equations is Rcable (V_{BUS}). The wire size and its length are the major contributors to V_{VBUS_DROP} . The V_{BUS} wire size shall be selected so that V_{VBUS_DROP} at a current of *iCable* does not exceed the maximum value listed in Table 3-7.

Page 92

3.6.10.3 Example Calculation of Overall IR Drop

The goal of this example is to design a compliant PD Cable with a Standard A and a Micro B plug (e.g. *iCable* = 3A) that is 1m in length.

The allowable Rcable (GND) to achieve this is found by:

- R=E/I or RE = IR -> Rcable (GND) = the maximum value for V_{GND_DROP} listed in Table 3-7/*iCable* -> 0.375/3 = 125mΩ.
- 2) Mated contact resistance is defined as $30m\Omega$ (Max) times 2 mated pair connections or $60m\Omega$.
- 3) Rcable (GND) = $125m\Omega 60m\Omega = 65m\Omega$ (the budget for the ground wire in the cable).

The allowable Rcable (V_{BUS}) to achieve this can be found by:

- 1) R=E/I or R = IR -> Rcable (V_{BUS}) = the maximum value for V_{VBUS_DROP} listed in Table 3-7/*iCable* -> 0.625/3 = 208m Ω .
- 2) Mated contact resistance is defined as $30m\Omega$ (Max) times 2 mated pair connections or $60m\Omega$.
- 3) Rcable (V_{BUS}) = $208m\Omega 60m\Omega = 148m\Omega$ (the budget for the V_{BUS} wire in the cable).

In this example, a 22AWG @ 52.94m Ω /m used for Ground and a 26AWG @ 134m Ω /m used for V_{BUS} meets the *vIRDrop_Cable* requirements for a 1m cable.

3.7 Electrical Parameters

Table 3-7 shows the parameters used in this Section.

Table 3-7 Electrical Parameters

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

Note 1: For Charging Only cables (e.g. cables without data lines), the maximum value of either or may be exceeded, however plus shall not exceed.

Note 1: For charging-only cables (e.g. cables without data lines), the maximum value of either V_{VBUS_DROP} or V_{GND_DROP} may be exceeded; however V_{VBUS_DROP} plus_V_{GND_DROP} shall not exceed vIRDrop_Cable.

USB Power Delivery Specification Revision 2.0, Version 1.0.

4. Electrical Requirements

This chapter covers the **Platform'splatform's** electrical requirements for implementing USB Power Delivery.

USB Power Delivery may be implemented alongside the *[USB2.0]*, *[USB3.1]*-and, *[BC1.2]* and *[USBType-C1.0]* specifications. In the case where a Device requests power via the Battery Charging Specification and then the USB Power Delivery Specification, it shall follow the USB Power Delivery Specification until the port pairPort Pair is unattached or there is a hard resetHard Reset. If the USB Power Delivery connection is lost, the portPort shall return to its default state, see Section 6.7.2.

4.1 Dead Battery Detection / Unpowered Port Detection

The <u>USB</u>-Power Delivery specification <u>definesprovides</u> a mechanism for a <u>Consumer/ProviderUSB Device</u> to provide power to a <u>Provider/ConsumerUSB Host</u> under the circumstances where the <u>Provider/ConsumerUSB Host</u>:

- Has a dead battery Dead Battery that requires charging or
- Has lost its power source or
- Does not have a power source or
- Does not want to provide power.

The USB Peripheral primarily acts as a USB Device that may also provide power to the USB Host if the correct detection is carried out.

The following sections detail mechanisms used for:

- Type-A to Type-B connections:
 - <u>o</u> The USB Device is a Consumer/Provider acting as a Source
 o The USB Host is a Provider/Consumer acting as a Sink.

For mapping of V_{BUS} level to USB states during Dead Battery detection see Figure 9-3.

4.1.1 Type-A to Type-B Dead Battery Operation

4.1.1.1 **Overview**

<u>A Consumer/Provider shall back power the Provider/Consumer at a reduced current level.</u> A Consumer/Provider shall back power the Provider/Consumer at a reduced current level. This enables the Provider/Consumer's PD transmitter on its downstream port<u>DFP</u> to send a continuous stream of alternating '0s' and '1s' (referred to in this section as a Bit Stream) that the Consumer/Provider's upstream port'sUFP's PD receiver can readily detect. The use of a current limited Source (*vSafeDB*) to back power V_{BUS} is intended to minimize the risk of damage to legacy USB downstream ports.<u>DFPs</u>. At the start of the process when the Consumer/Provider sees no voltage on V_{BUS}, it probes the bus by back powering V_{BUS} to see if its Port Partner has a <u>dead batteryDead Battery</u> or unpowered <u>portPort</u> that it wants powered. If so, the Consumer/Provider outputs *vSafe5V* on V_{BUS} and becomes the <u>defactode facto</u> power Provider.

When the process is complete, both ports will have performed an *implicit role swapImplicit Power Role Swap* without the use of the *PR_Swap* message (see Section 8.3.2.7.1.2) where the Consumer/Provider is now operating as the Source while the Provider/Consumer operates as a Sink. With communications and cable capabilities established, the Provider/Consumer may negotiate for a voltage/current combination to charge its battery or to operate.

Figure - Dead Battery / Unpowered Port Detection Flow

Figure 4-1 illustrates the flow for Dead Battery/Unpowered Port detection for both Provider/Consumer ports and Consumer/Provider ports. To ensure consistent behavior all Consumer/Provider ports shall have the ability to detect a Provider/Consumer with a Dead Battery or Unpowered Port.

The Consumer/Provider may use other means to detect the presence of a Port Partner before applying the method described in the following paragraph.

USB Power Delivery Specification Revision <u>42</u>.0. Version 1.0

4.1.1.2 Consumer/Provider Operational Details

In operation <u>(see Figure 4-17)</u>, a Consumer/Provider portPort that does not detect vSafe5V on V_{BUS} shall periodically apply a current limited five volt supply (vSafeDB) to V_{BUS} in an attempt to ascertain the presence of a Provider/Consumer portPort that wants to be powered. In response to vSafeDB on V_{BUS}, a Provider/Consumer portPort that wants to be powered. In response to vSafeDB on V_{BUS}, a Provider/Consumer portPort that wants to be powered. When the Consumer/Provider can detect indicating the presence of a portPort that wants to be powered. When the Consumer/Provider detects a Provider/Consumer portPort wanting to be powered, it shall apply vSafe5V to V_{BUS}. In all other cases, for example when connected to a legacy portPort or an unpowered Provider portPort, there will be no response and the Consumer/Provider portPort shall not apply full power (vSafe5V) to V_{BUS}. The Consumer/Provider shall continue to periodically probe for the presence of a Provider/Consumer portPort that wants power. The limitations on the current and power applied to back power V_{BUS} and its controlled duration shall be applied in order to prevent damage to legacy ports.

For mapping of V_{BUS} level to USB states during Dead Battery detection see Figure 9-3.

The Consumer/Provider may use other means to detect the presence of a Port Partner before applying the method described above.

4.1.1.1.4.1.1.3 Provider/Consumer Operational Details

In operation (see Figure 4-1^{The-}), the Provider/Consumer with a dead batteryDead Battery shall begin (as it must if its battery is truly dead) by outputting nothing on V_{BUS} . When power is applied to V_{BUS} (i.e. back powered), V_{BUS} is used by the Provider/Consumer to power its transmitter and to output the Bit Stream within the limited power offered by *vSafeDB*.

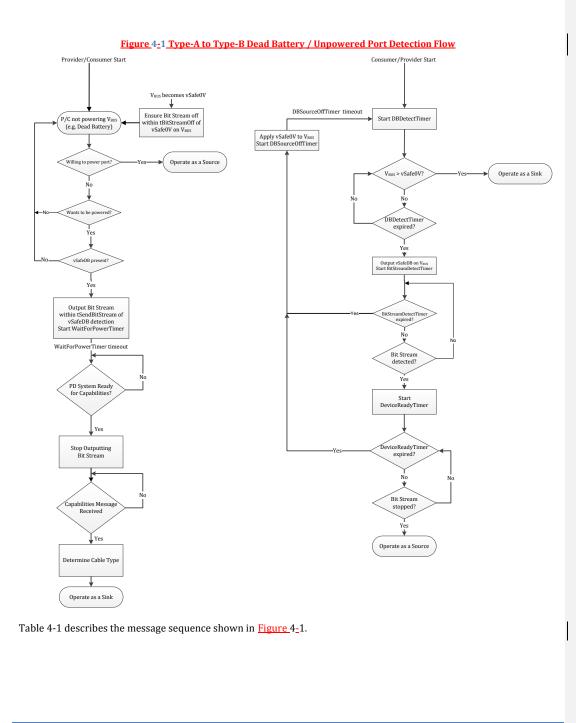

The Provider/Consumer shall begin outputting the Bit Stream on V_{BUS} within *tSendBitStream*. This is necessary because the application of full V_{BUS} power is dependent on the time it takes the Consumer/Provider to detect the presence of activity on V_{BUS} and to adjust its power supply.

The Provider/Consumer may have additional circuitry that requires more power than is available from V_{BUS} when powered by *vSafeDB*. The Provider/Consumer portPort can assume that full *vSafe5V* power is available *tWaitForPower* after it started sending the Bit Stream. After *tWaitForPower*, *vSafe5V* will be available to the Provider/Consumer to bring up any remaining logic required to process PD messages on V_{BUS}. When this logic is ready, the Provider/Consumer portPort shall signal its Port Partner that is ready to operate as Consumer by stopping the Bit Stream.

4.1.1.4 Sequence of operation

Figure 4-1 illustrates the flow for Dead Battery/Unpowered Port detection for both Provider/Consumer ports and Consumer/Provider ports. To ensure consistent behavior all Consumer/Provider ports shall have the ability to detect a Provider/Consumer with a Dead Battery or Unpowered Port.

Page 96

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

Step	Provider/Consumer	Consumer/Provider
5	If the Provider/Consumer wishes to be powered, and vSafeDB is present, it shall start to output Bit Stream within tSendBitStream of vSafeDB being available, and start the WaitForPowerTimer.	
	When budgeting for <i>tSendBitStream</i> the Provider/Consumer shall allow for:	
	 The time required for vSafeDB to charge the capacitance presented by itself to a level at which it can begin operation. 	
	 The time required for enough of its own circuitry to power up to transmit a Bit Stream. 	
	 The fact that <i>tTurnOnImpliedSink</i> is included in this budget 	
	Note that the effect of V_{BUS} capacitance on these timings is significant. The designer should verify their own design in this respect.	
6		If the Bit Stream is detected, the Consumer/Provider shall output $vSafe5V$ to V_{BUS} and start the <i>DeviceReadyTimer</i> . This timer is used to ensure that the Provider/Consumer is ready to operate as a Sink within a reasonable time.
7	When the WaitForPowerTimer expires, the Provider/Consumer assumes that $vSafe5V$ is present on V _{BUS} . It shall then bring up the full PD system and when ready to receive and process Source Capabilities messages, stop sending the Bit Stream.	If the DeviceReadyTimer expires, the Consumer/Provider shall perform the <i>Apply vSafe0V</i> <i>Procedure</i> defined in step 4 above, ending by going to step 1.
8	When the <i>Source Capabilities</i> message is received, the Provider/Consumer shall determine the connected cable type, and start operation as a Sink.	If the Bit Stream is detected to have stopped, the Consumer/Provider shall go and start operating as a Source. The first action will be to send the <i>Source</i> <i>Capabilities</i> message.
Note:	f at any time the Provider/Consumer sees

on V_{BL}	_{is} , it shall ensure that it is not sending Bit Stream wit	hin <i>tBitStreamOff</i> , and go to step 1.

4.1.2 Type-C to Type-C Dead Battery Operation

Dead Battery charging operation for connections between Type-C connectors is defined in [USBType-C1.0].

USB Power Delivery Specification Revision <u>42</u>.0<u>. Version 1.0</u>

4.2 Cable IR Ground Drop (IR Drop)

Every PD Sink Port capable of USB communications may be susceptible to unreliable USB communication if the voltage drop across ground falls outside of the acceptable common mode range for the USB Hi-Speed transceivers data lines (V_{GND_DROP}) due to excessive current draw. Certified PDUSB cabling is specified such that such errors should not occur (See Section 3.6.10).

4.3 <u>A-Plug Insertion Detect</u>

The USB Power Delivery specification defines an Insertion Detect mechanism for the Standard-A plug. It consists of a contact that connects with the shield when a Standard-A plug or a PD Standard-A plug is inserted into the receptacle. The shield is essentially connected to ground through at most *rID* max.

The Micro-A plug's ID pin is used for Insertion Detect. It is essentially connected to ground through at most a $1K\Omega$ resistance. This is the default defined in the Micro-A connector specification for *[USB2.0]* and *[USB3.1]*. See Section 3.4.2 for more details.

The Insertion Detect feature:

- When a plug is present for cold socket<u>Cold Socket</u> applications shall be used to indicate when to apply power to V_{BUS}
- Should be used to indicate to the PD logic to start sending *Source Capabilities* messages when a plug is present.
- Should be used to indicate to the PD logic to put V_{BUS} back to the default state<u>USB Default Operation</u> when the plug is removed.

The Insertion Detect feature for Standard-A receptacles shall be present for cold socket<u>Cold Socket</u> but is optional for all other Standard-A applications.

4.4 Cable Type Detection

1.1.2 Plug Type Detection

4.4.1 Detecting Cabling Capabilities

Non-compliant cables, such as 'Y' and 'W' cables create the potential to damage hardware were the PD system to allow more than *vSafe5V* to be placed on V_{BUS}. To prevent this, all PD <u>A-plug to B-plug assemblies</u> are made in a way that can be electronically detected. Only <u>cablesA-plug to B-plug assemblies</u> that are marked for PD shall be used for voltages higher than *vSafe5V* or current levels higher than 1.5A. <u>Standard Type-C cable assemblies are rated for PD voltages higher than *vSafe5V* and current levels of at least 3A.</u>

Providers and Provider/Consumers shall detect the type of attached cable and either limit the Capabilities they offer or operate in a Low Power mode based on:

• The receptacle type (e.g. Standard-A or Micro-AB) and current carrying capability.

• The A-plug type (e.g. Standard or PD or Low Power).

Consumers and Consumer/Providers shall detect the type of attached cable and limit their requests based on:

- The receptacle type (e.g. Standard-B or Micro-AB) and current carrying capability.
- The detected B-plug type (e.g. Standard or PD).
- The current carrying capability indicated by the PD B-plug.

Cable type detection is a multi-step process that both the <u>ProviderSource</u> and <u>ConsumerSink</u> perform. This section provides flow of the cable type detection based on the electronic markings defined in Section 3.4. The Source shall limit maximum capabilities it offers so as not to exceed to the capabilities of the type of plug detected. Requests made by the Sink shall not exceed the capabilities of the type of plug <u>detected</u>.

Page 100

The cable detection process is usually run when the Source is powered up<u>, after a Power Role Swap</u> or when power is applied to a Sink. The exact method used to detect these events is up to the manufacturer and shall meet the following requirements:

Sources shall run the cable detection process prior to the Source sending Source Capabilities messages offering voltages in excess of vSafe5V or currents in excess of -1.5Ar.;

<u>1.5A for Type-A/Type-B</u>
 <u>3A for Type-C.</u>

- Sinks <u>with Type-A and Type-B connectors</u> shall run the cable detection process prior to <u>sending any</u>
 Request making a request for power Messages.
- <u>Sinks with Type-C connectors shall select Capabilities from the offered Source Capabilities assuming that the</u> Source has already determined the Capabilities of the cable.
- Provider/Consumers with dead batteries shall wait until after receipt of the first *Source Capabilities* message before running the cable detection process and making a request for power.

Sources shall detect the type of attached cable and either limit the Capabilities they offer or operate in a Low Power mode based on:

- The receptacle type (i.e. Standard, Micro or Type-C) and its known current carrying capability.
 - The current carrying capability of the plug determined by:
 - The plug type (i.e. Type-C, PD, non-PD or Low Power).
 - <u>Cable capabilities determined using Structured VDM messages (see Section 6.4.4.2) sent using SOP'</u>
 <u>Communication (see Section 2.4).</u>

Sinks, except those with Type-C receptacles, shall detect the type of attached cable and limit their requests based on:

The receptacle type (i.e. Standard, or Micro) and its known current carrying capability.

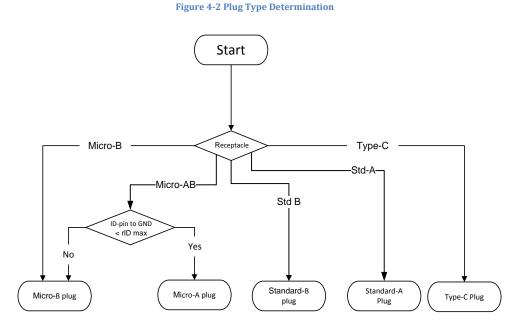

• The current carrying capability of the plug determined by:

o The plug type (i.e. PD or non-PD).

4.4.1<u>4.4.2</u> Plug Type Determination

Figure 4-2 shows the flow for the first portion of the multi-step process that shall be used to determine the kind of cable. It begins by determining the kind of plug inserted into the receptacle. Specifically the plug type: Standard-A, Standard-B, Micro-A-or, Micro-B-or Type-C, is determined. <u>Detection of Type-C plugs is defined in *[USBType-C1.0].*</u>

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

4.4.24.4.3 Detecting the PD Capabilities of the Standard-A Connector

The PD version of the Standard-A receptacle has one or two additional contacts that are used to:

- Optional detect if Standard-A plug is inserted in or removed from the receptacle.
- Required detect if the Standard-A plug is PD Capable or not.

The following description assumes that the two switches in the Standard-A receptacle are detected by having pull-up resistors to a positive voltage and looking at the voltage, so a high voltage indicates no connection in the switch and a low voltage indicates a connection in the switch. Other detection circuits may be used.

Page 102

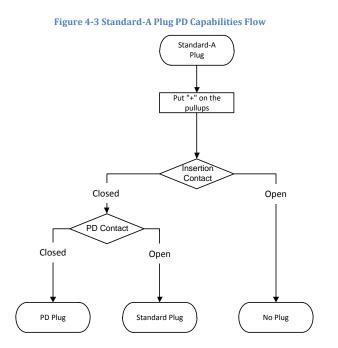

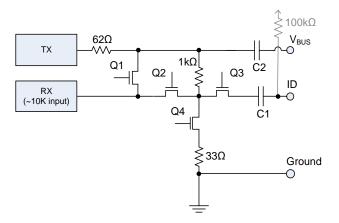

Figure 4-3 illustrates how the detection contacts in the A receptacle shall be used. Insertion Detect is an optional feature (see Section 3.1.5). When not present, the path through the Figure 4-3 follows the Insertion Detect 'Closed' arc.

4.4.3<u>4.4.4</u> Plug Type Detection except Standard-A

Figure 4-4 Plug Type Detection Circuit

The example circuit shown in Figure 4-4 is used to detect the electronic markings on the ID pin indicating the type of Micro connector.

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

The TX is used to put a carrier signal on the V_{BUS} line and the RX is used to detect whether a signal is present or not (typically the Squelch is used for this purpose). Q1 - Q4 are used to create a series of circuits where the voltage output (as measured by the RX) in each step is used to determine the configuration of the plug in accordance with to Table 4-2.

It is important that B-Plug type detection takes place when the line is idle and connected at the remote end. The ideal measurement opportunity is after sending the GoodCRC message in response to the Source Capabilities message and before sending the Request message as the line can be expected to be connected and idle because the sink will be the next to transmit.

Note: If the far-end is not terminated or not terminated correctly (see Section 5.8.2.5) then the cable-type detection described below may give erroneous results if signal levels at the cable input are reduced excessively by the reflections of the cable.

In normal operation Q1 is conducting (turned ON) and Q2, Q3 and Q4 are not conducting (turned OFF).

In order to check the plug type using the circuit in Figure 4-4, a series of steps are performed; the result of each step is recorded as a "0" or "1". The steps are:

- 1) Q1, Q3 and Q4 not conducting (turned OFF)
- 2) Q2 conducting (turned ON)
- 3) Check Squelch -> open "1", else "0" -> bit 1
- 4) Q3 conducting (turned ON)
- 5) Check Squelch -> open "1", else "0" -> bit 2
- 6) Q4 conducting (turned ON)
- 7) Check Squelch -> open "1", else "0" -> bit 3

Table 4-2 summarizes the results.

Table 4-2 Plug Type Determination

bit 1	bit 2	bit 3	Micro-A plug	Micro-B or PD Standard-B plug	Approximate level at RX when detecting bit 1	Approximate level at RX when detecting bit 2	Approximate level at RX when detecting bit 3
1	1	1	Low Power	PD (5A)	~ 0dB	$\sim 0 dB$	~ -9dB
1	1	0	PD	Legacy ¹	~ 0dB	~ -6dB (PD) ~ 0dB (Legacy)	~ -30dB
1	0	1	Fault	Fault			
1	0	0	Legacy	PD (3A)	~ 0dB	~ -40dB	~ -40dB
0	1	1	Fault	Fault			
0	1	0	Fault	Fault			
0	0	1	Fault	Fault			
0	0	0	Fault	Fault			
Note 1	Note 1: A legacy Standard-B plug does not have an ID pin but will be detected as legacy via the ID pin in the receptacle.						

4.5 Low Power Devices using Micro-A Plug

The Low Power feature enables Sources to minimize the power they output over V_{BUS} without using the PD negotiation process. These devices utilize a captive cable ending in a Micro-A plug.

Sources that are able to detect the Low Power plug shall automatically begin an Implicit Contract equivalent to a Battery PDO (Max Voltage = vLowPower max, Min Voltage = vLowPower min, Max Power=pLowPower nom) and shall not transmit or respond to PD messaging or signaling while the Low Power plug is connected. Low Power

Page 104

Devices (Sinks) shall be able to operate normally when powered by any voltage in the range *vLowPower* and shall not transmit USB PD messaging or signaling.

The entry process into Low Power operation is as follows:

- 1. The Source detects a Low Power Device is attached (see Table 4-2).
- 2. The Port Pair then operates on an Implicit Contract:
 - a. The Source supplies a voltage in the range *vLowPower* and at least *pLowPower* nominal
 - b. The Sink shall be able to operate on a voltage on the range *vLowPower* and shall draw no more than *pLowPower* nominal.
- The Source may monitor the voltage and when it falls below *vLowPower* min reapply *vSafe5V* in an attempt to continue operating. Alternatively, the Source may not monitor V_{BUS} and when it falls to this level₁₂ both it and the Low Power Device will likely fail for lack of power.

Exit from Low Power operation occurs when the Low Power plug is detached.

Sources that are not able to detect the Low Power plug shall treat the plug as a PD micro-A plug. These sources would therefore supply *vSafe5V* constantly to a Low Power Device (Sink).

4.6 Electrical Parameters

Table 4-3 shows the parameters used in this section.

Table 4-3 Electrical Parameters

5. Physical Layer

5.1 Physical Layer Overview

The Physical Layer (PHY<u>Layer</u>) defines the signaling technology for USB Power Delivery. This chapter defines the electrical requirements and parameters of the PD Physical Layer required for interoperability between USB PD <u>Devicesdevices</u>.

5.2 Physical Layer Functions

The USB PD Physical Layer consists of a pair of transmitters and receivers that communicate across a single signal wire-<u>(VBUS-Or CC)</u>. All communication is half duplex. The PHY <u>Layer</u> practices collision avoidance to minimize communication errors on the channel.

The transmitter performs the following functions:

- Receive packet data from the protocol layer
- Calculate and append a CRC
- Encode the packet data including the CRC (i.e. the payload)
 - _____Transmit the Packet (preamble<u>Preamble</u>, <u>SOP*</u>, payload, CRC and <u>EOP</u>) across the channel using <u>aeither</u> o <u>A Binary</u> Frequency Shift <u>Keying (FSKKeyed (BFSK</u>) modulated carrier <u>over V_{BUS} or</u> <u>o Biphase Mark Coding (BMC) over CC</u>

The receiver performs the following functions:

- <u>DetectFor BFSK detect</u> the FSK-modulated carrier from the channel, recover
- <u>Recover</u> the clock and lock onto the Packet from the <u>preamble</u>Preamble
- Detect the **SOP***

•

- Decode the received data including the CRC
- Detect the *EOP* and validate the CRC
 - If the CRC is valid, deliver the packet data to the protocol layer.
 - If the CRC is not valid, flush the received data.

The PHY functions are shown in , , and – The PHY is expected to keep power consumption low, especially when only the squelch detector is required to be active. In the active mode, where any of the functions listed above may be executed, the Phy Block power consumption should be minimized. In the squelch mode, when only the squelch detector is required, the power consumption should be minimized.

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

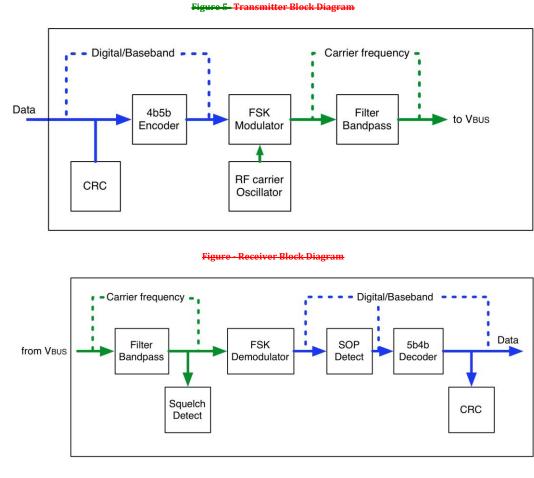

Figure - Channel Diagram (Cable Type Detection not shown)

Channel Overview 5.2.1.11.1.1.1

DUV USB V_{BHS} as $\mathbf{T}\mathbf{b}$ and the system is designed to treat the V_{BUS} line in the cable as a tran sion line terminated at both ends with The PHY shall be AC coupled to V_{BUS} or be tolerant of the maximum possible DC voltage that matching impedance. zent on V_{BUS}. For example, the PHY may be AG coupled to V_{BUS} through a capacitor at each end. While may be pro transmitting, the Source, or Sink, shall apply an AC signal with amplitude vTX to Value as measured between zlsolation and cAC Coupling.

Transceiver Isolation Impeda 5 2 1 21 1 1 1

Sinly chall place u_{BUS} wire bulk capacitance and the V_{BUS} pin on the T_{r} an isolation impedance allow the AC coupled UCP Dower Delive nicato over V_{BUS}

The isolation imp dance shall have an impedance of **zIsolation** at any frequency within **fRange.-See Sections and for** additional detail.

Page 108

Note: Isolation impedance surges may occur and need to be clamped in some manner. There are many variables that could enter into the nature of the surge that are not controlled by the spee and subject to implementation. The clamping method is therefore an implementation choice. Implementors are strongly advised to read through Appendix C to evaluate the need for this in their implementation.

5.2.1.31.1.1.1 Transceiver AC Coupling Capacitance

The Source and Sink shall be AC coupled to V_{BUS} or be tolerant of the maximum possible DC voltage that may be present on V_{BUS}.– For example, the Source and Sink may be AC coupled to V_{BUS}-by placing an AC coupling capacitance cAC Coupling between the V_{BUS}-pin on the connector and the transceiver as indicated in . A suggested value for cAC-Coupling in this case would be between 3 and 10 nF

1.2 Bit Encoding

PD uses a carrier of modulated with the information to avoid the noise from the power supplies. Continuous Phase Frequency Shift Keying (FSK) shall be used to encode bits for transmission on the channel. In this specification, FSK shall be understood to mean continuous phase FSK. A signal of amplitude vTX shall be injected onto V_{BUS}-using a carrier frequency, *fCarrier*. The following logic states shall be used:

- Logic 0 is indicated by a frequency fCarrier fDeviation.
- Logic 1 is indicated by a frequency fCarrier + fDeviation.

5.3 Symbol Encoding

Except for the **preamble** all communications on the line shall be encoded with a line code to ensure a reasonable level of DC-balance and a suitable number of transitions. This encoding makes receiver design less complicated and allows for more variations in the receiver design.

4b5b line code shall be used. This encodes 4-bit data to 5-bit symbols for transmission and decodes 5-bit symbols to 4-bit data for consumption by the receiver.

The 4b5b code provides data encoding along with special symbols. Special symbols are used to signal *Hard Reset*, and delineate packet boundaries.

5.4 Ordered Sets

Ordered sets shall be interpreted according to Figure 5-1.

An ordered set consists of 4 K-codes sent as shown in Figure 5-1.

A list of the ordered sets used by USB Power Delivery can be seen in Table 5-2. <u>SOP* is a generic term used in place of</u> SOP/SOP'.

Table 5-2 Ordered Sets				
Ordered Set	Section			
SOP	5.6.1.2.1			
<u>SOP'</u>	5.6.1.2.2			
<u>SOP"</u>	5.6.1.2.3			
Hard Reset	5.6.4			
<u>Cable Reset</u>	5.6.5			
<u>SOP' Debug</u>	5.6.1.2.4			
<u>SOP" Debug</u>	5.6.1.2.5			

The receiver shall search for all four K-codes and when it finds at least three in the correct place, it may interpret it as a valid ordered set (see Table 5-3).

Table 5-3 Validation of Ordered Sets

5.5 Transmitted Bit Ordering

This section describes the order of bits on the wire that shall be used when transmitting data of varying sizes. Table 5-4 shows the different data sizes that are possible.

Figure 5-2 shows the transmission order that shall be followed.

Table 5-4 Data Size

	Unencoded	Encoded
Byte	8-bits	10-bits
Word	16-bits	20- bits
DWord	32-bits	40-bits

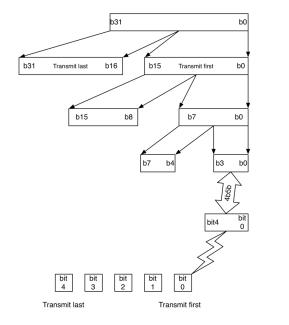

Figure 5-2 Transmit Order for Various Sizes of Data

5.6 Packet Format

The packet format shall consist of a preamble Preamble, an SOP*, (see Section 5.6.1.2), packet data including header, a CRC and an EOP (see Section 5.6.1.5). The packet format is shown in Figure 5-3). The packet format is shown in , and indicates which parts of the packet shall be 4b/5b encoded. Once 4b/5b encoded, the entire Packet shall be transmitted either using BFSK over V_{BUS} or BMC over CC. Note that when using BMC the Preamble is BMC encoded.

5.6.1 Packet Framing

The transmission starts with a preamble Preamble that is used to allow the receiver to lock onto the carrier. It is followed by a *SOP** (Start of Packet). The packet is terminated with an *EOP* (End of Packet) K-code.

5.6.1.1 Preamble

The **preamble**Preamble is used to achieve lock in the receiver by presenting an alternating series of "0s" and "1s", so the average frequency is the carrier frequency. Unlike the rest of the packet, the **preamble**Preamble shall not be <u>4b/5b</u> encoded.

The **preamble** Preamble shall consist of a 64-bit sequence of alternating 0s and 1s. The **preamble** shall start with a "0" and shall end with a "1".

5.6.1.2 Start of Packet Sequences

5.6.1.1.15.6.1.2.1 Start of Packet Sequence (SOP)

SOP is an ordered set. The *SOP* ordered set is defined as: three *Sync-1* K-codes followed by one *Sync-2* K-code <u>(see</u> Table 5-5-).

Table 5-5 SOP ordered set

K-code number	K-code in code table
1	Sync-1
2	Sync-1
3	Sync-1
4	Sync-2

A Power Delivery Capable Provider, Provider/Consumer, Consumer or Consumer/Provider shall be able to detect and communicate with packets using *SOP*. If a valid *SOP* is not detected (see Table 5-3) then the whole transmission shall be ignored.

Sending and receiving of SOP Packets shall be limited to PD Capable DFPs and UFPs only (i.e. PD Capable Ports on PDUSB Hosts and PDUSB Devices). Cable Plugs shall neither send nor receive SOP Packets. Note that PDUSB Devices, even if they have the physical form of a cable (e.g. AMAs), are still limited to SOP Packets only.

Page 114

5.6.1.2.2 Start of Packet Sequence Prime (SOP')

The SOP' ordered set is defined as: two Sync-1 K-codes followed by two Sync-3 K-codes (see Table 5-6).

		Table 5-6- vandation of sor sequence <u>SOP</u> ordered set						
_	1st-K- code <u>number</u>	2nd-K- code <u>in</u> <u>code table</u>	,3rd code	<u>Ath code</u>				-

Table 5-6-Validation of SOP sequence SOP' ordered set

The receiver <u>A Cable Plug capable of SOP'</u> <u>Communications</u> shall search for all four <u>K codes</u> only detect and <u>communicate with packets starting with **SOP'**.</u>

A DFP or Source needing to communicate with a Cable Plug capable of SOP' Communications, attached between a Port Pair will be able to communicate using both packets starting with **SOP'when it finds at least three in-** to communicate with **the** Cable Plug and starting with **SOP** correct order, it to communicate with its Port Partner. The DFP or Source shall interpret itco-ordinate SOP and SOP' Communication so as to avoid collisions.

For a Cable Plug supporting SOP' Communications, if a valid **SOP**' start of packet (See). If a valid is not detected [see Table 5-3] then the whole transmission shall be ignored. For the DFP or Source supporting SOP' Communications if a valid **SOP** or **SOP**' is not detected (see Table 5-3) then the whole transmission shall be ignored. When there is an Explicit Contract in place a UFP shall not send SOP' Packets and shall ignore all packets starting with **SOP**'. When there is no Explicit Contract or an Implicit Contract in place a Sink shall not send SOP' Packets and shall ignore all packets starting with **SOP**' discarded.

5.6.1.2.3 Start of Packet Sequence Double Prime (SOP")

The SOP" ordered set is defined as the following sequence of K-codes: Sync-1, Sync-3, Sync-1, Sync-3 (see Table 5-7). Table 5-7 SOP" ordered set

Table 57 501 Ofdered set					
<u>K-code number</u>	<u>K-code in code</u> <u>table</u>				
<u>1</u>	Sync-1				
<u>2</u>	<u>Sync-3</u>				
<u>3</u>	Sync-1				
<u>4</u>	<u>Sync-3</u>				

A Cable Plug capable of SOP" Communication, shall have a SOP' Communication capability in the other Cable Plug. No cable shall only support SOP" Communication. A Cable Plug to which SOP" Communication is assigned shall only detect and communicate with packets starting with **SOP**" and shall ignore any other packets.

A DFP needing to communicate with such a Cable Plug, attached between a Port Pair will be able to communicate using packets starting with **SOP**' and **SOP**'' to communicate with the Cable Plugs and packets starting with **SOP** to

communicate with its Port Partner. A DFP which supports SOP" Communication shall also support SOP' Communication and shall co-ordinate SOP* Communication so as to avoid collisions.

For the Cable Plug supporting SOP" Communication, if a valid *SOP*" is not detected (see Table 5-3) then the whole transmission shall be ignored. For the DFP if a valid *SOP** is not detected (see Table 5-3) then the whole transmission shall be ignored. A UFP shall not send SOP" Packets and shall ignore all Packets starting with *SOP*".

5.6.1.2.4 Start of Packet Sequence Prime Debug (SOP'_Debug)

The **SOP' Debug** ordered set is defined as the following sequence of K-codes: Sync-1_RST-2_RST-2_Sync-3 (see Table 5-8). The usage of this Ordered Set is presently undefined.

<u>Table 5-8 SOP</u>	<u>Debug ordered set</u>

Table 5-9 SOP"_Debug ordered set

5.6.1.25.6.1.3 Packet Payload

The packet payload is delivered from the protocol layer (Section 6.2) and shall be encoded with the hex data codes from Table 5-1.

5.6.1.3<u>5.6.1.4</u> CRC

The CRC shall be inserted just after the payload. It is described in Section 5.6.2.

5.6.1.4<u>5.6.1.5</u> End of Packet (EOP)

The end of packet marker shall be a single *EOP* K-code as defined in Table 5-1. This shall mark the end of the CRC. After the *EOP*, the CRC-residual shall be checked. If the CRC is not good, the whole transmission shall be discarded, if it is good, the packet shall be delivered to the Protocol Layer. <u>Note an *EOP* may be used to prematurely terminate a</u> <u>Packet e.g. before sending *Hard Reset* Signaling.</u>

5.6.2 CRC

The packet header and data shall be protected by a 32-bit CRC.

Page 116

CRC-32 protects the data integrity of the data payload. CRC-32 is defined as follows:

- The CRC-32 polynomial shall be = 04C1 1DB7h.
- The CRC-32 Initial value shall be = FFFF FFFFh.
- CRC-32 shall be calculated for all bytes of the payload not inclusive of any packet framing symbols (i.e. excludes the preamble Preamble, SOP*, EOP).
- CRC-32 calculation shall begin at byte 0 bit 0 and continue to bit 7 of each of the bytes of the packet.
- The remainder of CRC-32 shall be complemented.
- The residual of CRC-32 shall be C704 DD7Bh.

Note: This inversion of the CRC-32 remainder adds an offset of FFFF FFFFh that will create a constant CRC-32 residual of C704 DD7Bh at the receiver side.

Note: The CRC implementation is identical to the one used in [USB3.1].

Figure 5-4 is an illustration of CRC-32 generation. The output bit ordering shall be as detailed in Table 5-10.

The CRC-32 shall be encoded before transmission.

1.2.1 Error reporting

5.6.3 Packet Detection Errors

CRC errors, or errors detected while decoding encoded symbols using the code table, shall be treated the same way; the message shall be discarded and a *GoodCRC* message shall not be returned.

While the receiver is processing a packet, if at any time V_{BUS} becomes idle the receiver shall stop processing the packet and discard it (no *GoodCRC* message is returned). See Section 5.8.2.6.4 for the definition of BFSK idle and Section 5.8.3.6.1 for the definition of BMC idle.

5.6.4 Hard Reset

5.6.31.1.1 Hard Reset

Hard Reset signaling is an ordered set of bytes sent with the purpose to be recognized as an embedded toby the PHYlayer Layer. The *Hard Reset* signaling ordered set is defined as: three *RST-1* K-codes followed by one *RST-2* K-code (see Table 5-11-).

<u>K-code number</u>	<u>K-code in code</u> <u>table</u>
<u>1</u>	RST-1
<u>2</u>	RST-1
<u>3</u>	RST-1
<u>4</u>	RST-2

<u>K-code number</u>	<u>K-code in code</u> <u>table</u>
	table
4	RST 1
2	RST 1
3	RST 1
4	<u>PST-2</u>

A <u>Devicedevice</u> shall perform a Hard Reset when it receives *Hard Reset* signaling. <u>After receiving the *Hard Reset* signaling, the device shall reset as described in Section 6.7.2. If a valid *Hard Reset* is not detected (see Table 5-3) then the whole transmission shall be ignored.</u>

<u>A Cable Plug shall perform a Hard Reset when it detects</u> *Hard Reset* <u>signaling being sent between the Port Partners.</u> After receiving the *Hard Reset* signaling, the device shall reset as described in Section 6.7.2.

The procedure for sending Hard Reset signaling shall be as follows:

Table - Validation of Hard Reset

	1st code	2nd code	3rd code	4 th code
Valid, reset	Error	RST-1	RST-1	RST-2
Valid, reset	RST-1	Error	RST-1	RST-2
Valid, reset	RST-1	RST-1	Error	RST-2
Valid, reset	RST-1	RST-1	RST-1	Error
Valid (perfect) , reset	RST-1	RST-1	RST-1	RST-2
Not Valid, NO reset(example)	RST-1	Error	RST-1	Error

The procedure for conding Hard Reset signaling shall be as follows:

1. If the PHY Layer is currently sending a message, the message shall be interrupted by sending an *EOP* K-code<u>and</u> the rest of the message discarded.

2. Wait *tInterFrameGap*.

 2_{-3} . If V_{BUS} is not idle, wait for it to become idle then discard the message. See(see Section 5.8.2.6.4 for the definition of <u>BFSK</u> idle and Section 5.8.3.6.1 Ψ_{BUS} for the definition of <u>BMC idle</u>)

4. Send the Preamble followed by the 4 K-codes for Hard Reset signaling.

3.1. Wait Send the Preamble followed by the 4 K codes for Hard Reset signal

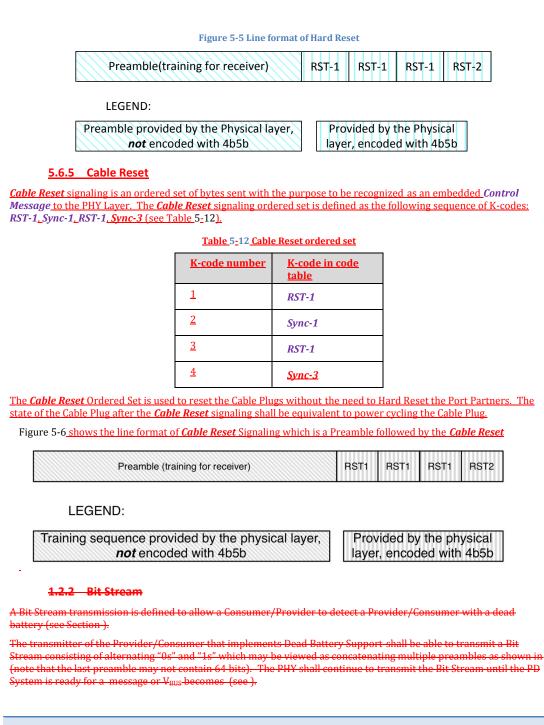

5. Disable the channel (i.e. stop sending and receiving), reset the PHY Layer and inform the Protocol Layer that the PHY Layer has been reset.

6. Re-enable the channel when requested by the Protocol Layer.

4. Figure 5-5 <u>shows the line format of Hard Reset Signaling which is a Preamble followed by the Hard Reset Reset</u> the PHY-layer.

Ordered Set.

Page 120

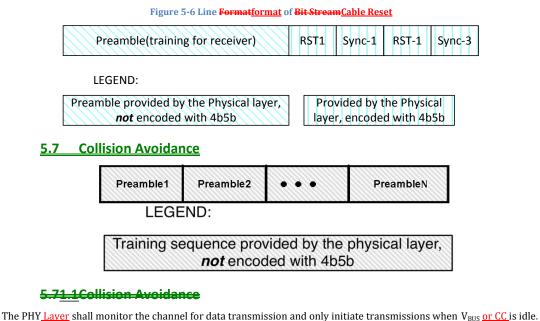

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

The Consumer/Provider's receiver shall declare a Bit Stream is detected after detecting 128 consecutive bits that match the preamble pattern of alternating "0s" and "1s".

Ordered Set.

After the Bit Stream is detected, the receiver shall indicate that the Bit Stream has stopped when the squelch has closed (the signal level is below *vSquelchOperating*) for *tBitStreamComplete*.

If the squelchbus idle condition is not brokenpresent, it shall be considered safe to start a transmission provided the conditions detailed in Section 5.8.1.4- are met. The bus idle condition shall be checked immediately prior to transmission cannot be initiated then the packet shall be discarded. squelch-shall be checked immediately prior to transmission. If transmission of the packet shall be discarded be checked immediately prior to transmission. If transmission cannot be initiated then the packet shall be discarded. If the packet is discarded because V_{BUS} or CC is not idle, the PHY Layer shall signal to the protocol layer that it has discarded the message as soon V_{BUS} or CC becomes idle. See Section 5.8.2.6.4 for the definition of idle V_{BUS} and Section 5.8.3.6.1 for the definition of idle CC.

5.8 Physical Layer signaling schemes

5.7.15.8.1 Common Signaling Specifications

This section defines the common-receiver and transmitter requirements which are common across different signaling schemes.

5.7.1.15.8.1.1 Common Signaling Parameters

The electrical requirements specified in Table 5-13 shall apply to both the transmitter and receiver.

Table 5-13 Common Normative Signaling Requirements

Parameter	Description	Min	Nom	Max	Units	Comment

Page **122**

Parameter	Description	Min	Nom	Max	Units	Comment
fCarrier	FSK carrier frequency	22.4	23.2	24.0	MHz	
fDeviation	FSK frequency deviation	450	500	600	kHz	
fBitRate	Bit rate	270	300	330	Kbps	

Parameter	Description	Min	Nom	Max	Units	Comment
<u>zisolation</u>	Impedance Allowed	80			<u>₽</u>	Measured at any frequency within <i>fRange</i> .
fRange	Range of frequencies used in communication	20.4		26	MHz	A spacing of 2MHz around fCarrior is allowed for the signal including FM tolorance and doviation.

One example implementation of a transceiver isolation impedance using the parameters listed in- is a 1μ H inductor (see Appendix).

5.7.1.2<u>5.8.1.2</u> Common Transmitter Signaling Specifications

Limts on the drift in ,fCarrier, and fDeviation are set in order to help low complexity receiver implementations.

The transceiver shall terminate the V_{BUS} line with **rTX** while it is powered, whether it is transmitting, receiving or waiting for the squelch to close.

Table 5-14 Common Normative Signaling Requirements for Transmitter Requirements

The requirements specified in shall apply to the transmitter.

Table - Transmitter Normative Requirements

Name	Description	Min	Nom	Max	Units	Comment
pBitRate	Maximum difference between the bit-rate during the part of the packet following the preamble and the reference bit-rate.			0.25	%	The reference bit rate is the average bit rate of the last 32 bits of the preamble.
pCarrierFreq	Maximum difference between the carrier- frequency during the part of the packet following the preamble and the reference carrier frequency.			0.2	%	The reference carrier frequency is the average carrier frequency of the last 32 bits of the preamble.
pDevFreq	Maximum difference between the deviation frequency during the part of the packet following the preamble and the reference deviation frequency.			1	%	The reference deviation frequency is the average deviation frequency during the last 32 bits of the preamble.

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

Name	Description	Min	Nom	Max	Units	Comment
rTX	The termination resistance and the cable impedance for test and calculation.	52	62	72	A	The impedance at the point between the TX block and the FIX resistor in Figure 5-3 is assumed to be 0Ω when the transceiver is powered (See also Figure 4-4).
tBusIdle	Transceiver turn around time, do not transmit during this time after receiving or transmitting the last bit of a message.	20			µs	This time is available to reconfigure the system for reception after transmitting
<i>vTX</i>	TX voltage injected on VBUS	100	150	200	mVRM S	This is the voltage on V _{BUS} when terminated by a nominal <i>rTX</i> through a cable no longer than 250mm whose characteristic impedance matches the termination impedance.

The carrier phase noise should be considered when designing the transmitter system in order to achieve the required BER (**nBER**). The carrier phase noise can be measured while the transmitter sends a **BIST Carrier Mode 0** or **BIST Carrier Mode 1**.

Parameter	Description	<u>Min</u>	<u>Nom</u>	<u>Max</u>	<u>Units</u>	<u>Comment</u>

End of Frame	Bus driven after end of Frame	Bus driven before Preamble	Preamble
	▲ tinterFi	ameGap 🕨	
	tEndDriveBFSK or tEndDriveBMC	tStartDrive	

The transmitter shall drive the bus for no longer than *tEndDriveBFSK* or *tEndDriveBMC* (as appropriate) after transmitting the final bit of the Frame. Detailed requirements for terminating the Frame and ceasing to drive the bus are given separately for BFSK and BMC.

Before starting to transmit the next Frame's Preamble the transmitter of the next Frame shall ensure that it waits for *tInterFrameGap* after either:

1. Transmitting the previous frame, or

2. Receiving the previous frame, or

3. Observing an idle condition on V_{BUS} or CC (see Section 5.7).

Note: the transmitter is also required to verify a bus idle condition immediately prior to starting transmission of the next Frame.

The transmitter of the next Frame may vary the start of the Preamble by tStartDrive (see Section 5.8.2.5.2).

See also Section 5.8.3.1 for figures detailing the timings relating to transmitting, receiving and observing idle in relating to Frames.

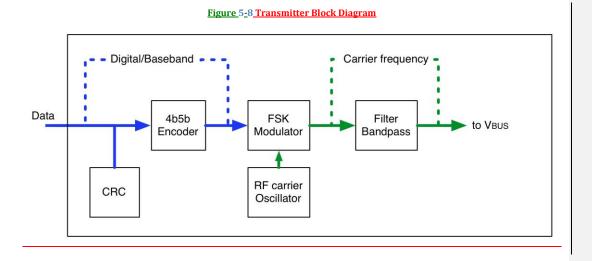

5.8.2 Binary Frequency Shift Keyed (BFSK) Signaling

The Binary Frequency Shift Keyed (BFSK) Signaling scheme over V_{BUS} uses a carrier of *fCarrier* modulated with the information to avoid the noise from the power supplies. Continuous Phase Binary Frequency Shift Keying (BFSK) shall be used to encode bits for transmission on the channel. In this specification, BFSK shall be understood to mean continuous phase BFSK. A signal of amplitude *vTX* shall be injected onto V_{BUS} using a carrier frequency, *fCarrier*. The following logic states shall be used:

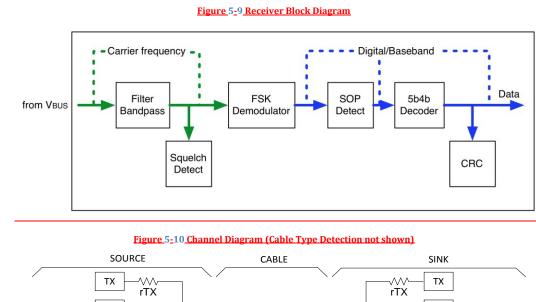

Logic 0 is indicated by a frequency <u>fCarrier</u> - <u>fDeviation</u>.

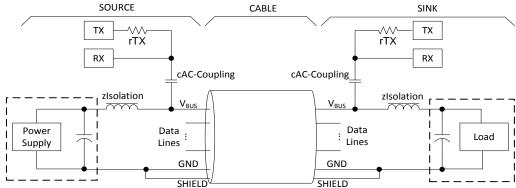

Logic 1 is indicated by a frequency <u>fCarrier</u> + <u>fDeviation</u>.

<u>The PHY Layer functions are shown in Figure 5-8, Figure 5-9, and Figure 5-10. The PHY Layer is expected to keep</u> power consumption low, especially when only the squelch detector is required to be active. In the active mode, where any of the functions listed above may be executed, the PHY Layer Block power consumption should be minimized. In the squelch mode, when only the squelch detector is required, the power consumption should be minimized.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

5.8.2.1 Channel Overview

The channel connects two PHYs together via a single-ended serial signal. The PD signal uses USB V_{BUS} as the channel, and the system is designed to treat the V_{BUS} line in the cable as a transmission line terminated at both ends with matching impedance. The PHY Layer shall be AC coupled to V_{BUS} or be tolerant of the maximum possible DC voltage that may be present on V_{BUS}. For example, the PHY Layer may be AC coupled to V_{BUS} through a capacitor at each end. While transmitting, the Source, or Sink, shall apply an AC signal with amplitude vTX to V_{BUS} as measured between zIsolation and cAC-Coupling.

5.8.2.2 Transceiver Isolation Impedance

The Source and Sink shall place an isolation impedance between the V_{BUS} wire bulk capacitance and the V_{BUS} pin on the connector to allow the AC coupled USB Power Delivery transceiver to communicate over V_{BUS} .

The isolation impedance shall have an impedance of *zIsolation* at any frequency within *fRange*. <u>See Sections</u> 7.1.13.1 and 7.2.9.1 for additional detail.

<u>Note:</u> Isolation impedance surges may occur and need to be clamped in some manner. There are many variables that could enter into the nature of the surge that are not controlled by the spec and subject to implementation. The

Page 128

<u>clamping method is therefore an implementation choice.</u> <u>Implementers are strongly advised to read through</u> <u>Appendix-C to evaluate the need for this in their implementation.</u>

5.8.2.3 Transceiver AC Coupling Capacitance

<u>The Source and Sink shall be AC coupled to V_{BUS} or be tolerant of the maximum possible DC voltage that may be</u> present on V_{BUS} . For example, the Source and Sink may be AC coupled to V_{BUS} by placing an AC coupling capacitance cAC-Coupling between the V_{BUS} pin on the connector and the transceiver as indicated in Figure 5-10. A suggested value for cAC-Coupling in this case would be between 3nF and 10nF.

5.8.2.4 BFSK Common Specifications

This section defines the common receiver and transmitter requirements.

5.8.2.4.1 BFSK Common Parameters

<u>The electrical requirements specified in Table 5-16 shall apply to both the transmitter and receiver.</u>

Table 5-16 BFSK Common Normative Requirements

Parameter	Description	<u>Min</u>	<u>Nom</u>	<u>Max</u>	<u>Units</u>	<u>Comment</u>
<u>fCarrier</u>	BFSK carrier frequency	<u>22.4</u>	<u>23.2</u>	<u>24.0</u>	<u>MHz</u>	
<u>fDeviation</u>	BFSK frequency deviation	<u>450</u>	<u>500</u>	<u>600</u>	<u>kHz</u>	

<u>Table 5-17 BFSK Transceiver Isolation Impedance Normative Requirements</u>

Parameter	Description	<u>Min</u>	Nom	Max	<u>Units</u>	<u>Comment</u>
<u>zIsolation</u>	Impedance Allowed	<u>80</u>			<u>Ω</u>	<u>Measured at any frequency</u> <u>within fRange</u> .
<u>fRange</u>	<u>Range of</u> <u>frequencies used in</u> <u>communication</u>	<u>20.4</u>		<u>26</u>	<u>MHz</u>	A spacing of 2MHz around fCarrier is allowed for the signal including FM tolerance and deviation.

<u>One example implementation of a transceiver isolation impedance using the parameters listed in Table 5-17 is a 1µH inductor (see Appendix C).</u>

5.8.2.5 BFSK Transmitter Specifications

Limits on the drift in *fCarrier*, and *fDeviation* are set in order to help low-complexity receiver implementations.

The transceiver shall terminate the V_{BUS} line with *rTX* while it is powered, whether it is transmitting, receiving or waiting for the squelch to close.

5.8.2.5.1 BFSK Transmitter Requirements

The requirements specified in Table 5-18 shall apply to the transmitter.

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

	Table 5-18 BFSK Tra	<u>nsmitter N</u>	lormative	Requirem	ents	
<u>Name</u>	Description	<u>Min</u>	Nom	Max	<u>Units</u>	<u>Comment</u>
<u>pCarrierFreq</u>	Maximum difference between the carrier- frequency during the part of the packet following the Preamble and the reference carrier-frequency.			0.2	<u>%</u>	The reference carrier frequency is the average carrier frequency of the last 32 bits of the Preamble.
pDevFreq	Maximum difference between the deviation frequency during the part of the packet following the Preamble and the reference deviation frequency.			1	<u>%</u>	The reference deviation frequency is the average deviation frequency during the last 32 bits of the Preamble.
<u>rTX</u>	The termination resistance and the cable impedance for test and calculation.	<u>52</u>	<u>62</u>	<u>72</u>	Ω	The impedance at the point betweenthe TX block and therTX resistor inFigure 5-10 isassumed to be 0Ωwhen thetransceiver ispowered (See alsoFigure 4-4).

.....

5.8.2.5.1.1 Carrier Noise

The carrier phase noise should be considered when designing the transmitter system in order to achieve the required BER (*nBER*). The carrier phase noise can be measured while the transmitter sends a *BIST Carrier Mode 0* or *BIST* Carrier Mode 1.

> <u>5.7.1.2.2.1</u>5.8.2.5.1.2 Carrier-Frequency Drift

fCarrier is the carrier frequency over the previous 10 bits at a given point in the packet. The change in *fCarrier* during a packet shall be less than **<u>pCarrierFreq</u>**. The reference carrier frequency (refCarrierFreq) is the average **<u>fCarrier</u>** of the last 32 bits of the **<u>preamblePreamble</u>**. **<u>fCarrier</u>** during the packet, including the **<u>EOP</u>**, shall be within *pCarrierFreq* of the reference carrier frequency. *pCarrierFreq* is expressed as a percentage:

pCarrierFreq = | *fCarrier* - refCarrierFreq| / refCarrierFreq x 100%-

Page 130

The transmitter shall have the same *pCarrierFreq* for all packet types. The *BIST Carrier Mode 3* signal is an example of a continuous signal without a *preamblePreamble*. When checking *pCarrierFreq* any set of 1044 bits within a continuous signal may be considered as the part of the packet following the *preamblePreamble* and the 32 preceding bits considered to be the last 32 bits of the *preamblePreamble* used to compute refCarrierFreq.

5.7.1.2.2.2 5.8.2.5.1.3 Deviation-Frequency Drift

[Deviation is the frequency deviation during one bit at any point in the packet. The change in **[Deviation** shall be less than **pDevFreq**. The reference deviation frequency (refDevFreq) is the average **[Deviation** during the last 32 bits of the **preamble [Deviation** during the packet, including the **EOP**, shall be within **pDevFreq** of the reference deviation frequency. **pDevFreq** is expressed as a percentage:

pDevFreq = | fDeviation - refDevFreq | / refDevFreq x 100%-

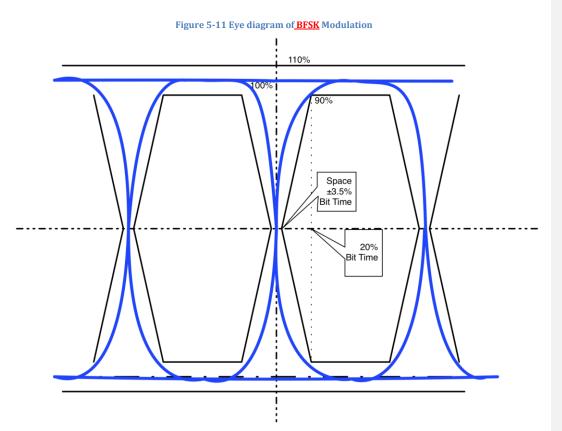

The transmitter shall have the same <u>*fDeviation*</u> for all packet types. The <u>BIST Carrier Mode 0</u> and <u>BIST Carrier Mode 1</u> signals are examples of continuous signals without a <u>preamblePreamble</u>. When checking <u>*pDevFreq*</u> any set of 1044 bits within a <u>continuous</u> signal may be considered as the part of the packet following the <u>preamblePreamble</u> and the 32 preceding bits considered to be the last 32 bits of the <u>preamblePreamble</u> for computing refDevFreq.

5.7.1.2.3 5.8.2.5.2 Transmitter Characteristics

In order to allow for low cost and simple receivers, there is a requirement for the transmitted waveform to have a minimum of edge steepness. The transmitted waveform shall fulfill the eye diagram mask in Figure 5-11.

In Figure 5-11 the Y-axis corresponds to the nominal deviation. A continuous string of '1's will produce a constant frequency, which is designated 100% in this figure. This frequency must fulfil the relevant requirements regarding tolerances as described in <u>Table 5-</u>16. Similarly a continuous stream of '0's corresponds to -100% on the Y-axis. This allows for a pre-filtering of the signal used for modulation if desired but limits the amount of filtering allowed. The designer can balance the design between filtering at the baseband or the RF level as appropriate as long as all of the requirements are fulfilled.

When starting to transmit a frame the transmitter shall enable its carrier *tStartDrive* before the start of the first preamble bit. It shall stop transmitting a carrier within *tEndDriveBFSK* of the end of the last transmitted symbol.

In order to manage the noise emitted from the cables, the emitted spectrum, on V_{BUS} at the transmitting device receptacle, shall comply with the mask in Figure 5-12 when V_{BUS} is terminated by a nominal <u>*rTX*</u> at the connector through a cable no longer than 250mm whose characteristic impedance matches the termination impedance. Normal rules and regulations for noise emissions shall still be applicable.

Side lobes outside the coverage of Figure 5-12 shall be kept below the level as the figure shows.

USB Power Delivery Specification Revision <u>2.0. Version</u> 1.0.

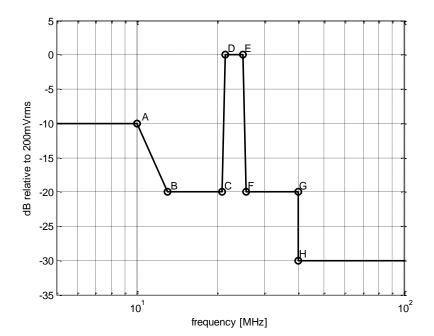

Figure 5-12 <u>BFSK</u> Transmit Spectral Mask, given in absolute terms relative to the maximum value of vTX

The corners in Figure 5-12 are specified in Table 5-19.

Table 5-19 BFSK Spectrum Mask Corners

Frequency (MHz)	Maximum Allowed Signal Level			
	(dB)	(mVrms)		
< 10 (A)	-10	63.2		
13 (B) to 20.8(C)	-20	20		
21.45(D) to 24.89 (E)	0	200		
25.54(F) to 40 (G)	-20	20		
>40 (H)	-30	6.3		

5.7.1.35.8.2.6 BFSK Receiver Specifications

5.7.1.3.15.8.2.6.1 BFSK Receiver Electrical Parameters

The requirements specified in Table 5-20 shall apply to the receiver (except *vSquelchDetecting*). There are two different squelch modes for the receiver. The Squelch Detection mode is used when the receiver is implementing cable-type detection following the suggested method in Section 4.4. The Squelch Operating mode is used when the receiver is watching for a packet to arrive. These two squelch modes have different required sensitivities. In the Squelch Detection mode, the receiver detects signals exceeding *vSquelchDetecting*. In the Squelch Operating mode the receiver shall meet the requirement <u>nBER</u> when the signal level exceeds *vSquelchOperating*. While the receiver is

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

processing a packet, if at any time V_{BUS} becomes idle the receiver shall stop processing the packet and discard it (no GoodGRG message is returned).

 V_{BUS} shall be declared idle when the signal level is less than . The power supply noise allowed by and shall not cause the receiver to indicate the channel is busy.

The input impedance of the receiver (the RX block in Figure 5-10 and Figure 4-4) is *zRX*. The input impedance as measured between V_{BUS} and GND is determined by *rTX* (see Section 5.8.2.5). The high impedance *zRX* is required for cable-type detection (see Section 4.4.4).

The receiver shall meet the <u>nBER</u> performance requirement in Table 5-20 when the voltage received on V_{BUS} is within the allowable range of *vRX*. Cables close to a quarter wavelength with characteristic impedance higher or lower than <u>rTX</u> may attenuate or amplify the signal level, so the allowable range of *vRX* includes margin above and below the allowable *vTX*. The ranges for *vRX* were selected to cover the variation seen in legacy cables.

	Name	Description	Min	Nom	Max	Units	Comment
ľ	nBER	Bit error rate, S/N = 25 dB			10-		
	tBitStreamComplete	The Bit Stream has stopped if the squelch has closed for Error! Not a valid bookmark self- reference	1		3	ms	
1	VRX	RX voltage received on V_{BUS}	55	150	300	mVRMS	This is the voltage on V_{BUS} (the link terminated by <u>rTX</u>). Legacy cables close to a quarter wavelength with characteristic impedance higher or lower than <u>rTX</u> may attenuate or amplify the signal level by up to 6dB. In practice, the minimum value will be the actual vSquelchOperating value.
	vSquelchDetecting	Squelch detection sensitivity in Squelch Detection Mode	15	20	25	mVRMS	Informative only.
	vSquelchOperating	Squelch detection sensitivity In Squelch Operating Mode	35		55	mVRMS	This parameter only pertains to the signal content within the frequency band of interest within <i>fRange</i> .

5.8.3 Biphase Mark Coding (BMC) Signaling
Biphase Mark Coding (BMC) is an alternative physical layer for carrying USB Power Delivery messages. This encoding assumes a dedicated DC connection, identified as the CC wire, which is used for sending PD messages.
Biphase Mark Coding is a version of Manchester coding (see [IEC60958-1]). In BMC, there is a transition at the start of every bit time (UI) and there is a second transition in the middle of the UI when a 1 is transmitted. BMC is effectively DC balanced, (each 1 is DC balanced and two successive zeroes are DC balanced, regardless of the number of intervening 1's). It has bounded disparity (limited to 1 bit over an arbitrary packet, so a very low DC level).
Figure 5-14 illustrates Biphase Mark Coding. This example shows the transition from a Preamble to the Sync-1 K- codes of the SOP Ordered Set at the start of a Message. Note that other K-codes can occur after the Preamble for Signaling such as Hard Reset and Cable Reset.
Figure 5-14 BMC Example

Data In
5.8.3.1 Encoding and signaling BMC uses DC coupled baseband signaling on CC. Figure 5-15 shows a block diagram for a Transmitter and Figure 5-16 shows a block diagram for the corresponding Receiver.

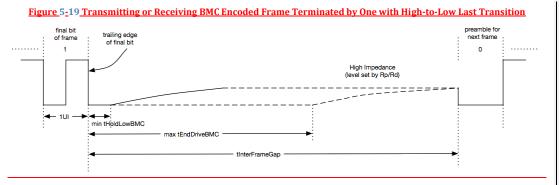

Page **136**

USB Power Delivery Specification Revision <u>42.0, Version 1.0</u>

USB Power Delivery Specification Revision 2.0, Version 1.0.

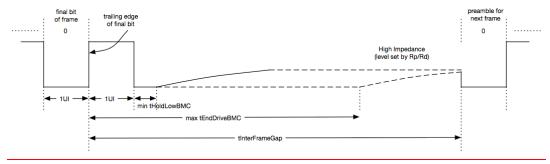

If the trailing edge results in the transmitter driving CC high (i.e. the final half-UI of the frame is low), then the transmitter:

- 1. Shall continue to drive CC high for 1 UI.
- 2. Then shall drive CC low for *tHoldLowBMC*.
- 3. Then shall continue to drive CC low for *tEndDriveBMC* measured from the final edge of the final bit of the Frame.
- 4. Then shall release CC to high impedance.

Figure 5-20 illustrates the ending of a BMC encoded Frame that ends with an encoded zero for which the final bit of the Frame is terminated by a low to high transition. Figure 5-21 illustrates the ending of a BMC encoded Frame that ends with an encoded zero for which the final bit of the Frame is terminated by a low to high transition. Both figures also illustrate the *tInterFrameGap* timing requirement before the start of the next Frame when the Port has either been transmitting or receiving the previous Frame (see Section 5.8.1.4).

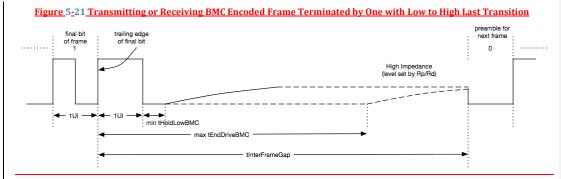

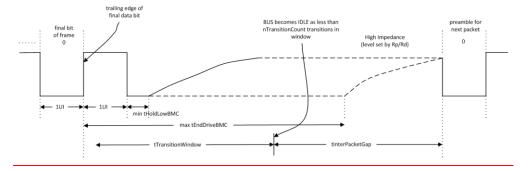

Figure 5-22 illustrates the end of a BMC encoded Frame with an encoded zero for which the final bit of the Frame is terminated by a high to low transition. The figure also illustrates the *tTransitionWindow* followed *tInterFrameGap* timing requirement before the start of the next Frame, when the Port did not either transmit or receive the previous Frame and is waiting for bus idle before transmission of the next Frame (see Section 5.8.1.4).

Note: There is no requirement to maintain a timing phase relationship between back-to-back packets.

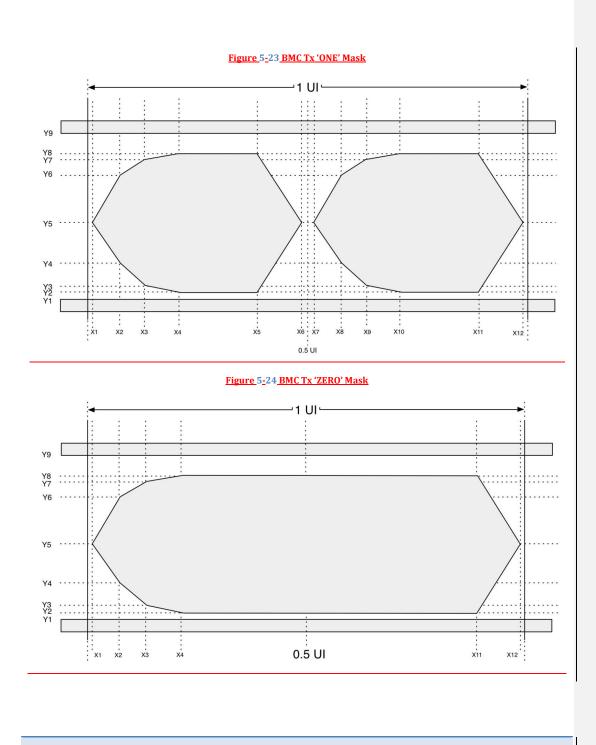

5.8.3.2 Transmit and Receive Masks

The transmitted signal shall not violate the masks defined in Figure 5-23, Figure 5-24, Table 5-21 and Table 5-22 at the output of a load equivalent to the cable model and receiver load model described in Section 5.8.3.3. The receiver shall be capable of receiving a signal that does not violate the masks defined in Figure 5-25 and Figure 5-26 and Table 5-23. The sign of the ground offset will not be changed during a message. Therefore, the minimum voltage swing between the high-level and the low-level of the received signal will be at least Y4Rx - Y2Rx + 250mV. The parameters are specified to be appropriate to either edge triggered or oversampling receiver implementations.

The masks are defined for 'ONE' and 'ZERO' separately as BMC enforces a transition at the midpoint of the unit interval while a 'ONE' is transmitted.

The boundaries of Rx outer mask are specified to accommodate a change in signal amplitude due to the ground offset. They are therefore larger than the boundaries of the Tx outer mask. Similarly, the boundaries of the Rx inner mask are smaller than the boundaries of the Tx inner mask.

The transmitter shall have rise and fall times no faster than the minima specified in Table 5-25. The maximum limit on the rise and fall times are enforced by the Tx inner masks.

Table 5-23 BMC Rx Mask Definition

5.8.3.3 Transmitter Load Model

The transmitter load model for the eye mask tests and *vSwing* shall be equivalent to the circuit outlined in Figure 5-27. It is formed by the concatenation of a cable load model and a receiver load model.

The value of the modeled cable capacitance, Ca, (in pF) shall be calculated from the following formula:

$$Ca = \frac{\text{tCableDelay}_{max}}{\text{zCable}_{min}}$$

The modeled cable capacitance is Ca = 625 pF for a cable with $zCable_{min} = 32 \Omega$ and $tCableDelay_{max} = 20 \text{ nS}$. Therefore, Ca/2 = 312.5 pF.

cCablePlug models the capacitance of the plug at each end of the cable. *cReceiver* models the capacitance of the receiver. The maximum values shall be used in each case.

Note: the transmitter load model assumes that there are no other return currents on the ground path.

5.8.3.4 BMC Common specifications

This section defines the common receiver and transmitter requirements.

5.8.3.4.1 BMC Common Parameters

<u>The electrical requirements specified in Table 5-24 shall apply to both the transmitter and receiver.</u>

<u>Table 5-24 BMC Common Normative Requirements</u>

<u>Name</u>	Description	<u>Min</u>	Nom	Max	<u>Units</u>	<u>Comment</u>	
<u>tUnitInterval1</u>	Unit Interval	BitRate		Bit rate		1/ 270 300	330 Kbps
<u>cCablePlug²</u>	Capacitance for a Cable Plug			<u>25</u>	<u>pF</u>	Each plug on a cable assembly can have capacitance up to this value	
<u>tCableDelay</u>	Signal propagation delay through the cable			<u>20</u>	<u>ns</u>		
<u>zCable</u>	Cable characteristic impedance on CC Wire	<u>32</u>		<u>65</u>	Ω		
Note 1: <i>tUnitInterval</i> denotes the time to transmit an unencoded data bit, not the shortest high or low times on the wire after encoding with BMC. A single data bit cell has duration of 1UI, but a data bit cell with value 1 will contain a centrally placed 01 or 10 transition in addition to the transition at the start of the cell. Note 2: The capacitance of the bulk cable is not included in the <i>cCablePlug</i> definition. It is modeled as transmission line in both modeling and compliance processes. However <i>cCablePlug</i> does include the BMC transceiver's capacitance in the Cable Plug(s).							
5.8.3.5 BMC Transmitter Specifications The transmitter shall meet the specifications defined in Table 5-25.							

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

	Table 5-25 BMC Transmitter Normative Requirements						
Name	Description	<u>Min</u>	Nom	<u>Max</u>	<u>Units</u>	<u>Comment</u>	
<u>tEndDriveBMC</u>	Time to cease driving the line after the end of the last bit of the Frame.			<u>23</u>	<u>µs</u>	<u>Min value is limited by</u> tHoldLowBMC.	
<u>tFall</u>	<u>Fall Time</u>	<u>300</u>			<u>ns</u>	<u>10 % and 90 %</u> <u>amplitude points,</u> <u>minimum is under an</u> <u>unloaded condition.</u>	
<u>tHoldLowBMC</u>	<u>Time to cease driving</u> <u>the line after the final</u> <u>high-to-low transition.</u>	1			<u>µs</u>	<u>Max value is limited by</u> <u>tEndDriveBMC.</u>	
<u>tRise</u>	<u>Rise time</u>	<u>300</u>			<u>ns</u>	<u>10 % and 90 %</u> <u>amplitude points,</u> <u>minimum is under an</u> <u>unloaded condition.</u>	
<u>vSwing</u>	Voltage Swing	<u>1.05</u>	<u>1.125</u>	<u>1.2</u>	V	Applies to both no load condition and under the load condition specified in Section 5.8.3.3.	
<u>zDriver</u>	<u>Transmitter output</u> impedance	<u>33</u>		<u>75</u>	Ω	Source output impedance at the Nyquist frequency of [USB2.0] low speed (750 kHz) while the source is driving the CC line.	

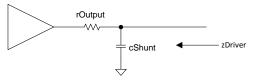

cReceiver is the capacitance that a DFP or UFP shall present on the CC line when the DFP or UFP's receiver is not transmitting on the line. The transmitter may have more capacitance than **cReceiver** while driving the CC line, but must meet the waveform mask requirements. Once transmission is complete, the transmitter shall disengage capacitance in excess of **cReceiver** from the CC wire within tInterFrameGap.

Source output impedance **zDriver** is determined by the driver resistance and the shunt capacitance of the source and is hence a frequency dependent term. **zDriver** impacts the noise ingression in the cable. It is specified such that the noise at the Receiver is bounded.

zDriver is defined by the following equation:

$$zDriver = \frac{rOutput}{1 + s * rOutput * cShunt}$$

Figure 5-28 Transmitter diagram illustrating zDriver

cShunt shall not cause a violation of cReceiver when not transmitting.

Page 146

5.8.3.6 BMC Receiver Specifications

The receiver shall meet the specifications defined in Table 5-26.

Table 5-26 BMC Receiver Normative Requirements

Name	Description	<u>Min</u>	<u>Nom</u>	Max	<u>Units</u>	<u>Comment</u>
<u>cReceiver</u>	<u>CC receiver capacitance</u>	<u>200</u>		<u>600</u>	<u>pF</u>	The DFP or UFP system shall have capacitance within this range when not transmitting on the line.
nTransitionCount	<u>Transitions for signal</u> <u>detect</u>	<u>3</u>				<u>Number of transitions to</u> <u>be detected to declare</u> <u>bus non-idle.</u>
<u>tRxFilter</u>	<u>Rx bandwidth limiting</u> <u>filter (digital or analog)</u>	<u>100</u>		-	<u>ns</u>	<u>Time constant of a single</u> pole filter to limit broad- band noise ingression ¹ .
<u>tTransitionWindow</u>	<u>Time window for</u> <u>detecting non-idle</u>	<u>12</u>		<u>20</u>	μs	
<u>zBmcRx</u>	<u>Receiver Input</u> Impedance	<u>10</u>			<u>ΜΩ</u>	
Note 1 December 1 and	ise ingression is due to sour			l		<u> </u>

Note 1. Broad-band noise ingression is due to coupling in the cable interconnect.

5.8.3.6.1 Definition of Idle

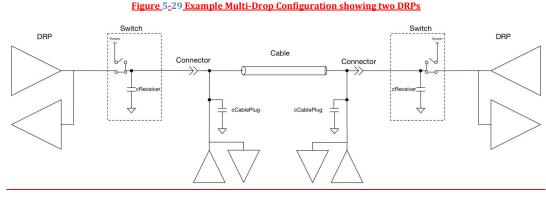

BMC packet collision is avoided by the detection of signal transitions at the receiver. This is the equivalent of squelch for FSK modulation. Detection is active when *nTransitionCount* transitions occur at the receiver within a time window of *tTransitionWindow*. After waiting *tTransitionWindow* without detecting *nTransitionCount* transitions the bus shall be declared idle.

Refer to Section 5.8.1.4 for details of when transmissions may start.

5.8.3.6.2 Multi-Drop

BMC signaling is suitable for use in Multi-Drop configurations containing one or two BMC Multi-Drop transceivers connected to the CC wire, for example where one or both ends of a cable contains a Multi-Drop transceiver. In this specification the location of the Multi-Drop transceiver is referred to as the Cable Plug.

Figure 5-29 below illustrates a typical Multi Drop configuration with two DRPs.

The Multi-Drop transceiver shall obey all the electrical characteristics specified in this section except for those relating to capacitance. The maximum capacitance allowed for the Multi-Drop node when not driving the line is *cCablePlug*. There are no constraints as to the distance of the Multi-Drop transceiver from the end of the plug. The Multi-Drop transceiver(s) may be located anywhere along the cable including the plugs. The Multi-Drop transceiver suffers less from ground offset compared to the transceivers in the host or device and contributes no significant reflections.

Since sourcing VCONN is not mandated for UFPs, it is possible to have a configuration where there is no switch in the UFP as outlined in Figure 5-30. In this configuration, the capacitance on the CC line contained within the UFP shall still be within *cReceiver* except when transmitting.

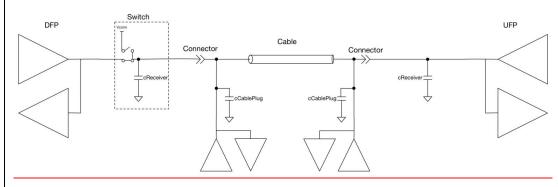

Figure 5-30 Example Multi-Drop Configuration showing a DFP and UFP

5.8.4 Interoperability with BFSK and BMC

In order to interoperate with systems supporting either BFSK or BMC, without requiring an adapter to convert between the two signaling systems, manufacturers may choose to support both BMC over the CC wire and BFSK over V_{BUS} on a Type-C connector. Products with Type-C connectors shall not support BFSK without supporting BMC. Note that any system utilizing the Type-C connector can see BFSK signaling on V_{BUS} when a suitable Type-A/B to Type-C adapter is used.

When both BMC and BFSK signaling schemes are supported by a [USBType-C1.0] Port:

• A Source shall first attempt to become Connected with its Port Partner, using BMC; the attempt failing when the Source enters the *PE_SRC_Disabled* state for a Source (see Section 8.3.3.2).

Page 148

- If the Source cannot become Connected using BMC then the Source may attempt to become Connected with its Port
 Partner using BFSK over V_{BUS} (re-entering the *PE_SRC_Startup* state for a Source see Section 8.3.3.2).
- A Sink shall be able to receive, in the *PE SNK Wait for Capabilities* state (see Section 8.3.3.3), a *Source Capabilities* message sent either over the CC wire using BMC or over V_{BUS} using BFSK.
- The Sink, after the SinkWaitCapTimer has timed out in the PE SNK Wait for Capabilities state (see Section 8.3.3.3), shall issue Hard Reset signaling over both BMC and BFSK.
- Once the Port Partners are Connected they shall continue to use the same signaling scheme, either BMC or BFSK, until a Detach or Hard Reset occurs.
- If either Port Partner issues *Hard Reset* signaling it shall issue *Hard Reset* signaling over both BMC and BFSK.

A Source or DFP may communicate using BMC with a Cable Plug regardless of the signaling scheme currently being used with its Port Partner.

5.85.9Built in Self-Test (BIST)

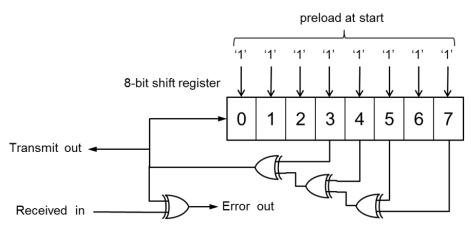

5.8.15.9.1 BIST PRBS Pattern

The generator polynomial for the PRBS-8 pattern shall be $x^8 + x^6 + x^5 + x^4 + 1$.

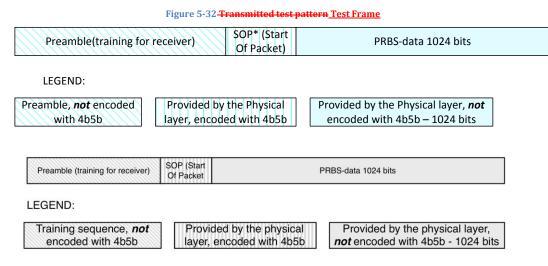

Figure 5-31 shows an example implementation of the PRBS-generator and checker.

The preloaded pattern shall be "all ones" i.e. all 8 bits in the shift register shall be set to "1". The pattern shall be preloaded when the <u>command_request</u> to enter test mode is given or received.

Figure 5-31 Example implementation of the BIST generator and checker

In BIST Transmit or Receiver Test Modes Frames are constructed as shown in Figure 5-32 with a test pattern as defined in Section 5.9.1. Note that the frameTest Frame does not include an *EOP*. At least *nBISTConfidence* of these frameSTest Frames shall be sent/received without error (see Section 5.9.1.1).

The PRBS data shall be continued without change in the PRBS generator between <u>framesTest Frames</u>. If the payloads from all <u>test framesTest Frames</u> were concatenated the resulting stream shall look like it was generated directly by the BIST generator.

The **packet**<u>Test Frame</u> shall have a fixed length and the only other signaling that shall be recognized in the test mode is the *Hard Reset* signaling, which shall be used to exit the test mode.

Since the payload length (*nBISTPayload*) and the BIST pattern cycle length are relatively prime, every pattern will eventually appear in every position providing a test of all pattern related weaknesses.

5.8.1.15.9.1.1 Test-Pattern Frame Transmission

The number of bits transferred needed to demonstrate the required <u>*nBER*</u> (see Table 5-27) at a 99% confidence level is 4.61x10⁶ (see [Maxim37]). To reach this level of confidence, a minimum of *nBISTConfidence* Test Pattern. Frames shall be transmitted. To end the test sequence, *Hard Reset* signaling shall be sent.

If errors are detected more bits shall be sent, see *[Maxim37]*). The number of *frames<u>Test Frames</u> versus*. the number of allowable error is given in Table 5-27.

Table 5-27 Allowable Bit Errors vs. Number of Test Pattern Frames

N (number of allowable errors)	Minimum number of frames<u>Test Frames</u> required for Confidence level 99%
0	4502

10	19673
15	26117
20	32328
30	44337

5.8.1.2<u>5.9.1.2</u> Error Counters

The UUT shall maintain a count of errors detected *BISTErrorCounter* (see Section 6.6.5). The number of errors shall be compared to the number of errors expected from the number of sent bits and the allowed error rate. Typical testing would take place at each supported voltage and in the presence of an acceptable noise level.

5.8.25.9.2 BIST Carrier Mode 0

In **BIST Carrier Mode 0**, the Physical Layer shall send out a continuous string of "0"s. This produces a continuous frequency that will allow measurement of *fCarrier* - *fDeviation*.

5.8.35.9.3 BIST Carrier Mode 1

In **BIST Carrier Mode 1**, the Physical Layer shall send out a continuous string of "1"s. This produces a continuous frequency that will allow measurement of <u>fCarrier</u> + <u>fDeviation</u>.

5.8.45.9.4 BIST Carrier Mode 2

In *BIST Carrier Mode 2*, the Physical Layer shall send out a continuous string of alternating "1"s and "0"s. This enables the measurement of power supply noise and frequency drift.

5.8.55.9.5 BIST Carrier Mode 3

In *BIST Carrier Mode 3*, the Physical Layer shall send out a continuous string of sixteen "1"s, followed by sixteen "0"s, followed by sixteen "1"s, etc. This enables the measurement of *fCarrier*.

5.8.65.9.6 BIST Eye Pattern

In *BIST Eye Pattern*, the Physical Layer shall send out a continuous string of bits in accordance with Section 5.9.1. This produces a signal that will allow measurement of the eye pattern and of the spectrum mask.

5.9.7 BIST Test Data

A *BIST Test Data* Message is used by the Tester to send various Tester generated test patterns to the UUT in order to test the UUT's receiver.

Figure 5-33 shows the Test Data Frame which shall be sent by the Tester to the UUT. The *BIST* message, with a *BIST Test Data* Data Object consists of a Preamble, followed by *SOP**, followed by the Header with a data length of 7 data objects, followed by the BIST Request Object containing a *BIST Test Data* Data Object, followed by 6 data objects containing Test data, followed by the CRC and then an *EOP*.

Page **152**

6. Protocol Layer

6.1 Overview

This chapter describes the requirements of the USB Power Delivery Specification's protocol layer including:

- Details of how messages are constructed and used
- Use of timers and timeout values
- Use of message and retry counters
- Reset operation
- Error handling
- State behavior

Refer to Section 2.5 for an overview of the theory of operation of USB Power Delivery.

6.2 Messages

This specification defines two types of messages:

- Control Messages that are short and used to manage the message flow between Port Partners or to exchange commandsmessages that require no additional data. Control Messages are 16 bits in length.
- **Data Messages** that are used to exchange information between a pair of Port Partners. Data Messages range from 48 to 240 bits in length. There are three types of **Data Messages**:
 - Those used to expose capabilities and negotiate power
 - Those used for the BIST
 - o Those that are Vendor Defined

6.2.1 Message Construction

All messages shall be composed of a header and a variable length (including zero) data portion. A message either originates in the Protocol Layer and is passed to the Physical Layer, or it is received by the Physical Layer and is passed to the Protocol Layer.

Figure 6-1 High Level Message Structure

6.2.1.1 Message Header

Every message shall start with a 16-bit header, as defined in Figure 6-1. The header contains the basic information used by the Physical Layer to send the message to its Port Partner. The header may be used standalone as a *Control Message* when the *Number of Data Objects* field is zero; or as the first part of a *Data Message* when the *Number of Data Objects* field is non-zero.

Table 6-1 Message Header

Bit(s)	Signaling	Field Name	Notes		Inserted Cells
15	N/A	Reserved	Shall be set to 0		
1412	<u>SOP*</u>	Number of Data Objects	See Section 6.2.1.2		
119	<u>SOP*</u>	MessageID	See Section 6.2.1.3		
8	<u>SOP only</u>	Port <u>Power</u> Role	See Section 6.2.1.4		Merged Cells
	<u>SOP'/SOP''</u>	<u>Cable Plug</u>	See Section 6.2.1.7		
76	SOP*	Specification Revision	See Section 6.2.1.5		Inserted Cells
<u>5</u>	<u>SOP only</u>	<u>Port Data Role</u>	See Section 6.2.1.6		
	<u>SOP'/SOP"</u>	Reserved	Shall be set to 0		
5 4	<u>N/A</u>	Reserved	Shall be set to 0		Inserted Cells
30	<u>SOP*</u>	Message Type	See Section 6.2.1.8		
6.2.1.2	Number of Da	ta Objects			

The 3-bit *Number of Data Objects* field shall indicate the number of 32-bit Data Objects that follow the header. When this field is zero the message is a *Control Message* and when it is non-zero, the message is a *Data Message*.

The Number of Data Objects field shall apply to all SOP* Packet types.

6.2.1.3 MessagelD

The 3-bit *MessageID* field is the value generated by a rolling counter maintained by the originator of the message. The *MessageIDCounter* shall be initialized to zero at power-on as a result of a Soft Reset, or a Hard Reset. The *MessageIDCounter* shall be incremented when a message is successfully received as indicated by receipt of a *GoodCRC* message. Note: during BIST, when sending test frames Test Frames, the *MessageID* is not incremented by the sender and is ignored by the receiver.

The MessageID field shall apply to all SOP* Packet types.

6.2.1.4 Port Power Role

The 1-bit *Port <u>Power</u> Role* field shall indicate the current <u>power</u> role of the port<u>Port</u>:

0b Sink

1b Source

Messages, such as *Ping*, and *GotoMin*, that are only ever sent by a Source, shall always have the *Port <u>Power</u>Role* field set to Source. Similarly messages such as *Request* that are only ever sent by a Sink₇ shall always have the *Port <u>Power</u> Role* field **Code Changed** *Role* field set to Sink.

During the <u>Power Role</u>.Swap Sequence, for the initial Source Port, the *Port <u>Power</u> Role* field shall be set to Sink in the *PS_RDY* message indicating that the initial Source's power supply is turned off (see Figure 8-6 and Figure 8-7).

During the <u>Power Role</u> Swap Sequence, for the initial Sink Port, the *Port <u>Power</u> Role* field shall be set to Source for messages initiated by the Policy Engine after receiving the *PS_RDY* message from the initial Source (see Figure 8-6 and Figure 8-7).

Note that the *GoodCRC* message sent by the initial Sink in response to the *PS_RDY* message from the initial Source will have its *Port <u>Power_Role</u>* field set to Sink since this is initiated by the Protocol Layer. Subsequent messages initiated by the Policy Engine, such as the *PS_RDY* message sent to indicate that V_{BUS} is ready, will have the *Port <u>Power_Role</u>* field set to Source.

The Port Power Role field shall only be defined for SOP Packets.

Page 154

USB Power Delivery Specification Revision 2.0, Version 1.0.

Field Code Changed

6.2.1.5 Specification Revision

The 2-bit *Specification Revision* field shall indicate the revision of the Power <u>DeliverDelivery</u> Specification supported by the Device.

- 00b Revision 1.0
- •___01b____01b____01b____01b____01b____00b____00b__00b__00b_00b_00b000b000b000b000b000b000b000b000b000b000b000b000b000b000b000b000b0
- <u>10b</u> 11b Reserved

On receipt of a message header with a higher revision number than that supported, a **portPort** shall respond using the highest revision number it supports.

The Specification Revision field shall apply to all SOP* Packet types.

6.2.1.6 Port Data Role

The 1-bit **Port Data Role** field shall indicate the current data role of the Port:

- <u>0b UFP</u>
- <u>1b DFP</u>

The **Port Data Role** field shall only be defined for SOP Packets. For all other SOP* Packets the **Port Data Role** field is Reserved and shall be set to zero.

6.2.1.7 Cable Plug

The 1-bit *Cable Plug* field shall indicate whether this message originated from a Cable Plug:

- Ob message originated from a DFP or UFP
- 1b message originated from a Cable Plug

The Cable Plug field shall only apply to SOP' and SOP" Packet types.

6.2.1.6<u>6.2.1.8</u> Message Type

The 4-bit *Message Type* field shall indicate the type of message being sent. To fully decode the *Message Type*, the *Number of Data Objects* field is first examined to determine whether the message is a *Control Message* or a *Data Message*. Then the specific *Message Type* can be found in

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

Table 6-2 (Control Message) or Table 6-3 (Data Message).

The Message Type (Control Message) or (Data Message).

field shall apply to all SOP* Packet types.

6.3 Control Message

A message is defined as a Control Message when the *Number of Data Objects* field in the header is set to 0. The Control Message consists only of a Message Header and a CRC. The Protocol Layer originates the Control Messages (i.e. *Accept* message, *Reject* message etc.).

The Control Message types are specified in the Header's *Message Type* field (bits 3...0) and are summarized in Table 6-2-. The Sent by column indicates entities which may send the given message (Source, Sink or Cable Plug); entities not listed shall not issue the corresponding message. The Valid Signaling column indicates the messages which shall only be issued in SOP Packets and the messages which may be issued in SOP* Packets.

USB Power Delivery Specification Revision 2.0, Version 1.0.

Page 156

Table 6-2 Control Message Types

Bits 30	Message Type	Sent by	Description	Valid Signaling
0000	Reserved	N/A	All values not explicitly defined are reserved and shall not be used.	
0001	GoodCRC	Source <u>, Sink</u> or Sink<u>Cable Plug</u>	See Section 6.3.1.	<u>SOP*</u>
0010	GotoMin	Source only	See Section 6.3.2.	<u>SOP only</u>
0011	Accept	Source <u>, Sink</u> or Sink<u>Cable Plug</u>	See Section 6.3.3.	<u>SOP*</u>

1010	<u>PR_</u> Swap	Source or Sink	See Section 6.3.10.	<u>SOP only</u>
1011	Reserved VCONN Swap	N/A<u>DFP</u>	All values not explicitly defined are reserved and shall not be used. <u>See</u> <u>Section</u> 6.3.11	<u>SOP only</u>
1100	Wait	Source only<u>or Sink</u>	See Section 6.3.12 .	<u>SOP only</u>
1101	Soft Reset	Source or Sink	See Section 6.3.13.	<u>SOP*</u>
1110- 1111	Reserved	N/A	All values not explicitly defined are reserved and shall not be used.	

6.3.1 GoodCRC Message

The *GoodCRC* message shall be sent by the receiver to acknowledge that the previous message was correctly received (i.e. had a good CRC). The *GoodCRC* message shall return the message's *MessageID* so the transmitter can determine that the correct message is being acknowledged. The first bit of the *GoodCRC* message shall be returned within *tTransmit* after receipt of the last bit of the previous message.

BIST does not send the *GoodCRC* message during the data stream (see Section 6.4.2.11).

6.3.2 GotoMin Message

The *GotoMin* message applies only to those Sinks that have requested power with the GiveBack capable flag set in the Sink Request Data Object.

It is a directive to the Sink Port to reduce its operating power level to the amount specified in the Minimum Operating Current field of its latest Sink Request Data Object.

The GotoMin process is designed to allow the Source to temporarily reallocate power to meet a short term requirement. For example, a Source may reduce a Sink's power consumption for 10-20 seconds to allow another Sink (e.g. an HDD to spin up).

The Source sends this message as a means to harvest power in order to meet a request for power that it cannot otherwise meet. The Device Policy Manager determines which **portPort** or ports will receive the message.

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

Inserted Cells

The Sink shall respond to a *GotoMin* message by reducing its power consumption to less than or equal to the prenegotiated value (Minimum Operating Current) within *tSnkNewPower* time.

The Source sends a *GotoMin* message as a shortcut in the power negotiation process since the Source and Sink have already made a <u>contractContract</u> with respect to the power to be returned. In essence, the Source does not have to advertise its Capabilities and the Sink does not have to make a Request based on them. The Source simply sends the *GotoMin* message in place of the *Accept* message normally sent during the power negotiation process (see step 19 in Figure 8-5). The power negotiation process then completes from this point in the normal manner with the Source sending a *PS_RDY* message once the power supply transition is complete. The steps of the GotoMin process are fully described in Figure 8-6.

The Source shall return power to the Sink(s) it has 'borrowed' from using the GotoMin mechanism before it can allocate any 'new' power to other devices.

6.3.3 Accept Message

The Accept message is a valid response to a or a message.- in the following cases:

- It shall be sent by the Source to signal the Sink that the Source is willing to meet the *Request* message.
- It shall be sent by the recipient of the <u>PR_Swap</u> message to signal that it is willing to <u>swapdo a Power Role Swap</u> and has begun the <u>Power Role Swap</u> sequence.
- It shall be sent by the recipient of the *DR Swap* message to signal that it is willing to do a Data Role Swap and has begun the Data Role Swap sequence.
- It shall be sent by the recipient of the VCONN Swap message to signal that it is willing to do a VCONN Swap and has begun the VCONN Swap sequence.
- It shall be sent by the recipient of the Soft Reset Message to indicate that it has completed its Soft Reset.

The *Accept* message shall be sent within *tReceiverResponse* of the receipt of the last bit of either the <u>Messagemessage</u> (see Section 6.5.3) or message.].

6.3.4 Reject Message

The *Reject* message is a valid response to a or a message. in the following cases:

- It shall be sent to signal the Sink that the Source is unable to meet the *Request* message. This may be due an invalid request or because the Source can no longer provide what it previously advertised.
- It shall be sent by the recipient of a <u>PR_Swap</u> message to indicate it is unable to do a <u>Power Role</u> Swap at this time.
- It shall be sent by the recipient of a **DR Swap** message to indicate it is unable to do a Data Role Swap at this time.
- It shall be sent by the recipient of a VCONN Swap message to indicate it is unable to do a VCONN Swap at this time.
- It shall be sent by a Source without Dual-Role capability in response to a *Get_Sink_Cap_message*.
- It shall be sent by a Sink without Dual-Role capability in response to a Get_Source_Cap message.

The *Reject* message shall be sent within *tReceiverResponse* of the receipt of the last bit of either the Messagemessage (see Section 6.5.3) or message.].

6.3.5 Ping Message

6.3.5.1 Pings on Type-A and Type-B connectors

The *Ping* message is used on Type-A and Type-B connectors to determine the continued presence of the Sink when no other messaging is taking place (see Figure 8-39 in Section 8.3). The *Pingshall* be message is sent periodically, every *tSourceActivity*, by the Source to the Sink. It is used to determine the continued presence of the Sink in the ready state when no other power negotiation or other messaging is taking place (see in Section).

<u>Once a Contract is established</u> Sources shall periodically send thisthe *Ping* message every *tSourceActivity* after the last message has been sent/received except when the:

<u>The system is not operating in USB Power Delivery mode (i.e.g. in standard [USB2.0], [USB3.1], [USB3.1</u>

Page 158

 <u>-messages are optional when the SourceA Provider or Provider/Consumer</u> is operating <u>as a Source at vSafe5V</u> in the <u>PE SRC ReadyReady</u> state (i.e. power negotiation has already taken place see Section 8.3.3.2.6).-<u>Regardless of</u>

6.3.5.2 Pings on Type-C Connectors

Type-C connectors have an alternative mechanism to determine Sink presence so when the Port Partners are both connected using Type-C connectors the *Ping* message is not necessary. A Sink using a Type-C connector shall not expect to receive *Ping* operational voltage messages but shall not treat *Ping* messages shall be sent by a Consumer/Provider operating as a Sourceas an error if they are received.

6.3.6 PS_RDY Message

The **PS_RDY** message shall be sent by the Source (or by both the <u>Sourcenew Sink</u> and <u>Sinknew Source</u> during the <u>Power Role</u> Swap sequence) to indicate its power supply has reached the desired operating condition. See Section 8.3.2.3 or Section 8.3.2.7.1.2 for examples of use.

6.3.7 Get_Source_Cap Message

The *Get_Source_Cap* (Get Source Capabilities) message may be sent by a portPort to request the Source Capabilities and Dual-Role capability of its Port Partner (e.g. <u>dual-roleDual-Role</u> capable). The <u>portPort</u> shall respond by returning a *Source Capabilities* message (see Section 6.4.1.1.1). A Sink <u>portPort</u>, without <u>dual-roleDual-Role</u> capability, shall return a *Reject* message.

6.3.8 Get_Sink_Cap Message

The *Get_Sink_Cap* (Get Sink Capabilities) message may be sent by a portPort to request the Sink Capabilities and Dual-Role capability of its Port Partner (e.g. <u>dual-roleDual-Role</u> capable). The <u>portPort</u> shall respond by returning a *Sink Capabilities* message (see Section 6.4.1.1.2). A Source <u>portPort</u>, without <u>dual-roleDual-Role</u> capability, shall return a *Reject* message.

6.3.9 DR Swap Message

The **DR Swap** message is used to exchange DFP and UFP operation between Port Partners both utilizing Type-C connectors while maintaining the direction of power flow over V_{BUS}. The DFP is the USB Host; the UFP is the USB Device.

1.2.3 [USBType-C1.0] DRPs shall have the capability to perform a Data Role Swap from the PE SRC Ready or PE SNK ReadyProtocol Error Message

This message has been deprecated. If a message is received it shall be discarded.

1.2.4 Swap Message

The states. A Data Role Swap shall be regarded in the same way as a cable detach/reattach in relation to any USB communication which is ongoing between the Port Partners and all active Modes shall be exited. The Source of V_{BUS} and VCONN shall remain unchanged as well as the R_p/R_d resistors on the CC wire during the Data Role Swap process.

The **DR Swap** message may be sent by either Port Partner. The recipient of the **DR Swap** message shall respond by sending an **Accept** message, **Reject** message or **Wait** message.

- If an *Accept* message is sent, the Source and Sink shall exchange operational roles.
- If a *Reject* message is sent, the requester is informed that the recipient is unable, or unwilling, to do a <u>Data Role</u> Swap and no action shall be taken.
- If a *Wait* message is sent, the requester is informed that a swapData.com might be possible in the future but that no immediate action shall be taken.

After a successful Data Role Swap the DFP/Host shall become the UFP/Device and vice-versa; the new DFP shall have its **Port Data Role** bit set to DFP, and the new UFP shall have its **Port Data Role** bit set to UFP. Where USB

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

Page **159**

6.3.10 PR Swap Message The PR Swap message may be sent by either Port Partner to request an exchange of power roles. The recipient of the message shall respond by sending an Accept message, Reject message or Wait message. If an Accept message is sent, the Source and Sink shall do a Power Role Swap. If a Reject message is sent, the requester is informed that the recipient is unable, or unwilling, to do a Power Role Swap and no action shall be taken. If a *Wait* message is sent, the requester is informed that a Power Role Swap might be possible in the future but that no immediate action shall be taken. After a successful Power Role Swap the Port Partners shall reset their respective Protocol Layers (equivalent to a Soft Reset): resetting their MessageIDCounter_RetryCounter_and Protocol Layer state machines before attempting to establish an Explicit Contract. At this point the Source shall also reset its CapsCounter. For Type-C Ports the Source shall have R_n asserted on the CC wire and the Sink shall have R_d asserted on the CC wire. When performing a Power Role Swap from Source to Sink, a Type-C Port shall change is CC Wire resistor from R_p to Rd. When performing a Power Role Swap from Sink to Source, a Type-C Port shall change is CC Wire resistor from Rd to Rp. The DFP (Host), UFP (Device) roles and Source of VCONN shall remain unchanged during the Power Role Swap process. For more information regarding the Power Role Swap, refer to Sections 7.3.9 and 7.3.10 in the Power Supply chapter, Sections 8.3.2.7.1_8.3.2.8.1_8.3.3.6.3.1_and 8.3.3.6.3.2 in the Device Policy chapter and Section 9.1.2 for V_{BUS} mapping to USB states. 6.3.96.3.11 WaitVCONN Swap Message The VCONN Swap message may only be sent by the DFP to request an exchange of VCONN power sources. The UFP shall respond by sending an Accept message, Reject message or Wait message.

Communication is supported by both Port Partners a USB data connection should be established according to the new

If the Data Role Swap is not successful, in order to attempt a re-establishment of the connection on the CC Wire, Type-

<u>C error recovery actions, such as disconnect, as defined in **[USBType-C1.0]** will be necessary.</u>

See Sections 8.3.2.8.2, 8.3.3.6.2.1 and 8.3.3.6.2.2 for further details.

- If an Accept message is sent, the VCONN source and sink shall do a VCONN Swap. The new VCONN source shall send a
 PS_RDY message within tVCONNSourceOn to indicate that it now sourcing VCONN. The initial VCONN source shall
 cease sourcing VCONN within tVCONNSourceOff of receipt of the last bit of the EOP of the PS_RDY message.
- If a *Reject* message is sent, the requester is informed that the recipient is unable, or unwilling, to do a VCONN Swap and no action shall be taken.
- If a *Wait* message is sent, the requester is informed that a VCONN Swap might be possible in the future but that no immediate action shall be taken.

The DFP (Host), UFP (Device) roles and Source of V_{BUS} shall remain unchanged as well as the R_p/R_d resistors on the CC wire during the VCONN Swap process.

Note: VCONN shall be continually sourced during the VCONN Swap process in order to maintain power to the Cable Plug(s) i.e. make before break.

6.3.106.3.12 Wait Message

The *Wait* message is a valid response to a *Request<u>a PR</u> Swap* or <u>*DR Swap*</u>-message.

- It shall be sent to signal the Sink that the Source is unable to meet the request at this time.
- It shall be sent by the recipient of a <u>PR_Swap</u> message to indicate it is unable to do a <u>Power Role</u> Swap at this time.
- It shall be sent by the recipient of a **DR Swap** message to indicate it is unable to do a Data Role Swap at this time.

Page 160

data roles.

USB Power Delivery Specification Revision 2.0, Version 1.0.

Field Code Changed

It shall be sent by the UFP on receiving a VCONN Swap message to indicate it is unable to do a VCONN Swap at this time.

The *Wait* message shall be sent within *tReceiverResponse* of the receipt of the last bit of <u>either</u> the <u>Messagemessage</u> (see Section 6.5.3) or message.).

6.3.10.16.3.12.1 Wait in response to a Request Message

The *Wait* message is used by the Source when a DeviceSink that has reserved power, requests it. The *Wait* message allows the Source time to recover the power it requires to meet the request through the GotoMin process.

The Sink is allowed to repeat the *Request* message using the *SinkRequestTimer* to ensure that there is *tSinkRequest* between requests.

6.3.10.26.3.12.2 Wait in response to a PR_Swap Message

The *Wait* message is used when responding to a <u>*PR_Swapswap* request message</u> to indicate that a <u>swapPower Role</u> <u>Swap</u> might be possible in the future. This can occur in any case where the device receiving the <u>*PR_Swap*</u> message needs to evaluate the request further e.g. by requesting Capabilities from the origin ator of the <u>*PR_Swap*</u> message. Once it has completed this evaluation one of the Port Partners should initiate the <u>swap-Power Role Swap</u> process again by sending a <u>*PR_Swap*</u> message.

The *Wait* message is also used where a <u>hubHub</u> is operating in intrusive mode <u>or in hybrid mode when a request</u> <u>cannot be satisfied</u> (see Section 0). In this case the <u>hubHub</u> shall send a *Wait* message in response to a <u>PR_Swap</u> message from its Port Partner. Once the System Policy Manager has completed its evaluation of the request the <u>hubHub</u> should initiate the <u>swap Power Role Swap</u> process again by sending a <u>PR_Swap</u> message.

6.3.12.3 Wait in response to a DR_Swap Message

The *Wait* message is used when responding to a *DR Swap* message to indicate that a Date Role Swap might be possible in the future. This can occur in any case where the device receiving the *DR Swap* message needs to evaluate the request further. Once it has completed this evaluation one of the Port Partners should initiate the Data Role Swap process again by sending a *DR Swap* message.

6.3.12.4 Wait in response to a VCONN Swap Message

The *Wait* message is used by the UFP when responding to a *VCONN Swap* message to indicate that a VCONN Swap might be possible in the future. This can occur in any case where the UFP receiving the *VCONN Swap* message needs to evaluate the request further. DFP should initiate the VCONN Swap process again at a future time by resending a *VCONN Swap* message.

6.3.116.3.13 Soft Reset Message

A *Soft Reset* message may be initiated by either the Source or Sink to its Port Partner requesting a Soft Reset. The *Soft Reset* message shall cause a Soft Reset of the connected Port Pair (see Section 6.7.1). The<u>If the</u> *Soft Reset* message shall not be retried; if it fails a Hard Reset shall be initiated within *tHardReset* of the *CRCReceiveTimer* expiring.

A *Soft Reset* message is used to recover from Protocol Layer errors; putting the message counters to a known state in order to regain message synchronization. The *Soft Reset* message has no effect on the Source or Sink; that is the previously negotiated direction. Voltage and current remain unchanged. <u>Modal Operation is unaffected by Soft Reset</u>.

A *Soft Reset* message may be sent by either the Source or Sink when there is a message synchronization error; such as an unexpected value, If the error is not corrected by the Soft Reset, *Hard Reset* signaling shall be issued (see Section 6.7).

<u>A Soft Reset message shall be targeted at a specific entity depending on the type of SOP* Packet used.</u> Soft Reset messages sent using SOP Packets shall Soft Reset the Port Partner only. Soft Reset messages sent using SOP'/SOP" Packets shall Soft Reset the corresponding Cable Plug only.

If, after a Power or Data Role Swap, a different Port starts to communicate with a given Cable Plug, the Cable Plug's Protocol Layer needs to be reset in order to ensure *MessageID* synchronization. If the Source or DFP wants to communicate with a Cable Plug using SOP' Packets it shall issue a *Soft Reset* message using a SOP' Packet in order to reset the Cable Plug's Protocol Layer. If the Source or DFP wants to communicate with a Cable Plug using SOP'' Packets it shall issue a *Soft Reset* message using a SOP'' Packet in order to reset the Cable Plug's Protocol Layer.

6.4 Data Message

A Data Message shall consist of a message header and be followed by one or more Data Objects. Data Messages are easily identifiable because the *Number of Data Objects* field in the header is a non-zero value.

There are four types of Data Objects:

- Power Data Object (PDO) used to expose a Source port'sPort's power capabilities or a Sink's power requirements
- Request Data Object (RDO) used by a Sink portPort to negotiate a power contractContract
- BIST Data Object (BDO) used for PHY_Layer compliance testing
- Vendor Defined Data Object (VDO) used to convey vendor specific information

The type of Data Object being used in a Data Message is defined by the Message Header's *Message Type* field and is summarized in Table 6-3. The Sent by column indicates entities which may send the given message (Source, Sink or Cable Plug): entities not listed shall not issue the corresponding message. The Valid Signaling column indicates the messages which shall only be issued in SOP Packets and the messages which may be issued in SOP* Packets.

Table 6	6-3 Data	Message	Types
---------	----------	---------	-------

Bits 30	Туре	Sent by	Description	Valid Signaling
0000	Reserved		All values not explicitly defined are reserved and shall not be used.	
0001	Source Capabilities	<u>Source or Dual-</u> Role operating as <u>Sink</u>	See Section 6.4.1.2	SOP only
0010	Request	<u>Sink only</u>	See Section 6.4.2	<u>SOP only</u>
0011	BIST	<u>Source or Sink</u>	See Section 6.4.3	<u>SOP*</u>
0100	Sink Capabilities	<u>Dual-Role</u>	See Section 6.4.1.3	<u>SOP only</u>
0101- 1110	Reserved		All values not explicitly defined are reserved and shall not be used.	
1111	Vendor Defined	<u>Source, Sink or</u> <u>Cable Plug</u>	See Section 6.4.4	<u>SOP*</u>

6.4.1 Capabilities Message

A Capabilities message (*Source Capabilities* message or *Sink Capabilities* message) shall have at least one Power Data Object for *vSafe5V*. The Capabilities message shall also contain the sending *port'sPort's* information followed by up to 6 additional Power Data Objects. Power Data Objects in a Capabilities message shall be sent in the following order:

- 1. The *vSafe5V* Fixed Supply Object shall always be the first object.
- 2. The remaining Fixed Supply Objects, if present, shall be sent in voltage order; lowest to highest.
- 3. The Battery Supply Objects, if present shall be sent in Minimum Voltage order; lowest to highest.
- 4. The Variable Supply (non-battery) Objects, if present, shall be sent in Minimum Voltage order; lowest to highest.

USB Power Delivery Specification Revision 2.0, Version 1.0.

Inserted Cells

Figure 6-2 Example Capabilities Message with 2 Power Data Objects	
Header No. of Data Objects = 2Object1Object2	
In Figure 6-2, the <i>Number of Data Objects</i> field is 2: <i>vSafe5V</i> plus one other voltage.	
Power Data Objects (PDO) are identified by the Header's Type field when it is set to 0001b. They are used to form <i>Source Capabilities</i> messages and <i>Sink Capabilities</i> messages.	l
There are three types of Power Data Objects. They contain additional information beyond that encoded in the Header to identify each of the three types of Power Data Objects:	
 Fixed Supply is the most commonly used to expose well regulated fixed voltage power supplies. Variable Power Supplypower supply is used to expose very poorly regulated power supplies. Battery is used to expose batteries than can be directly connected to V_{BUS}. 	l
Power Data Objects are also used to expose additional capabilities that may be utilized; such as in the case of a <u>Power</u> <u>Role</u> Swap.	
A list of one or more Power Data Objects shall be sent by the Source in order to convey its capabilities. The Sink may then request one of these capabilities by returning a Request Data Object , that contains a <u>an</u> index to a Power Data Object, in order to negotiate a mutually agreeable power contract<u>Contract</u>.	
The Source and Sink shall not negotiate a power level that would allow the current to exceed the maximum current supported by their receptacles or the attached plug (see Section 3.1.1 and <i>[USBType-C1.0]</i> -). The Source shall limit its offered capabilities to the maximum current supported by its receptacle and attached plug. The <u>A</u> Sink with a Type- <u>A or a Type-B receptacle</u> shall limit its requested capabilities to the maximum current supported by its receptacle and attached plug. A Sink with a Type-C receptacle may make a request from any of the capabilities offered by the Source. For further details see Section 4.4.	
Sources expose their power capabilities by sending a <i>Source Capabilities</i> message. Sinks expose their power requirements by sending a <i>Sink Capabilities</i> message. Both are composed of a number of 32-bit Power Data Objects (see <u>Section</u> Table 6-4).	Field Code Changed

Table 6-4 Power Data Object					
Bit(s)	Description				
B3130	Value	Parameter			
	00b	Fixed supply (Vmin = Vmax)			
	01b	Battery			
	10b	Variable Supply (non-battery)			
	11b	Reserved			
B290	Specific Power Capabilities are described by the PDOs in the following PDOssections.				

6.4.1.1 Use of the Capabilities Message

6.4.1.1.1 Use by Sources

Sources send a *Source Capabilities* message (see Section 6.4.1) either as part of advertising <u>portPort</u> capabilities, or in response to a *Get_Source_Cap* message.

Following a Hard Reset, a power-on event or plug insertion event, a Source <u>portPort</u> shall send a *Source Capabilities* message <u>after</u> every *SourceCapabilityTimer*<u>timeout</u> as an advertisement that shall be interpreted by the Sink

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Page **163**

portPort on attachment. The Source shall continue sending a minimum of *nCapsCount Source Capabilities* messages until a *GoodCRC* message is received.

Additionally, a *Source Capabilities* message shall only be sent in the following cases:

- By the Source portPort upon a change in its ability to supply power
- By a Source portPort or Dual-Role portPort in response to a Get_Source_Cap message

6.4.1.1.2 Use by Sinks

Sinks send a Sink Capabilities message (see Section 6.4.1.3) in response to a Get_Sink_Cap message.

A USB Power Delivery capable Sink, upon detecting *vSafe5V* on V_{BUS} and after a *SinkWaitCapTimer* timeout without seeing a *Source Capabilities* message, shall send a HardResetHard Reset. If the attached Source is USB Power Delivery capable, it responds by sending *Source Capabilities* messages thus allowing power negotiations to begin.

6.4.1.1.3 Use by Dual-Role devices

Dual-Role devices send a *Source Capabilities* message (see Section 6.4.1) <u>either</u> as part of advertising <u>portPort</u> capabilities when operating in Source role. Dual-Role devices send a *Source Capabilities* message (see Section 6.4.1) in response to a *Get_Source_Cap* message regardless of their present operating role. Similarly Dual-Role devices send a *Sink Capabilities* message (see Section 6.4.1.3) in response to a *Get_Sink_Cap* message regardless of their present operating role.

6.4.1.2 Source Capabilities Message

A Source **portPort** shall report its capabilities in a series of 32-bit Power Data Objects (see Table 6-4Section-) as part of a *Source Capabilities* message (see Figure 6-2). Power Data Objects are used to convey a Source **port'sPort's** capabilities to <u>Sourceprovide</u> power including Dual-Role ports presently operating as a Sink.

Each Power Data Object shall describe a specific Source capability such as a battery (e.g. 2.8-4.1V) or a fixed power supply (e.g. 12V) at a maximum allowable current. The *Number of Data Objects* field in the header shall define the number of Power Data Objects that follow the Header in a Data Message. All Sources shall minimally offer one Power Data Object that reports *vSafe5V*.

A Sink shall evaluate every *Source Capabilities* message it receives and shall respond with a *Request* message. If its power consumption exceeds the Source's capabilities it shall re-negotiate so as not to exceed the Source's most recently advertised capabilities.

6.4.1.2.1 Management of the Power Reserve

<u>A Power Reserve may be allocated to a Sink when it makes a request from Source Capabilities which includes a</u> <u>Maximum Operating Current/Power. The size of the Power Reserve for a particular Sink is calculated as the</u> difference between its Maximum Operating Current/Power field and its Operating Current/Power field. For a Hub with multiple ports this same Power Reserve may be shared between several Sinks. The Power Reserve may also be temporarily used by a Sink which has indicated it can give back power by setting the GiveBack flag.

Where a Power Reserve has been allocated to a Sink the Source shall indicate the Power Reserve as part of every Source Capabilities message it sends. When the same Power Reserve is shared between several Sinks the Source shall indicate the Power Reserve as part of every Source Capabilities message it sends to every Sink. Every time a Source sends capabilities including the Power Reserve capability and then accepts a request from a Sink including the Power Reserve is confirming that the Power Reserve is part of the Explicit Contract with the Sink.

When the Reserve is being temporarily used by a giveback capable Sink the Source shall indicate the Power Reserve as available in every *Source Capabilities* message it sends. However in this situation, when the Power Reserve is requested by a Sink, the Source shall return a *Wait* message while it retrieves this power using a *GotoMin* message. Once the additional power has been retrieved the Source shall send a new *Source Capabilities* message in order to trigger a new request from the Sink requesting the Power Reserve.

Page 164

The Power Reserve may be de-allocated by the Source at any time, but the de-allocation shall be indicated to the Sink or Sinks using the Power Reserve by sending a new *Source Capabilities* message.

6.4.1.2.16.4.1.2.2 Receipt of Unexpected Source Capabilities Message

When a Provider/Consumer portPort that is operating as a Source receives an unexpected *Source Capabilities* message (e.g. one not in response to a *Get_Source_Cap* message), it shall silently remove vSafe5V from V_{BUS} within tPSSourceOff of receiving the Source Capabilities message EOP.

Table 6-5 shows the behavior of various combinations of some of the portPort types.

Port 1	Port 2	Description
Provider/Consumer	Provider/Consumer	Either Port 1 or Port 2 will remove V _{BUS} depending on which sends its Capabilities first.
Provider/Consumer	Provider	Port 1 will silently remove $vSafe5V$ from V_{BUS}
Provider	Provider	Safe operation (see Section 1.1.1).
Provider/Consumer	Legacy host	Safe operation (see Section 1.1.1).
Consumer/Provider	Consumer/Provider	Undefined.
Legacy host	Legacy host	Outside scope of this specification

Table 6-5 Port to Port Behavior

6.4.1.2.2 6.4.1.2.3 Source Fixed Supply Power Data Object

Table 6-6 describes the Fixed Supply (00b) PDO. See Chapter 7 for the electrical requirements of the power supply.

Since all USB Providers support *vSafe5V*, the required *vSafe5V* Fixed Supply Power <u>Supply objectData Object</u> is also used to convey additional information that is returned in bits 29 through <u>2625</u>. All other Fixed Supply Power <u>Supply</u> <u>objectsData Objects</u> shall set bits 29...22 to zero.

For a Source offering no capabilities, the Voltage (B19..10) shall be set to 5V and the Maximum Current shall be set to 0mA. This is used in cases such as a Dual-Role device which offers no capabilities in its default role or when external power is required in order to offer power.

When a Source wants a Sink, consuming power from V_{BUS} , to go to its lowest power state, the Voltage (B19..10) shall be set to 5V and the Maximum Current shall be set to 0mA. This is used in cases where the Source wants the Sink to draw *pSnkSusp*.

Table 6-6 Fixed Supply PDO - Source

Bit(s)	Description
B3130	Fixed supply
B29	Dual-Role <u>Power</u>
B28	USB Suspend Supported
B27	Externally Powered
B26	USB Communications Capable
<u>B25</u>	Data Role Swap
B25<u>B24</u>22	Reserved – shall be set to zero.
B2120	Peak Current
B1910	Voltage in 50mV units

Bit(s)	Description
B90	Maximum Current in 10mA units

6.4.1.2.2.1 Dual-Role Power

The Dual-Role <u>Power</u> bit shall be set when the <u>portPort</u> is Dual-Role <u>Power</u> capable <u>i.e. supports the **PR** Swap</u> <u>message</u>. This is a static capability which shall remain fixed for a given device.

6.4.1.2.2.2 USB Suspend Supported

Prior to a <u>PD-contract_Contract</u>, this flag is undefined and Sinks shall follow the rules for suspend as defined in *[USB2.0]*, *[USB3.1]*.*[USBType-C1.0]* or *[BC1.2]*. After a <u>PD</u> Contract has been negotiated:

- If the USB Suspend Supported flag is set, then the Sink shall follow the [USB2.0] or [USB3.1] rules for suspend and
 resume. A PDUSB peripheral devicePeripheral may draw up to pSnkSusp during suspend; a PDUSB Hub may
 draw up to pHubSusp during suspend (see Section 7.2.4).
- If the USB Suspend Supported flag is cleared, then the Sink shall ignore the *[USB2.0]* or *[USB3.1]* rules for suspend and may continue to draw the negotiated power. However, Note that when USB is suspended, the USB device state is also suspended.

Sinks may indicate to the Source that they would prefer to have the USB Suspend Supported flag cleared by setting the No USB Suspend flag in a *Request* message (see Section 6.4.2.5).

6.4.1.2.2.36.4.1.2.3.3 Externally Powered

The Externally Powered bit shall only be set when an AC "wall" supply is providing 100% of the Source's power.

This means that either:

- There is an AC supply, e.g. a wall wart, directly connected to the Source.
 - Or, in the case of a PDUSB Hub:
 - The Hub is receiving 100% of its power from a PD Source with its Externally Powered bit set.
 - The Hub is receiving 100% of its power from multiple PD Sources all with their Externally Powered bits set.

6.4.1.2.2.46.4.1.2.3.4 USB Communications Capable

The USB Communications Capable bit shall only be set for devices capable of communication over the USB data lines (e.g. D+/- or SS Tx/Rx).

6.4.1.2.3.5 Data Role Swap

The Data Role Swap bit shall be set when the Port is a Type-C DRP (see **[USBType-C1.0]**) and supports the **DR Swap** message. This is a static capability which shall remain fixed for a given device.

6.4.1.2.2.5 6.4.1.2.3.6 Peak Current

The USB Power Delivery Fixed Supply is only required to deliver the amount of current requested in the Operating Current (Ioc) field of an RDO. In some usages however, for example computer systems, where there are short bursts of activity, it may be desirable to overload the power source for short periods.¬

For example when a <u>CPUcomputer system</u> tries to maintain average power consumption, the higher the peak current, the longer the low <u>activity (i.e. I.o., current (</u>see <u>Section 1.1.1</u>) period needed to maintain such average power. The Peak Current field allows a power source to advertise this additional capability. <u>This capability is intended for direct</u> Port to Port connections only and shall not be offered to downstream Sinks via a Hub.

Every Fixed Supply PDO shall contain a Peak Current field. Supplies that want to offer ana set of overload capabilitycapabilities shall advertise this through the Peak Current field in the corresponding Fixed Supply PDO (see

Page 166

Table 6-7). Supplies that do not support an overload capability shall set these bits to 00b in the corresponding Fixed Supply PDO.

Bits 2120	Description		
00	IMAX <mark>Peak current</mark> equals IOC (default)		
01	IMAXOverload Capabilities:		
	<u>1. Peak current</u> equals <u>130% loc</u> for 1ms @ <u>5% duty cycle (low current</u> equals <u>97% loc</u> for 19ms)		
	2. Peak current equals 125% I _{OC} for 2ms @ 10% duty cycle (low current equals 97% I _{OC} for 18ms)		
	1.3. Peak current equals 110% I _{oc} for 10ms @ 50% duty cycle (low current equals 90% I _{oc} for 10ms)		
10	IMAXOverload Capabilities:		
	 Peak current equals <u>95% loc for 19ms</u>) <u>95% loc for 19ms</u>) 		
	 Peak current equals 150% I_{oc} for 2ms @ 10% duty cycle (low current equals 94% I_{oc} for 18ms) 		
	1.3. Peak current equals 125% loc for 10ms @ 50% duty cycle (low current equals 75% loc for 10ms)		
11	IMAXOverload Capabilities:		
	 <u>Peak current</u> equals 200% <u>IocIoc</u> for 1ms @ 5% duty cycle<u>(low current equals</u> <u>95% Ioc for 19ms)</u> 		
	2. Peak current equals 175% I _{oc} for 2ms @ 10% duty cycle (low current equals 92% I _{oc} for 18ms)		
	4.3. Peak current equals 150% I _{oc} for 10ms @ 50% duty cycle (low current equals 50% I _{oc} for 10ms)		

Table 6-7 Fixed Power Source Peak Current Capability

6.4.1.2.3 6.4.1.2.4 Variable Supply (non-battery) Power Data Object

Table 6-9 describes a Variable Supply (non<u>-</u>battery) (10b) PDO for a Source. See <u>Chapter 7 Power SupplySection</u> 7 for the electrical requirements of the power supply.

The voltage fields shall define the range that output voltage shall fall within. This does not indicate the voltage that will actually be supplied, except it shall fall within that range.

Table 6-8 Variable Supply (non-battery) PDO - Source

Bit(s)	Description	
B3130	Variable Supply (non-battery)	
B2920	Maximum Voltage in 50mV units	
B1910	Minimum Voltage in 50mV units	
B90	Maximum Current in 10mA units	

6.4.1.2.4 6.4.1.2.5 Battery Supply Power Data Object

Table 6-9 describes a Battery (01b) PDO for a Source. See Chapter 7 for the electrical requirements of the power supply.

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

Page 167

The voltage fields shall represent the battery's voltage range. The battery shall be capable of supplying the Power value over the entire voltage range. Note, only the Battery PDO uses power instead of current.

The Sink may monitor the battery voltage.

Table 6-9 Battery Supply PDO - Source

Bit(s)	Description	
B3130	30 Battery	
B2920	Maximum Voltage in 50mV units	
B1910	.910 Minimum Voltage in 50mV units	
B90	Maximum Allowable Power in 250mW units	

6.4.1.3 Sink Capabilities Message

A Sink portPort shall report power levels it is able to operate at in a series of 32-bit Power Data Objects (see Table 6-4Section-). These are returned as part of a *Sink Capabilities* message in response to a *Get_Sink_Cap* message (see Figure 6-2). This is similar to that used for Source portPort capabilities with equivalent Power Data Objects for Fixed, Variable and Battery Supplies as defined in this section. Power Data Objects are used to convey the Sink port'sPort's operational power requirements including Dual-Role ports presently operating as a Source.

Each Power Data Object shall describe a specific Sink operational power level, such as a battery (e.g. 2.8-4.1V) or a fixed power supply (e.g. 12V). The *Number of Data Objects* field in the header shall define the number of Power Data Objects that follow the Header in a Data Message.

All Sinks shall minimally offer one Power Data Object with a power level at which the Sink can operate.

All Sinks shall include one Power Data Object that reports *vSafe5V* even if they require additional power to operate fully. In the case where additional power is required for full operation the Higher Capability bit shall be set.

6.4.1.3.1 Sink Fixed Supply Power Data Object

Table 6-6 describes the Sink Fixed Supply (00b) PDO. See Chapter 7 for the electrical requirements of the power supply. The Sink shall set Voltage to its required voltage and Operational Current to its required operating current. Required operating current is defined as the amount of current a given device needs to be functional. This value could be the maximum current the Sink will ever require or could be sufficient to operate the Sink in one of its modes of operation.

Since all USB Consumers support *vSafe5V*, the required *vSafe5V* Fixed Supply Power <u>Supply objectData Object</u> is also used to convey additional information that is returned in bits 29 through 20. All other Fixed Supply Power <u>Supply</u> objectsData Objects shall set bits 29...20 to zero.

For a Sink requiring no power from the Source, the Voltage (B19..10) shall be set to 5V and the Operational Current shall be set to 0mA.

	Bit(s)	Description
	B3130	Fixed supply
	B29	Dual-Role <u>Power</u>
	B28	Higher Capability
	B27	Externally Powered
	B26	USB Communications Capable
	<u>B25</u>	Data Role Swap

Table 6-10 Fixed Supply PDO - Sink

Bit(s)	Description
B25<u>B24</u>20	Reserved – shall be set to zero.
B1910	Voltage in 50mV units
В90	Operational Current in 10mA units

6.4.1.3.1.1 Dual-Role Power

The Dual-Role bit shall be set when the **portPort** is Dual-Role **<u>Power</u>** capable <u>i.e. supports the **PR**</u> <u>Swap</u> <u>message</u>. This is a static capability which shall remain fixed for a given device.</u>

6.4.1.3.1.2 Higher Capability

In the case that the Sink needs more than *vSafe5V* (e.g. 12V) to provide full functionality, then the Higher Capability bit shall be set.

6.4.1.3.1.3 Externally Powered

The Externally Powered bit shall only be set when an AC "wall" supply is providing 100% of the Sink's power.

This means that either:

- There is an AC supply, e.g. a wall wart, directly connected to the Sink.
- Or, in the case of a PDUSB Hub:
 - \circ $\,$ $\,$ The Hub is receiving 100% of its power from a PD Source with its Externally Powered bit set.
 - The Hub is receiving 100% of its power from multiple PD Sources all with their Externally Powered bits set.

6.4.1.3.1.4 USB Communications Capable

The USB Communications Capable bit shall only be set for devices capable of communication over the USB data lines (e.g. D+/- or SS Tx/Rx).

6.4.1.3.1.5 Data Role Swap

The Data Role Swap bit shall be set when the Port is a Type-C DRP (see **[USBType-C1.0]**) and supports the **DR Swap** message. This is a static capability which shall remain fixed for a given device.

6.4.1.3.2 Variable Supply (non-battery) Power Data Object

Table 6-11 describes a Variable Supply (non<u>-</u>battery) (10b) PDO used by a Sink. See <u>Chapter 7 Power SupplySection</u> 7 for the electrical requirements of the power supply.

The voltage fields shall be set to the output voltage range that the Sink requires to operate. The Operational Current field shall be set to the operational current that the Sink requires at the given voltage <u>range</u>. <u>Required</u> <u>operating current is defined as the amount of current a given device needs to be functional</u>. This value could be the <u>maximum current the Sink will ever require or could be sufficient to operate the Sink in one of its modes of operation</u>.

Table 6-11 Variable Supply (non-battery) PDO - Sink

Bit(s)	Description	
B3130	Variable Supply (non-battery)	
B2920	Maximum Voltage in 50mV units	
B1910	Minimum Voltage in 50mV units	
B90	Operational Current in 10mA units	

6.4.1.3.3 Battery Supply Power Data Object

Table 6-12 describes a Battery (01b) PDO used by a Sink. See Chapter 7 for the electrical requirements of the power supply.

The voltage fields shall shall be set to the output voltage range that the Sink requires to operate. The Operational <u>CurrentPower</u> field shall be set to the operational <u>currentpower</u> that the Sink requires at the given voltage <u>range</u>. Note, only the Battery PDO uses power instead of current. <u>Required operating power is defined as the amount of</u> <u>power a given device needs to be functional</u>. This value could be the maximum power the Sink will ever require or <u>could be sufficient to operate the Sink in one of its modes of operation</u>.

Bit(s)	Description	
B3130	Battery	
B2920	Maximum Voltage in 50mV units	
B1910) Minimum Voltage in 50mV units	
B90	Operational Power in 250mW units	

6.4.2 Request Message

A *Request* message shall be sent by a Sink to request power, typically during the request phase of a power negotiation. The Request Data Object shall be returned by the Sink making a request for power. It shall be sent in response to the most recent *Source Capabilities* message (see Section 8.3.2.3). A *Request* message shall return one and only one Sink Request Data Object that shall identify the Power Data Object being requested.

The *Request* message includes the requested power level. For example, if the *Source Capabilities* message includes a Fixed Supply PD0 that offers 12V @ 1.5A and if the Sink only wants 12V @ 0.5A, it will set the Operating Current field to 50 ($\underline{i}_{e.g.}$ 10mA * 50 = 0.5A). The *Request* message requests the highest current the Sink will ever require in the Maximum Operating Current Field (in this example it would be 100 (100 * 10mA = 1.0A)).

The request takes one of two forms depending on the kind of power requested. The Fixed Power <u>SupplyData</u> Object and Variable Power <u>SupplyData</u> Object share a common format (see Table 6-13 and Table 6-14). The Battery Power <u>SupplyData</u> Object uses a different format (see Table 6-15 and Table 6-16).

6.4.2.1 **Object Position**

The value in the Object Position field shall indicate which object in the *Source Capabilities* message the RDO refers. The value 1 always indicates the 5V Fixed Supply PDO as it is the first object following the *Source Capabilities* message header. The number 2 refers to the next PDO and so forth.

6.4.2.2 GiveBack Flag

The GiveBack flag shall be set to indicate that the Sink will respond to a *GotoMin* message by reducing its load to the Minimum Operating Current. It will typically be used by a <u>USB</u> Device while charging its battery because a short interruption of the charge will have minimal impact on the user and will allow the Source to manage its load better.

6.4.2.3 Capability Mismatch

A Capability Mismatch occurs when the Sink cannot satisfy its power requirements from the capabilities offered by the Source. In this case the Sink shall make a valid request from the offered capabilities and shall set the Capability Mismatch bit (see Section 8.2.5.2).

When a Sink returns a Request Data Object in response to advertised capabilities with this bit set, it indicates that the Sink wants power that the Source cannot provide. This may be due to either a voltage that is not available or the amount of available current. <u>At this point the Source can use the information in the *Request* message combined with the contents of the *Sink Capabilities* message to ascertain the Voltage and Current required by the Sink for full operation.</u>

In this context a valid Request message means the following:

- The Object position field shall contain a reference to an object in the last received Source Capabilities message.
- The Operating Current/Power field shall contain a value which is less than or equal to the maximum current/power offered in the Source Capabilities message.
- If the GiveBack flag is set to zero i.e. there is a Maximum Operating Current/Power field:
- If the Capability Mismatch bit is set to one
 - The Maximum Operating Current/Power field may contain a value larger than the maximum current/power offered in the *Source Capabilities* message's PDO as referenced by the Object position field. This enables the Sink to indicate that it requires more current/power than is being offered. If the Sink requires a different voltage this will be indicated by its *Sink Capabilities* message.
 - Else if the Capability Mismatch bit is set to zero
 - The Maximum Operating Current/Power field shall contain a value less than or equal to the maximum current/power offered in the *Source Capabilities* message's PDO as referenced by the Object position field.

Page 172

6.4.2.4 USB Communications Capable

The USB Communications Capable flag shall be set to one when the Sink has USB data lines and is capable of communicating using either [USB2.0] or [USB3.1] protocols. The USB Communications Capable flag shall be set to zero when the Sink does not have USB data lines or is otherwise incapable of communicating using either [USB2.0] or [USB3.1] protocols. This is used by the Source to determine operation in certain cases such as USB suspend. If the USB Communications Capable flag has been set to zero by a Sink then the Source needs to be aware that USB Su spend rules cannot be observed by the Sink.

6.4.2.5 No USB Suspend

The No USB Suspend flag may be set by the Sink to indicate to the Source that this device is requesting to continue its <u>PD contractContract</u> during USB Suspend. Sinks setting this flag typically have functionality that can use power for purposes other than USB communication e.g. for charging a battery.

The Source uses this flag to evaluate whether it should re-issue <u>the Source CapabilitiesSource capabilities message</u> with the USB Suspend flag cleared.

6.4.2.6 **Operating Current**

The Operating <u>currentCurrent</u> field in the Request Data Object shall be set to the actual amount of current the Sink <u>wantsneeds to operate</u> at a given time. A new Request message, with an updated Operating Current value, shall be issued whenever the Sink's power needs change e.g. from Maximum Operating Current down to a lower current level. In conjunction with the Maximum Operating Current field or Minimum Operating Current field, it provides the Source with additional information that allows it to better manage the distribution of its power. This field shall apply to the Fixed and Variable RDO.

6.4.2.7 Maximum Operating Current

The Maximum Operating Current field in the Request message shall be set to the highest current the Sink will ever require. The difference between the Operating Current and Maximum Operating Current fields (when the <u>GivebackGiveBack</u> Flag is cleared) is used by the Device Policy Manager <u>in the Source</u> to calculate the size of the <u>Power</u> Reserve to be maintained (see Section 8.2.5.1). The Operating Current value shall be less than or equal to the Maximum Operating Current value.

The When the Capabilities Mismatch bit is set to zero the requested Maximum Operating Current shall be less than or equal to the current in the offered Source Capabilities since the Source will need to reserve this power for future use π_2 . The Maximum Operating Current field shall continue to be set to the highest current needed in order to maintain the allocation of the <u>Power</u> Reserve. If Maximum Operating Current is requested when the <u>Power</u> Reserve is being used by a GotoMin capable device then the resulting message will be a *Wait* message to enable the Source to reclaim the additional current (see Sections 6.3.12.1 and 8.2.5.1).

When the Capabilities Mismatch bit is set to one the requested Maximum Operating Current may be greater than the current in the offered Source Capabilities since the Source will need this information to ascertain the Sink's actual needs.

See Section 6.4.2.3 for more details of the usage of the Capabilities Mismatch bit.

This field shall apply to the Fixed and Variable RDO.

6.4.2.8 Minimum Operating Current

The Minimum Operating Current field in the Request message shall be set to the lowest current the Sink requires to maintain operation. The difference between the Operating Current and Minimum Operating Current fields (when the GivebackGiveBack Flag is set) is used by the Device Policy Manager to calculate the amount of power which can be

USB Power Delivery Specification Revision 42.0, Version 1.0

Page 173

reclaimed using a *GotoMin* message. The Operating Current value shall be greater than or equal to the Minimum Operating Current value.

This field shall apply to the Fixed and Variable RDO.

6.4.2.9 **Operating Power**

The Operating <u>currentPower</u> field in the Request Data Object shall be set to the actual amount of power the Sink wants at this time. In conjunction with the Maximum Operating Power field, it provides the Source with additional information that allows it to better manage the distribution of its power. This field shall apply to the Battery RDO.

This field shall apply to the Battery RDO.

6.4.2.10 Maximum Operating Power

The Maximum Operating Power field in the Request message shall be set to the highest power the Sink will ever require. This allows a Source with a power supply shared amongst multiple ports to intelligently distribute power.

The When the Capabilities Mismatch bit is set to zero the requested Maximum Operating Power shall be less than or equal to the power in the offered Source Capabilities since the Source will need to reserve this power for future use π_z . The Maximum Operating Power field shall continue to be set to the highest power needed in order to maintain the allocation of the <u>Power</u> Reserve. If Maximum Operating Power is requested when the <u>Power</u> Reserve is being used by a GotoMin capable device then the resulting message will be a *Wait* message to enable the Source to reclaim the additional power (see Sections 6.3.12.1 and 8.2.5.1).

When the Capabilities Mismatch bit is set to one the requested Maximum Operating Power may be greater than the current in the offered Source Capabilities since the Source will need this information to ascertain the Sink's actual needs

See Section 6.4.2.3 for more details of the usage of the Capabilities Mismatch bit.

This field shall apply to the Battery RDO.

6.4.2.11 Minimum Operating Power

The Minimum Operating Power field in the Request message shall be set to the lowest current the Sink requires to maintain operation. When combined with the Operating Power, it gives a Source with a power supply shared amongst multiple ports information about how much power it can temporarily get back so it can to intelligently distribute power.

This field shall apply to the Battery RDO.

6.4.3 BIST Test-Message

The *BIST* message is sent to request the <u>portPort</u> to enter a Physical Layer test mode that performs one of the following functions:

- Enter the receiver mode which does the following:
 - o Zero accumulated BISTErrorCounter
 - Process a series of BIST <u>framesTest Frames</u> and compare the received data to the expected data pattern
 - Count the number of errors received and add to the BISTErrorCounter
- Enter a transmit mode to send BIST frames<u>Test Frames</u> to the tester<u>Tester</u>
- Return *BISTErrorCounter* to the <u>testerTester</u>

The message format is as follows:

Page 174

Figure 6-3 BIST Test Message		
Header	BIST Request	
No. of Data Objects = 1 or 7	Object	

All ports shall be able to be a Unit Under Test (UUT) only when operating at *vSafe5V*. <u>BIST Modes to be supported are</u> <u>defined in Section</u> 5.9.9, and thus shall implement. <u>For each supported BIST Mode</u> the following operations <u>shall be</u> <u>implemented</u> based on the reception of the appropriate *BIST* message Data Object (see Table 6-17):

- Process reception of a BIST Receiver Mode Data Object
- Process reception of a **BIST Transmit Mode** Data Object
- Generate a *Returned BIST Counters* Data Object response within a *BIST* message in response to each received data frameTest Frame.
- Process reception of a BIST Carrier Mode 0 Data Object which that shall result in the generation of the
 appropriate carrier signal
- Process reception of a *BIST Carrier Mode 1* Data Object that shall result in the generation of the appropriate carrier signal
- Process reception of a *BIST Carrier Mode 2* Data Object <u>that</u> shall result in the generation of the appropriate carrier signal.
- Process reception of a *BIST Carrier Mode 3* Data Object <u>that</u> shall result in the generation of the appropriate carrier signal.
- Process reception of a *BIST Eye Pattern* Data Object <u>that</u> shall result in the generation of the appropriate carrier signal

Process reception of a BIST Test Data Data Object that shall result in the message being ignored.

It is optional for a port<u>Port</u> to take on the role of a Tester. All Ports shall support the defined BIST test modes<u>Modes</u> listed in this Section 6.4.3.

It is anticipated that dedicated Testers will exist. Those testers may not be required to implement a local receiver test. However, a Tester shall always be able to complete the operations required when a *BIST* message with Data Object *BIST Transmit Mode* is sent by the Tester.

The usage model of the **PhyPHY Layer** BIST modes generally assumes that some controlling agent will request a test of its Port Partner. A UUT Port minimally has to process a request to enter test mode and return error counters. A Tester Port shall have a means to place the UUT Port into receiver test mode and retrieve the error counters from the UUT. A Port, that is not part of a Tester, is not expected to be the initiator of a receiver test operation, but is not precluded from doing so.

In Section 8.3.2.8.3 there is a sequence description of the test sequences used for compliance testing.

The fields in the BIST Data Object are defined in the Table 6-17.

Bit(s)	Value	Parameter	Description	Reference
B3128	0000b	BIST Receiver Mode	Requests receiver to enter BIST Receiver Mode	See Section 6.4.3.1
	0001b	BIST Transmit Mode	Requests receiver to enter BIST Transmit Mode	See Section 6.4.3.2
	0010b	Returned BIST Counters	Returned error counters	See Section 6.4.3.3
	0011b	BIST Carrier Mode 0	Requests transmitter to enter BIST Carrier Mode 0	See Section 6.4.3.
	0100b	BIST Carrier Mode 1	Requests transmitter to enter BIST Carrier Mode 1	See Section 6.4.3.
	0101b	BIST Carrier Mode 2	Request Transmitter to enter BIST Carrier Mode 2	See Section 6.4.3.
	0110b	BIST Carrier Mode 3	Request Transmitter to enter BIST Carrier Mode 3	See Section 6.4.3.
	0111b	BIST Eye Pattern	Requests transmitter to enter BIST Eye Pattern.	See Section 6.4.3.
	<u>1000b</u>	<u>BIST Test Data</u>	<u>Sends a Test Data Frame.</u>	See Section 6.4.3.
	1000b<u>1001b</u>- 1111b		All values not explicitly defined are reserved and shall not be used.	
B2716			Reserved and shall be set to zero.	
B150		16-bit unsigned integer	When Request Type is <i>Returned</i> <i>BIST Counters</i> , this field shall contain the contents of <i>BISTErrorCounter</i> otherwise it shall be set to zero.	See Section 6.4.3.

Table 6-17 BIST Data Object

6.4.3.1 BIST Receiver Mode

This operation shall be used to initiate a UUT remote receiver test by sending a *BIST* message containing a *BIST Receiver Mode* BIST Data object.

On receiving the request, the UUT shall zero its *BISTErrorCounter* and both the Tester and the UUT shall preload their PRBS generator with the designated pattern (see Section 5.9.1).

The receiver (UUT) shall acknowledge the **BIST** message with a **GoodCRC** message.

The UUT enters BIST Receiver Mode after the *BIST* message has been received (see Section 6.5.9.1). At this time the UUT shall be able to receive a Test-Pattern Frame from the Tester and to respond appropriately with a *BIST* message with a Data Object of *Returned BIST Counters* (see Section 6.5.2). After reception of the first Test Pattern Frame, further Test-Pattern Frames are sent at a rate determined by the Tester.

The test shall be ended by sending *Hard Reset* signaling to reset the UUT.

6.4.3.2 BIST Transmit Mode

Loopback mode is not possible so BIST Transmit <u>modeMode</u> shall be used to request a UUT transmitter test by sending a *BIST* message containing a *BIST Transmit Mode* BIST Data <u>objectObject</u>.

Before initiating the request the Tester shall zero its *BISTErrorCounter* and preload the PRBS generator with the designated pattern (see Section 5.9.1). On receiving the request the UUT shall preload the PRBS generator with the designated pattern (see Section 5.9.1).

The receiver in the UUT shall acknowledge the *BIST* message with a *GoodCRC* message. The UUT enters BIST Transmit Mode after the *BIST* message has been received (see Section 6.5.9.1). The UUT shall start transmitting the first Test Frame no later than *tBISTMode* max of the last bit of the *EOP* of the *BIST* message used to initiate the test is received by the Physical Layer. Each subsequent Test Pattern frameFrame shall be started:

- Either on reception of a BIST message, with a Returned BIST Counters Data Object or
- On expiry of the BISTReceiveErrorTimer and
- No later than *tBISTResponse* after the first bit of the Preamble of the previous Test Pattern-Frame has been transmitted on V_{BUS} by the Physical Layer.

The Tester shall preload its PRBS checker with the designated pattern and start counting errors. After receiving a suitable number of test frames Test Frames, the Tester shall freeze its error counter. The UUT shall be reset by sending *Hard Reset* signaling instead of a *BIST* message.

6.4.3.3 Returned BIST Counters

The *BIST* message, with a *Returned BIST Counters* Data Object, shall contain the error counters obtained during the receiver test. During BIST, when sending <u>framesTest Frames</u>, the *MessageID* of the *BIST* message, with a *Returned BIST Counters* Data Object shall be ignored.

6.4.3.4 BIST Carrier Mode 0

Upon receipt of a *BIST* message, with a *BIST Carrier Mode 0* Data Object, the UUT shall send out a continuous string of "0"s. This produces a continuous frequency that will allow measurement of *fCarrier* - *fDeviation*.

The UUT shall be reset by an out of band mechanism to exit this mode (e.g. removing power).

6.4.3.5 BIST Carrier Mode 1

Upon receipt of a *BIST* message, with a *BIST Carrier Mode 1* Data Object, the UUT shall send out a continuous string of "1"s. This produces a continuous frequency that will allow measurement of *fCarrier* + *fDeviation*.

The UUT shall be reset by an out of band mechanism to exit this mode (e.g. removing power).

6.4.3.6 BIST Carrier Mode 2

Upon receipt of a *BIST* message, with a *BIST Carrier Mode 2* Data Object, the UUT shall send out a continuous string of alternating "1"s and "0"s.

The UUT shall be reset by an out of band mechanism to exit this mode (e.g. removing power).

6.4.3.7 BIST Carrier Mode 3

Upon receipt of a *BIST* message, with a *BIST Carrier Mode 3* Data Object, the UUT shall send out a continuous string of sixteen "1"s, followed by sixteen "0"s.

The UUT shall be reset by an out of band mechanism to exit this mode (e.g. removing power).

6.4.3.8 BIST Eye Pattern

Upon receipt of a *BIST* message, with a *BIST Eye Pattern* Data Object, the UUT shall send out a continuous string of bits in accordance with section 5.9.1. This produces a signal that will allow measurement of the eye pattern and of the spectrum mask.

The UUT shall be reset by some out of band mechanism to stop this testing mode (e.g. removing power).

6.4.3.9 BIST Test Data

Upon receipt of a *BIST* message, with a *BIST Test Data* Data Object, the UUT shall return a *GoodCRC* message and shall enter a test mode in which it sends no further messages except for *GoodCRC* messages in response to received messages. See Section 5.9.7 for the definition of the Test Data Frame.

The UUT shall be reset by some out of band mechanism to stop this testing mode (e.g. removing power).

6.4.4 Vendor Defined Message

The *Vendor Defined* message (VDM) is provided to allow vendors to exchange information outside of that defined by this specification. If, or how, a vendor uses this mechanism is beyond the scope of this specification.

A *Vendor Defined* message shall consist of at least one data object, the First VDM-Data Object, the VDM Header, and may contain up to a maximum of six additional VDM Objects. (VDO).

To ensure vendor uniqueness of *Vendor Defined* messages, all *Vendor Defined* messages shall contain <u>a valid</u> USB <u>Standard or</u> Vendor ID <u>(SVID) allocated by USB-IF</u> in the <u>First-VDM ObjectHeader</u>.

<u>Two types of Vendor Defined messages are defined: Structured VDMs and Unstructured VDMs.</u> A port<u>Structured VDM defines an extensible structure designed to support Modal Operation. An Unstructured VDM does not define any structure and messages may be created in any manner that the vendor chooses.</u>

<u>A Port</u> receiving a *Vendor Defined* message that it does not recognize shall ignore the message.

Vendor Defined messages shall not be used for direct power negotiation. They may however be used to alter Local Policy, affecting what is offered or consumed via the normal PD messages. For example a *Vendor Defined* message could be used to enable the Source to offer additional power via a *Source Capabilities* message.

The message format shall be as shown in Figure 6-4.

Figure 6-4 Vendor Defined Message

Header	VDM Header	0-6 VDOs
No. of Data Objects = 1-7	VDIVITIEauei	0-0 0005

The VDM header shall be the first 4-byte object in a Vendor Defined Message. The VDM Header provides command space to allow vendors to customize messages for their own purposes. Additionally vendors may make use of the Commands in a Structured VDM.

The fields in the <u>First VDM ObjectVDM Header for an Unstructured VDM, when the VDM Type Bit is set to zero</u>, shall be as defined in the Table 6-18. <u>The fields in the VDM Header for a Structured VDM, when the VDM Type Bit is set to one shall be as defined in</u> Table 6-19.

Both Unstructured and Structured VDMs shall only be sent and received after an Explicit Contract has been established. The only exception to this is the *Discover Identity* Command which may be sent by Source when no Contract or an Implicit Contract (in place after a Power Role Swap) is in place in order to discover Cable capabilities (see Section 8.3.3.8.8). A VDM message sequence shall not interrupt any other PD Message Sequence. A VDM message sequence shall be interruptible by any other PD Message Sequence.

Page 178

6.4.4.1 Unstructured VDM

The Unstructured VDM does not define the contents of bits B14..0 in the VDM Header. Their definition and use are the sole responsibility of the vendor indicated by the VID. The Port Partners and Cable Plugs shall exit any states entered using an Unstructured VDM when a Hard Reset appears on PD.

The following rules apply to the use of Unstructured VDM messages:

Unstructured VDMs shall only be used when an Explicit Contract is in place.

- Prior to establishing an Explicit Contract Unstructured VDMs shall not be sent and shall be ignored if received.
- Only the DFP shall be an Initiator of Unstructured VDMs.
- Only the UFP or a Cable Plug shall be a Responder to Unstructured VDM.
- Unstructured VDMs shall not be initiated or responded to under any other circumstances.
- A DFP or UFP which does not support Unstructured VDMs shall ignore any Unstructured VDMs received.
- A "command" sequence shall be interruptible e.g. due to the need for a message sequence using SOP Packets.
- Unstructured VDMs shall only be used during Modal Operation in the context of a Mode.

Unstructured VDMs may be used with SOP* Packets.

Table 6-18 illustrates the VDM Header bits.

Table 6-18 FirstUnstructured VDM ObjectHeader

Bit(s)	Description	Reference	
B3116	16-bit unsigned integer. USB -Vendor ID <u>(VID)</u>	Unique 16-bit unsigned integer. Assigned by the USB-IF to the Vendor.	
<u>B15</u>	<u>VDM Type</u>	<u>0 = Unstructured VDM</u>	
B15<u>B14</u>0	<u>Available for V</u> endor specific<u>Use</u>	Content of this field is defined by the vendor.	

6.4.4.1.1 USB Vendor ID

The Vendor ID field shall contain the 16-bit Vendor ID value assigned to the vendor by the USB-IF (VID). No other value shall be present in this field.

6.4.4.1.2 VDM Type

The VDM Type field shall be set to zero indicating that this is an Unstructured VDM.

6.4.4.2 Structured VDM

Setting the VDM Type field to 1 (Structured VDM) defines the use of bits B14..0 in the Structured VDM Header. The fields in the <u>Structured VDM</u> ObjectHeader are defined in Table 6-19.

The following rules apply to the use of Structured VDM messages:

• Structured VDMs shall only be used when an Explicit Contract is in place with the following exception:

- <u>Prior to establishing an Explicit Contract a Source may issue *Discover Identity* messages, to a Cable
 <u>Plug using SOP' Packets, as an Initiator (see Section 8.3.3.8.8)</u>.
 </u>
- Only the DFP shall be an Initiator of Structured VDMs except for the *Attention* Command that shall only be initiated by the UFP.

Only the UFP or a Cable Plug shall be a Responder to Structured VDMs.

- Structured VDMs shall not be initiated or responded to under any other circumstances.
- A DFP or UFP which does not support Structured VDMs shall ignore any Structured VDMs received.

• A Command sequence shall be interruptible e.g. due to the need for a message sequence using SOP Packets.

6.4.4.2.1 SVID

The SVID field shall contain either a 16-bit USB Standard ID value (SID) or the 16-bit assigned to the vendor by the USB-IF (VID). No other value shall be present in this field.

<u>Table 6-21 lists specific SVID values referenced by this specification.</u>

Table 6-21 SVID Values

Parameter	<u>Value</u>	Description
<u>PD SID</u>	<u>0xFF00</u>	Standard ID allocated to this specification.
<u>VID Unassigned</u>	<u>0x0000</u>	Manufacturer does not have a USB-IF assigned Vendor ID e.g. because they do not manufacture USB communications capable devices. Shall only be returned in a Structured VDM <i>Discover Identity</i> ACK Command response as part of the ID Header (see Section 6.4.4.3.1.1).

6.4.4.2.2 VDM Type

The VDM Type field shall be set to one indicating that this is a Structured VDM.

6.4.4.2.3 Structured VDM Version

The Structured VDM Version field indicates the level of functionality supported in the Structured VDM part of the specification. This is not the same version as the version of this specification. At this time, there is only one version (1.0) defined. This field shall be set to zero to indicate Version 1.0.

<u>On receipt of a VDM message header with a higher Version number than that supported, a Port shall respond using the highest Version number it supports.</u>

6.4.4.2.4 Object Position

The Object Position field shall be used by the *Enter Mode* and *Exit Mode* Commands. The *Discover Modes* Command returns a list of zero to six VDOs, each of which describes a Mode. The value in Object Position field is an index into that list that indicates which VDO (e.g. Mode) in the list the *Enter Mode* and *Exit Mode* Command refers to. The Object Position shall start with one for the first Mode in the list. If the SVID is a VID, the content of the VDO for the Mode shall be defined by the vendor. If the SVID is a SID, the content shall be defined by the Standard. The VDO's content may be as simple as a numeric value or as complex as bit mapped description of capabilities of the Mode. In all cases, the Initiator is responsible for deciphering the contents to know whether or not it supports the Mode at the Object Position.

This field shall be set to zero when not required by the Command.

6.4.4.2.5 Command Type

This Command Type field shall be used to indicate the type of Command request/response being sent.

An Initiator shall set the field to "Initiator" to indicate that this is a Command request from an Initiator.

"Responder ACK" is the normal return indicating that the Command request was received and handled normally.

USB Power Delivery Specification Revision <u>+2</u>.0<u>, Version 1.0</u>

<u>"Responder NAK" is returned when the Command request was not understood or could not be acted upon. The handling of "Responder NAK" is left up to the Initiator.</u>

<u>"Responder BUSY" is sent in the response to a VDM when the Responder is unable to respond to the Command</u> request immediately, but the Command request may be retried. The DFP shall wait **tVDMBusy** after a "Responder BUSY" response is received before retrying the Command request.

6.4.4.2.6 Command

This field is used to identify devices and manage their operational Modes. The commands defined in this specification shall be used to manage Modes on the USB Type-C connector. There is a further range of Command values left for the vendor to use to manage additional extensions.

<u>A Structured VDM Command is deemed to be completed (and if applicable, the transition to the requested</u> <u>functionality is made) when the *GoodCRC* message has been successfully sent by the Initiator in reply to the <u>Responder's response</u>.</u>

If the Structured VDM Command request is not recognized it shall be NAKed.

6.4.4.3 Use of Commands

The Structured VDM Header defines Commands used to retrieve a list of SVIDs the device supports, to discover the Modes associated with each SVID, and to enter/exit the Modes. The Commands include:

• Discover Identity

- Discover SVIDs
- Discover Modes
- Enter Mode
- Exit Mode
- Attention

Additional Command space is also reserved for Standard and Vendor use and for future extensions.

The Command sequences use the terms Initiator and Responder to identify messaging roles the ports are taking on relative to each other. This role is independent of the Port's power capability (Provider, Consumer etc.) or its present power role (Source or Sink). The Initiator is the Port sending the initial Command request and the Responder is the Port replying with the Command response. See Section 6.4.4.3.6.

All Ports that support Modes shall support the *Discover Identity*, *Discover SVIDs*, the *Discover Modes*, the *Enter Mode* and *Exit Mode* Commands.

Table 6-22 details the responses a Responder may issue to each Command request. Responses not listed for a given Command shall not be sent by a Responder. A NAK response should be taken as an indication not to retry that particular Command.

<u>Command</u>	Allowed Response	<u>Reference</u>	
<u>Discover Identity</u>	ACK, NAK, BUSY	6.4.4.3.1	
Discover SVIDs	ACK, NAK, BUSY	6.4.4.3.1.10	
<u>Discover Modes</u>	ACK, NAK, BUSY	6.4.4.3.3	
<u>Enter Mode</u>	ACK. NAK	6.4.4.3.4	
<u>Exit Mode</u>	ACK	6.4.4.3.5	

Table 6-22 Commands and Responses

Page 182

<u>Command</u>	Allowed Response	<u>Reference</u>
Attention	None	6.4.4.3.6

Examples of Command usage can be found in Appendix G.

6.4.4.3.1 Discover Identity

The *Discover Identity* Command is provided to enable an Initiator (DFP) to identify its Port Partner and for an Initiator (Source or DFP) to identify the attached Cable Plug (Responder).

The SVID in the *Discover SVIDs* Command shall be set to the *PD SID* (see Table 6-21) by both the Initiator and the Responder for this Command.

The **Discover Identity** Command sent back by the Responder contains an ID Header, a Cert Stat VDO and some Type specific VDOs which depend on the Product Type (see Figure 6-5). This specification defines the following Type specific VDOs:

• Product VDO (see Section 6.4.4.3.1.8)

• Cable VDO (see Section 6.4.4.3.1.9).

• Alternate Mode Adapter VDO (see Section 6.4.4.3.1.10)

Figure 6-5 Discover Identity Command response

Header	VDM Header	ID Header	Cort Stat VDO	04 Type Specific VDO(s)
No. of Data Objects = 3-7		IDTIEader	Cert Stat VDO	04 Type Specific VDO(3)

6.4.4.3.1.1 ID Header

The ID Header contains the Vendor ID corresponding to the Power Delivery Product. The fields in the ID Header shall be as defined in Table 6-23.

Table 6-23 ID Header

<u>Bit(s)</u>	Description	<u>Reference</u>
<u>B31</u>	Data Capable as USB Host:	
	Shall be set to one if the product is	
	capable of enumerating USB Devices.	
	Shall be set to zero otherwise	
<u>B30</u>	Data Capable as a USB Device:	
	• Shall be set to one if the product is capable of enumerating as a USB Device.	
	Shall be set to zero otherwise	
<u>B2927</u>	Product Type:	
	• 000b – Undefined	
	• 001b – Hub	
	• 010b – Peripheral	
	• 011b – Passive Cable	
	• 100b – Active Cable	
	• 101b – Alternate Mode Adapter (AMA)	
	• 111b110b – Reserved, shall not be used.	
<u>B26</u>	Modal Operation Supported:	
USB Power Del	ivery Specification Revision 42.0. Version 1.0	Page 183

<u>Bit(s)</u>	Description	<u>Reference</u>
	Shall be set to one if the product supports Modal Operation. Shall be set to zero otherwise	
<u>B2516</u>	Reserved. Shall be set to zero.	
<u>B150</u>	<u>16-bit unsigned integer. USB Vendor ID</u>	[USB2.0] <mark>/</mark> [USB3.1]

6.4.4.3.1.2 Data Capable as a USB Host

The Data Capable as a USB Host field is used to indicate whether or not the Port has a USB Host Capability.

6.4.4.3.1.3 Data Capable as a USB Device

The Data Capable as a USB Device field is used to indicate whether or not the Port has a USB Device Capability.

6.4.4.3.1.4 Product Type

The Product Type field indicates the type of Product, whether a VDO will be returned and if so the type of VDO to be returned. Table 6-24 defines the VDOs which shall be returned.

Product Type	Description	<u>VDO</u>	<u>Reference</u>
<u>Undefined</u>	Shall be used where no other Product Type value is appropriate.		
<u>Hub</u>	<u>Shall be used when the Product is a USB</u> <u>Hub.</u>	<u>Product VDO</u>	6.4.4.3.1.8
<u>Peripheral</u>	<u>Shall be used when the Product is a USB</u> <u>Device other than a USB Hub.</u>	<u>Product VDO</u>	6.4.4.3.1.8
Active Cable	Shall be used when the Product is a cable that incorporates signal conditioning circuits.	<u>Cable VDO</u>	6.4.4.3.1.9
Passive Cable	<u>Shall be used when the Product is a cable</u> <u>that does not incorporate signal</u> <u>conditioning circuits.</u>	<u>Cable VDO</u>	6.4.4.3.1.9
<u>Alternate Mode</u> <u>Adapter</u>	<u>Shall be used when the Product is a USB</u> <u>Device that supports one or more</u> <u>Alternate Modes.</u>	<u>Product VDO</u> <u>AMA VDO</u>	6.4.4.3.1.10

Table 6-24 Product Types

6.4.4.3.1.5 Modal Operation Supported

The Modal Operation Supported bit is used to indicate whether or the not the Product supports Modes.

6.4.4.3.1.6 Vendor ID

Manufacturers who have a Vendor ID assigned by USB-IF shall set the Vendor ID field to this value. For USB Devices or Hubs which support USB communications the Vendor ID field shall be identical to the Vendor ID field defined in the product's USB Device Descriptor (see [USB2.0] and [USB3.0]).

Manufacturers who do not have a Vendor ID assigned by USB-IF shall set the Vendor ID field to *Vendor ID Unassigned*.

Page 184

6.4.4.3.1.7 Cert Stat VDO

The Cert Stat VDO contains the Test ID (TID) allocated by USB-IF during certification. The fields in the Cert Stat VDO shall be as defined in Table 6-25.

Table 6-25 Cert Stat VDO

<u>Bit(s)</u>	Description	<u>Reference</u>
<u>B3120</u>	Reserved, shall be set to zero.	
<u>B190</u>	20-bit unsigned integer	USB-IF compliance

6.4.4.3.1.8 Product VDO

The Product VDO shall be returned when the Product Type is Hub, Peripheral or Alternate Mode Adapter. The Product VDO contains identity information relating to the product. The fields in the Product VDO shall be as defined in Table 6-26.

Table 6-26 Product VDO

<u>Bit(s)</u>	Description	<u>Reference</u>
<u>B3116</u>	<u>16-bit unsigned integer. USB Product ID</u>	[USB2.0] <mark>/</mark> [USB3.1]
<u>B150</u>	<u>16-bit unsigned integer. bcdDevice</u>	[USB2.0] <u>/</u> [USB3.1]

Manufacturers should set the USB Product ID field to a unique value identifying the product and should set the bcdDevice field to a version number relevant to the release version of the product. For USB Devices or Hubs which support USB communications the Product ID and bcdDevice fields shall be identical to the Product ID and bcdDevice fields defined in the product's USB Device Descriptor (see [USB2.0] and [USB3.1]).

When the Vendor ID field in the ID Header is set to Vendor ID Unassigned the Product VDO shall not be sent.

6.4.4.3.1.9 Cable VDO

The Cable VDO defined in this section shall be sent when the Product Type is given as Passive or Active Cable. Table 6:27 defines the Cable VDO which shall be sent.

		Table 6-27 Cable VDO
Bit(s)	Field	Description
<u>B3128</u>	Cable HW Version	0000b1111b assigned by the VID owner
<u>B2724</u>	Cable Firmware Version	0000b1111b assigned by the VID owner
<u>B2320</u>	Reserved	Shall be set to zero.

6.4.4.3.2 Discover SVIDs

The **Discover SVIDs** Command is used by an Initiator (DFP) to determine the SVIDs for which a Responder (UFP or Cable Plug) has Modes. The **Discover SVIDs** Command is used in conjunction with the **Discover Modes** Command in the Discovery Process to determine which Modes a device supports. The list of SVIDs is always terminated with one or two 0x0000 SVIDs.

The SVID in the *Discover SVIDs* Command shall be set to the *PD SID* (see Table 6-21) by both the Initiator and the Responder for this Command. The SVIDs are returned 2 per VDO (see Table 6-29). If there are an odd number, the remaining half of the last used VDO shall be set to zero. A Responder that does not support any SVIDs shall return a NAK.

If the Responder supports more than 12 SVIDs then this Command may be executed multiple times until a Discover SVIDs VDO is returned ending either with a SVID value of 0x0000 or containing two SVIDs with values of 0x0000.

Figure 6-6 shows an example response to the *Discover SVIDs* Command request with two VDOs containing three SVIDs. Figure 6-7 shows an example response with two VDOs containing four SVIDs followed by an empty VDO to terminate the response. Figure 6-8 shows an example response with six VDOs containing twelve SVIDs followed by an additional request that returns an empty VDO indicating there are no more SVIDs to return.

Table 6-29 Discover SVIDs Responder VDO					
<u>Bit(s)</u>	<u>Field</u>	Description			
<u>B3116</u>	<u>SVID n</u>	<u>16 bit unsigned integer, assigned by the USB-IF or</u> <u>0x0000 if this is the last VDO and the Responder supports an</u> <u>even number of SVIDs.</u>			
<u>B150</u>	<u>SVID n+1</u>	<u>16 bit unsigned integer, assigned by the USB-IF or</u> <u>0x0000 if this is the last VDO and the Responder supports an odd</u> <u>or even number of SVIDs.</u>

No. of Data Objects = 1-7	VDIMITIEAUEI	0x0000 (B3116)	0x0000 (B150)

6.4.4.3.3 Discover Modes

The *Discover Modes* Command is used by an Initiator (DFP) to determine the Modes a Responder (UFP or Cable Plug) supports for a given ID. The Responder to the *Discover Modes* Command request shall return a Message Header with the Number of Data Objects field set to a value of 1 to 7 (the actual value is the number of Mode objects plus one). If the ID is a VID, the structure and content of the VDO is left to the Vendor. If the ID is a SID, the structure and content of the VDO is defined by the relevant Standard. A Responder that does not support any Modes shall return a NAK. Figure 6-9 shows an example of a *Discover Modes* Command response from a Responder which supports three Modes for a given SVID.

Figure 6-9 Example Discover Modes response for a given SVID with 3 Modes

Header No. of Data Objects = 1-7	VDM Header	Mode 1	Mode 2	Mode 3
-------------------------------------	------------	--------	--------	--------

6.4.4.3.4 Enter Mode Command

The *Enter Mode* Command is used by an Initiator (DFP) to command a Responder (UFP or Cable Plug) to enter a specified Mode of operation. Only DFP is allowed to initiate the Enter Mode Process which it starts after it has successfully completed the Discovery Process.

The value in the Object Position field shall indicate to which Mode in the *Discover Modes* Command the VDO refers (see Figure 6-9). The value 1 always indicates the first Mode as it is the first object following the VDM header. The value 2 refers to the next Mode and so forth.

Before entering a Mode, by sending the *Enter Mode* Command request, that requires the reconfiguring of any pins on entry to that Mode, the Initiator shall ensure that those pins being reconfigured are placed into the USB Safe State. Before entering a Mode that requires the reconfiguring of any pins, the Responder shall ensure that those pins being reconfigured are placed into either USB operation or the USB Safe State.

<u>A device may support multiple Modes with one or more active at any point in time. Any interactions between them</u> are the responsibility of the Standard or Vendor. Where multiple Modes are active at the same time Modal Operation shall start on entry to the first Mode.

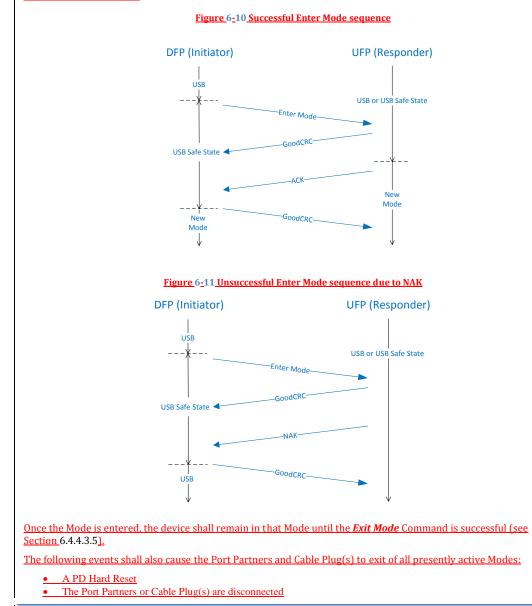

<u>On receiving an *Enter Mode* Command request the Responder shall respond with either an ACK or a NAK response.</u> The Responder is not allowed to return a BUSY response.

If the Responder responds to the *Enter Mode* Command request with an ACK, the Responder shall enter the Mode before sending the ACK. The Initiator shall enter the Mode on reception of the ACK. Receipt of the *GoodCRC* message corresponding to the ACK confirms to the Responder that the Initiator has entered the Mode and is ready to operate.

If the Responder responds to the *Enter Mode* Command request with a NAK, the Mode is not entered. If not presently in Modal Operation the Initiator shall return to USB operation. If not presently in Modal Operation the Responder shall remain in either USB operation or the USB Safe State.

If the Initiator fails to receive a response within *tVDMWaitModeEntry* it shall not enter the Mode but return to USB operation.

Figure 6-10 shows the sequence of events during the transition between USB operation and entering a Mode. It illustrates when the Responder's mode changes and when the Initiator's mode changes. Figure 6-11 illustrates that when the Responder returns a NAK the transition to a Mode do not take place and the Responder and Initiator remain in their default USB roles.

Page **190**

- A Data Role Swap
- A Cable Reset (only exits Modes active in the Cable Plug(s))

The Initiator shall return to USB Operation within *tVDMExitMode* of a disconnect or of *Hard Reset* signaling being detected. During the Data Role Swap Process an Initiator shall return to USB Operation prior to changing its CC resistor.

The Responder shall return to either USB operation or USB Safe State within *tVDMExitMode* of a disconnect or of *Hard Reset* signaling being detected. During the Data Role Swap Process a Responder shall go to either USB Operation or USB Safe Mode prior to transitioning its CC resistor.

6.4.4.3.5 Exit Mode Command

The *Exit Mode* Command is used by an Initiator (DFP) to command a Responder (UFP or Cable Plug) to exit its Mode of operation and return to normal USB operation. Only the DFP is allowed to initiate the Exit Mode Process.

The value in the Object Position field shall indicate to which Mode in the *Discover Modes* Command the VDO refers (see Figure 6-9) and shall have been used previously in an *Enter Mode* Command request for a Mode which is currently active. The value 1 always indicates the first Mode as it is the first object following the VDM header. The value 2 refers to the next Mode and so forth. A value of 111b in the Object Position field shall indicate that all Modes shall be exited.

The Responder shall exit the Mode before sending the response message. The Initiator shall exit the Mode before sending *GoodCRC* message in response to the ACK. Receipt of the *GoodCRC* message confirms to the Responder that the Initiator has exited the Mode. The Responder is not allowed to return either a NAK or a BUSY acknowledgement. An Initiator which fails to receive an ACK within *tVDMWaitModeExit* or receives a NAK or BUSY response shall exit the Mode.

Figure 6-12 shows the sequence of events during the transition between exiting a Mode and USB operation. It illustrates when the Responder's mode changes and when the Initiator's mode changes.

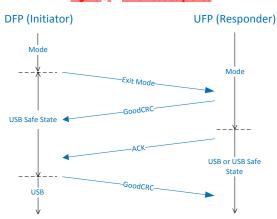

Figure 6-12 Exit Mode sequence

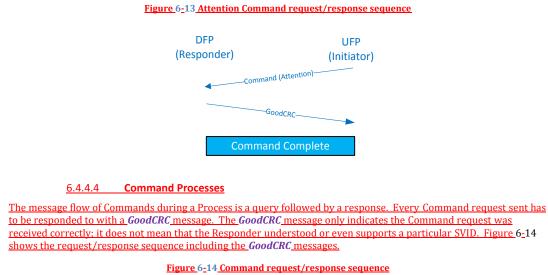

6.4.4.3.6 Attention

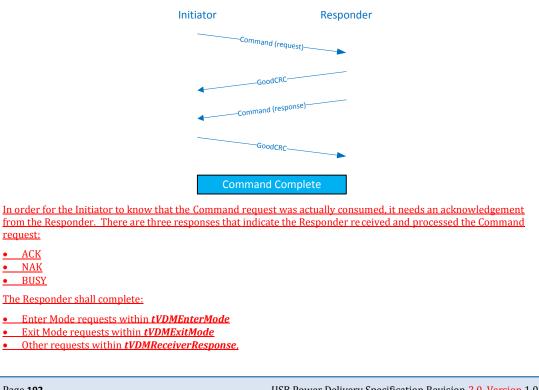

The Attention Command may be used by the Initiator (UFP) to notify the Responder (DFP) that it requires service.

The value in the Object Position field shall indicate to which Mode in the **Discover Modes** Command the VDO refers (see Figure 6-9) and shall have been used previously in an **Enter Mode** Command request for a Mode which is currently active. The value 1 always indicates the first Mode as it is the first object following the VDM header. The

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

Page 192

An Initiator not receiving a response within the following times shall timeout and return to either the *PE SRC Ready* or *PE SNK Ready* state (as appropriate):

Enter Mode requests within *tVDMWaitModeEntry*

- Exit Mode requests within tVDMWaitModeExit
- Other requests within *tVDMSenderResponse*.

The Responder shall respond with:

ACK if it recognizes the SVID and can process it at this time
 NAK

if it recognizes the SVID but cannot process the Command request

o or if it does not recognize the SVID

o or if it does not support the Command

BUSY if it recognizes the SVID and the Command but cannot process the Command request at this time

6.4.4.1 Discovery Process

The Initiator (DFP) always begins the Discovery Process. The Discovery Process has two phases. In the first phase, the **Discover SVIDs** Command request is sent by the Initiator to get the list of SVIDs the Responder supports. In the second phase, the Initiator sends a **Discover Modes** Command request for each SVID supported by both the Initiator and Responder.

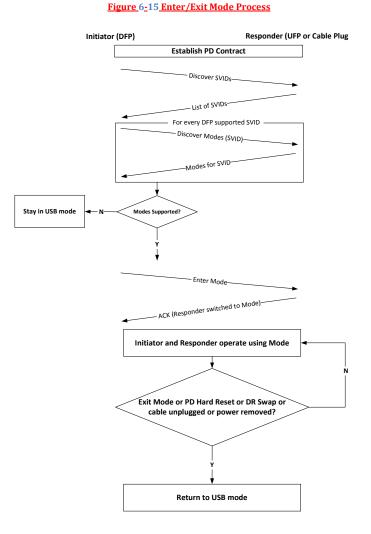

The result of the Discovery Process is that both the Initiator (DFP) and Responder (UFP or Cable Plug) identify the Modes they mutually support. It is then up to the Initiator to select the Mode it wants to use and use the *Enter Mode* Command using the SVID and Object Position appropriate for that Mode.

6.4.4.4.2 Enter Vendor Mode / Exit Vendor Mode Processes

The Initiator (DFP), upon finding a Mode it supports, uses the Enter Mode Command to enable the Mode.

The Responder (UFP or Cable Plug) and Initiator continue using the Mode until the Mode operation is terminated. In a managed termination, using the *Exit Mode* Command, the Mode shall be exited in a controlled manner as described in Section 6.4.4.3.5. In an unmanaged termination, triggered by a Power Delivery Hard Reset (i.e., *Hard Reset* signaling sent by either Port Partner) or a Data Role Swap or by cable detach (device unplugged), the Mode shall still be exited but there may not be a transition through the USB Safe State. In both the managed and unmanaged terminations the Initiator and Responder return to USB operation as defined in *[USBType-C1.0]* following an exit from a Mode.

The overall message flow is illustrated in Figure 6-15.

6.4.4.5 VDM Message Timing and Normal PD messages

Any Command Process or other VDM sequence may be interrupted by any other USB PD message. The Vendor or Standards defined state operation shall comprehend this and continue to operate as expected when processing any other USB PD messages.

The timing and interspersing of VDMs between regular PD messages shall be done without perturbing the PD message sequences. This requirement shall apply to both Unstructured VDMs and Structured VDMs. Structured and Unstructured VDM sequences shall not be atomic although they may require a strict albeit interrupted ordering.

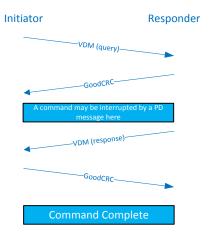

The use of Structured VDMs by an Initiator shall not interfere with the normal PD message timing requirements nor shall either the Initiator or Responder interrupt a PD message sequence (e.g. Power Negotiation, Power Role Swap, Data Role Swap etc.). The use of Unstructured VDMs shall not interfere with normal PD message timing.

Page 194

<u>VDM sequences shall be interruptible after the return of a *GoodCRC* message has been completed. In the case where there is an error in transmission of the *Vendor Defined* Message, as for any other PD message, the *Vendor Defined* Message will not be retried, but instead the incoming message will be processed by the Policy Engine. This means that the *Vendor Defined* Message will need to be re-sent after the USB PD message sequence has completed.</u>

The overall message flow is illustrated in Figure 6-16.

Figure 6-16 Vendor Defined Message interrupted by a Power Delivery message

6.5 Timers

All the following timers are defined in terms of bits on the bus regardless of where they are implemented in terms of the logical architecture. This is to ensure a fixed reference for the starting and stopping of timers. It is left to the implementer to ensure that this timing is observed in a real system.

6.5.1 CRCReceiveTimer

The *CRCReceiveTimer* shall be used by the sender's Protocol Layer to ensure that a message has not been lost. Failure to receive an acknowledgement of a message (a *GoodCRC* message) whether caused by a bad CRC on the receiving end or by a garbled message within *tReceive* is detected when the *CRCReceiveTimer* expires.

The sender's Protocol Layer response when a *CRCReceiveTimer* expires shall be, depending on the message, to either retry *nRetryCount* times, or to give up and assume communications have been lost. Sending of the Preamble corresponding to the retried message shall start within *tRetry* of the *CRCReceiveTimer* expiring.

The *CRCReceiveTimer* shall be started when the last bit of the message *EOP* has been transmitted on V_{BUS}-by the Physical Layer. The *CRCReceiveTimer* shall be stopped when the last bit of the *EOP* corresponding to the *GoodCRC* message has been received by the Physical Layer.

The Protocol Layer receiving a message shall respond with a *GoodCRC* message within *tTransmit* in order to ensure that the sender's *CRCReceiveTimer* does not expire. The *tTransmit* shall be measured from when the last bit of the message *EOP* has been received by the Physical Layer until the first bit of the <u>preamblePreamble</u> of the *GoodCRC* message has been transmitted on *V*_{BUS} by the Physical Layer.

6.5.2 BISTReceiveErrorTimer

The *BISTReceiveErrorTimer* shall be used by the sender's Protocol Layer during BIST operation to detect when a <u>frameTest Frame</u> has been lost and to trigger the transmission of the next <u>test frameTest Frame</u>. Failure to receive an acknowledgement of a <u>frameTest Frame</u> (*BIST* message with a Data Object of *Returned BIST Counters*) whether caused by a bad CRC on the receiving end or by a garbled message within *tBISTReceive* is detected when the *BISTReceiveErrorTimer* expires.

The sender's Protocol Layer response when a BISTReceiveErrorTimer expires shall be to continue operation.

The *BISTReceiveErrorTimer* shall be started when the *nBISTPayload* bit past the last bit of the *SOP** has been transmitted on V_{BUS} by the Physical Layer. The *BISTReceiveErrorTimer* shall be stopped when the last bit of the *EOP* corresponding to the *BIST* message with a Data Object of *Returned BIST Counters* has been received by the Physical Layer.

The Protocol Layer receiving a test frameTest Frame shall respond with a *BIST* message with a Data Object of *Returned BIST Counters* within *tTransmit* in order to ensure that the sender's *BISTReceiveErrorTimer* does not expire. The *tTransmit* shall be measured from when the last bit of the test frameTest Frame has been received by the Physical Layer until the first bit of the preamblePreamble of the *BIST* message has been transmitted on V_{BUS} by the Physical Layer.

6.5.3 SenderResponseTimer

The *SenderResponseTimer* shall be used by the sender's <u>Protocol LayerPolicy Engine</u> to ensure that a message requesting a response (e.g. *Get_Source_Cap* message) is responded to within a bounded time of *tSenderResponse*. Failure to receive the expected response is detected when the *SenderResponseTimer* expires.

The <u>Protocol Layer'sPolicy Engine's</u> response when the *SenderResponseTimer* expires shall be dependent on the message sent (see Section 8.3).

The *SenderResponseTimer* shall be started from the time the last bit of the *GoodCRC* message *EOP* (i.e. the *GoodCRC* message corresponding to the message requesting a response) has been received on V_{BUS}-by the Physical Layer. The *SenderResponseTimer* shall be stopped when the last bit of the expected response message *EOP* has been received by the Physical Layer.

The receiver of a message requiring a response shall respond within *tReceiverResponse* in order to ensure that the sender's *SenderResponseTimer* does not expire.

The *tReceiverResponse* time shall be measured from the time the last bit of the message *EOP* has been received by the Physical Layer until the first bit of the response message <u>preamblePreamble</u> has been transmitted on V_{BUS} by the Physical Layer.

6.5.4 Activity Timers

The Protocol Layer uses activity timers to ensure that there is adequate activity $\frac{On V_{BUS}}{One}$ -to allow the Source to know that a Sink is still present. The activity timer's value and use are specific to the role the <u>Devicedevice</u> is playing – either Source or Sink. The values are selected to allow one missed response to a *Ping* message without the Source returning its output to the default state. <u>Activity Timers are not used in conjunction with the [USBType-C1.0]</u> connector (see Section 6.3.5.2)

6.5.4.1 SourceActivityTimer

A PD Source is required to maintain a minimal level of bus traffic. It does so by periodically sending a *Ping* message during a connection to a PD Sink, whenever there is no other message traffic.

In order to maintain bus activity the Source shall start its *SourceActivityTimer* as described in Section 8.3.3.2. Whenever the timer expires, after *tSourceActivity*, the Source shall send a *Ping* message. It shall then initialize and restart the *SourceActivityTimer* ready for the next *Ping* message. This ensures that message activity is maintained in cases where the time between normal messages would exceed the Sink's activity timeout. For example power supply transitions may take longer than the activity timeout meaning that a *Ping* is sent prior to the *PS_RDY* message.

Page 196

USB Power Delivery Specification Revision 2.0, Version 1.0.

Field Code Changed

The *SourceActivityTimer* shall be reset and restarted on entry to the *PE SRC Ready* state (see Section 8.3.3.2). This occurs when:

- The last bit of the *GoodCRC* message *EOP* has been received on V_{BUS}-by the Physical Layer (i.e. a message has been successfully sent prior to entering the <u>PE SRC ReadyReady</u> state).
- The last bit of any message *EOP* has been received on *V*_{BUS}-by the Physical Layer.
- The *SenderResponseTimer* times out.

A failure to see a *GoodCRC* message in response to a *Ping* message within *tReceive* (after *nRetryCount* retries) is indicative of a communications failure. This shall cause the Source to send a *Soft Reset* message, transmission of which shall be completed within *tSoftReset* of the *CRCReceiveTimer* expiring (see Section 6.7.1).

See Section 8.3.3.6 for more details of when *Ping* messages are transmitted.

6.5.4.2 SinkActivityTimer

The Sink shall support the *SinkActivityTimer*. Sinks shall observe an absence of a *Ping*, or other messages within *tSinkActivity*, as an indication of communications failure and as such shall issue *Hard Reset* signaling in order to return to default operation. USB Default Operation. Initialization and restarting of the *SinkActivityTimer* is described in Section 8.3.3.3.7. Any additional action taken is Device implementation specific. Sinks shall also use the absence of V_{BUS} to return to default operationUSB Default Operation unless this is part of an ongoing <u>Power Role</u> Swap sequence.

The *SinkActivityTimer* shall be re-initialized and re-started when the last bit of a *Ping*, or any other message *EOP*, has been received by the Physical Layer.

Note: to avoid triggering unnecessary Hard Resets the *SinkActivityTimer* shall not be run when the Source is operating in its default role, at , in the Ready state. This is because messages are optional in this case, (see Section).Sink is:

- Using a [USBType-C1.0] connector or
- Using a Type-A operating in its default Source role or using a Type-B connector operating in its default Sink role, at vSafe5V, in the PE SNK Ready state. This is because Ping messages are optional in these cases, (see Section 6.3.5).

See Section 8.3.3.3 for more details of when the *SinkActivityTimer* is run.

6.5.5 Capability Timers

Sources and Sinks use Capability Timers to determine attachment of a PD <u>capable Device</u>. By periodically sending or requesting capabilities it is possible to determine PD <u>Devicedevice</u> attachment when a response is received.

6.5.5.1 SourceCapabilityTimer

APrior to a successful negotiation a Source shall use the *SourceCapabilityTimer* to periodically send out a *Source Capabilities* message every *tTypeCSendSourceCap* for the Type-C connector and *tSendSourceCap* prior to a successful negotiation for all other connectors while:

- An A-plug is attached
- The Source is not in an active connection with a PD Sink Port

Whenever there is a *SourceCapabilityTimer* timeout the Source shall send a *Source Capabilities* message. It shall then re-initialize and restart the *SourceCapabilityTimer*. The *SourceCapabilityTimer* shall be stopped when the last bit of the *EOP* corresponding to the *GoodCRC* message has been received by the Physical Layer since a PD connection has been established. At this point the Source waits for a *Request* message or a response timeout.

See Section 8.3.3.2 more details of when Source Capabilities messages are transmitted.

6.5.5.2 SinkWaitCapTimer

The Sink shall support the *SinkWaitCapTimer*. When a Sink observes an absence of *Source Capabilities* messages, after V_{BUS} is present, for a duration of *tTypeCSinkWaitCap* for the Type-C connector and *tSinkWaitCap* after V_{BUS} is present, for all other connectors the Sink shall issue *Hard Reset* signaling in order to restart the sending of *Source Capabilities* messages by the Source (see Section 6.6.4).

See Section 8.3.3.3 for more details of when the SinkWaitCapTimer are run.

6.5.6 SinkRequestTimer

The *SinkRequestTimer* is used to ensure that the time between Sink *Request* messages, after a *Wait* message has been received from the Source, is a minimum of *tSinkRequest* (see Section 6.3.12).

The *SinkRequestTimer* shall be started when a *Wait* message has been received and shall be stopped if any other message is received or during a Hard Reset.

The Sink shall wait at least *tSinkRequest*, after receiving a *Wait* message, before issuing a new *Request* message. Whenever there is a *SinkRequestTimer* timeout the Sink may send a *Request* message. It shall then re-initialize and restart the *SinkRequestTimer*.

6.5.7 Power Supply Timers

6.5.7.1 **PSTransitionTimer**

The *PSTransitionTimer* is used by the Policy Engine to timeout on a *PS_RDY* message. It is started when a request for a new Capability has been accepted and will timeout after *tPSTransition* if a *PS_RDY* message has not been received. This condition leads to a Hard Reset and a return to default operation.USB Default Operation. The *PSTransitionTimer* relates to the time taken for the Source to transition from one voltage, or current level, to another

(see Section 7.1). The *PSTransitionTimer* shall be started when the last bit of an *Accept* or *GotoMin* message *EOP* has been received on

 $\frac{V_{BUS}}{V_{BUS}}$ by the Physical Layer. The *PSTransitionTimer* shall be stopped when the last bit of the *PS_RDY* message *EOP* has been received by the Physical Layer.

6.5.7.2 **PSSourceOffTimer**

The *PSSourceOffTimer* is used by the Policy Engine in Dual-Role Device that is currently acting as a Sink to timeout on a *PS_RDY* message during a <u>Power Role</u> Swap sequence. This condition leads to a Hard Reset and return to <u>default</u> <u>operationUSB Default Operation</u>.

If a <u>PR_Swap</u> message request, has been sent by the Dual-Role Device currently acting as a Source the Sink can respond with an *Accept* message. When the last bit of the *EOP* of the *GoodCRC* message corresponding to this *Accept* message is received by the Sink, then the *PSSourceOffTimer* shall be started.

If a <u>PR</u>_Swap message request, has been sent by the Dual-Role Device currently acting as a Sink the Source can respond with an *Accept* message. When the last bit of the *EOP* of this *Accept* message is received by the Sink then the *PSSourceOffTimer* shall be started.

The **PSSourceOffTimer** shall be stopped when:

• The last bit of the EOP of the PS_RDY message is received.

The *PSSourceOffTimer* relates to the time taken for the remote Dual-Role Device to stop supplying power (see also Sections 7.3.9 and 7.3.10). The timer shall time out if a *PS_RDY* message has not been received from the remote Dual-Role Device within *tPSSourceOff* indicating this has occurred.

Field Code Changed

Field Code Changed

Page 198

6.5.7.3 **PSSourceOnTimer**

The *PSSourceOnTimer* is used by the Policy Engine in Dual-Role Device that has just stopped sourcing power and is waiting to start sinking power to timeout on a *PS_RDY* message during a <u>swap.Power Role Swap.</u> This condition leads to a Hard Reset and return to <u>default operationUSB Default Operation</u>.

The **PSSourceOnTimer** shall be started when:

 The last bit of the *EOP* of the *GoodCRC* message corresponding to the transmitted *PS_RDY* message is received by the Physical Layer

The **PSSourceOnTimer** shall be stopped when:

The last bit of the EOP of the PS_RDY message is received by the Physical Layer

The *PSSourceOnTimer* relates to the time taken for the remote Dual-Role Device to start sourcing power (see also Sections 7.3.9 and 7.3.10) and will time out if a *PS_RDY* message indicating this has not been received within *tPSSourceOn*.

6.5.8 NoResponseTimer

The *NoResponseTimer* is used by the Policy Engine in a Source or Sink to determine that its Port Partner is not responding after a Hard Reset. When the *NoResponseTimer* times out, the Policy Engine shall issue up to *nHardResetCount* additional Hard Resets before determining that the Port Partner is non-responsive to USB Power Delivery messaging.

If the Sink fails to receive a *Source Capabilities* message received within *tNoResponse* of:

- The last bit of a *Hard Reset* signaling being sent by the PHY layerLayer if the *Hard Reset* signaling was initiated by the Sink
- The last bit of a *Hard Reset* signaling being received by the PHY <u>layerLayer</u> if the *Hard Reset* signaling was initiated by the Source

Then the Sink shall issue additional Hard Resets up to *nHardResetCount* times (see Section 6.7.2).

If the Source fails to receive a *GoodCRC* message in response to a *Source Capabilities* message within *tNoResponse* of:

- The last bit of a *Hard Reset* signaling being sent by the PHY layerLayer if the *Hard Reset* signaling was initiated by the Sink
- The last bit of a *Hard Reset* signaling being received by the PHY <u>layerLayer</u> if the *Hard Reset* signaling was initiated by the Source

Then the Source shall issue additional Hard Resets up to *nHardResetCount* times (see Section 6.7.2).

For a non-responsive device, the Policy Engine in a Source may either decide to continue sending *Source Capabilities* messages or to go to non-USB Power Delivery operation and cease sending *Source Capabilities* messages.

6.5.9 BIST Timers

6.5.8.1<u>6.5.9.1</u>tBISTMode

tBISTMode is used to define the maximum time that a UUT has to enter a BIST mode when requested by a Tester.

A UUT shall enter the appropriate BIST mode within *tBISTMode* of the last bit of the *EOP* of the *BIST* message used to initiate the test is received by the Physical Layer. When in BIST Receiver Mode the UUT is ready to receive a Test Pattern Frame from the Tester and to respond appropriately with the *BISTErrorCounter* (see Sections 6.5.2<u>6.5.2</u> and 6.4.3.1<u>6.4.3.1</u>). When in BIST Transmit mode the UUT starts transmitting Test Pattern Frames (see Section 6.4.3.2<u>6.4.3.2</u>). For modes transmitting a continuous carrier signal (i.e. carrier modes and eye pattern) transmission shall start as soon as the UUT enters BIST mode.

6.5.8.26.5.9.2 tBISTResponse

tBISTResponse defines the maximum time which a UUT has to respond with a Test Frame when operating in BIST Transmit Mode (see Section 6.4.3.2).

6.5.8.36.5.9.3 BISTStartTimer

The *BISTStartTimer* is used by the Tester to ensure that there is a delay of more than *tBISTMode* before sending the first Test Pattern Frame after requesting *BIST Receiver Mode*. The *BISTStartTimer* is initialized and run once the *BIST* message containing the data object has been sent i.e. a *GoodCRC* message has been received. The first Test Pattern Frame is not sent until after the *BISTStartTimer* has expired.

6.5.10 Power Role Swap Timers

6.5.8.46.5.10.1 SwapRecoveryTimer

The *SwapRecoveryTimer* is used by a Provider/Consumer acting in Sink role during a Hard Reset. The Provider/Consumer shall wait *tSwapRecover* after either sending or receiving *Hard Reset* signaling before turning on its Power Source.

6.5.10.2 SwapSourceStartTimer

The *SwapSourceStartTimer* shall be used by the new Source, after a Power Role Swap, to ensure that it does not send *Source Capabilities* Message before the new Sink is ready to receive the *Source Capabilities* Message. The new Source shall not send the *Source Capabilities* Message earlier than *tSwapSourceStart* after the last bit of the *EOP* of *GoodCRC* Message sent in response to the *PS_RDY* Message sent by the new Source indicating that its power supply is ready. The Sink shall be ready to receive a *Source Capabilities* Message *tSwapSinkReady* after having sent the last bit of the *EOP* of *GoodCRC* Message sent in response to the *PS_RDY* Message sent by the new Source indicating that its power supply is ready.

6.5.11 HardResetCompleteTimer

The *HardResetCompleteTimer* is used by the Protocol Layer in the case where it has asked the PHY Layer to send *Hard Reset* signaling and the PHY Layer is unable to send the signaling within a reasonable time due to a non-idle channel. If the PHY Layer does not indicate that the *Hard Reset* signaling has been sent within *tHardResetComplete* of the Protocol Layer requesting transmission, then the Protocol Layer shall inform the Policy Engine that the *Hard Reset* signaling has been sent in order to ensure the power supply is reset in a timely fashion.

6.5.12 Structured VDM Timers

6.5.12.1 VDMResponseTimer

The *VDMResponseTimer* shall be used by the Initiator's Policy Engine to ensure that a Structured VDM Command request needing a response (e.g. *Discover Identity* Command request) is responded to within a bounded time of *tVDMSenderResponse*. Failure to receive the expected response is detected when the *VDMResponseTimer* expires.

The Policy Engine's response when the *VDMResponseTimer* expires shall be dependent on the message sent (see Section 8.3).

The *VDMResponseTimer* shall be started from the time the last bit of the *GoodCRC* message *EOP* (i.e. the *GoodCRC* message corresponding to the VDM Command requesting a response) has been received by the Physical Layer. The *VDMResponseTimer* shall be stopped when the last bit of the expected VDM Command response *EOP* has been received by the Physical Layer.

The receiver of a message requiring a response shall respond within *tVDMReceiverResponse* in order to ensure that the sender's *VDMResponseTimer* does not expire.

The *tVDMReceiverResponse* time shall be measured from the time the last bit of the message *EOP* has been received by the Physical Layer until the first bit of the response message Preamble has been transmitted by the Physical Layer.

Page 200

6.5.12.2 VDMModeEntryTimer

The **VDMModeEntryTimer** shall be used by the Initiator's Policy Engine to ensure that the response to a Structured VDM **Enter Mode** Command request (ACK or NAK with ACK indicating that the requested Mode has been entered) arrives within a bounded time of **tVDMWaitModeEntry**. Failure to receive the expected response is detected when the **VDMModeEntryTimer** expires.

The Policy Engine's response when the *VDMModeEntryTimer* expires is to inform the Device Policy Manager (see Section 8.3.3.8.6).

The *VDMModeEntryTimer* shall be started from the time the last bit of the *GoodCRC* message *EOP* (i.e. the *GoodCRC* message corresponding to the VDM Command request) has been received by the Physical Layer. The *VDMModeEntryTimer* shall be stopped when the last bit of the expected Structured VDM Command response (ACK. NAK or BUSY) *EOP* has been received by the Physical Layer.

The receiver of a message requiring a response shall respond within *tVDMEnterMode* in order to ensure that the sender's *VDMModeEntryTimer* does not expire.

The *tVDMEnterMode* time shall be measured from the time the last bit of the message *EOP* has been received by the Physical Layer until the first bit of the response message Preamble has been transmitted by the Physical Layer.

6.5.12.3 VDMModeExitTimer

The **VDMModeExitTimer** shall be used by the Initiator's Policy Engine to ensure that the ACK response to a Structured VDM **Exit Mode** Command, indicating that the requested Mode has been exited, arrives within a bounded time of **tVDMWaitModeExit**. Failure to receive the expected response is detected when the **VDMModeExitTimer** expires.

The Policy Engine's response when the *VDMModeExitTimer* expires is to inform the Device Policy Manager (see Section 8.3.3.8.7).

The **VDMModeExitTimer** shall be started from the time the last bit of the **GoodCRC** message **EOP** (i.e. the **GoodCRC** message corresponding to the VDM Command requesting a response) has been received by the Physical Layer. The **VDMModeExitTimer** shall be stopped when the last bit of the expected Structured VDM Command response ACK **EOP** has been received by the Physical Layer.

The receiver of a message requiring a response shall respond within *tVDMExitMode* in order to ensure that the sender's *VDMModeExitTimer* does not expire.

The *tVDMExitMode* time shall be measured from the time the last bit of the message *EOP* has been received by the Physical Layer until the first bit of the response message Preamble has been transmitted by the Physical Layer.

6.5.12.4 tVDMBusy

The Initiator shall wait at least *tVDMBusy*, after receiving a BUSY Command response, before repeating the Structured <u>VDM request again.</u>

6.5.13 VCONN Timers

6.5.13.1 VCONNOnTimer

The VCONNOnTimer is used by the DFP or UFP during a VCONN Swap.

The VCONNOnTimer shall be started when:

• The last bit of the EOP of the Accept message is received by the DFP.

• The last bit of the EOP of GoodCRC message corresponding to the Accept message is received by the UFP.

The VCONNOnTimer shall be stopped when:

• The last bit of the EOP of the PS_RDY message is received by the DFP or UFP.

The DFP or UFP, prior to sending the **PS_RDY** message, shall have turned VCONN On.

USB Power Delivery Specification Revision <u>42</u>.0, <u>Version 1.0</u>

6.5.13.2 tVCONNSourceOff

The *tVCONNSourceOff* time applies during a Vconn swap. The initial VCONN source shall cease sourcing VCONN within *tVCONNSourceOff* of receipt of the last bit of the *EOP* of the *PS_RDY* message.

6.5.96.5.14 Time Values and Timers

Table 6-30 summarizes the values for the timers listed in this section. For each Timer Value, a given implementation shall pick a fixed value within the range specified. Table 6-31 lists the timers.

USB Power Delivery Specification Revision 2.0, Version 1.0.

Parameter	Value	Value (max)	Units	Section
i urumeter	(min)	Vulue (mux)	onits	Section

6.6 Counters

6.6.1 MessageID Counter

The *MessageIDCounter* is a rolling counter, ranging from 0 to *nMessageIDCount*, used to detect duplicate messages. This value is used for the *MessageID* field in the header of each transmitted message.

Each portPort shall maintain a copy of the last *MessageID* value received from its Port Partner. Devices that support multiple ports, such as Hubs, shall maintain copies of the last *MessageID* on a per Port basis. A DFP or Source which communicates using SOP* Packets shall maintain copies of the last *MessageID* for each type of *SOP**port basis it uses.

The transmitter shall use the *MessageID* in a *GoodCRC* message to verify that a particular message was received correctly. The receiver shall use the *MessageID* to detect duplicate messages.

6.6.1.1 Transmitter Usage

The Transmitter shall use the *MessageID* as follows:

 Upon receiving either *Hard Reset* signaling, or a *Soft Reset* message, the transmitter shall set its *MessageIDCounter* to zero and re-initialize its retry mechanism.

Page 204

- If a GoodCRC message with a MessageID matching the MessageIDCounter is not received before the CRCReceiveTimer expires, it shall retry the same packet up to nRetryCount times using the same MessageID.
- If a *GoodCRC* message is received with a *MessageID* matching the current *MessageIDCounter* before the *CRCReceiveTimer* expires, the transmitter shall re-initialize its retry mechanism and increment its *MessageIDCounter*.
- If the message is aborted by the higher layer protocol, the transmitter shall delete the message from itsit's transmit buffer, re-initialize its retry mechanism and increment its MessageIDCounter.

6.6.1.2 Receiver Usage

The Receiver shall use the *MessageID* as follows:

- When the first good packet is received after a reset, the receiver shall store a copy of the received MessageID value.
- For subsequent messages, if *MessageID* value in a received message is the same as the stored value, the receiver shall return a *GoodCRC* message with that *MessageID* value and drop the message (this is a retry of an already received message). Note: this shall not apply to the *Soft Reset* message which always has a *MessageID* value of zero.
- If *MessageID* value in the received message is different than the stored value, the receiver shall return a *GoodCRC* message with the new *MessageID* value, store a copy of the new *MessageID* value and process the message.

6.6.2 Retry Counter

The *RetryCounter* is used <u>by a DFP or UFP</u> whenever there is a message transmission failure (timeout of *CRCReceiveTimer*). If the *nRetryCount* retry fails, then the link shall be reset using the Soft Reset mechanism. <u>Cable</u> <u>Plugs shall not retry messages</u>.

6.6.3 Hard Reset Counter

The *HardResetCounter* is used to retry the Hard Reset whenever there is no response from the remote device (see Section 6.5.8). Once the Hard Reset has been retried *nHardResetCount* times then it shall be assumed that the remote device is non-responsive.

6.6.4 Capabilities Counter

The *CapsCounter* is used to count the number of *Source Capabilities* messages which have been sent by a Source at power up-or after a Hard Reset. Implementation of the *CapsCounter* is optional but may be used by any Source which wishes to preserve power by not sending *Source Capabilities* messages after a period of time.

When <u>the CapsCounter is implemented and</u> the Source detects that a Sink is attached then after *nCapsCount Source Capabilities* messages have been sent the Source shall issue *Hard Reset* signaling up to *nHardResetCount* times (see Section 6.7.2) before it decides that the Sink is non-responsive and it stops sending *Source Capabilities* messages.

A Sink shall use the *SinkWaitCapTimer* to trigger the resending of *Source Capabilities* messages by a USB Power Delivery capable Source which has previously stopped sending *Source Capabilities* messages. Any Sink which is attached and does not detect a *Source Capabilities* message within, shall issue *Hard Reset* signaling when the *SinkWaitCapTimer_times out* in order to reset the Source. Resetting the Source shall also reset the *CapsCounter* and restart the sending of *Source Capabilities* messages.

6.6.5 BIST Error Counter

The <u>Tester and</u> UUT shall maintain a count of errors detected <u>BISTErrorCounter (see Sections 6.4.3.1 and 6.4.3.2.)</u>. The <u>BISTErrorCounter</u> shall contain the number of bits in error during a BIST Transmit or Receive test.

The *BISTErrorCounter* shall be a 16-bit counter that shall be <u>resetset</u> to zero upon the BIST test start. The *BISTErrorCounter* shall freeze at a value of FFFFh.

6.6.6 Counter Values and Counters

Table 6-33 lists the counters used in this section and Table 6-32 shows the corresponding parameters.

Table 6-32 Counter parameters							
Parameter	Value	Section					
nCapsCount	50	6.6.4					
nHardResetCount	2	6.6.3					
nMessageIDCount	7	6.6.1					
nRetryCount	2	6.6.2					

Table 6-33 Counters

Counter	Max	Section
BISTErrorCounter	FFFFh	6.6.5
CapsCounter	nCapsCount	6.6.4
HardResetCounter	nHardResetCount	6.6.3
MessageIDCounter	nMessageIDCount	6.6.1
RetryCounter	nRetryCount	6.6.2

6.7 Reset

Resets are a necessary response to protocol or other error conditions. USB Power Delivery defines two different types of reset; a Soft Reset, that resets protocol, and a Hard Reset which resets both the power supplies and protocol.

6.7.1 Soft Reset

A *Soft Reset* message is used to cause a Soft Reset of protocol communication when this has broken down in some way. It shall not have any impact on power supply operation, but shall be used whenever there is a protocol error that it is not possible to handle in another way. The Soft Reset may be triggered by either Port Partner in response to an error.

A failure to see a *GoodCRC* message in response to any message within *tReceive* (after *nRetryCount* retries), when a Port Pair is Connected, is indicative of a communications failure. This shall cause the Source to send a *Soft Reset* message, transmission of which shall be completed within *tSoftReset* of the *CRCReceiveTimer* expiring.

A Soft Reset shall impact the USB Power Delivery layers in the following ways:

- Physical Layer: Reset not required since the Physical Layer resets on each packet transmission/reception
- Protocol Layer: Reset MessageIDCounter, RetryCounter and state machines
- Policy Engine: Reset state dependent behavior
- Power Supplypower supply: Shall not change

A Soft Reset is performed using a sequence of protocol messages (see Table 8-6). Message numbers shall be set to zero prior to sending the *Soft Reset/Accept* message since the issue may be with the counters. The sender of a *Soft Resetreset* message shall reset its and, the receiver of the message shall reset its *MessageIDCounter* and *RetryCounter*, the receiver of the message shall reset its *MessageIDCounter* and *RetryCounter*. The receiver of the message shall reset its *MessageIDCounter* and *RetryCounter*. The receiver of the message shall reset its *MessageIDCounter* and *RetryCounter*. The receiver of the message shall reset its *MessageIDCounter* and *RetryCounter* before sending the *Accept* message response. Any failure in the Soft Reset process will trigger a <u>Hard Reset when SOP Packets are being</u> used or Cable Reset for any other SOP* Packets; for example a *GoodCRC* message is not received during the Soft Reset process (see <u>SectionSections</u> 6.7.2), and).

Page 206

6.7.2 Hard Reset

6.7.2.1 Hard Reset Common Requirements

Hard Resets are signaled by an ordered set as defined in Section 5.6.4. Both the sender and recipient shall cause their <u>Power Supplies power supplies</u> to return to their default states (see Sections 7.3.12 to 7.3.17 for details of voltage transitions); this includes returning to default Source/Sink roles if there has been a Swap.). In addition their respective Protocol Layers shall be reset as for the Soft Reset. This allows the attached <u>Devicesdevices</u> to be in a state where they can re-establish USB PD communication. Hard Reset is retried up to *nHardResetCount* times (see also Sections 6.5.8 and 6.6.3).

6.7.2.2 Type-A/B and Hard Reset

When there has been a Type-A/B Power Role Swap, a Hard Reset shall cause the Port Partners to return to their default Source/Sink roles. A Type-A Port shall return to Source operation. A Type-C Port shall return to Sink operation.

6.7.2.3 Type-C and Hard Reset

<u>A Hard Reset shall not cause any change to either the R_p/R_d resistor being asserted, to the Data Role or to the Source of VCONN.</u> If the Hard Reset is insufficient to clear the error condition then the Port should use error recovery mechanisms as defined in **[USBType-C1.0]**.

6.7.2.4 Cable Plugs and Hard Reset

<u>Cable Plugs shall not generate</u> *Hard Reset* signaling but shall monitor for *Hard Reset* signaling between the Port Partners and shall reset when this is detected (see Section 8.3.3.9.3). The Cable Plugs shall perform the equivalent of a power cycle returning to their initial power up state. This allows the attached products to be in a state where they can re-establish USB PD communication.

6.7.2.5 Modal Operation and Hard Reset

A Hard Reset shall cause all Modes to be exited by both Port Partners and any Cable Plugs (see Section 6.4.4.3.4).

6.7.3 Cable Reset

<u>Cable Resets are signaled by an ordered set as defined in Section 5.6.5.</u> Both the sender and recipient of *Cable Reset* signaling shall reset their respective Protocol Layers. The Cable Plugs shall perform the equivalent of a power cycle returning to their initial power up state. This allows the attached products to be in a state where they can re-establish USB PD communication.

Cable Plugs shall not generate Cable Reset signaling but shall reset when Cable Reset signaling is present.

A Cable Reset shall cause all Modes currently active in the Cable Plugs to be exited (see Section 6.4.4.3.4).

6.8 State behavior

6.8.1 Introduction to state diagrams used in Chapter 6

The state diagrams defined in Section 6.8 are normative and shall define the operation of the Power Delivery protocol layer. <u>Note that these state diagrams are not intended to replace a well written and robust design</u>.

Figure 6-17Figure - Outline of States

shows an outline of the states defined in the following sections. At the top there is the name of the state. This is followed by "Actions on entry" a list of actions carried out on entering the state-<u>and in some states "Actions on exit" a list of actions carried out on exiting the state.</u>

USB Power Delivery Specification Revision <u>42.0, Version 1.0</u>

Figure 6-17 Outline of States

	<name of="" state=""></name>
	<u>on entry:</u> actions to carry out on entering the
Actions "List of state"	on exit: actions to carry out on exiting the

Transitions from one state to another are indicated by arrows with the conditions listed on the arrow. Where there are multiple conditions these are connected using either a logical OR "|" or a logical AND "&". The inverse of a condition is shown with a "NOT" in front of the condition.

In some cases there are transitions which can occur from any state to a particular state. These are indicated by an arrow which is unconnected to a state at one end, but with the other end (the point) connected to the final state.

In some state diagrams it is necessary to enter or exit from states in other diagrams. Figure 6-18 indicates how such references are made. The reference is indicated with a hatched box. The box contains the name of the <u>referenced</u> state.

Figure 6-18 References to states

Timers are included in many of the states. Timers are initialized (set to their starting condition) and run (timer is counting) in the particular state it is referenced. As soon as the state is exited then the timer is no longer active. Timeouts of the timers are listed as conditions on state transitions.

Conditions listed on state transitions will come from one of three sources:

- Messages received from the PHY Layer
- Events triggered within the Protocol Layer e.g. timer timeouts
- Message and related indications passed up to the Policy Engine from the Protocol Layer (message sent, message received etc.)

6.8.2 General State Operation

The following section details Protocol Layer State Operation when sending and receiving SOP* Packets. For each SOP* Communication being sent and received there shall be separate Protocol Layer Transmission and Protocol Layer Reception and BIST State Machine instances, with their own counter and timer instances. Soft Reset shall only apply to the State Machine instances it is targeted at based on the type of SOP* Packet used to send the <u>Soft Reset</u> message. The Hard Reset State Machine (including Cable Reset) shall apply simultaneously to all Protocol Layer State Machine instances active in the DFP. UFP and Cable Plug (if present).

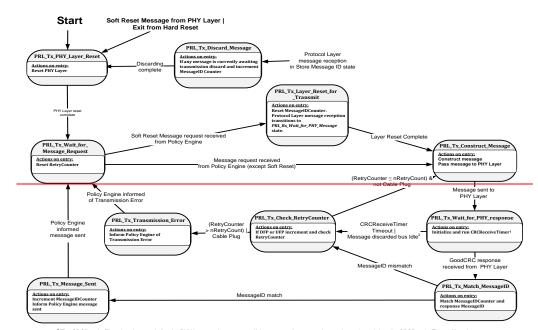

Page 208

6.8.2.1 **Protocol Layer Message Transmission**

Figure 6-19 shows the state behavior for the Protocol layerLayer when transmitting a message.

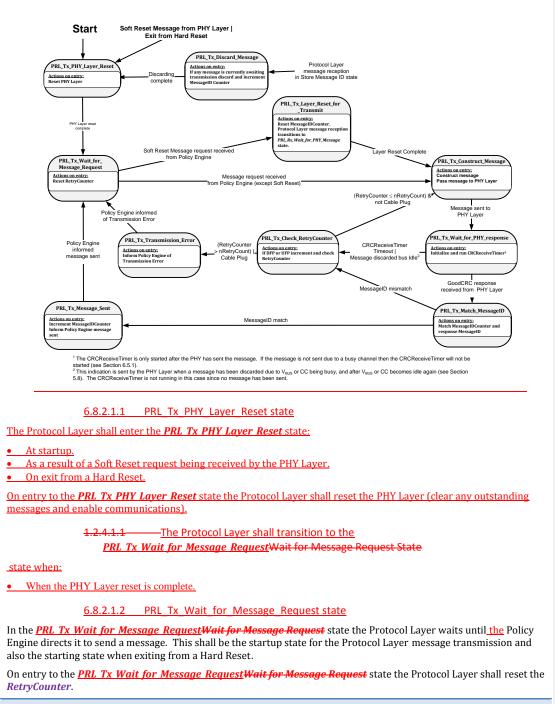

Figure 6-19 Protocol layerLayer message transmission

USB Power Delivery Specification Revision <u>42</u>.0<u>. Version 1.0</u>

 1 The CRCReceiveTimer is only started after the PHY has sent the message. If the message is not sent due to a busy channel then the CRCReceiveTimer will not be started (see Section 6.5.1). 2 This indication is sent by the PHY Layer when a message has been discarded due to V_{BUS} or CC being busy, and after V_{BUS} or CC becomes idle again (see Section 5.8). The CRCReceiveTimer is not running in this case since no message has been sent.

USB Power Delivery Specification Revision 2.0, Version 1.0.

USB Power Delivery Specification Revision <u>42</u>.0<u>Version 1.0</u>

The Protocol Layer shall transition to the PRL Tx Construct MessageConstruct message state when:

• A message request is received from the Policy Engine which is not a Soft Reset message.

The Protocol Layer shall transition to the <u>PRL Tx Layer Reset for TransmitLayer Reset for Transmit</u> state when:

• A message request is received from the Policy Engine which is a Soft Reset message.

6.8.2.1.16.8.2.1.3 PRL Tx Layer Reset for Transmit state

On entry to the <u>PRL Tx Layer Reset for Transmit</u>Layer Reset for Transmit state the Protocol Layer shall reset the MessageIDCounter. The Protocol Layer shall transition Protocol Layer message reception to the <u>PRL Rx Wait for PHY MessageWait for first PHY Message</u> state (see Section 6.8.2.2.1) in order to reset the stored MessageID.

The Protocol Layer shall transition to the PRL Tx Construct MessageConstruct Message

• The Soft Reset layer reset actions in this state have been completed.

6.8.2.1.26.8.2.1.4 PRL Tx Construct Message Statestate

On entry to the <u>PRL Tx Construct MessageConstruct Message</u> state the Protocol Layer shall construct the message requested by the Policy Engine, or resend a previously constructed message, and then pass this message to the PHY Layer.

The Protocol Layer shall transition to the <u>PRL Tx Wait for PHY Response</u> Wait for PHY Response state when:

• The message has been sent to the PHY Layer.

1.2.4.1.2 Wait for PHY Response State

6.8.2.1.5 On entry to the PRL Tx Wait_for_PHY_Response state

<u>On entry to the *PRL Tx Wait for PHY Response*</u> State, once the message has been sent (see Section), the Protocol Layer shall initialize and run the *CRCReceiveTimer* <u>(see Section 6.5.1-)</u>.

The Protocol Layer shall transition to the <u>PRL Tx Match MessageIDMatch MessageID</u> state when:

A GoodCRC message response is receive from the PHY Layer.

The Protocol Layer shall transition to the <u>PRL Tx Check RetryCounter</u> State when:

- The CRCReceiveTimer times out-and
- This is not a Soft Reset
- Or the PHY Layer indicates that a message has been discarded due to V_{Bus}the channel being busy but V_{Bus}the channel is now idle (see Section 5.7).

The Protocol Layer shall transition to the Transmission Error state when:

- The CRCReceiveTimer times out and
- This is a Soft Reset

6.8.2.1.36.8.2.1.6 PRL Tx Match MessageID Statestate

On entry to the <u>PRL Tx Match MessageID</u>Match MessageID state the Protocol Layer shall compare the MessageIDCounter and the MessageID of the received GoodCRC message.

The Protocol Layer shall transition to the <u>PRL Tx Message Sent Message Sent</u> state when:

• The MessageIDCounter and the *MessageID* of the received *GoodCRC* message match.

The Protocol Layer shall transition to the <u>PRL Tx Check RetryCounterCheck RetryCounter</u> state when:

The MessageIDCounter and the MessageID of the received GoodCRC message do not match and.

Page 212

This is not a Soft Reset.

The Protocol Layer shall transition to the Transmission Error state when:

- The and the of the received message do not match and
- This is a Soft Reset

6.8.2.1.46.8.2.1.7 PRL Tx Message_Sent state

On entry to the <u>PRL Tx Message Sent</u> state the Protocol Layer shall increment the MessageIDCounter, reset the RetryCounter and inform the Policy Engine that the message has been sent.

The Protocol Layer shall transition to the <u>PRL Tx Wait for Message Request</u> state when:

• The Policy Engine has been informed that the message has been sent.

<u>1.2.4.1.3</u> <u>PRL_Tx_Check-RetryCounter State</u>

6.8.2.1.8 On entry to the **Check**_RetryCounter state

<u>On entry to the **PRL Tx Check RetryCounter** state</u> the Protocol Layer <u>in a DFP or UFP</u> shall increment the value of the **RetryCounter** and then check it in order to determine whether it is necessary to retry sending the message. <u>Note that</u> <u>Cable Plugs do not retry messages and so do not use the RetryCounter</u>.

The Protocol Layer shall transition to the <u>PRL Tx Construct MessageConstruct Message</u> state in order to retry message sending when:

RetryCounter ≤ nRetryCount- and
 This is not a Cable Plug.

The Protocol Layer shall transition to the <u>PRL_Tx_Transmission_Error</u>Transmission Error state when:

- *RetryCounter* > *nRetryCount*, or
- This is a Cable Plug, which does not retry.

6.8.2.1.56.8.2.1.9 PRL Tx Transmission_Error state

On entry to the <u>*PRL Tx Transmission Error* Transmission Error</u> state the Protocol Layer shall inform the Policy Engine of the transmission error.

The Protocol Layer shall transition to the <u>PRL Tx Wait for Message Request</u> Wait for Message Request state when:

• The Policy Engine has been informed of the transmission error.

6.8.2.1.66.8.2.1.10 PRL Tx Discard Message state

Protocol Layer message transmission shall enter the <u>PRL Tx Discard Message</u> state whenever Protocol Layer Message reception receives an incoming message.

On entry to the <u>PRL Tx Discard Message</u>the <u>Discard Message</u> state, if there is a message queued awaiting transmission, the Protocol Layer shall discard the message and increment the <u>MessageIDCounter</u>.

The Protocol Layer shall transition to the <u>PRL Tx PHY Layer Reset</u>Wait for Message Request state when:

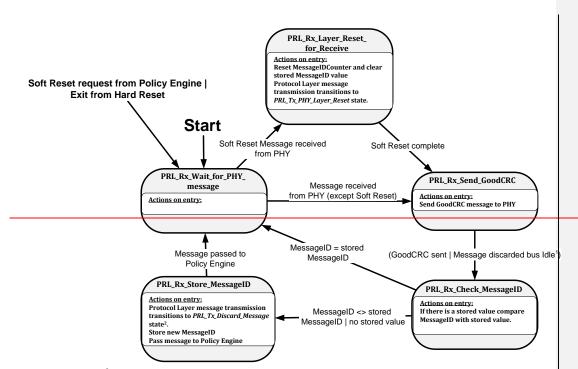

• Discarding is complete i.e. the message queue is empty.

6.8.2.2 Protocol Layer Message Reception

Figure 6-20 shows the state behavior for the Protocol layerLayer when receiving a message.

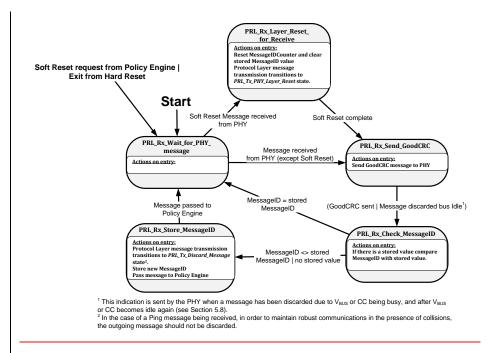

Figure 6-20 Protocol layer message reception

USB Power Delivery Specification Revision 2.0, Version 1.0.

 $^{\rm 1}$ This indication is sent by the PHY when a message has been discarded due to V_{BUS} or CC being busy, and after V_{BUS}

This indication is sent by the PTF when a message has been discarded due to v_{BUS} of CC being busy, and after v_{BUS} or CC becomes idle again (see Section 5.8). ² In the case of a Ping message being received, in order to maintain robust communications in the presence of collisions, the outgoing message should not be discarded.

6.8.2.2.1 PRL Rx_Wait_for-First_PHY_Message state

The Protocol Layer shall enter the **PRL Rx Wait for PHY Message** In the **Wait for First PHY Message** state Protocol Layer waits until the PHY Layer passes up a received message. This shall be the startup state for the Protocol Layer message reception and shall also be the state Protocol Layer message reception enters after completion of a Soft Rese or Hard Reset.

The Protocol Layer shall transition to the Initialize MessageID state when:

A received message is passed up state:

• At startup.

<u>As a result of a Soft Reset request</u> from the PHY Layer

1.2.4.1.4 Initialize MessageID state

On entry to the *Initialize MessageID* state the Protocol Layer shall transition Protocol Layer message transmission to the *Diseard Message* state, store the of the incoming message and then pass the message to the Policy Engine.

The Protocol Layer shall transition to the Send First GoodCRC state when:

The message has been passed to the Policy Engine.

The Protocol Layer shall transition to the *Layer Reset for Receive* state when:

A-message is received from the PHY.

1.2.4.1.5 Send First GoodCRC state

On entry to the Send First GoodCRC state the Protocol Layer shall construct message and request the PHY to transmit

Page 216

it.

The Protocol Layer shall transition to the Wait for PHY Message state when:

The message has been passed to the PHY Layer.

1.2.4.1.6 Wait For PHY Message state

• On exit from a Hard Reset.

In the <u>PRL Rx Wait for PHY Message</u> Wait For PHY Message state the Protocol Layer waits until the PHY Layer passes up a received message.

The Protocol Layer shall transition to the <u>PRL_Rx_Send_GoodCRCSend GoodCRC</u> state when:

• A message is passed up from the PHY Layer.

The Protocol Layer shall transition to the PRL Rx Layer Reset for Receive Layer Reset for Receive state when:

• A Soft Reset message is received from the PHY -

1.2.4.1.7 Layer Reset for Receive State

On entry to the Layer.

6.8.2.2.2 PRL Rx Layer_Reset_for_Receive_state

<u>On entry to the **PRL Rx Layer Reset for Receive**</u> state the Protocol Layer shall reset the **MessageIDCounter** and clear the stored **MessageID**. The Protocol Layer shall transition Protocol Layer message transmission to the **PRL Tx Wait for Message Request** Wait Message **Request** state (see Section 6.8.2.1.1).

The Protocol Layer shall transition to the <u>PRL Rx Send GoodCRC</u>Send GoodCRC State when:

• The Soft Reset actions in this state have been completed.

6.8.2.2.2 6.8.2.2.3 PRL Rx Send_GoodCRC state

On entry to the <u>PRL Rx Send GoodCRCSend GoodCRC</u> state the Protocol Layer shall construct a <u>GoodCRC</u> message and request the PHY <u>Layer</u> to transmit it.

The Protocol Layer shall transition to the <u>PRL Rx Check MessageID Check MessageID</u> state when:

- The message has been passed to the PHY Layer or
- The GoodCRC message has been passed to the PHY Layer or
- The PHY Layer indicates that a message has been discarded due to V_{BUS} or <u>CC</u> being busy but V_{BUS} or <u>CC</u> is now idle (see Section 5.7)
- And a Soft Reset is NOT being performed.

The Protocol Layer shall transition to the Wait For First PHY Message state when:

The GoodCRC message has been passed to the PHY Layer or

- The PHY Layer indicates that a message has been discarded due to V_{BUS} being busy but V_{BUS} is now idle (see Section)
- And Soft Reset is being performed.

6.8.2.2.36.8.2.2.4 -PRL Rx Check MessageID state

On entry to the <u>PRL Rx Check MessageIDCheck MessageID</u> state the Protocol Layer shall compare the MessageID of the received message with its stored value-<u>if a value has previously been stored</u>.

The Protocol Layer shall transition to the <u>PRL Rx Wait for PHY Message</u>Wait For PHY Message state when:

• The *MessageID* of the received message equals the stored *MessageID* value since this is a message retry which shall be discarded.

USB Power Delivery Specification Revision <u>12</u>.0. Version 1.0

Page 217

The Protocol Layer shall transition to the <u>PRL Rx Store MessageID</u> state when:

 The MessageID of the received message does not equal the stored MessageID value since this is a new messageor

1.2.4.1.8 This is the first received message and no MessageIDStore MessageID

• On entry to the value is currently stored.

6.8.2.2.5 PRL Rx Store MessageID state

On entry to the *PRL Rx Store MessageID* state the Protocol Layer shall transition Protocol Layer message transmission to the *PRL Tx Discard Message* state (except when a *Ping* message has been received in which case the *PRL Tx Discard Message* state, state should not be entered), replace the stored value of *MessageID* with the value of *MessageID* in the received message and pass the message up to the Policy Engine.

The Protocol Layer shall transition to the PRL Rx Wait for PHY MessageWait for PHY Message state when:

• The message has been passed up to the Policy Engine.

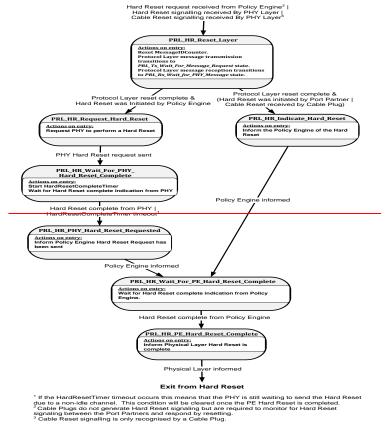

6.8.2.3 Hard Reset operation

Figure 6-21 shows the state behavior for the Protocol layerLayer when receiving a Hard Reset request from the Policy Engine or *Hard Reset* signaling from the Physical Layer (see also Section 6.7.2).

Page 218

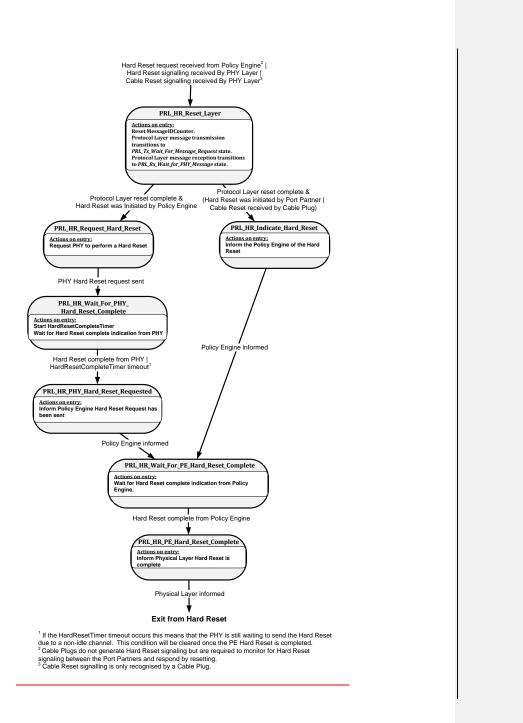

Figure 6-21 Hard Reset

USB Power Delivery Specification Revision <u>**42</u>**.0, <u>Version 1.0</u></u>

USB Power Delivery Specification Revision 2.0, Version 1.0.

Page **220**

USB Power Delivery Specification Revision <u>+2</u>.0<u>, Version 1.0</u>

6.8.2.3.1 PRL_HR_Reset_Layer Statestate

The <u>PRL HR Reset LayerReset Layer</u> State defines the mode of operation of both the Protocol Layer <u>Transmittransmission</u> and <u>Receiverception</u> state machines during a Hard Reset. During this mode no USB Power Delivery protocol messages are sent or received; only *Hard Reset* signaling is present after which the communication channel is assumed to have been disabled by the Physical Layer until completion of the Hard Reset.

The Protocol Layer shall enter the <u>PRL HR Reset LayerReset Layer</u> state from any other state when:

- A Hard Reset Request is received from the Policy Engine or
- Hard Reset signaling is received from the Physical Layer

On Entryentry to the PRL HR Reset LayerReset Layer state the Protocol Layer shall reset the MessageIDCounter. It shall also reset the states of the Protocol Layer transmittransmission and receiver reception state machines to their starting points. The Protocol Layer transmittransmission state machine shall transition to the PRL Tx Wait for Message Request Wait for Message Request state. The Protocol Layer receiver eception state machine shall transition to the PRL Tx Wait for Message Request for PHY Message Wait For First PHY Message state.

The Protocol Layer shall transition to the **<u>PRL_HR_Request_Hard_Reset</u>** state when:

The Protocol Layer's reset is complete and

<u>Request Hard Reset</u> The Hard Reset request has originated from the Policy Engine.

The Protocol Layer shall transition to the PRL HR Indicate Hard Reset state when:

• The Protocol Layer's reset is complete and

The Protocol Layer shall transition to the Indicate Hard Reset state when:

-The Protocol Layor's reset is complete and

o The Hard Reset request has been passed up from the Physical Layer-<u>or</u>

1.2.4.2 Request Hard Reset

o A Cable Reset request has been passed up from the Physical Layer (Cable Plug only).

6.8.2.3.2 PRL HR Indicate Hard Reset state

On entry to the <u>PRL HR Indicate Hard Reset</u>Request Hard Reset state the Protocol Layer shall request the Physical Layer to send signaling.

The Protocol Layer shall transition to the Wait For Hard Reset Complete state when:

The Physical Layer signaling has been sent.

1.2.4.3 Indicate Hard Reset

On entry to the Indicate Hard Reset state the Protocol Layer shall indicate to the Policy Engine that Hard Reset signaling has been received.

The Protocol Layer shall transition to the <u>PRL HR Wait for PE Hard Reset Complete</u>Wait for Hard Reset Complete state when:

• The Indication to the Policy Engine has been sent.

6.8.2.3.26.8.2.3.3 Wait for PRL HR Request Hard_Reset Completestate

In On entry to the *PRL HR Request Hard ResetWait for Hard Reset Complete* state the Protocol Layer shall request the Physical Layer to send *Hard Reset* signaling.

The Protocol Layer shall transition to the PRL HR Wait for PHY Hard Reset Complete state when:

Page 222

• The Physical Layer Hard Reset signaling request has been sent.

6.8.2.3.4 PRL HR Wait for PHY Hard Reset Complete state

In the *PRL HR Wait for PHY Hard Reset Complete* state the Protocol Layer shall start the <u>HardResetCompleteTimer</u> and wait for the <u>Policy Engine PHY Layer</u> to indicate that the Hard Reset has been completed.

The Protocol Layer shall transition to the PRL HR PE Hard Reset CompleteHard Reset Complete state when:

- A Hard Reset complete indication is received from the Policy Engine. PHY Layer or
- The HardResetCompleteTimer times out.

6.8.2.3.3 <u>PRL_HR_PHY_Hard_Reset-Complete_Requested state</u>

On entry to the <u>PRL HR Hard Reset RequestedHard Reset Complete</u> state the Protocol Layer shall inform the <u>Physical Layer Policy Engine</u> that the <u>PHY Layer has been requested to perform a</u> Hard Reset.

The Protocol Layer shall transition to the PRL HR Wait for PE Hard Reset Complete state when:

• The Indication to the Policy Engine has been sent.

6.8.2.3.6 PRL_HR_Wait_for_PE_Hard_Reset_Complete state

In the *PRL HR Wait for PE Hard Reset Complete* state the Protocol Layer shall wait for the Policy Engine to indicate that the Hard Reset has been completed.

The Protocol Layer shall transition to the PRL HR PE Hard Reset Complete is state when:

<u>A Hard Reset</u> complete <u>indication is received from the Policy Engine</u>.

6.8.2.3.7 PRL HR PE Hard Reset Complete

On entry to the *PRL HR PE Hard Reset Complete* state the Protocol Layer shall inform the Physical Layer that the Hard Reset is complete.

The Protocol Layer shall exit from the Hard Reset and return to normal operation when:

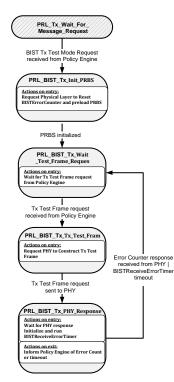

• The Physical Layer has been informed that the Hard Reset is complete so that it will re-enable the communications channel. <u>If *Hard Reset* signaling is still pending due to a non-idle channel this shall be cleared and not sent.</u>

6.8.3 BIST Operation

6.8.3.1 BIST TransmitTransmitter Test

Figure 6-22 shows the state behavior for the Protocol layerLayer when in BIST Transmitter test<u>Test</u> mode and transmitting BIST Transmitter Test Frames. The Protocol Layer changes from normal operation for Protocol Message Layer Transmission (see Section 6.8.2.1) to BIST <u>Transmittransmitter</u> Test Mode when directed by the Policy Engine.

Figure 6-22 BIST Transmitter Test

6.8.3.1.1 PRL_BIST_Tx_Init_PRBS_state

The Protocol Layer shall enter the <u>PRL BIST Tx Init PRBSBIST Init PRBS</u> state from the <u>PRL Tx Wait for Message RequestWait For Message Request</u> state (see Section 6.8.2.1.1) when:

• The Policy Engine requests the Protocol Layer to enter BIST TxTransmitter Test Mode.

On entry to the <u>PRL BIST Tx Init PRBSBIST Init PRBS</u> state the Protocol Layer shall zerorequest the <u>Physical Layer</u> to reset the <u>BISTErrorCounter</u> and preload the PRBS <u>(see Section 5.9.1generator.)</u>.

The Protocol Layer shall transition to the <u>PRL BIST Tx Wait Test Frame RequestBIST Wait Test Frame Request</u> state when:

• The PRBS generator has been preloaded.

Page 224

6.8.3.1.2 PRL_BIST_Tx_Wait_Test_Frame state

On entry to the <u>PRL BIST Tx Wait Test Frame Request</u> BIST Wait Test Frame Request state the Protocol Layer shall wait for a test frameTest Frame from the Policy Engine.

The Protocol Layer shall transition to the <u>PRL BIST Tx Test Frame</u> state when:

• When a request to transmit a test frame<u>Test Frame</u> is received from the Policy Engine.

6.8.3.1.3 PRL_BIST_Tx_Test_Frame_state

On entry to the <u>PRL BIST Tx Test Frame</u>BIST Tx Test Frame state the Protocol Layer shall request the Physical Layer to construct the Test Frame.

The Protocol Layer shall transition to the <u>PRL BIST Tx PHY Response</u>BIST PHY Response state when:

• The Test Frame request has been sent to the Physical Layer.

1.2.4.3.1 PRL_BIST_PHY Response state

6.8.3.1.4 In the **BIST** Tx PHY Response state

In the *PRL BIST Tx PHY Response* state the Protocol Layer shall wait for the Physical Layer to provide a response to the Test Frame.

On entry to the <u>PRL BIST Tx PHY ResponseBIST PHY Response</u> state the Protocol Layer shall initialize and run the BISTReceiveErrorTimer.

On exit from the <u>PRL BIST Tx PHY Response</u>BIST PHY Response state the Protocol Layer shall inform the Policy Engine either of the received Error Counter value or of a BISTReceiveErrorTimer timeout.

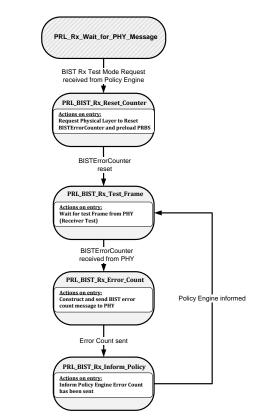

The Protocol Layer shall transition to the <u>PRL BIST Tx Wait Test Frame Request</u> state (see Section 0) when:

- An error counter response is received from the Physical Layer.
- Or the *BISTReceiveErrorTimer* times out.

6.8.3.2 BIST Receiver Test

Figure 6-23 shows the state behavior for the Protocol layerLayer when in BIST Receiver testTest mode and receiving BIST Receiver Test Frames. The Protocol Layer changes from normal operation for Protocol Layer Message Reception (see Section 6.8.2.2) to BIST Receiver Test Mode when directed by the Policy Engine. Exit from this mode of operation is via Hard Reset (see Section 6.8.2.3).

Figure 6-23 BIST Receiver Test

6.8.3.2.1 PRL_BIST_Rx_Reset_Counter state

The Protocol Layer shall enter the <u>PRL BIST Rx Reset Counter</u>BIST Reset Counter state from the <u>PRL Rx Wait for PHY Message</u>Wait For First PHY Message or Wait For PHY Message

• A BIST Receiver Test Mode request is received from the Policy Engine.

On entry to the <u>PRL BIST Rx Reset Counter</u>BIST Reset Counter state the Protocol Layer shall request the Physical Layer to reset the <u>BISTErrorCounter</u> and preload the PRBS (see Section 5.9.1).

The Protocol Layer shall transition to the PRL BIST Rx Test Frame BIST Rx Test Frame state when:

• The BISTErrorCounter has been reset by the Physical Layer.

6.8.3.2.2 PRL_BIST_Rx_Test_Frame state

In the <u>PRL BIST Rx Test FrameBIST Rx Test Frame</u> State the Protocol Layer shall wait for the Physical Layer to receive the next test frame<u>Test Frame</u>.

The Protocol Layer shall transition to the PRL BIST Rx Error CountBIST Error Count state when:

Page 226

The Physical Layer has received the next Test Frame and passes up the current value of the BISTErrorCounter-is received from the PHY Layer.

6.8.3.2.3 PRL_BIST_Rx_Error_Count Statestate

On entry to the <u>PRL BIST Rx Error CountBIST Error Count</u> state the Protocol Layer shall construct a **BIST** message with a Data Object of *Returned BIST Counters* using the **BISTErrorCounter** value returned by the Physical Layer. This **BIST** message shall be passed to the Physical Layer for transmission.

The Protocol Layer shall transition to the <u>PRL BIST Rx Inform Policy</u>BIST Inform Policy state when:

• The **BIST** message has been sent.

6.8.3.2.4 PRL_BIST_Rx_BIST_Inform_Policy state

On entry to the <u>PRL BIST Rx Inform Policy</u>BIST Inform Policy state the Protocol Layer shall inform the Policy Engine that the BIST message containing the BISTErrorCounter has been sent.

The Protocol Layer shall transition to the <u>PRL BIST Rx Test Frame</u> state when:

• The Policy Engine has been informed that the BIST message containing the BISTErrorCounter has been sent.

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

Page **228**

7. Power Supply

7.1 Source Requirements

7.1.1 Behavioral Aspects

The Source in a Provider or Provider/Consumer exhibits the following behaviors.

- Shall be backward compatible with legacy V_{BUS} ports.
- Shall supply the default [USB2.0], [USB3.1], [USB3.1]
- Shall supply the default [USB2.0], [USB3.1], [USBType-C1.0] or [BC1.2] voltage and current to V_{BUS} when a USB Power Delivery contractContract does not exist. (USB Default Operation).
- Shall return

vSafeOV Safe operating voltage at "zero volts".	0		0. <u>8</u>	V	Section 7.1.6
---	---	--	-------------	---	---------------

- for some time then return to *vSafe5V* when *Hard Reset* signaling is received.
- Shall control V_{BUS} voltage transitions as bound by undershoot, overshoot and transition time requirements.

The Source in a Consumer/Provider exhibits the following behaviors.

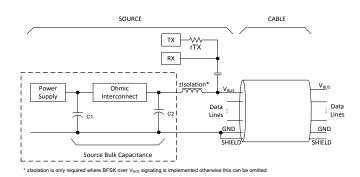

- Shall support Dead Battery operation <u>as defined in Section 4.1.1 for Type-A to Type-B connections and as defined</u> in *[USBType-C1.0]* for Type-C to Type-C connections.
- Shall return to Sink operation when *Hard Reset* signaling is received.
- Shall control V_{BUS} voltage transitions as bound by undershoot, overshoot and transition time requirements.

7.1.2 Source Bulk Capacitance

The Source shall have a bulk capacitance located between the output of the power supply and the transceiver isolation impedance as shown in Figure 7-1. The Source bulk capacitance shall not be placed between the transceiver isolation impedance and the USB receptacle. The bulk capacitance consists of C1 and C2 as shown in Figure 7-1. The Ohmic Interconnect may consist of PCB traces for power distribution or power switching devices. The capacitance may be a single capacitor, a capacitor bank or distributed capacitance. If the power supply is shared across multiple ports, bulk capacitance is defined as *cSrcBulkShared*. If the power supply is dedicated to a single *portPort*, the minimum bulk capacitance is defined as *cSrcBulk*.

The Source bulk capacitance is allowed to change for a newly negotiated power level. The capacitance change shall occur before the Source is ready to operate at the new power level. During a <u>Power</u> Role Swap, the Default Source shall transition to Swap Standby before operating as the new Sink. Any change in bulk capacitance required to complete the <u>Power</u> Role Swap shall occur during Swap Standby.

Figure 7-1 Placement of Source Bulk Capacitance

7.1.3 Types of Sources

Consistent with the Power Data Objects discussed in Section 6.4.1, the three possible power supply types that are available as Sources in a USB Power Delivery System are:

• Fixed Supply is used to expose well regulated fixed voltage power supplies. Sources shall support at least one fixed power source capable of supplying *vSafe5V*. The output voltage of a Fixed Supply shall be specified in terms of an absolute tolerance,

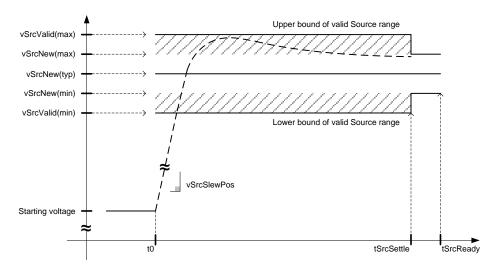

<u>vSrcNew</u>	Fixed Supply output tolerance measured at the Source receptacle.	<u>-5</u>		<u>+5</u>	<u>%</u>	Figure 7-2 Figure 7-3	<	Merged Cells Merged Cells		
 , relative to the nominal value. Refer to Table 7-22-for the output voltage tolerance specification. for the output voltage tolerance specification. Variable Power Supply (non-battery) is used to expose very poorly regulated Sources. The output voltage of a Variable Power Supply (non-battery) shall be specified as 										
<u>vSrcNew</u>	Fixed Supply output tolerance measured at the Source receptacle.	<u>-5</u>		<u>+5</u>	<u>%</u>	Figure 7-2 Figure 7-3	<	Merged Cells Merged Cells		
• Battery <u>Supply</u> is	in terms of an absolute maximum output voltage and an absolute minimum output voltage.									
<u>vSrcNew</u>	Fixed Supply output tolerance measured at the Source receptacle.	<u>-5</u>		<u>+5</u>	<u>%</u>	Figure 7-2 Figure 7-3	<	Merged Cells Merged Cells		
• expressed, in term	ns of an absolute maximum out	put voltage a	nd an absolu	ıte minimum	output volt	age.				
7.1.4 Posi	tive Voltage Transitions									
The Source shall transition V _{BUS} from the <mark>oldstarting</mark> voltage to the higher new voltage in a controlled manner. <u>The</u> negotiated new voltage (e.g., 12V or 20V) defines the typical value for										
<u>vSrcNew</u>	Fixed Supply output tolerance measured at the Source receptacle.	<u>-5</u>		<u>+5</u>	<u>%</u>	Figure 7-2 Figure 7-3	<	Merged Cells Merged Cells		
Page 230		USB Po	ower Deliver	y Specificati	on Revision	<u>2.0. Version</u> 1.0 <u>.</u>				

<u>. If the newly negotiated voltage is 5V, then vSafe5V limits shall apply.</u> During the positive transition the Source shall be able to supply the Sink standby power and the transient current to charge the total bulk capacitance on V_{BUS} . The slew rate of the positive transition shall not exceed <u>vSrcSlewPos</u>. The Source output voltage during <u>a positive transitionstransition</u> shall settle within the Source output tolerance <u>windowrange</u>

<u>vSrcNew</u>	Fixed Supply output	<u>-5</u>	<u>+5</u>	<u>%</u>	Figure 7-2
	<u>tolerance measured</u> at <u>the S</u> ource receptacle.				Figure 7-3

-by. The Source shall be able to supply the newly negotiated power level at the new voltage by <u>tSrcReady</u>. The positive voltage transition shall remain monotonic while the transitioning voltage is below <u>vSrcValid</u>. Positive voltage transitions min and shall remain within the <u>vSrcValid</u> range upon crossing <u>vSrcValid</u> tolerance window specified min as shown in Figure 7-2. The starting time, t0, in Figure 7-2 starts <u>tSnkTransition</u> The lower bound after the last bit of the <u>EOP</u> transition window is and the upper bound is. The voltage transition shall remain monotonic until inside the transition window. Once inside of the <u>GoodCRC window</u>, the voltage shall remain inside the window message has been transmitted on V_{BUS}.

Figure 7-2 Transition Envelope for Positive Voltage Transitions

When a positive voltage transition is started, the V_{BUS} voltage may decrease at the onset of the transition. When the starting voltage on V_{BUS} for the transition is *vSafe5V*, the V_{BUS} voltage shall not droop below *vSafe5V* min. When the starting voltage on V_{BUS} is any voltage other than *vSafe5V*, the V_{BUS} voltage shall not droop below *vSafe5V* min.

During normal operation, not including V_{BUS} transitions or discharge, V_{BUS} shall not go beyond the limits of *vSrcValid* (or *vSafe5V* if V_{BUS} is 5V). This limitation shall apply to static and transient V_{BUS} behavior across all single port and multi-port power configurations.

7.1.5 Negative Voltage Transitions

<u>Negative voltage transitions are defined as shown in Figure 7-3 and are specified in a similar manner to positive voltage transitions.</u> Figure 7-3 <u>does not apply to</u>

vSafe0V	Safe operating voltage at "zero volts <mark>".</mark>	0	0. <u>8</u>	V	Section 7.1.6
USB Power Delivery Spe		Page 231			

Merged Cells

Merged Cells

transitions. If the newly negotiated voltage is 5V, then *vSafe5V* limits shall apply. The slew rate of the negative transition shall not exceed *vSrcSlewNeg*. The negative voltage transition shall remain monotonic while the transitioning voltage is above *vSrcValid* max and shall remain within the *vSrcValid* range upon crossing *vSrcValid* max as shown in Figure 7-3. The starting time, t0, in Figure 7-3 starts *tSnkTransition* after the last bit of the *EOP* of the *GoodCRC* The Source shall transition V_{BUS} from the old voltage to the lower new voltage in a controlled manner. During the negative transition the Source shall be able to supply the Sink standby current and the transient current to discharge the total bulk capacitance on V_{BUS}. The slew rate of the negative transition shall not exceed . The transitioning output voltage shall settle within the Source output tolerance window by . The Source shall be able to supply the newly negotiated power level at the new voltage by . Negative voltage transitions shall remain within the tolerance window specified in . The lower bound of the transition window. Once inside the window, the voltage shall remain inside the window.

message has been transmitted on V_{BUS}.

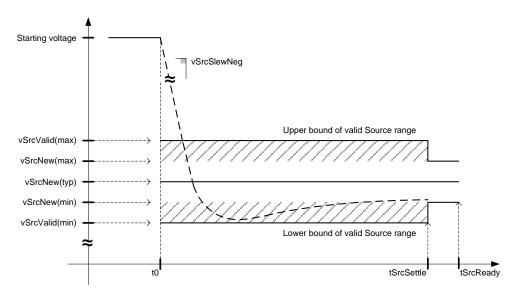

Figure 7-3 Transition Envelope for Negative Voltage Transitions

7.1.6 Response to Hard Resets

Hard Reset signaling indicates a communication failure has occurred and the Source shall revert to a safe operating voltage as specified in Figure 7-4. The safe operating voltage is specified as

vSafeOV Safe operating at "zero volts"	—	0. <u>8</u>	V	Section 7.1.6
---	---	-------------	---	---------------

. The USB connection may reset during a Hard Reset since the V_{BUS} voltage will be less than *vSafe5V* for an extended period of time. After establishing the safe voltage condition on V_{BUS} , the power supply shall wait

tSrcRecover	Time allotted for the Source to recover <u>.</u>	0. <u>66</u>		1	S	Section 7.1.6
Page 232		USB Po	ower Deliver	y Specificati	on Revision	<u>2.0, Version</u> 1.0 <u>.</u>

before powering V_{BUS} to *vSafe5V*. Device operation during and after a Hard Reset is defined as follows:

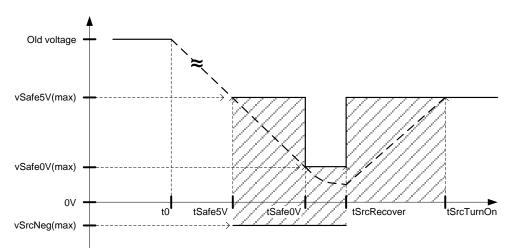

- Self-powered devices should not disconnect from USB during a Hard Reset (see Section 9.1.2-).
- Self-powered devices operating at more than vSafe5V5V may not maintain full functionality after a Hard Reset.
- Bus powered devices will disconnect from USB during a Hard Reset due to the loss of their power source.

When a Hard Reset occurs the Source shall start to transition the V_{BUS} voltage to

vSafe0V Safe operating voltag at "zero volts".	ge O		0. <u>8</u>	V	Section 7.1.6
---	------	--	-------------	---	---------------

after the last bit of the *Hard Reset* signaling has been transmitted on V_{BUS} . The Source shall meet both *tSafe5V* and *tSafe0V* relative to the start of the voltage transition as shown in Figure 7-4.

7.1.7 Changing the Output Power Capability

Some USB Power Delivery negotiations <u>will</u> require the Source to adjust its output power capability without changing the output voltage. <u>TheIn this case the</u> Source shall be able to supply a higher or lower load current within <u>tSrcReady</u>. <u>This time is much faster than the positive and negative voltage transition times</u>.

1.2.5 Transceiver Isolation Impedance

An isolation impedance as specified in Section is used to isolate the transceiver from the capacitive loading of the Source. The DC component of the isolation impedance introduces additional voltage loss between the Source power path and the connector. The Source output impedance, the total V_{BUS}-bulk capacitance, the transceiver isolation impedance(s), the USB cable and the Sink network creates a complex output isolation impedance that should be taken into consideration when designing the Source. Refer to Appendix more information on this topic.

1.2.6 Noise Injected on V_{BUS}

The Source shall not interfere with the USB Power Delivery FSK waveform that is transmitted on V_{BUS}—Power stage switching harmonics or poor layout and component selection may result in a significant amount of in-band noise injected on V_{BUS}—The characteristics of the noise will be implementation specific and in some cases an additional filter may be required to meet the in-band signal to noise ratio requirement of *smrSrs*—Refer to Section and Section for the

reference impedance, carrier signal amplitude and transmission bandwidth of the USB Power Delivery FSK waveform. Refer to Appendix C for more information on this topic.

Out of band noise (including spurs) can also affect the reception of the FSK signal; therefore the Source shall limit its out of band noise below the spectrum shown in and the levels indicated in . shows the level of allowed noise relative to the level of the allowed in band noise [for a Source: dbV(minimum value of)]. The limits shown in and -do not include any other regulations (such as FCC regulations) that govern signal emissions.

The V_{BUS} to CND noise measurement shall be made at the connector. The noise measurement can be made using a breakout board or equivalent method that does not introduce additional loading of the AC impedance of the V_{BUS} wire. Such measurement access methods will require calibration to ensure accurate measurement results.

USB Power Delivery Specification Revision 2.0, Version 1.0.

Page 234

1.2.7 Short Circuit Current Limiting

7.1.8 Safe Operating Considerations

The Source shall provide short circuit current limiting to protect its **portPort** from prolonged exposure to excessive current draw. For the purposes of this standard, excessive current draw is defined as any current that significantly exceeds the output capability of the **Power Supplypower supply** or the contact rating of the receptacle. The maximum steady state operating current of the Source shall be the lesser of these two values. For example, the Source **portPort** powered by a 6A power supply connected to two 3A receptacles will provide a maximum continuous operating current of 3A on each receptacle. The short circuit protection mechanism shall be designed to avoid tripping at the maximum continuous operating current of the Source **portPort** and shall not interfere with negotiated current levels. The protected **portPort** shall recover automatically, by performing a Hard Reset, when the fault is removed and resume operation at **vSafe5V** within **tShortCctRecover** of the fault removal. Mechanical or user intervention shall not be required to reset the short circuit protection mechanism unless the Provider is purely a power source, which does not support USB communication, when mechanical intervention may be used.

Safe $\frac{Operationoperation}{P}$ mandates that Power Delivery Sources shall be tolerant of vSafe5V = V being present on V_{BUS} when simultaneously applying power to V_{BUS}. This shall not interfere with normal PD communication.

<u>A USB detach can be detected mechanically (e.g. Standard-A receptacle with insertion detect) or electrically (e.g. CC detection on the Type-C or via the ID pin on the Micro-A plug or using Attach Detection Protocol from **[USBOTG2.0]**. When the Source is capable of detecting a detach either mechanically or electrically, the Source shall transition to</u>

vSafe0V	Safe operating voltage at "zero volts".	0		0. <u>8</u>	V	Section 7.1.6		
by <i>tSafe0V</i> relative to when the detach event occurred (i.e. physical removal of the plug). During the transition to								
vSafe0V	Safe operating voltage	0		0. <u>8</u>	V	Section 7.1.6		

the V_{BUS} voltage shall be below *vSafe5V* max by *tSafe5V* relative to when the detach event occurred (i.e. physical removal of the plug) and shall not exceed *vSafe5V* max after this time.

7.1.87.1.9 Output Voltage Tolerance and Range

at "zero volts"

The Source output voltage tolerance,

<u>vSrcNew</u>	Fixed Supply output	<u>-5</u>	<u>+5</u>	<u>%</u>	Figure 7-2
	<u>tolerance measured</u> at				Figure 7-3
	the Source receptacle.				8

, shall be measured at the connector receptacle. The output tolerance includes load regulation, transient response and output ripple. The stability of the Source shall be tested in 25% load step increments from minimum load to maximum load and also from maximum load to minimum load. The positive and negative going slew rates fortransient behavior of the load step arecurrent is defined by Source 1.1.1 and. The time between each step should be sufficient to allow for the output voltage to settle in between load steps. The output voltage tolerance does not include undershoot and overshoot that may occur during voltage transitions. In some systems it may be necessary to design the Source to compensate for the voltage drop between the output stage of the power supply electronics and the receptacle contact. The determination of when compensation may be necessary is left to the discretion of the implementation. Refer to Table 7-22 for the output voltage tolerance specifications that shall be used for the Source.

7.1.97.1.10 Charging and Discharging the Bulk Capacitance on V_{BUS}

The Source shall charge and discharge the bulk capacitance on V_{BUS} whenever the Source voltage is negotiated to a different value. The charging or discharging occurs during the voltage transition and shall not interfere with the Source's ability to meet <u>tSrcReady</u>.

Page 235

Merged Cells Merged Cells

Field Code Changed

7.1.107.1.11 Swap Standby for Sources

Sources and Sinks of a Dual-Role $\frac{portPort}{Port}$ shall support Swap Standby. Swap Standby occurs for the Source after the Source power supply has discharged the bulk capacitance on V_{BUS} to

vSafe0V	Safe operating voltage at "zero volts <u>".</u>	0		0. <u>8</u>	v	Section 7.1.6

 <u>the shall be removed from V_{BUS}</u>. <u>The</u> Dual-Role portPort shall be configured as a Sink-and the <u>The</u> USB connection shall not reset even though <i>vSafe5V</i> is no longer present on V_{BUS} (see Section 9.1.2-). 						

The **PS_RDY** message associated with the Source being in Swap Standby shall be sent after the V_{BUS} drive is removed. The time for the Source to transition to Swap Standby shall not exceed **tSrcSwapStdby**. Upon entering Swap Standby the Source has relinquished its role as Source and is ready to become the new Sink. The transition time from Swap Standby to being the new Sink shall be no more than **tNewSnk**. The new Sink may start using power after the new Source sends the **PS_RDY** message.

1.2.8 Dead Battery Operation

Dead Battery operation shall be supported by all Consumer/Providers. A Consumer/Provider shall apply to its port when it detects its port-voltage to be vSafe0V (see Section 4.1). The Operation Region of vSafeDB source shall be as shown in Figure 7–6. For example if the Provider/Consumer attempts to draw 30mA the voltage will remain above 2.4V; if the Provider/Consumer attempts to draw more than 90mA the voltage will drop to -0V.- The Consumer/Provider shall fully support the vSafeDB Operating Region as shown in Figure 7–6 on reaching 2V. The output voltage shall reach 2V and comply with the vSafeDB Operating Region within tTurnOnSafeDB of when it first applies voltage to V_{EUS}. The Source bulk capacitance shall be limited to cSrcBulkDB for the Consumer/Provider when applying vSafeDB. The Consumer/Provider shall be limited to cSnkBulk when not applying vSafeDB.

A detailed description of the Consumer/Provider's behavior during Dead Battery operation is provided in Section-

Figure - vSafeDB - Operating Region

7.1.117.1.12 Source Peak Current Operation

A Source that has the Fixed Supply PDO Peak Current bits set to 01b, 10b and 11b shall be designed to support one of the overload capabilities defined in Table 6-7. The overload conditions are bound in magnitude, duration and duty cycle as listed in Table 6-7. Sources are not required to support continuous overload operation. When the overload capability is exceeded, the Source is expected take whatever action is necessary to prevent electrical or thermal damage to the Source. The Source may send a new *Source Capabilities* message with the Fixed Supply PDO Peak Current bits set to 00b to prohibit overload operation even if an overload capability was previously negotiated with the Sink.

Page 236

7.21.1Sink Requirements

7.2.11.1.1 Behavioral Aspects

7.1.13 BFSK over V_{BUS} Considerations for Sources

The Sinkfollowing sections list Source power supply considerations when applying BFSK signaling to V_{BUS}.

7.1.13.1 Transceiver Isolation Impedance

For BFSK signaling over V_{BUS} an isolation impedance as specified in Section 5.8.2.2 is used to isolate the transceiver from the capacitive loading of the Source. The DC component of the isolation impedance introduces additional voltage loss between the Source power path and the connector. The Source output impedance, the total V_{BUS} bulk capacitance, the transceiver isolation impedance(s), the USB cable and the Sink network creates a complex output isolation impedance that should be taken into consideration when designing the Source. Refer to Appendix C.1 for more information on this topic.

7.1.13.2 Noise Injected on V_{BUS}

The Source shall not interfere with the USB Power Delivery BFSK waveform that is transmitted on V_{BUS}. Power stage switching harmonics or poor layout and component selection may result in a significant amount of in-band noise injected on V_{BUS}. The characteristics of the noise will be implementation specific and in some cases an additional filter may be required to meet the in-band signal-to-noise ratio requirement of *snrSrc*. Refer to Section 5.8.2 for the reference impedance, carrier signal amplitude and transmission bandwidth of the USB Power Delivery BFSK waveform. Refer to Appendix C for more information on this topic.

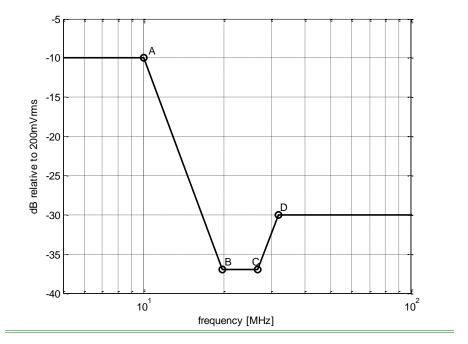

<u>Out-of-band noise (including spurs) can also affect the reception of the BFSK signal: therefore the Source shall limit its</u> <u>out-of-band noise below the spectrum shown in Figure 7-5 and the levels indicated in</u>

Table 7-1. Figure 7-5 shows the level of allowed noise relative to the level of the allowed in-band noise [for a Source:dbV (minimum value of vTX) – *snrSrc*]. The limits shown in Figure 7-5 and

Table 7-1 do not include any other regulations (such as FCC regulations) that govern signal emissions.

<u>The V_{BUS}-to-GND noise measurement shall be made at the connector. The noise measurement can be made using a</u> <u>breakout board or equivalent method that does not introduce additional loading of the AC impedance of the V_{BUS} wire.</u> <u>Such measurement access methods will require calibration to ensure accurate measurement results.</u>

The Source bulk capacitance shall be limited to cSrcBulkDB for the Consumer/Provider when applying vSafeDB. The Consumer/Provider shall be limited to cSncBulk when not applying vSafeDB.

<u>A detailed description of the Consumer/Provider's behavior during Dead Battery operation is provided in Section</u> 1.1.1.1.1.1.

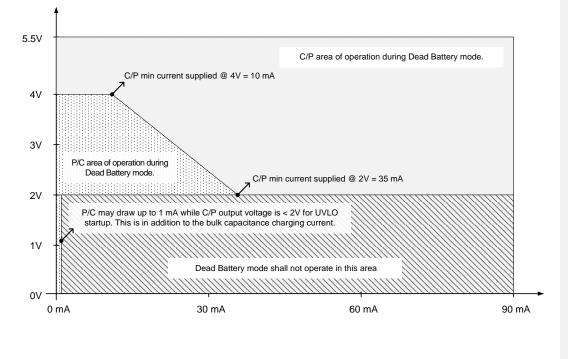

Figure 7-6 vSafeDB Operating Region

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

7.2 Sink Requirements

7.2.1 Behavioral Aspects

The Sink in a Consumer or Consumer/Provider exhibits the following behaviors.

- Shall be backward compatible with legacy V_{BUS} ports.
- Shall be backward compatible with legacy V_{BUS} ports.
- Shall draw the default [USB2.0], [USB3.1], [USBType-C1.0] or [BC1.2] V_{BUS} current when the USB cable is attached. [USB Default Operation].
- Shall draw the default [USB2.0]. [USB3.1]. [USBType-C1.0] or [BC1.2] V_{BUS} current when a USB Power Delivery contract does not exist. [USB Default Operation].
- Shall return to the default [USB2.0]. [USB3.1]. [USBType-C1.0] or [BC1.2] V_{BUS} when responding to a Hard Reset. (USB Default Operation).
- Shall control V_{BUS} in-rush current when increasing and decreasing current consumption.

The Sink in a Provider/Consumer exhibits the following behaviors.

The Sink in a Provider/Consumer exhibits the following behaviors.

- May support Dead Battery operation <u>as defined in Section 4.1.1 for Type-A to Type-B connections and as defined</u> in *[USBType-C1.0]* for Type-C to Type-C connections.
- Shall return to Source operation when responding to a Hard Reset.
- Shall control V_{BUS} in-rush current when increasing and decreasing current consumption.

7.2.2 Sink Bulk Capacitance

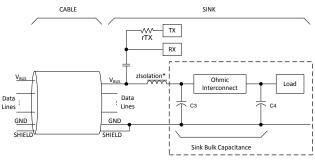

The Sink shall have a bulk capacitance, <u>*CSnkBulk*</u>, located between the input of the power supply and the transceiver isolation impedance as shown in Figure 7-7. The Sink bulk capacitance shall not be placed between the transceiver isolation impedance and the USB receptacle. The bulk capacitance consists of C3 and C4 as shown in Figure 7-7. The Ohmic Interconnect may consist of PCB traces for power distribution or power switching devices. The capacitance may be a single capacitor, a capacitor bank or distributed capacitance. An upper bound of *CSnkBulkPd* shall not be exceeded so that the transient charging, or discharging, of the total bulk capacitance on V_{BUS} can be accounted for during voltage transitions. If more bypass capacitance than *CSnkBulk* max or *cSnkBulkPd* max is required in the device, then the device must incorporate some form of V_{BUS} surge current limiting as described in *[USB3.1]* Section 11.4.4.1.

The Sink bulk capacitance is allowed to change to support a newly negotiated power level. The capacitance can be changed when the Sink enters Sink Standby or during a voltage transition or when the Sink begins to operate at the new power level. Regardless of when the change occurs, the capacitance change shall occur in such a manner that does not introduce a V_{BUS} transient current greater than

iCapChange	Transient current allowed to flow when the Sink changes its		10	mA	Section 7.2.2
	bulk capacitance <mark>.</mark>				

. During a <u>Power</u> Role Swap the Default Sink shall transition to Swap Standby before operating as the new Source. Any change in bulk capacitance required to complete the <u>Power</u> Role Swap shall occur during Swap Standby.

Figure 7-7 Placement of Sink Bulk Capacitance

* zIsolation is only required where BFSK over V_{BUS} signaling is implemented otherwise this can be omitted

7.2.3 Sink Standby

The Sink shall transition to Sink Standby before a positive or negative voltage transition of V_{BUS} . The Sink shall reduce its power draw during Sink Standby to *pSnkStdby* to allow for the Source to manage the voltage transition as well as supply sufficient operating current to the Sink to maintain PD operation during the transition. The Sink shall complete this transition to Sink Standby within *tSnkStdby* after evaluating the *Accept*-Message from the Source. The transition when returning to Sink <u>operation</u> from Sink Standby shall be completed within *tSnkNewPower*. The *pSnkStdby* requirement shall only apply if the Sink power draw is higher than this level.

7.2.4 Suspend Power Consumption

When Source has set its USB Suspend Supported flag (see Section 6.4.1.2.3.2), a Sink shall go to the lowest power state during USB suspend. The lowest power state shall be *pSnkSusp* or lower for a PDUSB peripheral device<u>Peripheral</u> and *pHubSusp* or lower for a PDUSB Hub. There is no requirement for the Source voltage to be changed during USB suspend.

7.2.5 Zero Negotiated Current

When a Sink Requests zero current as part of a power negotiation with a Source, the Sink shall go to the lowest power state, *pSnkSusp* or lower, where it can still communicate over V_{BUSUSING} PD signaling.

1.2.9 In-rush Current Limiting

The Sink shall control the rate of change of current draw when transitioning between negotiated levels, when transitioning to Sink Standby and when transitioning to a newly negotiated current level. The in-rush current rates for increasing and decreasing current shall be defined by and .

1.2.10 Transceiver Isolation Impedance

An isolation impedance as specified in Section is used to isolate the transceiver from the capacitive loading of the Sink. The DC component of the isolation impedance introduces additional voltage loss between the connector and the Sink power path. The Sink input impedance, the total V_{BUS} -bulk capacitance, the transceiver isolation impedance(c), the USB cable and the Source creates a complex input isolation impedance that should be taken into consideration when designing the Sink. Refer to Appendix C.1 for more information on this topic.

7.2.5.11.1.1.1 Noise Reflected on Vous

The Sink shall not interfore with the USB Power Delivery-FSK waveform that is transmitted on V_{BUS}-Power stage switching harmonics or poor layout and component selection may result in a significant amount of in band noise

reflected on V_{BUS}. The characteristics of the noise will be implementation specific and in some cases an additional filter may be required to meet the in-band signal to noise ratio requirement of *snrSnk*.-Refer to Section and Section for the reference impedance, carrier signal amplitude and transmission bandwidth of the USB Power Delivery FSK waveform.-Refer to Appendix C.1.1 for more information on this topic.

Out-of-band noise (including spurs) can also affect the reception of the FSK signal; therefore the Sink shall limit its out-of-band noise below the spectrum shown in and as detailed in .- also shows the noise level that shall be allowed relative to the level of the allowed in band noise [for a Sink: dbV(minimum value of)]. The limits shown in Figure 7.8 and Table 7.2 do not include any other regulations (such as FCC regulations) that govern signal emissions.

The V_{BUS} to CND noise measurement shall be made at the connector.

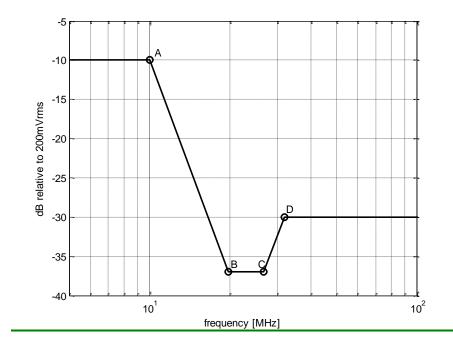

Table 7-2 Noise Spectral Mask Corners

Frequency (MHz)	Maximum Allowed Signal Level		
	(dB)	(mVpp)	
<10 (A)	-10	178.7	
19.7(B) to 26.7 (C)	-37	<u>7.92</u>	
≻32 (D)	-30	17.8	

7.2.6 Transient Load Behavior

When a Sink's operating current changes due to a load step, load release or any other change in load level, the positive or negative overshoot of the new load current shall not exceed the range defined by *iOvershoot*. For the purposes of measuring *iOvershoot* the new load current value is defined as the average steady state value of the load current after

Page 244

the load step has settled. The rate of change of any shift in Sink load current during normal operation shall not exceed *iLoadStepRate* (for load steps) and *iLoadReleaseRate* (for load releases) as measured at the Sink receptacle.

7.2.67.2.7 Swap Standby for Sinks

The <u>Sink'sSink</u> capability in a Dual-Role <u>portPort</u> shall support Swap Standby. Swap Standby occurs for the Sink after evaluating the *Accept* message from the Source during a <u>Power</u> Role Swap negotiation. While in Swap Standby the <u>Sink-Sink's current draw</u> shall not <u>draw powerexceed</u> *iSnkSwapStdby* from V_{BUST} and the Dual-Role <u>portPort</u> shall be configured as a Source <u>after V_{BUS} has been discharged to</u>

<i>vSafe0V</i> Safe operating voltage at "zero volts".	0		0. <u>8</u>	v	Section 7.1.6
--	---	--	-------------	---	---------------

and the by the existing Initial Source. The Sink's USB connection should not be reset even though vSafe5V is not present on the V_{BUS} conductor <u>(see Section 9.1.2-)</u>. The time for the Sink to transition to SwapStandby shall be no more than *tSnkTransition*. When in Swap Standby the Sink has relinquished its role as Sink and will prepare to become the new Source. The transition time from Swap Standby to new Source shall be no more than *tNewSrc*. The Sink current draw shall not exceed during Swap Standby.

1.2.11 Dead Battery Operation

Dead Battery operation is only supported by Provider/Consumers that want to perform an implicit (i.e. nonnegotiated) Role Swap when attached to a Consumer/Provider. When a Provider/Consumer port is not able to Source power (or has chosen to not source power) and would like to be powered by a Consumer/Provider, the Provider/Consumer shall discharge its port voltage to , present and be ready to power up the transceiver if is applied to its port. When operating from , the Provider/Consumer, acting as Sink, shall be able to operate from any Source that complies with the Operating Region of . The Provider/Consumer may regain the ability to Source power (or decide to do so) at any time and shall not apply power to its port when is present. The Provider/Consumer shall not commence Dead Battery operation or draw more than 1 mA until the voltage on V. The Sink bulk capacitance shall be limited to *cSnkBulkDB* for the Provider/Consumer acting as the Sink during Dead Battery operation. A detailed description of the Provider/Consumer's behavior during Dead Battery operation is provided in Sections 4.1 and.

7.2.77.2.8 Sink Peak Current Operation

Sinks shall only make use of a Source overload capability when the corresponding Fixed Supply PDO Peak Current bits are set to 01b, 10b and 11b <u>(see Section 6.4.1.2.3.6-)</u>. Sinks shall manage thermal aspects of the overload event by not exceeding the average negotiated output of a Fixed Supply that supports Peak Current operation. For example, if the Peak Current bits are set to 01b, a 130% Peak Current condition shall be followed immediately by a 70% or less load condition (I₁₀) for at least 1ms so as not to exceed the Source's average negotiated output.

Table - Fixed Power Source ILO Profile

Bits 2120	Description
00	I _{LO} = N/A
01	I _{LO} for no greater than 70% for at least 1ms
10	I_{LO} for no greater than 83% for at least 3ms
11	I _{LO} for no greater than 95% for at least 19ms

Sinks that depend on the Peak Current capability for enhanced system performance shall also function correctly when attached to a Source that does not offer the Peak Current capability or when the Peak Current capability has been inhibited by the Source.

7.2.9 BFSK over V_{BUS} Considerations for Sinks

The following sections list Sink considerations when applying BFSK signaling to V_{BUS}.

7.2.9.1 Transceiver Isolation Impedance

For BFSK signaling over V_{BUS} an isolation impedance as specified in Section 5.8.2.2 is used to isolate the transceiver from the capacitive loading of the Sink. The DC component of the isolation impedance introduces additional voltage loss between the connector and the Sink power path. The Sink input impedance, the total V_{BUS} bulk capacitance, the transceiver isolation impedance(s), the USB cable and the Source creates a complex input isolation impedance that should be taken into consideration when designing the Sink. Refer to Appendix C.1 for more information on this topic.

7.2.9.2 Noise Reflected on V_{BUS}

<u>The Sink shall not interfere with the USB Power Delivery BFSK waveform that is transmitted on V_{BUS_2} . Power stage switching harmonics or poor layout and component selection may result in a significant amount of in-band noise reflected on V_{BUS_2} . The characteristics of the noise will be implementation specific and in some cases an additional filter may be required to meet the in-band signal-to-noise ratio requirement of *snrSnk_Refer* to Section 5.8.2 for the reference impedance, carrier signal amplitude and transmission bandwidth of the USB Power Delivery BFSK waveform. Refer to Appendix C.1.1 for more information on this topic.</u>

Out-of-band noise (including spurs) can also affect the reception of the BFSK signal; therefore the Sink shall limit its out-of-band noise below the spectrum shown in Figure 7-8 and as detailed in Table 7-2. Figure 7-8 also shows the noise level that shall be allowed relative to the level of the allowed in-band noise [for a Sink: dbV (minimum value of *vTX*) – *snrSnk*]. The limits shown in Figure 7-8 and Table 7-2 do not include any other regulations (such as FCC, regulations) that govern signal emissions.

The V_{BUS}-to-GND noise measurement shall be made at the connector.

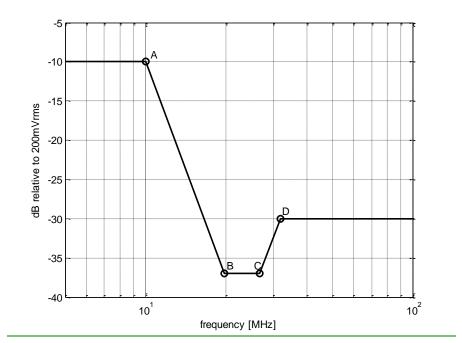

Figure 7-8 Noise Spectral Mask, given in absolute terms relative to the maximum value of vTX

Table 7-2 Noise Spectral Mask Corners

Frequency (MHz)	Maximum Allowed Signal Level		
	<u>(dB)</u>	<u>(mVpp)</u>	
<u><10 (A)</u>	<u>-10</u>	<u>178.7</u>	
<u>19.7(B) to 26.7 (C)</u>	<u>-37</u>	<u>7.92</u>	
<u>>32 (D)</u>	<u>-30</u>	<u>17.8</u>	

7.2.9.3 Dead Battery Operation

<u>Dead Battery operation is only supported by Provider/Consumers that want to perform an Implicit (i.e. non-negotiated) Power Role Swap when attached to a Consumer/Provider. When a Provider/Consumer Port is not able to Source power (or has chosen to not source power) and would like to be powered by a Consumer/Provider, the Provider/Consumer shall discharge its Port voltage to</u>

<i>vSafe0V</i> Safe operating voltage at "zero volts <u>".</u>	0		0. <u>8</u>	V	Section 7.1.6
--	---	--	-------------	---	---------------

, present cSnkBulk and be ready to power up the transceiver if *vSafeDB* is applied to its Port. When operating from *vSafeDB*, the Provider/Consumer, acting as a Sink, shall be able to operate from any Source that complies with the Operating Region of Figure 7-6. The Provider/Consumer may regain the ability to Source power (or decide to do so) at any time and shall not apply power to its Port when *vSafeDB* is present. The Provider/Consumer shall not commence Dead Battery operation or draw more than 1 mA until the voltage on V_{BUS} is above 2V. The Sink bulk capacitance shall be limited to *cSnkBulkDB* for the Provider/Consumer acting as the Sink during Dead Battery

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

operation. A detailed description of the Provider/Consumer's behavior during Dead Battery operation is provided in Sections 4.1 and 7.1.13.3.

7.3 Transitions

The following sections illustrate the <u>Power Supply'spower supply's</u> response to various types of negotiations. The negotiation cases take into consideration for the examples are as follows:

- Higher Power Transitions
 - o Increase the current
 - $\circ \quad \text{Increase the voltage} \\$
 - Increase the voltage and the current
- Relatively Constant Power Transitions
 - o Increase the voltage and decrease the current
 - Decrease the voltage and increase the current
- Lower Power Transitions
 - o Decrease the current
 - Decrease the voltage
 - $\circ \quad \text{Decrease the voltage and the current}$
- Power Role Swap Transitions
 - o Source requests a <u>Power</u> Role Swap
 - Sink requests a <u>Power</u>Role Swap
- Go To Minimum Current Transition
- Response to Hard Reset signaling
 - Source issues *Hard Reset* signaling
 - Sink issues *Hard Reset* signaling
 - o New Source issues *Hard Reset* signaling and New Sink Receives *Hard Reset* signaling.
 - New Source issues Hard Reset signaling and New Sink Does Not Receive Hard Reset signaling.
 - New Sink issues *Hard Reset* signaling and New Source Receives *Hard Reset* signaling.
 - o New Sink issues Hard Reset signaling and New Source Does Not Receive Hard Reset signaling.
- Dead Battery Operation.
- No change in Current or Voltage.

The transition from *[USB2.0]*, *[USB3.1]*.*[USBType-C1.0]* or *[BC1.2]* operation into Power Delivery Mode can also lead to a Power Transition since this is the initial Contract negotiation. The following types of Power Transitions shall also be applied when moving from *[USB2.0]*, *[USB3.1]*.*[USBType-C1.0]* or *[BC1.2]* operation into Power Delivery Mode:

- High Power
- Relatively Constant Power
- Lower Power Transitions
- No change in Current or Voltage.

7.3.1 Increasing the Current

The interaction of the System Policy, Device Policy, and <u>Power Supplypower supply</u> that shall be followed when increasing the current is shown in Figure 7-9. The sequence that shall be followed is described in Table 7-3. The timing parameters that shall be followed are listed in Table 7-22 and Table 7-23. <u>Note in this figure, the Sink has previously sent a *Request*-message to the Source.</u>

Policy Engine tells the Device Policy Manager to instruct the Power Supplypower supply to reduce power consumption.
3		The Sink shall not violate the in-rush current specificationstransient load behavior defined in Section 1.1.1 and when while transitioning to and operating at the new power level-and. The Sink shall complete the transition withinbe able to operate with lower currentwithin tSnkNewPower (t1); t1 shall complete before tSnkTransition.
4	After <i>tSnkTransition</i> , the Policy Engine tells the Device Policy Manager to instruct the Power Supplypower supply to change its output power capability. The Power <u>Supplypower supply</u> shall be ready to operate at the new power level within <i>tSrcReady</i> (t2). The Power Supplypower <u>supply</u> informs the Device Policy Manager that it is ready to operate at the new power level. The Power Supplypower supply is passed to the Policy Engine.	
5	The Policy Engine sends the <i>PS_RDY</i> message to the SinkPolicy Engine receives the message from the Sink.	<u>The</u> Policy Engine <u>sendsreceives</u> the <u>PS_RDY</u> message to from the Source.
6	Protocol Layer receives the GoodCRC message from the Sink.	Protocol Layer sends the <i>GoodCRC</i> message to the <u>Source</u> . Policy Engine evaluates the <i>PS_RDY</i> message from the Source. The Sink is already operating at the new power level so no further action is required.

Page 264

USB Power Delivery Specification Revision 2.0, Version 1.0.

7.3.7 Decreasing the Voltage

The interaction of the System Policy, Device Policy, and <u>Power Supplypower supply</u> that shall be followed when decreasing the voltage is shown in Figure 7-15. The sequence that shall be followed is described in Table 7-9. The timing parameters that shall be followed are listed in Table 7-22, Table 7-23 and Table 7-24. <u>Note in this figure, the Sink has previously sent a *Request*-message to the Source.</u>

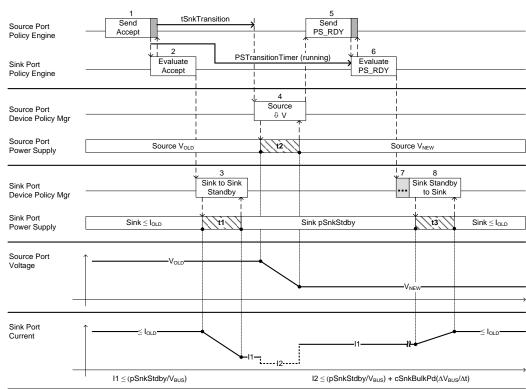

Figure 7-15 Transition Diagram for Decreasing the Voltage

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

Table 7-9 Sequence Description for Decreasing the Voltage

Step	Source Port	Sink Port
1	Policy Engine sends the <i>Accept</i> message to the Sink. <u>Policy Engine receives the</u> message from the Sink. The Policy Engine waits before telling the Device Policy Manager to instruct the Power Supply to modify its output power.	Policy Engine receives the Accept message and starts the PSTransitionTimer.
2	Protocol Layer receives the <i>GoodCRC</i> message from the Sink. The Policy Engine waits <i>tSnkTransition</i> before telling the Device Policy Manager to instruct the power supply to modify its output power.	Policy Engine starts and Protocol Layer sends the GoodCRC message to the SourcePolicy Engine then evaluates the Accept message.
3		Policy Engine tells the Device Policy Manager to instruct the Power Supplypower supply to reduce power consumption to <i>pSnkStdby</i> within <i>tSnkStdby</i> (t1); t1 shall complete before <i>tSnkTransition</i> . <u>The</u> Sink shall not violate transient load behavior defined in Section 1.1.1 while transitioning to and operating at the new power level.
4	After <i>tSnkTransition</i> , the Policy Engine tells the Device Policy Manager to instruct the Power Supplypower supply to change its output voltage to operate at the new power level. The Power Supplypower supply shall be ready to operate at the new power level within <u><i>tSrcReady</i></u> (t2). The Power <u>Supplypower supply</u> informs the Device Policy Manager that it is ready to operate at the new power level. The Power <u>Supplypower supply</u> status is passed to the Policy Engine.	
5	The Policy Engine sends the <i>PS_RDY</i> message to the SinkPolicy Engine receives the message from the Sink.	The Policy Engine sendsreceives the <i>PS_RDY</i> message tofrom the Source.
6	<u>Protocol Layer receives the <i>GoodCRC</i></u> message from the Sink.	Protocol Layer sends the GoodCRC message to the Source. Policy Engine then evaluates the PS_RDY message from the Source and tells the Device Policy to instruct the Power SupplyManager it is okay to operate at the new power level.
7		The Sink may begin operating at the new power level any time after having evaluatedevaluation of the <i>PS_RDY</i> message. This time duration is indeterminate.

Page **266**

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

Step	Source Port	Sink Port
8		The Sink shall not violate the in rush current specficationstransient load behavior defined in Section 1.1.1 and when while transitioning to and operating at the new power level and shall complete. The time duration (t3) depends on the transition within (t3).magnitude of the load change.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

7.3.8 Decreasing the Voltage and the Current

The interaction of the System Policy, Device Policy, and <u>Power Supplypower supply</u> that shall be followed when decreasing the voltage and current is shown in Figure 7-16. The sequence that shall be followed is described in Table 7-10. The timing parameters that shall be followed are listed in Table 7-22, Table 7-23 and Table 7-24. <u>Note in this figure, the Sink has previously sent a *Request*-message to the Source.</u>

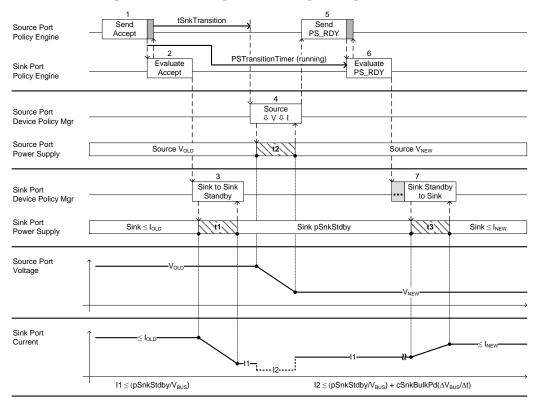

Figure 7-16 Transition Diagram for Decreasing the Voltage and the Current

Step	Source Port	Sink Port
8		The Sink shall not violate the in-rush current specificationstransient load behavior defined in Section 1.1.1 and when while transitioning to and operating at the new power level and shall complete. The time duration (t3) depends on the transition within (t3).magnitude of the load change.

USB Power Delivery Specification Revision 2.0, Version 1.0.

7.3.9 Sink Requested **Power** Role Swap

The interaction of the System Policy, Device Policy, and <u>Power Supplypower supply</u> that shall be followed during a Sink requested <u>Power</u> Role Swap is shown in Figure 7-17. The sequence that shall be followed is described in Table 7-11. The timing parameters that shall be followed are listed in Table 7-23. Note in this figure, the Sink has previously sent a <u>PR_SwapSwap</u> message to the Source.

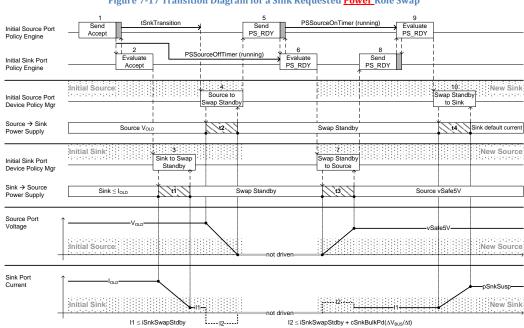

Figure 7-17 Transition Diagram for a Sink Requested Power Role Swap

USB Power Delivery Specification Revision <u>42.0, Version 1.0</u>

Step	Initial Source Port $ ightarrow$ New Sink Port	Initial Sink Port → New Source Port
1	Policy Engine sends the <i>Accept</i> message to the Initial Sink.— <u>Policy Engine receives the</u> message from the Initial Sink.—The Policy Engine waits before telling the Device Policy Manager to instruct the Power Supply to transition to Swap Standby.	<u>Policy Engine receives the Accept and starts the</u> <i>PSSourceOffTimer</i> .
2	Protocol Layer receives the <i>GoodCRC</i> message from the Initial Sink. The Policy Engine waits <i>tSnkTransition</i> before telling the Device Policy Manager to instruct the power supply to transition to Swap Standby.	Policy Engine starts and Protocol Layer sends the GoodCRC message to the Initial Source Policy Engine then evaluates the Accept message.
3		Policy Engine tells the Device Policy Manager to instruct the Power Supplypower supply to transition to Swap Standby within <i>tSnkStdby</i> (t1); t1 shall complete before <i>tSnkTransition</i> . When in Sink Standby the Initial Sink shall not draw more than <i>iSnkSwapStdby</i> (I1). The Sink shall not violate transient load behavior defined in Section 1.1.1} except during the V _{BUS} voltage transition (I2). while transitioning to and operating at the new power level.
4	After <i>tSnkTransition</i> , the Policy Engine tells the Device Policy Manager to instruct the Power Supplypower supply to transition to Swap Standby (see Section 7.1.11). The Power Supplypower supply shall complete the transition to Swap Standby within <i>tSrcSwapStdby</i> (t2). The Power <u>Supplypower supply</u> informs the Device Policy Manager that it is ready to operate as the new Sink. The Power Supplypower <u>supply</u> status is passed to the Policy Engine.	
5	The Power Supply power supply is ready and the Policy Engine sends the <i>PS_RDY</i> message to the device that will become the new Source. <u>Policy Engine receives the message</u> from the device that will become the new <u>Source and starts the</u> . Upon sending the message and receiving the message the Initial Source is ready to be the new Sink.	Policy Engine stops the and sends the message to the new Sink.
6	Protocol Layer receives the GoodCRC message from the device that will become the new Source. Policy Engine starts the PSSourceOnTimer. Upon sending the PS_RDY message and receiving the GoodCRC message the Initial Source is ready to be the new Sink.	Upon evaluatingPolicy Engine stops the PSSourceOffTimer_ The Protocol Layer sends the GoodCRC message to the Initialnew Sink is ready to operate as the new Source Policy Engine tells the Device Policy to instruct the Power Supplypower supply to operate as the new Source.

Step	Initial Source Port → New Sink Port	Initial Sink Port → New Source Port
7		The Power Supplypower supply as the new Source transitions from Swap Standby to sourcing default vSafe5V 5V within tNewSrc (t3). The Power Supplypower supply informs the Device Policy Manager that it is operating as the new Source.
8	Policy Engine stops<u>receives</u> the <i>PS_RDY</i> sends the message to<u>from</u> the new-Source.	Device Policy Manager informs the Policy Engine the Power Supplypower supply is ready and the Policy Engine sends the <i>PS_RDY</i> message to the new Sink. Policy Engine receives the message from the new Sink.
9	Policy Engine stops the PSSourceOnTimer.Protocol Layer sends the GoodCRC message to the new Source.Policy Engine evaluates the PS_RDY message from the new Source and tells the Device Policy Manager to instruct the Power Supplypower supply to draw current as the new Sink.	Protocol Layer receives the GoodCRC message from the new Sink.
10	The Power Supplypower supply as the new Sink transitions from Swap Standby to drawing pSnkSusp within tNewSnk (t4). The Power Supplypower supply informs the Device Policy Manager that it is operating as the new Sink. At this point subsequent negotiations between the new Source and the new Sink may proceed as normal. <u>The Sink shall not violate the transient load behavior defined in Section 1.1.1 while transitioning to and operating at the new power level. The time duration (t4) depends on the magnitude of the load change.</u>	

USB Power Delivery Specification Revision <u>**42</u>**.0, <u>Version 1.0</u></u>

7.3.10 Source Requested **Power** Role Swap

The interaction of the System Policy, Device Policy, and <u>Power Supplypower supply</u> that shall be followed during a Source requested <u>Power</u> Role Swap is shown in Figure 7-18. The sequence that shall be followed is described in Table 7-12. The timing parameters that shall be followed are listed in Table 7-22. <u>Prior to.</u> Note in this figure, the Sink sending the has previously sent a <u>PR</u> Swap message (step 1)to the Source has sent a <u>Swap</u> message to the <u>Sink</u>.

USB Power Delivery Specification Revision 2.0, Version 1.0.

7.3.16 New Sink Initiates Hard Reset and New Source Receives Hard Reset Signaling

The interaction of the System Policy, Device Policy, and <u>Power Supplypower supply</u> that shall be followed during a Hard Reset initiated by the new Sink when the new Source receives the *Hard Reset* signaling is shown in Figure 7-24. The sequence that shall be followed is described in Table 7-18. The timing parameters that shall be followed are listed in Table 7-22 and Table 7-23.

After a Hard Reset a Provider/Consumer shall return to its Source role and a Consumer/Provider shall return to its Sink role.

Step	New Source Port	New Sink Port
1		Policy Engine sends the <i>Hard Reset</i> signaling to the new Source and waits <i>tSwapRecover</i> before telling the Device Policy Manger to revert to Source operation.
2	Policy Engine evaluates the Hard Reset notification and tells the Device Policy Manager to turn off the new Source.	
3	The Device Policy Manager instructs the <u>Power Supplypower supply</u> to turn off the Source and revert to Sink operation by <u>tSafe0V</u> (t1).	
4	The Sink shall not violate the transient load <u>behavior defined in Section</u> 1.1.1 <u>while</u> transitioning to and operating at the new power level.	Source applies vSafe5V when V _{BUS} is within vSafe0V Safe operating voltage at "zero volts". . The transition to vSafe5V shall be completed with tSrcTurnOn (t2).

USB Power Delivery Specification Revision 2.0, Version 1.0.

7.3.17 New Sink Initiates Hard Reset and New Source Does Not Receive Hard Reset Signaling

The interaction of the System Policy, Device Policy, and **Power Supply** power supply that shall be followed during a Hard Reset initiated by the new Sink when the new Source does not receive the **Hard Reset** signaling is shown in Figure 7-25. The sequence that shall be followed is described in Table 7-19. The timing parameters that shall be followed are listed in Table 7-22 and Table 7-23.

After a Hard Reset, a Provider/Consumer shall return to its Source role and a Consumer/Provider shall return to its Sink role.

	. The transition to vSafe5V_shall be completed within tSrcTurnOn(t2).	

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

7.3.17.1<u>1.1.1.1. Dead Battery Operation</u>

7.3.18 Type-A to Type-B Dead Battery Operation

The interaction of the System Policy, Device Policy, and <u>Power Supplypower supply</u> that shall be followed during <u>Type-A to Type-B</u> Dead Battery operation is shown in Figure 7-26. The sequence that shall be followed is described in Table 7-20. The timing parameters that shall be followed are listed in Table 4-4, Table 7-22 and Table 7-23. The Initial Source Port is not applying power to V_{BUS} at the beginning of this sequence.

After a Hard Reset, a Provider/Consumer shall return to its Source role and a Consumer/Provider shall return to its Sink role.

8. Device Policy

8.1 Overview

This section describes the Device Policy and Policy Engine that implements it. For an overview of the architecture and how the Device Policy Manager fits into this architecture, please see Section 2.6.

8.2 Device Policy Manager

The Device Policy Manager is responsible for managing the power used by one or more USB Power Delivery ports. In order to have sufficient knowledge to complete this task it needs relevant information about the device it resides in. Firstly it has a priori knowledge of the device including the capabilities of the power supply and the receptacles on each <u>portPort</u> since these will for example have specific current ratings. It also has to know information from the cable detection module regarding cable insertion, type and rating of cable etc. It also has to have information from the <u>Power Supply power supply</u> about changes in its capabilities as well as being able to request power supply changes. With all of this information the Device Policy Manager is able to provide up to date information regarding the capabilities available to a specific portPort and to manage the power resources within the device.

When working out the capabilities for a given Source **portPort** the Device Policy Manager will take into account firstly the current rating of the **port'sPort's** receptacle and whether the inserted cable is PD or non-PD rated and if so what is the capability of the plug. This will set an upper bound for the capabilities which may be offered. After this the Device Policy Manager will consider the available **Power Supply power supply** resources since this will bound which voltages and currents may be offered. Finally, the Device Policy Manager will consider what power is currently allocated to other ports, which power is in **reservethe Power Reserve** and any other amendments to Policy from the System Policy Manager. The Device Policy Manager will offer a set of **Capabilities** within the bounds detailed above.

When selecting a capability for a given Sink **portPort** the Device Policy Manager will first look at the capabilities offered by the Source. The Device Policy Manager will take into account the current rating of the **port'sPort's** receptacle and <u>for Type-A/Type-B plugs</u> whether the inserted cable is PD or non-PD rated and if so what is the capability of the plug. This will set an upper bound for the capabilities which may be requested. The Device Policy Manager will also consider which capabilities are required by the Sink in order to operate. If an appropriate match for Voltage and Current can be found within the limits of the receptacle and cable then this will be requested from the Source. If an appropriate match cannot be found then a request for <u>defaultan offered</u> voltage and current will be made, along with an indication of a capability mismatch.

For Dual-Role <u>portsPorts</u> the Device Policy Manager manages the functionality of both a Source and a Sink. In addition it is able to manage the <u>role swapPower Role Swap</u> process between the two. In terms of power management this could mean that a <u>portPort</u> which is initially consuming power as a Sink is able to become a power resource as a Source. Conversely, attached Sources may request that power be provided to them.

The functionality within the Device Policy Manager (and to a certain extent the Policy Engine) is scalable depending on the complexity of the device, including the number of different power supply capabilities and the number of different features supported for example System Policy Manager interface or Capability Mismatch, and the number of ports being managed. Within these parameters it is possible to implement devices from very simple power supplies to more complex power supplies or devices such as USB hubs or Hard Drives. Within multiport devices it is also permitted to have a combination of USB Power Delivery and non-USB Power Delivery ports which should all be managed by the Device Policy Manager.

As noted in Section 2.6 the logical architecture used in the PD specification will vary depending on the implementation. This means that different implementations of the Device Policy Manager may be relative small or large depending on the complexity of the device, as indicated above. It is also possible to allocate different responsibilities between the Policy Engine and the Device Policy Manager, which will lead to different types of architectures and interfaces.

The Device Policy Manager is responsible for the following:

• Maintaining the Local Policy for the Devicedevice

- For a Source, monitoring the present capabilities and triggering notifications of the change.
- For a Sink, evaluating and responding to capabilities related requests from the Policy Engine for a given portPort.
- Control of the Source/Sink in the Devicedevice.
- Control of the cable detection module for each portPort.
- Interface to the Policy Engine for a given portPort.

The Device Policy Manager is responsible for the following optional features when implemented:

- Communications with the System Policy over USB.
- For Sources with multiple ports monitoring and balancing power requirements across these ports.
- Monitoring of batteries and AC power supplies.

8.2.1 Capabilities

The Device Policy Manager in a Provider shall know the <u>Powerpower</u> supplies available in the <u>Devicedevice</u> and their capabilities. In addition it shall be aware of any other PD Sources of power such as batteries and AC in puts. The available power sources and existing demands on the <u>Devicedevice</u> shall be taken into account when presenting capabilities to a Sink.

The Device Policy Manager in a Consumer shall know the requirements of the Sink and use this to evaluate the capabilities offered by a Source. It shall be aware of its own power sources e.g. Batteries or AC supplies where these have a bearing on its operation as a Sink.

The Device Policy Manager in a Provider/Consumer or Consumer/Provider shall combine the above capabili ties and shall also be able to present the dual-role nature of the <u>Devicedevice</u> to an attached PD <u>DeviceCapable device</u>.

8.2.2 System Policy

A given PD<u>Capable</u> device may have no USB capability, or PD may have been added to a USB device in such a way that PD is not integrated with USB. In these two cases there shall be no requirement for the Device Policy Manager to interact with the USB interface of the device. The following requirements shall only apply to PD devices that expose PD functionality over USB.

The Device Policy Manager shall communicate over USB with the System Policy Manager according to the requirements detailed in Chapter 9. Whenever requested the Device Policy Manager shall implement a Local Policy according to that requested by the System Policy Manager. For example the System Policy Manager may request that a battery powered Device temporarily stops charging so that there is sufficient power for a HDD to spin up.

The System Policy Manager may operate in an "Intrusive" POLICY_MODE where supported by a PD <u>Capable</u> device. This means that each and every request, which can be handled by the System Policy Manager, received by the Device Policy Manager is passed up to the USB Host for a response. In practice this means that there is a Device Policy Manager running on the USB Host and communicating via the USB bus to the PD Module. This enables software based implementations of the Device Policy Manager but has serious implications in terms of response times which have to be taken into consideration.

Note: that due to timing constraints, a PD<u>Capable</u> device shall be able to respond autonomously to all time-critical PD related requests.

8.2.3 Control of Source/Sink

The Device Policy Manager for a Provider shall manage the power supply for each PD Source Port and shall know at any given time what the negotiated power is. It shall request transitions of the supply and inform the Policy Engine whenever a transition completes.

The Device Policy Manager for a Consumer shall manage the Sink for each PD Sink Port and shall know at any given time what the negotiated power is.

The Device Policy Manager for a Provider/Consumer or Consumer/Provider shall manage the transition between Source/Sink roles for each PD dual role port<u>Dual-Role Port</u> and shall know at any given time what operational role the port<u>Port</u> is in.

The Device Policy Manager for a Consumer/Provider shall be able to detect and handle cases where back-powering is required due to a <u>dead batteryDead Battery</u> on the Provider/Consumer side. It shall determine the absence of V_{BUS} and the Provider/Consumer's ability to be back-powered from the Cable Detection module. It shall then initiate Provider role and instruct the <u>Power Supplypower supply</u> to start providing default output power. Refer to Section 4.1.

The Device Policy Manager for a Provider/Consumer may be able to detect and handle cases where back-powering is possible due to a <u>dead batteryDead Battery</u>. Where supported it shall determine the presence of V_{BUS} from the Cable Detection module. It shall then initiate Consumer role and instruct the <u>Power Supplypower supply</u> to start sinking default input power.

8.2.4 Cable Detection

8.2.4.1 Device Policy Manager in a Provider

The Device Policy Manager in the Provider shall control the Cable Detection module and shall be able to use the Cable Detection module to determine the attachment of a <u>cable and for Type-A/Type-B whether it is a</u> USB Power Delivery or non-USB Power Delivery cable for a given port.

This information and the type of receptacle on the local device shall be used to determine the capabilities of the <u>Port</u> and attached cabling. Note: that it may be necessary for the <u>Device Policy Manager to also initiate additional</u> discovery via Structured VDM messages in order to determine the full capabilities of the cabling (see Section 6.4.4.2port and attached cabling.).

8.2.4.2 Device Policy Manager in a Consumer

The Device Policy Manager in a Consumer controls the Cable Detection module and shall be able to use the Cable Detection module to determine the attachment of a USB Power Delivery or non-USB Power Delivery cable.

The type of cabling and receptacle together determine the current <u>carringcarrying</u> ability of the <u>portPort</u> and attached cabling.

8.2.4.3 Device Policy Manager in a Consumer/Provider

The Device Policy Manager in a Consumer/Provider inherits characteristics of Consumers and Providers and shall control the Cable Detection module in order to support the Dead Battery back-powering case to determine the following for a given portPort:

Attachment of a USB Power Delivery Provider/Consumer which supports Dead Battery back-powering

Presence of V_{BUS}.

8.2.4.4 Device Policy Manager in a Provider/Consumer

The Device Policy Manager in a Provider/Consumer inherits characteristics of Consumers and Providers and may control the Cable Detection module in order to support the Dead Battery back-powering case to determine the following for a given portPort:

Presence of V_{BUS}.

8.2.5 Managing Power Requirements

The Device Policy Manager in a Provider shall be aware of the power requirements of all <u>Devicesdevices</u> connected to its Source Ports. This includes being aware of any reserve power that may be required by <u>Devicesdevices</u> in the future and ensuring that power is shared optimally amongst attached PD <u>DevicesCapable devices</u>. This is a key function of the Device Policy Manager, whose implementation is critical to ensuring that all PD <u>DevicesCapable devices</u> get the

USB Power Delivery Specification Revision <u>42.0, Version 1.0</u>

power they require in a timely fashion in order to facilitate smooth operation. This is balanced by the fact that the Device Policy Manager is responsible for managing the sources of power that are, by definition, finite.

The Consumer's Device Policy Manager shall ensure that it takes no more power than is required to perform its functions and gives back unneeded power whenever possible (in such cases the Provider shall maintain a reservePower Reserve to ensure future operation is possible).

8.2.5.1 Managing the Power Reserve

There may be some products where a Device has certain functionality at one power level and a greater functionality at another, for example a Printer/Scanner that operates only as a printer with one power level and as a scanner if it can get more power. Visibility of the linkage between power and functionality will only be apparent at the USB Host; however the Device Policy Manager provides the mechanisms to manage the power requirements of such Devices.

Devices with the GiveBack flag cleared report Operating Current and Maximum Operating Current (see Section 6.4.2). For many Devices the Operating Current and the Maximum Operating Current will be the same. Devices with highly variable loads, such as Hard Disk Drives, may use Maximum Operating Current.

Devices with the GiveBack flag set report Operating Current and Minimum Operating Current (see Section 6.4.2). For many Devices the Operating Current and the Minimum Operating Current will be the same. Devices that charge their own batteries may use the Minimum Operating Current and GiveBack flag.

For example in the first case, a mobile device may require 500mA to operate, but would like an additional 1000mA to charge its battery. The mobile device would <u>set the GiveBack flag (see Section 6.4.2.2then) and</u> request 500mA in the Minimum Operating Current field and 1500mA in the Operating Current field. <u>Additionally, it would set the GiveBack flag (see Section) (provided that 1500mA was offered by the Source)</u> indicating to the Provider that it could temporarily recover the 1000mA to meet a transitory request.

In the second case, a Hard Disk Drive (HDD) may require 2A to spin-up, but only 1A to operate. At startup the HDD would request Maximum Operating Current of 2A and an Operating Current of 2A. After the drive is spun-up and ready to operate it would make another request of 1A for its Operating Current and 2A for its Maximum Operating Current. Over time, its inactivity timers may expire and the HDD will go to a lower power state. When the HDD is next accessed, it has to spin-up again. So it will request an Operating Current of 2A and a Maximum Operating Current of 2A. The Provider may have the extra power available immediately and can immediately honor the request. If the power is not available, the Provider may have to harvest power, for example use the *GotoMin* message to get back some power before honoring the HDD's request. In such a case, the HDD would be told to wait using a *Wait* message. The HDD continues to Request additional power until the request is finally granted.

It shall be the Device Policy Manager's responsibility to allocate power and maintain a **powerPower** Reserve so as not to over-subscribe its available power resource. A Device with multiple ports such as a Hub shall always be able to meet the incremental demands of the **portPort** requiring the highest incremental power from its **Power** Reserve.

The *GotoMin* message is designed to allow the Provider to reclaim power from one <u>portPort</u> to support a Consumer on another <u>portPort</u> that temporarily requires additional power to perform some short term operation. In the example above, the mobile device that is being charged reduces its charge rate to allow a Device Policy Manager to meet a request from an HDD for start-up current required to spin-up its platters. Any power which is available to be reclaimed using a *GotoMin* message may be counted as part of the <u>powerPower</u> Reserve.

A Consumer requesting power shall take into account its operational requirements when advertising its ability to temporarily return power. For example, a mobile device with a <u>dead batteryDead Battery</u> that is being used to make a call should make a request that retains sufficient power to continue the call. When the Consumer's requirements change, it shall re-negotiate its power to reflect the changed requirements.

8.2.5.2 Power Capability Mismatch

A capability mismatch occurs when a Consumer cannot obtain required power from a Provider and the Consumer requires such capabilities to operate. Different actions are taken by the Device Policy Manager and the System Policy Manager in this case.

8.2.5.2.1 Local device handling of mismatch

The Consumer's Device Policy Manager shall cause a message to be displayed to the end user that a power capability mismatch has occurred. Examples of such feedback can include:

- For a simple Device an LED may be used to indicate the failure. For example, during connection the LED could be solid amber. If the connection is successful the LED could change to green. If the connection fails it could be red or alternately blink amber.
- A more sophisticated Device with a user interface, e.g., a mobile device or monitor, should provide notification through the user interface on the Device.

The Provider's Device Policy Manager may cause a message to be displayed to the user of the power capability mismatch.

8.2.5.2.2 Device Policy Manager Communication with System Policy

In a USB Power Delivery aware system with an active System Policy manager (see Section 8.2.2), the Device Policy Manager shall notify the System Policy Manager of the mismatch. This information shall be passed back to the System Policy Manager using the mechanisms described in Chapter 8.3.3. The System Policy Manager should ensure that the user is informed of the condition. When another **portPort** in the system could satisfy the Consumer's power requirements the user should be directed to move the Device to the alternate **portPort**.

In order to identify a more suitable Source Port for the Consumer the System Policy Manager shall communicate with the Device Policy Manager in order to determine the Consumer's requirements. The Device Policy Manager shall use a *Get_Sink_Cap* message (see Section 6.3.8) to discover which Powerpower levels can be utilized by the Consumer.

8.2.6 Use of "Externally Powered" bit with Batteries and AC supplies

The Device Policy Manager in a Provider or Consumer may monitor the status of any variable sources of power that could have an impact on its capabilities as a Source such as Batteries and AC supplies and reflect this in the "Externally Powered" bit <u>(see Section 6.4.1.3.1.3)</u> provided as part of the Source or Sink Capabilities message (see Section 6.4.1). When monitored, and a USB interface is supported, the External Power status (see Section 9.4.4) and the battery state (see Section 9.4.2) shall also be reported to the System Policy Manager using the USB interface.

8.2.6.1 AC Supplies

The Externally Powered bit provided by Sources and Sinks (see Sections 6.4.1.2.3.3 and 6.4.1.3.1.3) refers to the presence of an external AC power supply (i.e. from a wall wart) that is providing 100% of the power to a given device. This means that the device is solely getting its power from this power supply and is not aggregating power from other, non-external, power sources. Logically this power can either be from an AC supply directly connected to the device or from an AC supply connected to an attached device, which is also getting 100% of its power from this power supply. The Externally Powered bit is in this way communicated through a PD system indicating that the origin of the power is from a single or multiple AC supplies:

- If the "Externally Powered" bit is set then that power is originally sourced from an AC supply.
- Devices capable of consuming on multiple ports, can only claim that they are "Externally Powered" for the power advertised as a provider <u>portPort</u> if 100% of the consumed power is from external supplies, (e.g. multiple AC supplies).
- This concept applies as the power is routed through multiple provider and <u>consumerConsumer</u> tiers, so, as an example. Power provided out of a monitor that is connected to a monitor that gets power from an AC supply, will claim it is "Externally Powered" even though it is not directly connected to the AC supply.

An example use case is a Tablet computer that is used with two USB A/V displays that are daisy chained (see Figure 8-1). The tablet and 1st display are not externally powered, (meaning, they have no source of power outside of USB PD). The 2nd display has an external supply attached which may either be a USB PD based supply or some other form of external supply. When the displays are connected as shown, the power adapter attached to the 2nd display is able to power both the 1st display and the tablet. In this case the 2nd display will indicate the presence of the wall wart, to the 1st display, by setting its "Externally Powered" bit. The 1st display will then in turn indicate the presence of an

external supply to the tablet by setting its "Externally Powered" bit. Power is transmitted through the system to all devices, provided that there is sufficient power available from the external supply.

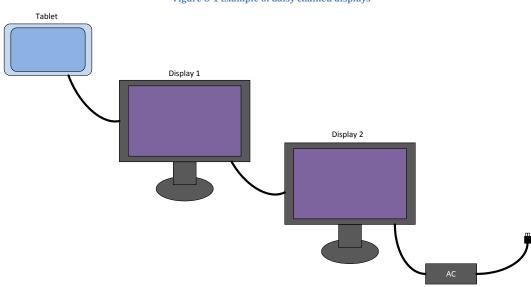

Figure 8-1 Example of daisy chained displays

8.2.6.2 Battery Supplies

When monitored, and a USB interface is supported, the battery state shall be reported to the System Policy Manager using the USB interface.

A simplified algorithm is detailed below to ensure that battery powered devices will get charge from non-battery powered devices when possible, and also to ensure that devices do not constantly role swapPower Role Swap back and forth. When two devices are connected that are not Externally Powered, they should define their own policies so as to prevent constant role swappingPower Role Swapping.

This algorithm uses the "Externally Powered" bit (see Sections 6.4.1.2.3.3 and 6.4.1.3.1.3), thus the decisions are based on the availability of an external supply, not the full capabilities of a system or device or product.

Rules:

- 1. Provider/Consumers using external sources ("Externally powered" bit set) shall always deny swapPower Role
- Swap requests from Consumer/Providers not using external sources ("Externally Powered" bit cleared).
- 2. Provider/Consumers not using external sources ("Externally Powered" bit cleared) shall always accept a swapPower Role Swap request from a Consumer/Provider using external power sources ("Externally Powered" bit set) unless the requester is not able to provide the requirements of the present Provider/Consumer.

8.2.7 Interface to the Policy Engine

The Device Policy Manager shall maintain an interface to the Policy Engine for each portPort in the Devicedevice.

8.2.7.1 Device Policy Manager in a Provider

The Device Policy Manager in a Provider shall also provide the following functions to the Policy Engine:

- Inform the Policy Engine of changes in cable/Device device attachment status for a given cable.
- Inform the Policy Engine whenever the Source capabilities available for a portPort change.

Page 308

Evaluate requests from an attached Consumer and provide responses to the Policy Engine. Respond to requests for Power Supplypower supply transitions from the Policy Engine. Indication to Policy Engine when Power Supplypower supply transitions are complete. Maintain reserve capability<u>a</u> Power Reserve for Devices<u>devices</u> operating on a <u>portPort</u> at less than maximum power.		
8.2.7.2 Device Policy Manager in a Consumer		
he Device Policy Manager in a Consumer shall also provide the following functions to the Policy Engine:		
Inform the Policy Engine of changes in cable/ Device<u>device</u> attachment status. Inform the Policy Engine whenever the power requirements for a port<u>Port</u> change. Evaluate Source capabilities and provide suitable responses:		
 Request from offered capabilities Indicate whether additional power is required 		
Respond to requests for Sink transitions from the Policy Engine.		
8.2.7.3 Device Policy Manager in a Provider/Consumer		
he Device Policy Manager in a Provider/Consumer shall provide the following functions to the Policy Engine:		
Provider Device Policy Manager Consumer Device Policy Manager Interface for the Policy Engine to request Power Supplypower supply transitions from Source to Sink and vice	l	
versa. Indications to Policy Engine during Power <u>Role</u> .Swap transitions.		
8.2.7.4 Device Policy Manager in a Provider/Consumer dead batteryDead Battery handling		
he Device Policy Manager in a Provider/Consumer with a battery should also provide:		
Detection and handling of back powering in the case of a dead battery <u>Type-A to Type-B Dead Battery</u> (see Section 4.1.1).	Field Code C	Chan
n this scenario a Provider/Consumer shall:		
Detect that V _{BUS} is present and that its battery is dead Switch to Consumer role without using a <u>PR_Swap</u> message Use V _{BUS} to power the USB Power Delivery communications	I	
8.2.7.5 Device Policy Manager in a Consumer/Provider		
he Device Policy Manager in a Consumer/Provider shall provide the following functions to the Policy Engine:		
Consumer Device Policy Manager Provider Device Policy Manager Interface for the Policy Engine to request Power Supplypower supply transitions from Sink to Source and vice versa.	1	
Indications to Policy Engine during Power <u>Role</u> Swap transitions.		
8.2.7.6 Device Policy Manager in a Consumer/Provider dead battery Dead Battery handling		
he Device Policy Manager in a Consumer/Provider shall also provide:		
Detection and handling of back powering in the case of a dead battery Dead Battery (see Section 4.1).		
n this scenario a Consumer/Provider shall:		
Detect that a Provider/Consumer with a dead batteryDead Battery capable of being back powered is attached	l	

٠

- Check that V_{BUS} is not present. Temporarily output *vSafeDB* on V_{BUS} to provide power to the Provider/Consumer so that it can send a Bit Stream.
- Detect Bit Stream sent by Provider/Consumer. •
- ٠ Switch to the Provider role without using a <u>PR</u>_SwapSwap message and output vSafe5V on V_{BUS} that will power the Provider/Consumer's PD communications.

8.3 Policy Engine

8.3.1 Introduction

There is one Policy Engine instance per portSOP* per Port that interacts with the Device Policy Manager in order to implement the present Local Policy for that particular portPort. This section includes:

- Message sequences for various operations
- A state diagram of the Policy Engine for a Source Port
- A state diagram of the Policy Engine for a Sink Port
- A state diagram of the Policy Engine for Dual-Role Ports
- State diagrams for handling Soft Reset
- State diagrams for handling *Ping* messages
- State diagrams for the Provider/Consumer and Consumer/Provider dead-battery/back-powering case
- State diagrams for Hard Reset
- State diagrams for BIST

8.3.2 Message Sequence Diagrams

The Device Policy Engine drives the message sequences and responses based on both the expected message sequences and the present Local Policy. This section contains sequence diagrams that highlight some of the more interesting transactions. It is by no means a complete summary of all possible combinations, but is illustrative in nature.

8.3.2.1 Basic Message Exchange

Figure 8-2 Basic Message Exchange (Successful) below illustrates how a message is sent. Note that the sender may be either a Source or Sink while the receiver may be either a Sink or Source. The basic message sequence is the same. It starts when the Message Sender's Protocol Layer at the behest of its Policy Engine forms a message that it passes to the Physical Layer.

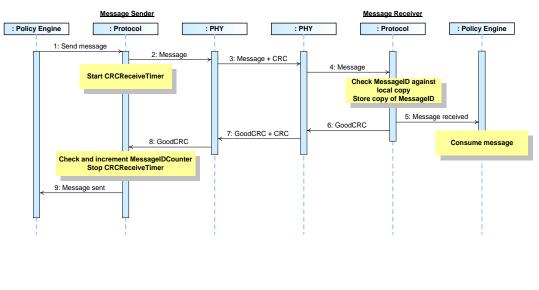

Figure 8-2 Basic Message Exchange (Successful)

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

Table 8-1 Basic Message Flow

Step	Message Sender	Message Receiver
1	Policy Engine directs Protocol Layer to send a message.	
2	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
3	Physical Layer appends a CRC and sends the message.	Physical Layer receives the message and checks the CRC to verify the message.
4		Physical Layer removes the CRC and forwards the message to the Protocol Layer.
5		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.
		Protocol Layer forwards the received message information to the Policy Engine that consumes it.
6		Protocol Layer generates a <i>GoodCRC</i> message and passes it to the Physical Layer.
7	Physical Layer receives the message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
8	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
	Protocol Layer checks and increments the <i>MessageIDCounter</i> and stops <i>CRCReceiveTimer</i> .	
9	Protocol Layer informs the Policy Engine that the message was successfully sent.	

8.3.2.2 Errors in Basic Message flow

There are various points during the message flow where failures in communication or other issues can occur. Figure 8-3 is an annotated version of Figure 8-2 indicating at which points issues may occur.

Page **312**

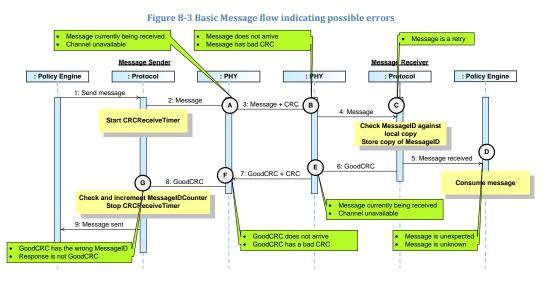

Table 8-2 Potential issues in Basic Message Flow

Point	Possible issues
А	1. There is an incoming message on the channel meaning that the <u>PhysicalPHY</u> Layer is unable to send. In this case the outgoing message is removed from the queue and the incoming message processed.
	 Due to some sort of noise on the line it is not possible to transmit. In this case the outgoing message is discarded by the PHY Layer. Retransmission is via the Protocol Layer's normal mechanism.
В	1. Message does not arrive at the Physical Layer due to noise on the channel.
	2. Message arrives but has been corrupted and has a bad CRC.
	There is no message to passed up to the Protocol Layer on the receiver which means a <i>GoodCRC</i> message is not sent. This leads to a <i>CRCReceiveTimer</i> timeout in the Message Sender.
С	1. <i>MessageID</i> of received message matches stored <i>MessageID</i> so this is a retry. Message is not passed up to the Policy Engine.
D	1. Policy Engine receives a known message that it was not expecting.
	2. Policy Engine receives an unknown (unrecognised) message.
	These cases are errors in the protocol which leads to the generation of a <i>Soft Reset</i> message.
Е	Same as point A but at the Message Receiver side.
F	1. <i>GoodCRC</i> message response does not arrive Message Sender side due to the noise on the channel.
	2. <i>GoodCRC</i> message response arrives but has a bad CRC.
	A <i>GoodCRC</i> message is not received by the Message Sender's Protocol Layer. This leads to a <i>CRCReceiveTimer</i> timeout in the Message Sender.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Point	Possible issues					
G	1. <i>GoodCRC</i> message is received but does contain the same <i>MessageID</i> as the transmitted message.					
	2. A message is received but it is not a <i>GoodCRC</i> message (similar case to that of an unexpected or unknown message but this time detected in the Protocol Layer).					
	Both of these issues indicate errors in receiving an expected <i>GoodCRC</i> message which will lead to a <i>CRCReceiveTimer</i> timeout in the Protocol Layer and a subsequent retry. <u>(except for</u> communications with Cable Plugs).					

Figure 8-4 illustrates one of these cases; the basic message flow with a retry due to a bad CRC at the Message Receiver. It starts when the Message Sender's Protocol Layer at the behest of its Policy Engine forms a message that it passes to the Physical Layer. The Protocol Layer is responsible for retries on a "3 strikes and you are out" basis (*nRetryCount*).

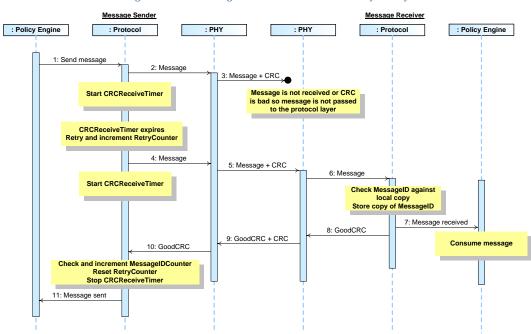

Figure 8-4 Basic Message Flow with Bad CRC followed by a Retry

Step	Message Sender	Message Receiver
1	Policy Engine directs Protocol Layer to send a message.	
2	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
3	Physical Layer appends a CRC and sends the message.	Physical Layer receives no message or a message with an incorrect CRC. Nothing is passed to Protocol Layer.

Page 314

Step	Message Sender	Message Receiver
4	Since no response is received, the <i>CRCReceiveTimer</i> will expire and trigger the first retry by the Protocol Layer. The <i>RetryCounter</i> is incremented. Protocol Layer passes the message to the Physical Layer. Starts <i>CRCReceiveTimer</i> .	
5	Physical Layer appends a CRC and sends the message.	Physical Layer receives the message and checks the CRC to verify the message.
6		Physical Layer removes the CRC and forwards the message to the Protocol Layer.
7		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.
		Protocol Layer forwards the received message information to the Policy Engine that consumes it.
8		Protocol Layer generates a <i>GoodCRC</i> message and passes it to the Physical Layer.
9	Physical Layer receives the message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
10	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
11	Protocol Layer verifies the <i>MessageID</i> , stops <i>CRCReceiveTimer</i> and resets the <i>RetryCounter</i> . Protocol Layer informs the Policy Engine that the message was successfully sent.	

8.3.2.3 **Power Negotiation**

Figure 8-5 illustrates an example of a successful message flow during Power Negotiation. The negotiation goes through 5 distinct phases:

- The Source sends out its power capabilities in a *Source Capabilities* message.
- The Sink evaluates these capabilities and in the request phase selects one power level by sending a *Request* message.
- The Source evaluates the request and accepts the request with an *Accept* message.
- The Source transitions to the new power level and then informs the Sink by sending a *PS_RDY* message.
- The Sink starts using the new power level.

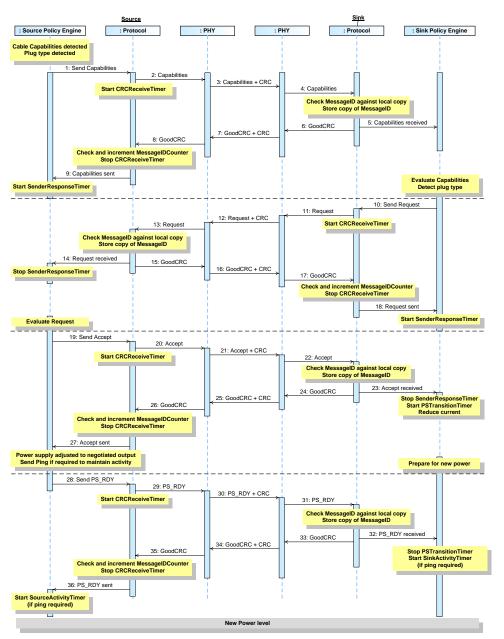

Figure 8-5 Successful Power Negotiation

Table 8-4 below provides a detailed explanation of what happens at each labeled step in Figure 8-5 above.

Page **316**

Table 8-4 Steps for a successful Power Negotiation

Step	Source	Sink
1	The plug type isCable Capabilities or Plug Type are detected if this isthese are not already known (see Section 4.4.). Policy Engine directs the Protocol Layer to send a <i>Source</i> <i>Capabilities</i> message that represents the power supply's present capabilities.	
2	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
3	Physical Layer appends CRC and sends the <i>Source Capabilities</i> message.	Physical Layer receives the <i>Source Capabilities</i> message and checks the CRC to verify the message.
4		Physical Layer removes the CRC and forwards the <i>Source Capabilities</i> message to the Protocol Layer.
5		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Source Capabilities</i> message information to the Policy Engine that consumes it.
6		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
7	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
8	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
9	Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops <i>CRCReceiveTimer</i> . Protocol Layer informs the Policy Engine that the <i>Source Capabilities</i> message was successfully sent. Policy Engine starts <i>SenderResponseTimer</i> .	
10		Policy Engine evaluates the <i>Source Capabilities</i> message sent by the Source, detects the plug type if this is <u>necessary (see Section</u> 4.4 <u>unknown</u>] and selects which power it would like. It tells the Protocol Layer to form the data (e.g. Power Data Object) that represents its Request into a message.
11		Protocol Layer creates the <i>Request</i> message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .

Step	Source	Sink
12	Physical Layer receives the <i>Request</i> message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the <i>Request</i> message.
13	Physical Layer removes the CRC and forwards the <i>Request</i> message to the Protocol Layer.	
14	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.	
	The Protocol Layer passes the Request information to the Policy Engine. Policy Engine stops <i>SenderResponseTimer</i> .	
15	The Protocol Layer generates a <i>GoodCRC</i> message and passes it to its Physical Layer.	
16	Physical Layer appends CRC and sends the message.	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.
17		Physical Layer forwards the <i>GoodCRC</i> message to the Protocol Layer.
18		The protocol Layer verifies and increments the <i>MessageIDCounter</i> . It informs the Policy Engine that the <i>Request</i> message was successfully sent. The Protocol Layer stops the <i>CRCReceiveTimer</i> .
		The Policy Engine starts <i>SenderResponseTimer</i> .
19	Policy Engine evaluates the <i>Request</i> message sent by the Sink and decides if it can meet the request. It tells the Protocol Layer to form an <i>Accept</i> message.	
20	The Protocol Layer forms the <i>Accept</i> message that is passed to the Physical Layer and starts the <i>CRCReceiveTimer</i> .	
21	Physical Layer appends CRC and sends the <i>Accept</i> message.	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.
22		Physical Layer forwards the <i>Accept</i> message to the Protocol Layer.

Page **318**

Step	Source	Sink
23		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.
		Protocol Layer informs the Policy Engine that an <i>Accept</i> message has been received. The Policy Engine stops <i>SenderResponseTimer</i> , starts the <i>PSTransitionTimer</i> and reduces its current draw.
		The Device Policy Manager prepares the Power supply for transition to the new power level.
24		The Protocol Layer generates a <i>GoodCRC</i> message and passes it to its Physical Layer.
25	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends CRC and sends the message.
26	Physical Layer forwards the <i>GoodCRC</i> message to the Protocol Layer. The Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops the <i>CRCReceiveTimer</i> .	
27	The Protocol Layer informs the Policy Engine that an <i>Accept</i> message was successfully sent.	
	Power Supplypower supply Adjusts its	Output to the Negotiated Value
28	The Device Policy Manager informs the Policy Engine that the power supply has settled at the new operating condition and tells the Protocol Layer to send a PS_RDY message. If the time taken to settle exceeds SourceActivityTimer tSourceActivity then a Ping message will be sent.	
29	The Protocol Layer forms the <i>PS_RDY</i> message and starts the <i>CRCReceiveTimer</i> .	
30	Physical Layer appends CRC and sends the <i>PS_RDY</i> message.	Physical Layer receives the PS_RDY message and compares the CRC it calculated with the one sent to verify the message.
31		Physical Layer forwards the PS_RDY message to the Protocol Layer.
32		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.
		Protocol Layer informs the Policy Engine that a RS_RDY has been received. The Policy Engine stops the <i>PSTransitionTimer</i> and optionally starts the <i>SinkActivityTimer</i> to monitor for <i>Ping</i> message timeout <u>if required (see Section</u> 6.3.5- <u>)</u> .
Derver	Delivery Specification Revision <u>+2</u> .0, <u>Version 1.0</u>	Page 319

Step	Source	Sink
33		The Protocol Layer generates a <i>GoodCRC</i> message and passes it to its Physical Layer.
34	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends CRC and sends the message.
35	Physical Layer forwards the <i>GoodCRC</i> message to the Protocol Layer. The Protocol Layer verifies and increments the <i>MessageIDCounter</i> . Stops the <i>CRCReceiveTimer</i> .	
36	The Protocol Layer informs the Policy Engine that the <i>PS_RDY</i> message was successfully sent. The Policy Engine starts the <i>SourceActivityTimer</i> in order to start pinging <u>if</u> <u>required (see Section 6.3.5–).</u>	

1.2.11.1 Source Initiated Swap without subsequent Power Negotiation

This is an example of a successful Swap operation initiated by a-Dual Role Port which initially, at the start of this message sequence, is acting as a Source. It does not include any subsequent Power Negotiation which is required in order to establish an Explicit Contract (see previous section for the details of a Power Negotiation).

There are four distinct phases to the power swap negotiation:

A message is sent.

An message in response to the message.

1. The original Source sets its power output to *vSafe0V* and sends a *PS_RDY* message when it gets there.

2.1. The new Source then sets its power output to *vSafe5V* and sends a *PS_RDV* message when it is ready to supply power.

-shows the messages as they flow across the bus and within the Devices to accomplish the Swap sequence.

Figure - Successful Swap Sequence Initiated by the Source

-below provides a detailed explanation of what happens at each labeled step in above.

Table - Steps for a Successful Source Initiated Swap Sequence

Step	Dual RolePort (initially Source Port)	Dual Role Port (initially Sink Port)
4	Port Role starts as Source. Policy Engine directs the Protocol Layer to send a <i>Swap</i> message.	Port Role starts as Sink.
2	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
3	Physical Layer appends CRC and sends the Swap message.	Physical Layer receives the Swap message and checks the CRC to verify the message.
4		Physical Layer removes the CRC and forwards the Swap message to the Protocol Layer.

Page 320

Step	Dual RolePort (initially Source Port)	Dual Role Port (initially Sink Port)
5		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received Swap message information to the Policy Engine that consumes it.
6		Protocol Layer generates a <i>CoodCRC</i> message and passes it Physical Layer.
7	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
8	Physical Layer removes the CRC and forwards the CoodCRC message to the Protocol Layer.	
9	Protocol Layer verifies and increments the MessagelDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Swap message was successfully sent. Policy Engine starts SenderResponseTimer.	
10		Policy Engine evaluates the <i>Swap</i> message sent by the Source and decides that it is able and willing to do the Role Swap. It tells the Protocol Layer to form an <i>Accept</i> message.
11		Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the message over V _{BUS} .
13	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received Swap message information to the Policy Engine that consumes it.	
14	The Policy Engine requests its Power Supply to stop supplying power. Stops SenderResponseTimer. If the time taken to stop supplying power exceeds tSourceActivity then a Ping message will be sent.	
15	Protocol Layer generates a <i>CoodCRC</i> message and passes it Physical Layer.	
16	Physical Layer appends a CRC and sends the GoodCRC message over V _{BUS} .	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.

USB Power Delivery Specification Revision <u>+2</u>.0<u>. Version 1.0</u>

Step	Dual RolePort (initially Source Port)	Dual Role Port (initially Sink Port)
17		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
18		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Accept message was successfully sent. The Policy Engine starts the PSSourceOffTimer and tells the Power supply to stop sinking current.
19	The Policy Engine determines its power supply is no longer supplying V _{BUS} , it directs the Protocol Layer to generate a PS_RDY message to tell its Port Partner that it can begin to Source V _{BUS} .	
20	Protocol Layer sets the Port Role bit in the header set to "Sink", creates the message and passes to Physical Layer. Starts CRCReceiveTimer .	
21	Physical Layer appends CRC and sends the PS_RDY message.	Physical Layer receives the PS_RDY message and checks the CRC to verify the message.
22		Physical Layer removes the CRC and forwards the PS_RDY message to the Protocol Layer.
23		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.
		The Protocol Layer forwards the received PS_RDY message information to the Policy Engine that consumes it. The Policy Engine stops the PSSourceOffTimer and starts switching the power supply to vSafe5V Source operation.
		If the time taken to start supplying power exceeds tSourceActivity then a Ping message will be sent.
24		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
25	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layor apponds CRC and sonds the GoodGRC message.
26	Physical Layer removes the CRC and forwards the CoodCRC message to the Protocol Layer.	
27	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the PS_RDY message was successfully cont. Policy Engine starts PSSourceOnTimer.	

Step	Dual RolePort (initially Source Port)	Dual Role Port (initially Sink Port)
28		Policy Engine, when its power supply is ready to supply power, tells the Protocol Layer to form a PS_RDY message. The Port Role bit used in this and subsequent message headers is now set to <u>"Source".</u>
29		Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer.
30	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the message over \$\mathbf{V}_{BUS}\$
31	Physical Layer removes the CRC and forwards the <i>PS_RDY</i> message to the Protocol Layer.	
32	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.	
	The Protocol Layer forwards the receivedPS_RDY message information to the PolicyEngine that consumes it. The Policy Enginestops the PSSourceOnTimer, informs thepower supply that it can start consuming powerand optionally starts the SinkActivityTimer tocheck for Ping messages.	
33	Protocol Layer generates a <i>CoodCRC</i> message and passes it Physical Layer.	
3 4	Physical Layer appends a CRC and sends the GoodCRC message over V _{BUS} .	Physical Layer receives GoodCRC message and compares the CRC it calculated with the one sent to verify the message.
35		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
36		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the PS_RDY message was successfully sent. The Policy Engine starts the SourceCapabilityTimer in order to generate Source Capabilities messages.
	The Swap is complete, the roles have been revers power.	ed and the ports are free to negotiate for more

1.2.11.2 Sink Initiated Swap without subsequent Power Negotiation

This is an example of a successful Swap operation initiated by a Dual-Role Port which initially, at the start of this message sequence, is acting as a Sink. It does not include any subsequent Power Negotiation which is required in order to establish an Explicit Contract (see previous section for the details of a Power Negotiation).

There are four distinct phases to the power swap negotiation:

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

8) A message is sent.

9) An message in response to the message.

10)1)_____The original Source sets its power output to *vSafe0V* and sends a *PS_RDY* message when it gets there.

1)]_____ The new Source then sets its power output to **vSafe5V** and sends a **PS_RDY** message when it is ready to supply power.

-shows the messages as they flow across the bus and within the Devices to accomplish the Role Swap.

Figure - Successful Swap Sequence Initiated by the Sink

USB Power Delivery Specification Revision 2.0, Version 1.0.

Table - Steps for a Successful Sink Initiated Swap Sequence		
Step	Dual Role Port (initially Sink Port)	Dual Role Port (initially Source Port)
1	Port Role starts as Sink. Policy Engine directs the Protocol Layer to send a <i>Swap</i> message.	Port Role starts as Source.
₽	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
3	Physical Layer appends CRC and sends the Swap message.	Physical Layer receives the <i>Swap</i> message and checks the CRC to verify the message.
4		Physical Layer removes the CRC and forwards the Swap message to the Protocol Layer.
5		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.
		The Protocol Layer forwards the received Swap message information to the Policy Engine that consumes it.
6		Protocol Layer generates a <i>CoodCRC</i> message and passes it Physical Layer.
7	Physical Layer receives the GoodCRC message and checks the CRC to verify the message.	Physical Layor apponds CRC and sonds the GoodGRC message.
8	Physical Layer removes the CRC and forwards the CoodCRC message to the Protocol Layer.	
9	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Swap message was successfully sent. Policy Engine starts SenderResponseTimer.	
10		Policy Engine evaluates the <i>Swap</i> message sent by the Sink and decides that it is able and willing to do the Role Swap. It tells the Protocol Layer to form an <i>Accept</i> message.
11		Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer .
12	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the message over V_{BUS} .
13	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.	
	The Protocol Layer forwards the received Swap message information to the Policy Engine that consumes it.	

Table - Steps for a Successful Sink Initiated Swap Sequence

Step	Dual Role Port (initially Sink Port)	Dual Role Port (initially Source Port)
1 4	The Policy Engine stops the SenderResponseTimer, starts the PSSourceOffTimer and tells the Power supply to stop sinking current.	
15	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
16	Physical Layer appends a CRC and sends the GoodCRC message over V _{BUS} .	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.
17		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
18		Protocol Layer verifies and increments the MessageIDCounter and stops CRCRoceiveTimer. Protocol Layer informs the Policy Engine that the Accept message was successfully sent. The Policy Engine tells the Power supply to stop supplying power. If the time taken to stop supplying power exceeds tSourceActivity then a Ping message will be sent.
19		The Policy Engine determines its power supply- is no longer supplying V_{BUS} , it directs the Protocol Layer to generate a PS_RDY message to tell its Port Partner that it can begin to source V_{BUS} .
20		Protocol Layer sets the Port Role bit in the header set to "Sink", creates the message and passes to Physical Layer. Starts CRCReceive Timer .
21	Physical Layer receives the PS_RDY message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the PS_RDY message.
22	Physical Layer removes the CRC and forwards the PS_RDY message to the Protocol Layer.	
23	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.	
	The Protocol Layer forwards the received PS_RDY message information to the Policy Engine that consumes it. The Policy Engine stops the PSSourceOffTimer and starts switching the power supply to vSafe5V Source operation.	
	If the time taken to start supplying power exceeds tSourceActivity then a Ping message will be sent.	

Page **326**

Step	Dual Role Port (initially Sink Port)	Dual Role Port (initially Source Port)
24	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
25	Physical Layer appends CRC and sends the CoodCRC message.	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.
26		Physical Layer removes the CRG and forwards the CoodCRC message to the Protocol Layer.
27		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the PS_RDY message was successfully sent. Policy Engine starts PSSourceOnTimer.
28	Policy Engine, when its power supply is ready to supply power, tells the Protocol Layer to form a PS_RDY message. The Port Role bit used in this and subsequent message headers is now set to "Source".	
29	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
30	$\frac{Physical Layer appends a CRC and sends the}{message over V_{BUS}}$	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.
31		Physical Layer removes the CRC and forwards the PS_RDY message to the Protocol Layer.
32		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.
		The Protocol Layer forwards the received PS_RDY message information to the Policy Engine that consumes it. The Policy Engine stops the PSSourceOnTimor , informs the power supply that it can start consuming power and optionally starts the SinkActivityTimor to check for Ping messages.
33		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
3 4	Physical Layer receives GoodCRC message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the GoodCRC message over V _{BUS} .
35	Physical Layer removes the CRC and forwards the CoodCRC to the Protocol Layer.	

Step	Dual Role Port (initially Sink Port)	Dual-Role Port (initially Source Port)
36	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the PS_RDY message was successfully sent. The Policy Engine starts the SourceCapabilityTimer in order to generate Source Capabilities messages.	
	The Role Swap is complete, the roles have been reversed and the ports are free to negotiate for more power.	

8.3.2.4 Reclaiming Power with GotoMin message

This is an example of a GotoMin operation. Figure 8-6 shows the messages as they flow across the bus and within the Devices devices to accomplish the GotoMin. The following figure illustrates the case where the Sink receives the request.

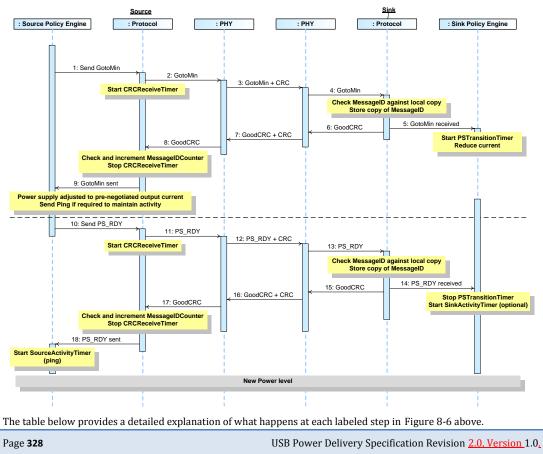

Figure 8-6 Successful GotoMin operation

Step	Source	Sink
1	Policy Engine tells the Protocol Layer to form a <i>GotoMin</i> message.	
2	The Protocol Layer forms the <i>GotoMin</i> message that is passed to the Physical Layer and starts the <i>CRCReceiveTimer</i> .	
3	Physical Layer appends CRC and sends the <i>GotoMin</i> message.	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.
4		Physical Layer forwards the <i>GotoMin</i> message to the Protocol Layer.
5		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.
		Protocol Layer informs the Policy Engine that a <i>GotoMin</i> message has been received. The Policy starts the <i>PSTransitionTimer</i> and reduces its current draw.
		The Policy Engine prepares the Power supply for transition to the new power level.
6		The Protocol Layer generates a <i>GoodCRC</i> message and passes it to its Physical Layer.
7	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends CRC and sends the message.
8	Physical Layer forwards the <i>GoodCRC</i> message to the Protocol Layer. The Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops the <i>CRCReceiveTimer</i> .	
9	The Protocol Layer informs the Policy Engine that ang <i>GotoMin</i> message was successfully sent.	
	Power Supplypower supply Adjusts its Output to the Negotiated Value	
10	Policy Engine sees the power supply has settled at the new operating condition and tells the Protocol Layer to send a PS_RDY message. If the time taken to settle exceeds tSourceActivity then a Ping message will be sent <u>(if required</u> <u>see Section</u> 6.3.5;).	
11	The Protocol Layer forms the PS_RDY message and starts the CRCReceiveTimer .	
12	Physical Layer appends CRC and sends the PS_RDY message.	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.

Table 8-5 Steps for a GotoMin Negotiation

Step	Source	Sink
13		Physical Layer forwards the PS_RDY message to the Protocol Layer.
14		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.
		Protocol Layer informs the Policy Engine that a <i>PS_RDY</i> message has been received. The Policy Engine stops the <i>PSTransitionTimer</i> and optionally starts the <i>SinkActivityTimer</i> to monitor for <i>Ping</i> message timeout <u>(if required see Section 6.3.5-).</u>
15		The Protocol Layer generates a <i>GoodCRC</i> message and passes it to its Physical Layer.
16	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends CRC and sends the message.
17	Physical Layer forwards the <i>GoodCRC</i> message to the Protocol Layer. The Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops the <i>CRCReceiveTimer</i> .	
18	The Protocol Layer informs the Policy Engine that the <i>PS_RDY</i> message was successfully sent. The Policy Engine starts the <i>SourceActivityTimer</i> in order to start pinging (if required see Section 6.3.5-).	

8.3.2.5 Soft Reset

This is an example of a Soft Reset operation. Figure 8-7 shows the messages as they flow across the bus and within the Devices devices to accomplish the Soft Reset.

Page **330**

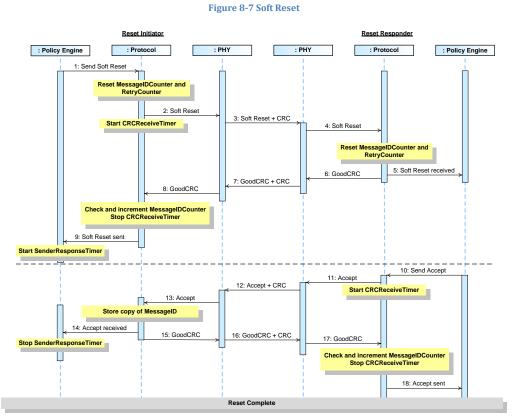

Table 8-6 below provides a detailed explanation of what happens at each labeled step in Figure 8-7 above.

Table 8-6 Steps for a Soft Reset

Step	Reset Initiator	Reset Responder
1	The Policy Engine directs the Protocol Layer to generate a <i>Soft Reset</i> message to request a Soft Reset.	
2	Protocol Layer resets <i>MessageIDCounter</i> and <i>RetryCounter</i> . Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
3	Physical Layer appends CRC and sends the <i>Soft Reset</i> message-over V _{BUS} .	Physical Layer receives the <i>Soft Reset</i> message and compares the CRC it calculated with the one sent to verify the message.
4		Physical Layer removes the CRC and forwards the <i>Soft Reset</i> message to the Protocol Layer.

Reset Initiator	Reset Responder
	Protocol Layer does not check the <i>MessageID</i> in the incoming message and resets <i>MessageIDCounter</i> and <i>RetryCounter</i> .
	The Protocol Layer forwards the received <i>Soft Reset</i> message information to the Policy Engine that consumes it.
	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
Physical Layer receives the <i>GoodCRC</i> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops <i>CRCReceiveTimer</i> . Protocol Layer informs the Policy Engine that the <i>Soft Reset</i> message was successfully sent. Policy Engine starts <i>SenderResponseTimer</i> .	
	Policy Engine tells the Protocol Layer to form an <i>Accept</i> message.
	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .
Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the message-over V _{BUS} .
Protocol Layer stores the <i>MessageID</i> of the incoming message.	
The Protocol Layer forwards the received <i>Accept</i> message information to the Policy Engine that consumes it.	
Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
Physical Layer appends a CRC and sends the <i>GoodCRC</i> message over V _{BUS} .	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sen to verify the message.
	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
	Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops <i>CRCReceiveTimer</i> . Protocol Layer informs the Policy Engine that the <i>Accept</i> message was successfully sent.
	Physical Layer receives the GoodCRC and checks the CRC to verify the message. Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer. Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Soft Reset message was successfully sent. Policy Engine starts SenderResponseTimer. Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the message. Protocol Layer stores the MessageID of the incoming message. The Protocol Layer forwards the received Accept message information to the Policy Engine that consumes it. Protocol Layer generates a GoodCRC message and passes it Physical Layer. Physical Layer appends a CRC and sends the

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

Page **332**

8.3.2.6 Hard Reset

The following sections describe the steps required for a USB Power Delivery Hard Reset. The Hard Reset returns the operation of the USB Power Delivery to default role and operating voltage/current. During the Hard Reset USB Power Delivery PHY Laver communications shall be disabled preventing communication between the pertPort partners.

Note: Hard Reset, in this case, is applied to the USB Power Delivery capability of an individual portPort on which the Hard Reset is requested. A side effect of the Hard Reset is that it might reset other functions on the portPort such as USB.

8.3.2.6.1 Provider Initiated Hard Reset

This is an example of a Hard Reset operation when initiated by a Provider. Figure 8-8 shows the messages as they flow across the bus and within the <u>Devicesdevices</u> to accomplish the Hard Reset.

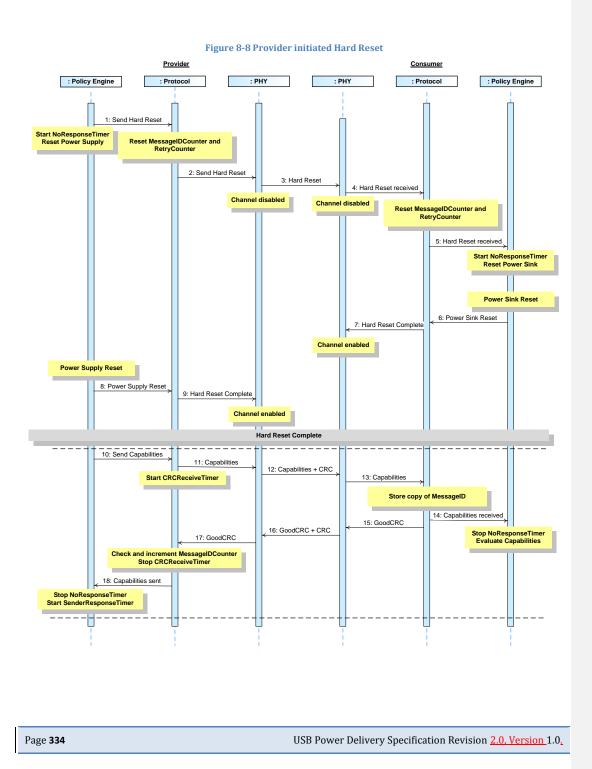

Table 8-7 Steps for Source initiated Hard Reset

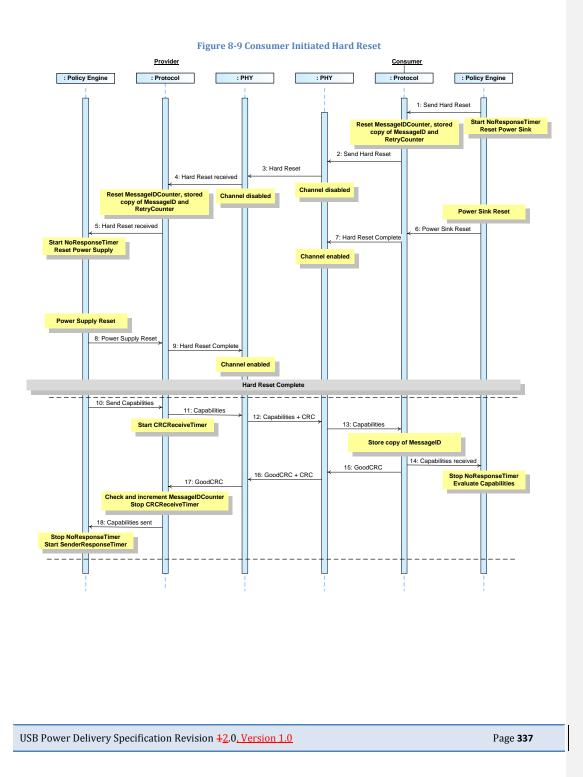

Step	Provider	Consumer
1	The Policy Engine directs the Protocol Layer to generate <i>Hard Reset</i> signaling. The Policy Engine starts the <i>NoResponseTimer</i> and directs the Power Supplypower supply to reset to default operation <u>USB Default</u> Operation.	
2	Protocol Layer resets <i>MessageIDCounter</i> , stored copy of and <i>RetryCounter</i> . Protocol Layer requests the Physical Layer send <i>Hard Reset</i> signaling.	
3	Physical Layer sends <i>Hard Reset</i> signaling over V_{BUS} and then disables the PHY Layer communications channel for transmission and reception.	Physical Layer receives the <i>Hard Reset</i> signaling and disables the PHY <u>Layer</u> communications channel for transmission and reception.
4		Physical Layer informs the Protocol Layer of the Hard Reset. Protocol Layer resets <i>MessageIDCounter</i> , stored copy of and <i>RetryCounter</i> .
5		The Protocol Layer informs the Policy Engine of the Hard Reset. The Policy Engine starts the <i>NoResponseTimer</i> and directs the Power Sink to reset to default operation.
6		The Power Sink returns to default operation. The Policy Engine informs the Protocol Layer that the Power Sink has been reset.
7		The Protocol Layer informs the PHY <u>layerLayer</u> that the Hard Reset is complete. The PHY <u>layerLayer</u> enables the PHY <u>Layer</u> communications channel for transmission and reception.
8	The Power Supplypower supply is reset to default operation. The Policy Engine informs the Protocol Layer that the Power Supplypower supply has been reset.	
9	The Protocol Layer informs the PHY layerLayer that the Hard Reset is complete. The PHY layerLayer enables the PHY Layer communications channel for transmission and reception.	
	The reset is complete and protocol communicatio	on can restart.

Step	Provider	Consumer
10	Policy Engine directs the Protocol Layer to send a <i>Source Capabilities</i> message that represents the power supply's present capabilities.	
11	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
12	Physical Layer appends CRC and sends the <i>Source Capabilities</i> message.	Physical Layer receives the <i>Source Capabilities</i> message and checks the CRC to verify the message.
13		Physical Layer removes the CRC and forwards the <i>Source Capabilities</i> message to the Protocol Layer.
14		Protocol Layer stores the <i>MessageID</i> of the incoming message. The Protocol Layer forwards the received <i>Source Capabilities</i> message information to the Policy Engine that consumes it. The Policy Engine stops the <i>NoResponseTimer</i> .
15		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
16	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
17	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
18	Protocol Layer verifies and increments the MessagelDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Source Capabilities message was successfully sent. Policy Engine stops the NoResponseTimer and starts the SenderResponseTimer.	
	USB Power Delivery communication is re-establis	shed.

8.3.2.6.2 Consumer Initiated Hard Reset

This is an example of a Hard Reset operation when initiated by a Consumer. Figure 8-9 shows the messages as they flow across the bus and within the <u>Devicesdevices</u> to accomplish the Hard Reset.

Page **336**

Step	Provider	Consumer
1		The Policy Engine directs the Protocol Layer to generate <i>Hard Reset</i> signaling.
		The Policy Engine starts the <i>NoResponseTimer</i> and directs the Power Sink to reset to default operation. <u>USB Default Operation.</u>
2		Protocol Layer resets <i>MessageIDCounter</i> , stored copy of <i>MessageID</i> and <i>RetryCounter</i> .
		Protocol Layer requests the Physical Layer send <i>Hard Reset</i> signaling.
3	Physical Layer receives the <i>Hard Reset</i> signaling and disables the PHY <u>Layer</u> communications channel for transmission and reception.	Physical Layer sends the <i>Hard Reset</i> signaling over V _{BUS} -and then disables the PHY <u>Layer</u> communications channel for transmission and reception.
4	Physical Layer informs the Protocol Layer of the Hard Reset.	
	Protocol Layer resets <i>MessageIDCounter</i> , stored copy of <i>MessageID</i> and <i>RetryCounter</i> .	
5	The Protocol Layer Informs the Policy Engine of the Hard Reset.	
	The Policy Engine starts the <i>NoResponseTimer</i> and requests the <u>Power Supplypower supply</u> to reset to <u>default operation</u> <u>USB Default</u> <u>Operation</u> .	
6		The Power Sink returns to default operation. <u>USB Default Operation.</u>
		The Policy Engine informs the Protocol Layer that the Power Sink has been reset.
7		The Protocol Layer informs the PHY layerLayer that the Hard Reset is complete.
		The PHY <u>layerLayer</u> enables the PHY <u>Layer</u> communications channel for transmission and reception.
8	The Power Supplypower supply is reset to default operationUSB Default Operation.	
	The Policy Engine informs the Protocol Layer that the Power Supply power supply has been reset.	
9	The Protocol Layer informs the PHY layerLayer that the Hard Reset is complete. The PHY layerLayer enables the PHY Layer communications channel for transmission and reception.	
	The reset is complete and protocol communicatio	on can restart.

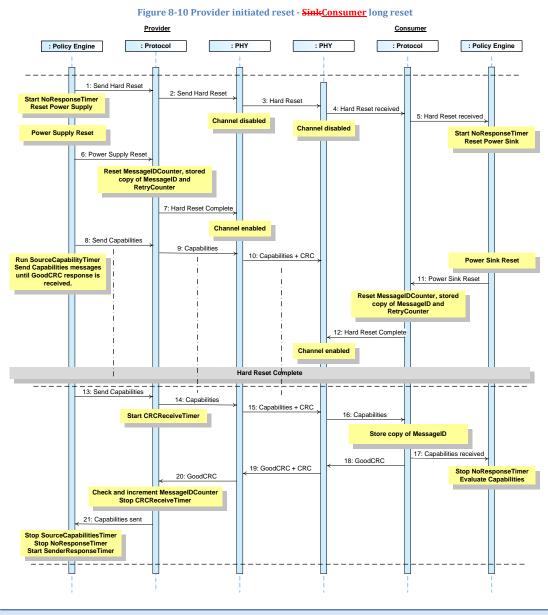

Table 8-8 Steps for Sink initiated Hard Reset

Page **338**

Step	Provider	Consumer
10	Policy Engine directs the Protocol Layer to send a <i>Source Capabilities</i> message that represents the power supply's present capabilities.	
11	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
12	Physical Layer appends CRC and sends the <i>Source Capabilities</i> message.	Physical Layer receives the <i>Source Capabilities</i> message and checks the CRC to verify the message.
13		Physical Layer removes the CRC and forwards the <i>Source Capabilities</i> message to the Protocol Layer.
14		Protocol Layer stores the <i>MessageID</i> of the incoming message. The Protocol Layer forwards the received <i>Source Capabilities</i> message information to the Policy Engine that consumes it. The Policy Engine stops the <i>NoResponseTimer</i> .
15		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
16	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
17	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
18	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Source Capabilities message was successfully sent. Policy Engine stops the NoResponseTimer and starts the SenderResponseTimer.	
	USB Power Delivery communication is re-establis	shed.

8.3.2.6.3 Provider Initiated Hard Reset – Consumer Long Reset

This is an example of a Hard Reset operation when initiated by a Provider. In this example the Consumer is slow responding to the reset causing the Provider to send multiple *Source Capabilities* messages before it receives a *GoodCRC* message response. Figure 8-10 shows the messages as they flow across the bus and within the <u>Devicesdevices</u> to accomplish the Hard Reset.

Page 340

Page **345**

<u>Step</u>	Dual-RolePort (initially Source Port)	Dual-Role Port (initially Sink Port)
<u>14</u>	The Policy Engine requests its power supply to stop supplying power and stops the SenderResponseTimer. If the time taken to stop supplying power exceeds tSourceActivity then a Ping message will be sent(if required see Section 6.3.5).	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the <i>GoodCRC</i> message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one set to verify the message.
17		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the Accept message was successfully sent. The Policy Engine starts the PSSourceOffTimer_and tells the power supply stop sinking current.
<u>19</u>	The Policy Engine determines its power supply is no longer supplying V_{BUS} , it directs the Protocol Layer to generate a <i>PS_RDY</i> message, with the <i>Port Power Role</i> bit in the header set to "Sink", to tell its Port Partner that it can begin to Source V_{BUS} .	
<u>20</u>	Protocol Layer sets the Port Power Role bit in the header set to "Sink", creates the message and passes to Physical Layer. Starts CRCReceive Timer.	
<u>21</u>	Physical Layer appends CRC and sends the PS_RDY message.	Physical Layer receives the PS_RDY_message as checks the CRC to verify the message.
<u>22</u>		Physical Layer removes the CRC and forwards the PS_RDY message to the Protocol Layer.
<u>23</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>PS_RDY</i> message information to the Policy Engine that consumes it. The Policy Engine stops the <i>PSSourceOffTimer</i> and starts switching the power supply to <i>vSafe5V</i> Source operation. If the time taken to start supplying power exceeds <i>tSourceActivity</i> then a <i>Ping</i> message will be sent (if required see Section 6.3.5).

Page **346**

<u>Step</u>	Dual-RolePort (initially Source Port)	Dual-Role Port (initially Sink Port)
<u>24</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>25</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	<u>Physical Laver appends CRC and sends the</u> <i>GoodCRC<u>message.</u></i>
<u>26</u>	<u>Physical Layer removes the CRC and forwards</u> <u>the <i>GoodCRC</i> message to the Protocol Layer.</u>	
<u>27</u>	Protocol Layer verifies and increments the MessageIDCounter <u>and stops</u> CRCReceiveTimer <u>Protocol Layer informs the</u> Policy Engine that the PS_RDY_message was successfully sent. Policy Engine starts PSSourceOnTimer <u></u>	
<u>28</u>		Policy Engine, when its power supply is ready to supply power, tells the Protocol Layer to form a <i>PS_RDY</i> _message. The <i>Port Power Role</i> _bit used in this and subsequent message headers is now set to "Source".
<u>29</u>		Protocol Layer creates the PS_RDY_message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>30</u>	<u>Physical Layer receives the PS_RDY message</u> and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the PS_RDY_message.
<u>31</u>	<u>Physical Layer removes the CRC and forwards</u> <u>the <i>PS_RDY</i> message to the Protocol Layer.</u>	
<u>32</u>	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received	
	PS_RDY _message information to the Policy Engine that consumes it.	
<u>33</u>	<u>Protocol Layer generates a <i>GoodCRC</i> message</u> and passes it Physical Layer.	
<u>34</u>	Physical Layer appends a CRC and sends the GoodCRC message The Policy Engine stops the PSSourceOnTimer_informs the power supply it can now Sink power and resets the Protocol Layer.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.
<u>35</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.

<u>Step</u>	Dual-RolePort (initially Source Port)	Dual-Role Port (initially Sink Port)
<u>36</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the PS_RDY message was successfully sent. The Policy Engine resets the CapsCounter, resets the Protocol Layer and starts the SwapSourceStartTimer which must timeout before sending any Source Capabilities messages.
	The Power Role Swap is complete, the roles have negotiate for more power.	been reversed and the Port Partners are free to

8.3.2.7.1.2 Type-A/B Sink Initiated Power Role Swap without subsequent Power Negotiation

This is an example of a successful Power Role Swap operation initiated by a Type-A or Type-B Dual-Role Port which initially, at the start of this message sequence, is acting as a Sink. It does not include any subsequent Power Negotiation which is required in order to establish an Explicit Contract (see Section 8.3.2.3).

There are four distinct phases to the Power Role Swap negotiation:

1) A PR Swap message is sent.

2) An Accept message in response to the PR Swap message.

<u>12)3) The original Source sets its power output to</u>

<i>vSafe0V</i> Safe operating voltage at "zero volts <u>".</u>	0		0. <mark>8</mark>	v	Section 7.1.6
--	---	--	-------------------	---	---------------

<u>4) and sends a *PS_RDY* message when it gets there.</u>

5) The new Source then sets its power output to *vSafe5V* and sends a *PS_RDY* message when it is ready to supply power.

Figure 8-12 shows the messages as they flow across the bus and within the devices to accomplish the Power Role Swap.

Page 348

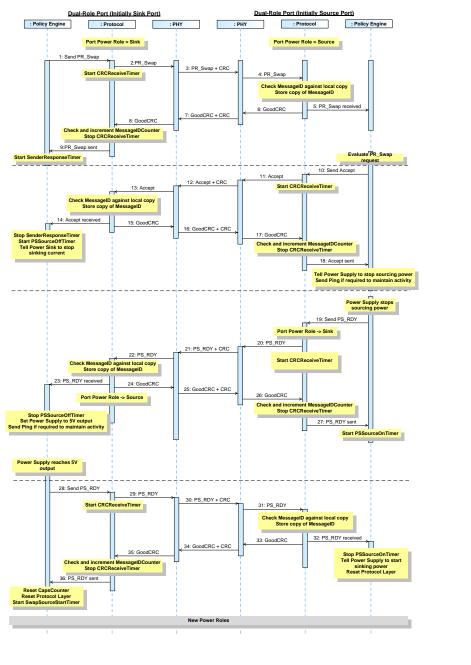

Figure 8-12 Type-A or Type-B Successful Power Role Swap Sequence Initiated by the Sink

<u>Step</u>	Dual-Role Port (initially Sink Port)	Dual-Role Port (initially Source Port)
1	Port Power Role starts as Sink. Policy Engine directs the Protocol Layer to send a PR_Swap message.	Port <u>Power Role starts as Source.</u>
<u>2</u>	<u>Protocol Layer creates the message and passes</u> <u>to Physical Layer. Starts <i>CRCReceiveTimer</i>.</u>	
<u>3</u>	Physical Layer appends CRC and sends the <u>PR Swap message.</u>	Physical Layer receives the <i>PR_Swap</i> message and checks the CRC to verify the message.
<u>4</u>		Physical Layer removes the CRC and forwards the PR_Swap_message to the Protocol Layer.
<u>5</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>PR_Swap</i> message information to the Policy Engine that consumes it.
<u>6</u>		<u>Protocol Layer generates a <i>GoodCRC</i> message</u> and passes it Physical Layer.
<u>Z</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	<u>Physical Layer appends CRC and sends the</u> <i>GoodCRC<u>message.</u></i>
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>9</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the PR Swap message was successfully sent. Policy Engine starts SenderResponseTimer.	
<u>10</u>		Policy Engine evaluates the <i>PR_Swap</i> message sent by the Sink and decides that it is able and willing to do the Power Role Swap. It tells the <u>Protocol Layer to form an <i>Accept</i> message</u> .
11		Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the <i>Accept</i> message.	Physical Layer appends a CRC and sends the Accept message.
<u>13</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.The Protocol Layer forwards the received PR Swap message information to the Policy Engine that consumes it.

Page 354

Step	Provider/Consumer (InitiallySink <u>Port</u>)	Consumer/Provider (InitiallySource <u>Port</u>)
1	Port <u>Power</u> Role Port Role starts as Sink.	Port Power RolePort Role starts as Source. The Policy Engine directs the Protocol Layer to generate <i>Hard Reset</i> signaling.
		The Policy Engine starts the <i>NoResponseTimer</i> and directs the <u>Power Supplypower supply</u> to stop sourcing power.
2		Protocol Layer resets <i>MessageIDCounter</i> , stored copy of <i>MessageID</i> and <i>RetryCounter</i> .
		Port Power_Role_Port Role reverts to Sink.
		Protocol Layer requests the Physical Layer send <i>Hard Reset</i> signaling.
3	Physical Layer receives the <i>Hard Reset</i> signaling and disables the PHY <u>Layer</u> communications channel for transmission and reception.	Physical Layer sends the <i>Hard Reset</i> signaling over V_{BUS} and then disables the PHY <u>Layer</u> communications channel for transmission and reception.
4	Physical Layer informs the Protocol Layer of the Hard Reset.	
	Protocol Layer resets <i>MessageIDCounter</i> , stored copy of <i>MessageID</i> and <i>RetryCounter</i> . <i>Port <u>Power</u> RolePort Role</i> reverts to Source.	
5	The Protocol Layer Informs the Policy Engine of the Hard Reset.	
	The Policy Engine starts the <i>NoResponseTimer</i> and directs the Sink to stop sinking power.	
6		The Power Supplypower supply stops sourcing power on V_{BUS} and reverts to Sink operation.
		The Policy Engine informs the Protocol Layer that the Sink has been reset.
7		The Protocol Layer informs the PHY layer<u>Layer</u> that the Hard Reset is complete.
		The PHY <u>layerLayer</u> enables the PHY <u>Layer</u> communications channel for transmission and reception.
		When $vSafe5V$ is detected on V_{BUS} the Policy Engine directs the Sink to start Sinking power.
8	The Sink stops sinking power.	
	When there is no voltage detected on V_{BUS} the Policy Engine requests the Source to go to <i>vSafe5V</i> output.	
	When the Source reaches <i>vSafe5V</i> the Policy Engine informs the Protocol Layer that the Power Supplypower supply has been reset.	

Table 8-12 Steps for Type-A or Type-B.Source initiated Hard Reset (role swapped Power Role Swapped)

Step	Provider/Consumer (InitiallySink <u>Port</u>)	Consumer/Provider (InitiallySource <u>Port</u>)	
9	The Protocol Layer informs the PHY <u>layerLayer</u> that the Hard Reset is complete. The PHY <u>layerLayer</u> enables the PHY <u>Layer</u> communications channel for transmission and reception.		
	The reset is complete and protocol communication can restart.		
10	Policy Engine directs the Protocol Layer to send a <i>Source Capabilities</i> message that represents the power supply's present capabilities.		
11	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .		
12	Physical Layer appends CRC and sends the <i>Source Capabilities</i> message.	Physical Layer receives the <i>Source Capabilities</i> message and checks the CRC to verify the message.	
13		Physical Layer removes the CRC and forwards the <i>Source Capabilities</i> message to the Protocol Layer.	
14		Protocol Layer stores the <i>MessageID</i> of the incoming message. The Protocol Layer forwards the received	
		<i>Source Capabilities</i> message information to the Policy Engine that consumes it.	
		The Policy Engine stops the <i>NoResponseTimer</i> .	
15		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
16	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.	
17	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.		
18	Protocol Layer verifies and increments the MessagelDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Source Capabilities message was successfully sent.		
	Policy Engine stops the <i>NoResponseTimer</i> and starts the <i>SenderResponseTimer</i> .		
_	USB Power Delivery communication is re-establis	shed.	

8.3.2.6.3.28.3.2.7.1.4 Type-A/B Sink Initiated Hard Reset (role swappedPower Role Swapped)

This is an example of a Hard Reset operation when initiated by a <u>Type-A or Type-B</u> Dual-Role device which is currently <u>swappedPower Role Swapped</u> and initially acting as a Sink at the start of this message sequence. In this example both Dual-Role devices return to their original roles after the Hard Reset. Figure 8-14 shows the messages as they flow across the bus and within the <u>Devicesdevices</u> to accomplish the Hard Reset.

Page **356**

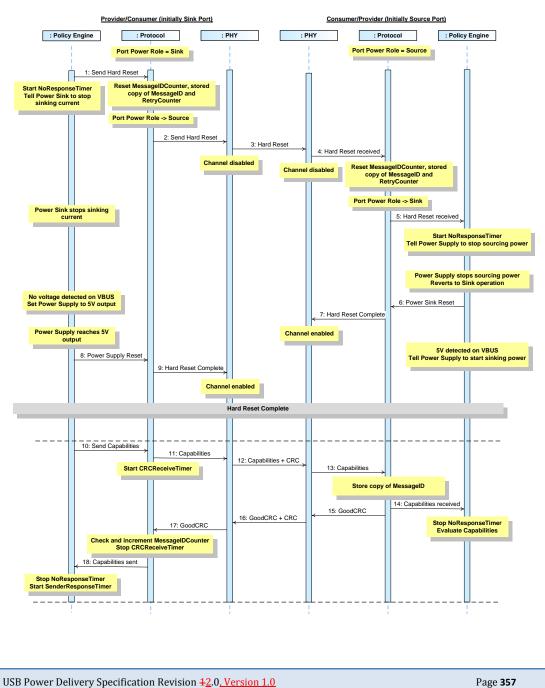

Figure 8-14 <u>Type-A or Type-B</u> Sink Initiated Hard Reset (role swapped Power Role Swapped)

Step	Provider/Consumer (InitiallySink <u>Port</u>)	Consumer/Provider (InitiallySource <u>Port</u>)
1	Port <u>Power_RolePort Role</u> starts as Sink. The Policy Engine directs the Protocol Layer to generate <i>Hard Reset</i> signaling. The Policy Engine starts the <i>NoResponseTimer</i> and directs the Sink to stop sinking power.	<i>Port <u>Power</u> Role</i> Port Role starts as Source.
2	Protocol Layer resets <i>MessageIDCounter</i> , stored copy of <i>MessageID</i> and <i>RetryCounter</i> . <i>Port <u>Power</u> RolePort Role</i> reverts to Source. Protocol Layer requests the Physical Layer send <i>Hard Reset</i> signaling.	
3	Physical Layer sends the <i>Hard Reset</i> signaling over V _{BUS} and then disables the PHY <u>Layer</u> communications channel for transmission and reception.	Physical Layer receives the <i>Hard Reset</i> signalin and disables the PHY <u>Layer</u> communications channel for transmission and reception.
4		Physical Layer informs the Protocol Layer of the Hard Reset. Protocol Layer resets <i>MessageIDCounter</i> , stored copy of <i>MessageID</i> and <i>RetryCounter</i> . <i>Port <u>Power</u> RolePort Role reverts to Sink.</i>
5		The Protocol Layer Informs the Policy Engine of the Hard Reset. The Policy Engine starts the <i>NoResponseTimer</i> and directs the Source to stop sourcing power.
6		The Power Supplypower supply stops sourcing power on V_{BUS} and reverts to Sink operation. The Policy Engine informs the Protocol Layer that the Sink has been reset.
7		When vSafe5V is detected on V _{BUS} the Policy Engine directs the Sink to start Sinking power. The Protocol Layer informs the PHY layerLayer that the Hard Reset is complete. The PHY layerLayer enables the PHY Layer communications channel for transmission and reception.
8	The Sink stops sinking power. When there is no voltage detected on V _{BUS} the Policy Engine requests the Source to go to <i>vSafe5V</i> output. When the Source reaches <i>vSafe5V</i> the Policy Engine informs the Protocol Layer that the Power Supplypower supply has been reset.	<u>When <i>vSafe5V</i> is detected on <i>V_{BUS}</i> the Policy</u> Engine directs the Sink to start Sinking power.

9	The Protocol Layer informs the PHY <u>layerLayer</u> that the Hard Reset is complete. The PHY <u>layerLayer</u> enables the PHY <u>Layer</u> communications channel for transmission and reception.	
The reset is complete and protocol communication can restart.		n can restart.
10	Policy Engine directs the Protocol Layer to send a <i>Source Capabilities</i> message that represents the power supply's present capabilities.	
11	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
12	Physical Layer appends CRC and sends the <i>Source Capabilities</i> message.	Physical Layer receives the <i>Source Capabilities</i> message and checks the CRC to verify the message.
13		Physical Layer removes the CRC and forwards the <i>Source Capabilities</i> message to the Protocol Layer.
14		Protocol Layer stores the <i>MessageID</i> of the incoming message. The Protocol Layer forwards the received <i>Source Capabilities</i> message information to the Policy Engine that consumes it. The Policy Engine stops the <i>NoResponseTimer</i> .
15		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
16	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
17	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
18	Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops <i>CRCReceiveTimer</i> . Protocol Layer informs the Policy Engine that the <i>Source Capabilities</i> message was successfully sent. Policy Engine stops the <i>NoResponseTimer</i> and	
	starts the SenderResponseTimer.	
	USB Power Delivery communication is re-establi	shed.

8.3.2.8 Type-C specific Message Sequence Diagrams

8.3.2.8.1 Type-C Power Role Swap

8.3.2.8.1.1 Type-C Source Initiated Power Role Swap without subsequent Power Negotiation

This is an example of a successful Power Role Swap operation initiated by a **[USBType-C1.0]** Port which initially, at the start of this message sequence, is acting as a Source and therefore has R_p pulled up on its CC wire. It does not

include any subsequent Power Negotiation which is required in order to establish an Explicit Contract (see previous section for the details of a Power Negotiation).

There are four distinct phases to the Power Role Swap negotiation:

A PR Swap message is sent. 1

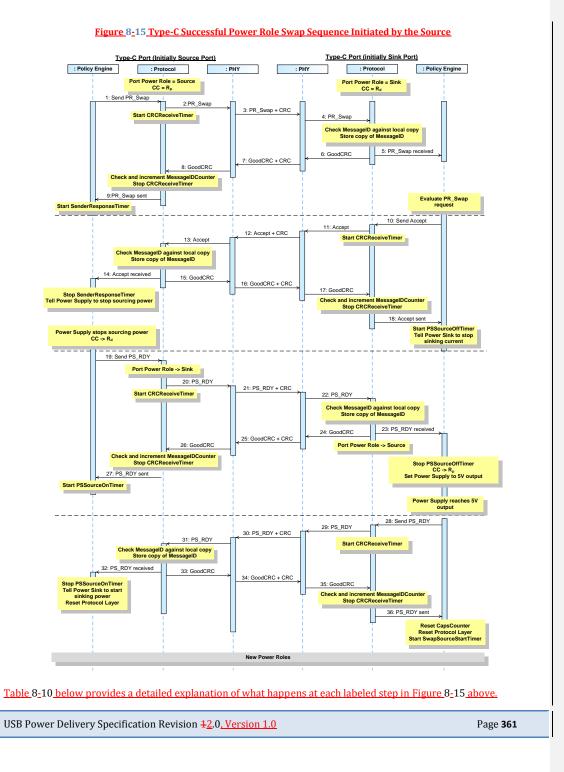

2. An Accept message in response to the PR Swap message. 4.3. The original Source sets its power output to

<u>4</u>.

, then asserts R_d and sends a *PS_RDY* message when this process is complete. The new Source asserts R_D, then sets its power output to *vSafe5V* and sends a *PS_RDY* message when it is ready to 5. supply power.

Figure 8-15 shows the messages as they flow across the bus and within the devices to accomplish the Power Role Swap sequence.

Page 360

<u>Step</u>	Type-C Port (initially Source Port)	Type-C Port (initially Sink Port)
1	The [USBType-C1.0] Port has Port Power Role set to Source and the R_p pull up on its CC wire.Policy Engine directs the Protocol Layer to send a PR_Swap message.	The [USBType-C1.0] Port has Port Power Role set to Sink with the R _d pull down on its CC wire.
<u>2</u>	Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>3</u>	Physical Layer appends CRC and sends the <u>PR_Swap message.</u>	<u>Physical Layer receives the PR Swap message</u> and checks the CRC to verify the message.
<u>4</u>		Physical Layer removes the CRC and forwards the PR_Swap message to the Protocol Layer.
<u>5</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>PR_Swap_</i> message information to the Policy Engine that consumes it.
<u>6</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>Z</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>9</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the PR_Swap message was successfully sent. Policy Engine starts SenderResponseTimer_	
<u>10</u>		Policy Engine evaluates the PR Swap message sent by the Source and decides that it is able and willing to do the Power Role Swap. It tells the Protocol Layer to form an Accept message.
<u>11</u>		Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the <i>Accept</i> message.	Physical Layer appends a CRC and sends the Accept message.

Table 8-14 Steps for a Successful Type-C Source Initiated Power Role Swap Sequence

Page **362**

<u>Step</u>	Type-C Port (initially Source Port)	Type-C Port (initially Sink Port)
<u>13</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received PR Swap message information to the Policy Engine that consumes it.	
<u>14</u>	<u>The Policy Engine requests its power supply to</u> <u>stop supplying power and stops the</u> <u>SenderResponseTimer.</u>	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the <i>GoodCRC</i> message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.
<u>17</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the Accept message was successfully sent. The Policy Engine starts the PSSourceOffTimer and tells the power supply to stop sinking current.
<u>19</u>	The Policy Engine determines its power supply is no longer supplying V_{BUS} . The Policy Engine requests the Device Policy Manager to assert the R_d pull down on the CC wire. The Policy Engine then directs the Protocol Layer to generate a PS_RDY message, with the Port Power Role bit in the header set to "Sink", to tell its Port Partner that it can begin to Source V_{BUS} .	
<u>20</u>	Protocol Layer sets the Port Power Role bit in the header set to "Sink", creates the message and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>21</u>	Physical Layer appends CRC and sends the PS_RDY_message.	<u>Physical Layer receives the PS_RDY message and checks the CRC to verify the message.</u>
<u>22</u>		Physical Layer removes the CRC and forwards the PS_RDY_message to the Protocol Layer.

<u>Step</u>	<u>Type-C Port (initially Source Port)</u>	Type-C Port (initially Sink Port)
<u>23</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.
		The Protocol Layer forwards the received PS_RDY message information to the Policy Engine that consumes it. The Policy Engine stops the PSSourceOffTimer , directs the Device Policy Manager to apply the R _p pull up and then starts switching the power supply to vSafe5V Source operation.
<u>24</u>		<u>Protocol Layer generates a <i>GoodCRC</i> message</u> and passes it Physical Layer.
<u>25</u>	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>26</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>27</u>	Protocol Layer verifies and increments the MessageIDCounter_and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the PS_RDY_message was successfully sent. Policy Engine starts PSSourceOnTimer_	
<u>28</u>		Policy Engine, when its power supply is ready to supply power, tells the Protocol Layer to form a PS_RDY message. The Port Power Role bit used in this and subsequent message headers is now set to "Source".
<u>29</u>		Protocol Layer creates the PS_RDY_message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>30</u>	Physical Layer receives the PS_RDY message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the PS_RDY_message.
<u>31</u>	Physical Layer removes the CRC and forwards the PS_RDY message to the Protocol Layer.	
32	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>PS_RDY</i> message information to the Policy Engine that consumes it.	
<u>33</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	

Page **364**

<u>Step</u>	Type-C Port (initially Source Port)	Type-C Port (initially Sink Port)
<u>34</u>	Physical Layer appends a CRC and sends the GoodCRC message The Policy Engine stops the PSSourceOnTimer, informs the power supply it can now Sink power and resets the Protocol Layer.	Physical Layer receives GoodCRC message and compares the CRC it calculated with the one sent to verify the message.
<u>35</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>36</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the PS_RDY message was successfully sent. The Policy Engine resets the CapsCounter, resets the Protocol Layer and starts the SwapSourceStartTimer which must timeout before sending any_Source Capabilities messages.
	The Power Role Swap is complete, the roles have been reversed and the Port Partners are free to negotiate for more power.	

8.3.2.8.1.2 Type-C Sink Initiated Power Role Swap without subsequent Power Negotiation

This is an example of a successful Power Role Swap operation initiated by a **[USBType-C1.0]** Port which initially, at the start of this message sequence, is acting as a Sink and therefore has R_d pulled down its CC wire. It does not include any subsequent Power Negotiation which is required in order to establish an Explicit Contract (see Section 8.3.2.3).

There are four distinct phases to the Power Role Swap negotiation:

6) A PR Swap message is sent.

7) An Accept message in response to the PR Swap message.

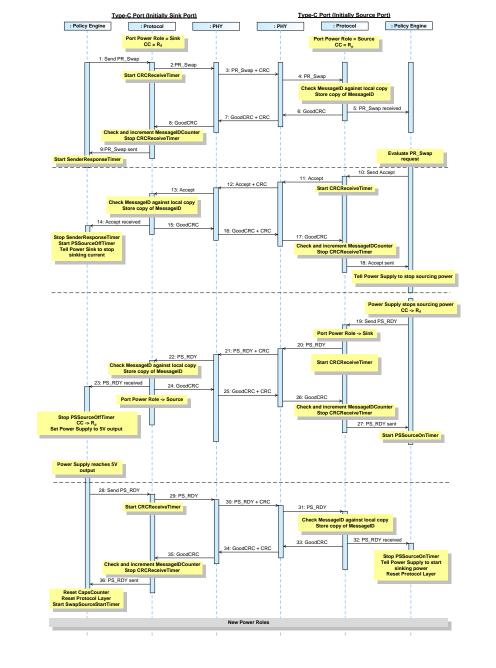

13)8) The original Source sets its power output to

vSafe0V Safe operating voltage at "zero volts".	0		0. <u>8</u>	V	Section 7.1.6
--	---	--	-------------	---	---------------

9) . then asserts R_d and sends a **PS_RDY** message when this process is complete.

10) The new Source asserts R_p, then sets its power output to *vSafe5V* and sends a *PS_RDY* message when it is ready to supply power.

Figure 8-16 shows the messages as they flow across the bus and within the devices to accomplish the Power Role Swap.

<u>Figure 8-16 Type-C Successful Power Role Swap Sequence Initiated by the Type-C Sink</u>

USB Power Delivery Specification Revision 2.0, Version 1.0.

Page 366

Table 8-15 Steps for a Successful Type-C Sink Initiated Power Role Swap Seque	ence

Step	Type-C Port (initially Sink Port)	Type-C Port (initially Source Port)
1	The [USBType-C1.0] Port has Port Power Role set to Sink with the R _d pull down on its CC wire. Policy Engine directs the Protocol Layer to send <u>a PR_Swap message.</u>	The [USBType-C1.0] Port has Port Power Role set to Source and the R_p pull up on its CC wire.
2	Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>3</u>	Physical Layer appends CRC and sends the <u>PR_Swap_message.</u>	<u>Physical Layer receives the PR Swap message</u> and checks the CRC to verify the message.
<u>4</u>		<u>Physical Layer removes the CRC and forwards</u> the <u>PR_Swap_message to the Protocol Layer.</u>
<u>5</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>PR_Swap</i> message information to the Policy Engine that consumes it.
<u>6</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>7</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>9</u>	Protocol Layer verifies and increments the MessageIDCounter_and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the PR_Swap_message was successfully sent. Policy Engine starts SenderResponseTimer_	
<u>10</u>		Policy Engine evaluates the PR <u>Swap</u> message sent by the Sink and decides that it is able and willing to do the Power Role Swap. It tells the Protocol Layer to form an <u>Accept</u> message.
<u>11</u>		Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the message and compares the CRC it calculated with the one sent to verify the <i>Accept</i> message.	Physical Layer appends a CRC and sends the Accept message.

<u>Step</u>	Type-C Port (initially Sink Port)	Type-C Port (initially Source Port)
<u>13</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received PR_Swap message information to the Policy Engine that consumes it.	
<u>14</u>	<u>The Policy Engine stops the</u> <u>SenderResponseTimer, starts the</u> <u>PSSourceOffTimer and tells the power supply</u> to stop sinking current.	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the GoodCRC message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.
<u>17</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter_and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the Accept message was successfully sent. The Policy Engine tells the power supply to stop supplying power.
<u>19</u>		The Policy Engine determines its power supply is no longer supplying V _{BUS} . The Policy Engine requests the Device Policy Manager to assert the R _d pull down on the CC wire. The Policy Engine then directs the Protocol Layer to generate a PS_RDY message, with the Port Power Role bit in the header set to "Sink", to tell its Port Partner that it can begin to Source V _{BUS} .
<u>20</u>		Protocol Layer sets the Port Power Role bit in the header set to "Sink", creates the message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>21</u>	<u>Physical Layer receives the PS_RDY message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the PS_RDY_message.
<u>22</u>	Physical Layer removes the CRC and forwards the PS_RDY_message to the Protocol Layer.	

Page **368**

<u>Step</u>	<u>Type-C Port (initially Sink Port)</u>	<u>Type-C Port (initially Source Port)</u>
23	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.The Protocol Layer forwards the received PS_RDY message information to the Policy Engine that consumes it. The Policy Engine	
	stops the <i>PSSourceOffTimer</i> , directs the Device Policy Manager to apply the R _p pull up and then starts switching the power supply to <i>vSafe5V</i> Source operation.	
<u>24</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>25</u>	Physical Layer appends CRC and sends the GoodCRC message.	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.
<u>26</u>		<u>Physical Layer removes the CRC and forwards</u> the <i>GoodCRC</i> message to the Protocol Layer.
<u>27</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimerProtocol Layer informs the Policy Engine that the PS_RDY_message was successfully sent. Policy Engine starts PSSourceOnTimer.
<u>28</u>	Policy Engine, when its power supply is ready to supply power, tells the Protocol Layer to form a PS_RDY_message. The Port Power Role bit used in this and subsequent message headers is now set to "Source".	
<u>29</u>	Protocol Layer creates the PS_RDY_message and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>30</u>	Physical Layer appends a CRC and sends the PS_RDY_message.	Physical Layer receives the PS_RDY message and compares the CRC it calculated with the one sent to verify the message.
<u>31</u>		Physical Layer removes the CRC and forwards the PS_RDY message to the Protocol Layer.
<u>32</u>		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.
		The Protocol Layer forwards the received PS_RDY _message information to the Policy Engine that consumes it. The Policy Engine stops the PSSourceOnTimer , informs the power supply that it can start consuming power.
<u>33</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.

USB Power Delivery Specification Revision <u>42</u>.0<u>. Version 1.0</u>

<u>Step</u>	Type-C Port (initially Sink Port)	<u>Type-C Port (initially Source Port)</u>	
<u>34</u>	Physical Layer receives GoodCRC message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the GoodCRC message. The Policy Engine stops the PSSourceOnTimer, informs the power supply it can now Sink power and resets the Protocol Layer.	
<u>35</u>	Physical Layer removes the CRC and forwards the GoodCRC to the Protocol Layer.		
<u>36</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the PS_RDY message was successfully sent. The Policy Engine resets the CapsCounter, resets the Protocol Layer and starts the SwapSourceStartTimer which must timeout before sending any_Source Capabilities messages.		
	The Power Role Swap is complete, the roles have been reversed and the Port Partners are free to negotiate for more power.		

8.3.2.8.2 Type-C Data Role Swap

8.3.2.8.2.1 Type-C Data Role Swap, Initiated by UFP Operating as Sink

This is an example of message sequence between a Port Pair both utilizing the Type -C connector.

Figure 8-17 shows an example sequence between a **[USBType-C1.0]** DRP, which is initially a UFP (Device) and a Sink (R_d asserted), and a **[USBType-C1.0]** DRP which is initially a DFP (Host) and a Source (R_p asserted). A Data Role Swap is initiated by the UFP. During the process the Port Partners maintain their operation as either a Source or a Sink (power and R_p/R_d remain constant) but exchange data roles between DFP (Host) and UFP (Device).

Page 370

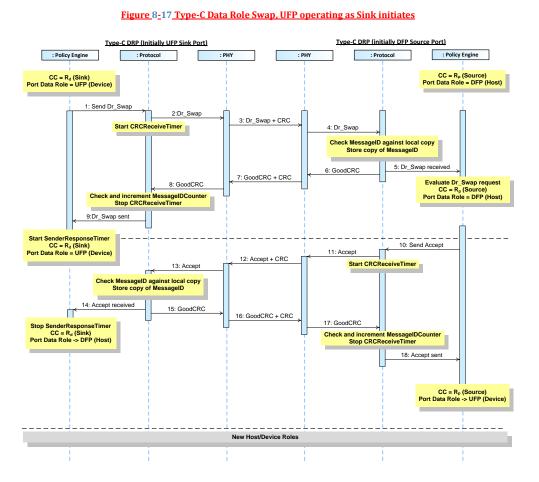

Table 8-10 below provides a detailed explanation of what happens at each labeled step in Figure 8-17 above.

Table 8-16 Steps for Type-C Data Role Swap, UFP operating as Sink initiates

<u>Step</u>	Type-C DRP (initially UFP Sink Port)	Type-C DRP (initially DFP Source Port)
1	Port starts as a UFP (Device) operating as a Sink with R_d asserted and Port Data Role set to UFP. The Policy Engine directs the Protocol Layer to send a DR Swap message.	Port starts as a DFP (Host) operating as Source with R_p asserted and Port Data Role set to DFP.
2	Protocol Layer creates the DR Swap message and passes to Physical Layer. Starts CRCReceiveTimer .	
<u>3</u>	Physical Layer appends CRC and sends the DR Swap message.	Physical Layer receives the DR Swap message and checks the CRC to verify the message.

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

<u>Step</u>	Type-C DRP (initially UFP Sink Port)	<u>Type-C DRP (initially DFP Source Port)</u>
<u>4</u>		<u>Physical Layer removes the CRC and forwards the</u> <u>DR Swap message to the Protocol Layer.</u>
<u>5</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>DR Swap</i> message information to the Policy Engine that consumes it.
<u>6</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
Z	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>9</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the DR Swap message was successfully sent. Policy Engine starts SenderResponseTimer_	
<u>10</u>		Policy Engine evaluates the <i>DR Swap</i> message and decides that it is able and willing to do the Data Role Swap. It tells the Protocol Layer to form an <i>Accept</i> message.
<u>11</u>		Protocol Layer creates the Accept message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the Accept message and checks the CRC to verify the message.	Physical Layer appends a CRC and sends the Accept message.
<u>13</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.The Protocol Layer forwards the received Accept message information to the Policy Engine that consumes it.	
<u>14</u>	Engine that consumes it. The Policy Engine stops the SenderResponseTimer, requests that Data Role is changed from UFP (Device) to DFP (Host). The Power Delivery role is now a DFP (Host), with Port Data Role set to DFP, still operating as a Sink (Rd asserted).	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	

Page **372**

<u>Step</u>	Type-C DRP (initially UFP Sink Port)	Type-C DRP (initially DFP Source Port)
<u>16</u>	Physical Layer appends a CRC and sends the GoodCRC message.	<u>Physical Layer receives <i>GoodCRC</i> message and</u> <u>compares the CRC it calculated with the one sent</u> <u>to verify the message.</u>
<u>17</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops <i>CRCReceiveTimer</i> . Protocol Layer informs the Policy Engine that the <i>Accept</i> message was successfully sent. The Policy Engine requests that the Data Role is changed to UFP (Device), with <i>Port Data Role</i> set to UFP and continues supplying power as a Source (R _p asserted).
	The Data Role Swap is complete, the data roles have been reversed while maintaining the direction of power flow.	

8.3.2.8.2.2 Type-C Data Role Swap, Initiated by UFP Operating as Source

This is an example of message sequence between a Port Pair both utilizing the Type-C connector.

Figure 8-18 shows an example sequence between a *[USBType-C1.0]* DRP, which is initially a UFP (Device) and a Source (R_p asserted), and a *[USBType-C1.0]* DRP which is initially a DFP (Host) and a Sink (R_d asserted). A Data Role Swap is initiated by the UFP. During the process the Port Partners maintain their operation as either a Source or a Sink (power and R_p/R_d remain constant) but exchange data roles between DFP (Host) and UFP (Device).

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

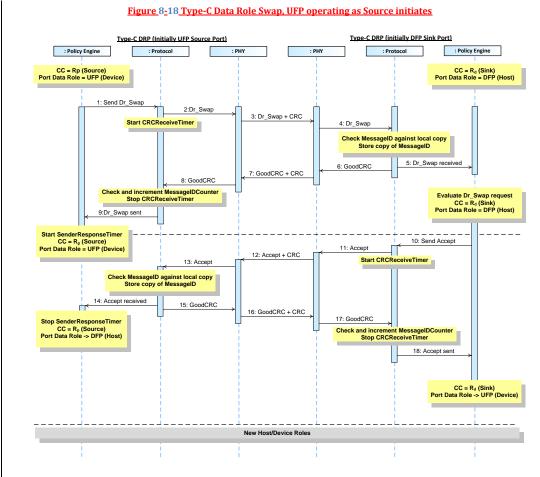

Table 8-17 below provides a detailed explanation of what happens at each labeled step in Figure 8-18 above.

<u>Step</u>	Type-C DRP (initially UFP Source Port)	Type-C DRP (initially DFP Sink Port)
<u>4</u>	Physical Layer removes the CRC and forwards the DR Swap message to the Protocol Layer.	
<u>5</u>	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>DR Swap</i> message information to the Policy Engine that consumes it.	
<u>6</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
Z	Physical Layer appends CRC and sends the GoodCRC message.	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.
<u>8</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>9</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the DR Swap message was successfully sent. Policy Engine starts SenderResponseTimer.
<u>10</u>	Policy Engine evaluates the <i>DR Swap</i> message and decides that it is able and willing to do the Data Role Swap. It tells the Protocol Layer to form an <i>Accept</i> message.	
<u>11</u>	Protocol Layer creates the Accept message and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>12</u>	Physical Layer appends a CRC and sends the Accept message.	<u>Physical Layer receives the <i>Accept</i> message and checks the CRC to verify the message.</u>
<u>13</u>		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received Accept message information to the Policy Engine that consumes it.
<u>14</u>		The Policy Engine stops the SenderResponseTimer, requests that Data Role is changed from DFP (Host) to UFP (Device). The Power Delivery role is now a UFP (Device), with Port Data Role set to UFP, still operating as a Sink (Rd asserted).
<u>15</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

<u>Step</u>	Type-C DRP (initially UFP Source Port)	Type-C DRP (initially DFP Sink Port)
<u>16</u>	<u>Physical Layer receives</u> <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the <i>GoodCRC</i> message.
<u>17</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>18</u>	Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops <i>CRCReceiveTimer</i> . Protocol Layer informs the Policy Engine that the <i>Accept</i> message was successfully sent. The Policy Engine requests that the Data Role is changed to DFP (Host), with <i>Port Data Role</i> set to DFP, and continues supplying power as a Source (R _p asserted).	
	The Data Role Swap is complete, the data roles have power flow.	been reversed while maintaining the direction of

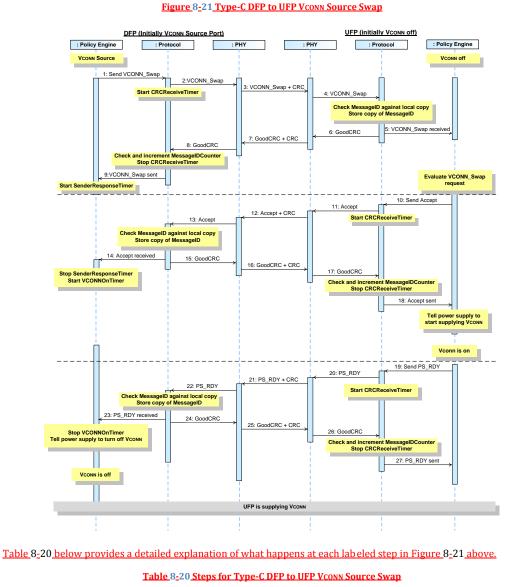

8.3.2.8.3 Type-C VCONN

8.3.2.8.3.1 Type-C DFP to UFP VCONN Source Swap

This is an example of message sequence between a Port Pair both utilizing the Type -C connector.

Figure 8-21 shows an example sequence between a Type-C DFP and UFP, where the DFP is initially supplying VCONN and then tells the UFP to supply VCONN. During the process the Port Partners, keep their role as DFP or UFP, maintain their operation as either a Source or a Sink (power remains constant) but exchange the VCONN Source from the DFP to the UFP.

Page 382

<u>Step</u>	DFP (initially VCONN Source)	UFP (Initially VCONN off)
1	The DFP starts as the VCONN Source. The Policy Engine directs the Protocol Layer to send a VCONN Swap message.	The UFP starts with VCONN off.

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

<u>Step</u>	DFP (initially VCONN Source)	UFP (Initially VCONN off)
2	Protocol Layer creates the VCONN Swap message and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>3</u>	Physical Layer appends CRC and sends the <u>VCONN Swap</u> message.	Physical Layer receives the VCONN Swap message and checks the CRC to verify the message.
<u>4</u>		Physical Layer removes the CRC and forwards the VCONN Swap message to the Protocol Layer.
<u>5</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>VCONN_Swap</i> message information to the Policy Engine that consumes it.
<u>6</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>7</u>	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>9</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the VCONN Swap message was successfully sent. Policy Engine starts SenderResponseTimer.	
<u>10</u>		Policy Engine evaluates the <i>VCONN Swap</i> message sent by the DFP and decides that it is able and willing to do the VCONN Swap. It tells the Protocol Layer to form an <i>Accept</i> message.
<u>11</u>		Protocol Layer creates the message and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the <i>Accept</i> message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Accept message.
<u>13</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received Accept message information to the Policy Engine that consumes it.	
<u>14</u>	<u>The Policy Engine stops the</u> <u>SenderResponseTimer and starts the</u> <u>VCONNOnTimer.</u>	
e 384		Power Delivery Specification Revision <u>2.0, Version</u> 1

<u>Step</u>	DFP (initially VCONN Source)	UFP (Initially VCONN off)
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the GoodCRC message.	<u>Physical Layer receives <i>GoodCRC</i> message and</u> compares the CRC it calculated with the one sent to verify the message.
<u>17</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the Accept message was successfully sent. The Policy Engine asks the Device Policy Manager to turn on VCONN.
<u>19</u>		The Device Policy Manager informs the Policy Engine that its power supply is supplying VCONN. The Policy Engine directs the Protocol Layer to generate a <i>PS_RDY</i> message to tell the DFP it can turn off VCONN.
<u>20</u>		<u>Protocol Layer creates the PS_RDY message and passes to Physical Layer. Starts</u> CRCReceiveTimer.
<u>21</u>	Physical Layer receives the <i>PS_RDY</i> message and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the PS_RDY message.
<u>22</u>	Physical Layer removes the CRC and forwards the PS_RDY_message to the Protocol Layer.	
<u>23</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.The Protocol Layer forwards the received PS_RDY_message information to the Policy Engine that consumes it.	
<u>24</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>25</u>	Physical Layer appends a CRC and sends the GoodCRC message The Policy Engine stops the VCONNOnTimer, and tells the power supply to stop sourcing VCONN.	<u>Physical Layer receives GoodCRC message and</u> compares the CRC it calculated with the one sent to verify the message.
<u>26</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>27</u>	VCONN is off.	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the PS_RDY message was successfully sent.

USB Power Delivery Specification Revision <u>42</u>.0<u>. Version 1.0</u>

	<u>Step</u>	DFP (initially VCONN Source)	UFP (Initially VCONN off)
ſ		The UFP is now the VCONN Source and the DFP has VCONN turned off.	

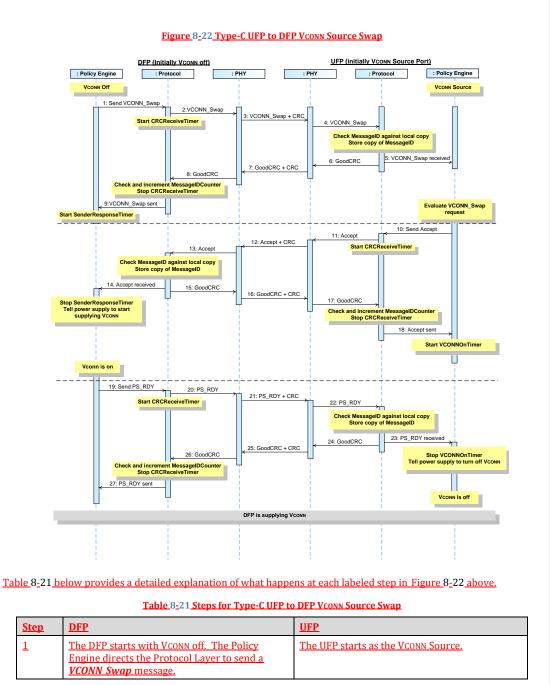

8.3.2.8.3.2 Type-C UFP to DFP VCONN Source Swap

This is an example of message sequence between a Port Pair both utilizing the Type-C connector.

Figure 8-22 shows an example sequence between a Type-C DFP and UFP, where the UFP is initially supplying VCONN and then the DFP tells the UFP that it will become the VCONN Source. During the process the Port Partners, keep their role as DFP or UFP, maintain their operation as either a Source or a Sink (power remains constant) but exchange the VCONN Source from the UFP to the DFP.

USB Power Delivery Specification Revision 2.0, Version 1.0.

<u>Step</u>	DFP	<u>UFP</u>
<u>13</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.The Protocol Layer forwards the received Discover Identity Command ACK response information to the Policy Engine that consumes it.	
<u>14</u>	The Policy Engine stops the VDMResponseTimer and passed the Indentity information to the Device Policy Manager for evaluation.	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the <i>GoodCRC</i> message.	<u>Physical Layer receives <i>GoodCRC</i> message and</u> <u>compares the CRC it calculated with the one sent</u> <u>to verify the message.</u>
<u>17</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover Identity Command ACK response was successfully sent.

8.3.2.9.2 Source Port to Cable Plug Discover Identity

This is an example of message sequence between a Source and a Cable Plug both utilizing the Type-C connector.

Figure 8-24 shows an example sequence between a Type-C Source and a Cable Plug, where the Source attempts to discover identity information from the Cable Plug prior to establishing an Explicit Contract with its Port Partner.

USB Power Delivery Specification Revision 2.0, Version 1.0.

Page **392**

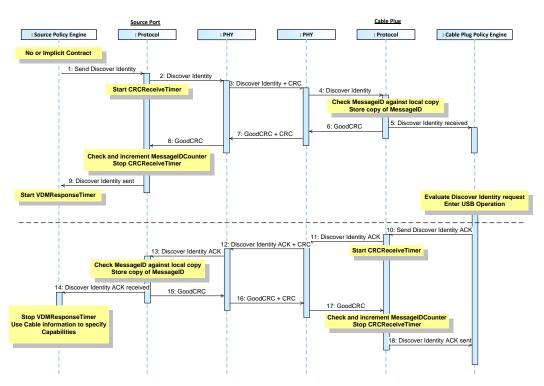

Figure 8-24 Source Port to Cable Plug Discover Identity

Table 8-23 below provides a detailed explanation of what happens at each labeled step in Figure 8-24 above.

Table 8-23 Steps for Source Port to Cable Plug Discover Identity

<u>Step</u>	Source Port	Cable Plug
<u>1</u>	The Source has no Contract or an Implicit Contract with its Port Partner. The Policy Engine directs the Protocol Layer to send a Discover Identity Command request.	
2	Protocol Layer creates the <i>Discover Identity</i> Command request and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>3</u>	<u>Physical Layer appends CRC and sends the</u> Discover Identity Command request.	Physical Layer receives the Discover Identity Command request and checks the CRC to verify the message.
<u>4</u>		Physical Layer removes the CRC and forwards the Discover Identity Command request to the Protocol Layer.

<u>Step</u>	Source Port	Cable Plug
<u>5</u>		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.
		The Protocol Layer forwards the received Discover Identity Command request information to the Policy Engine that consumes it.
<u>6</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>Z</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>9</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover Identity Command request was successfully sent.	
	Policy Engine starts the <i>VDMResponseTimer</i> .	
<u>10</u>		Policy Engine requests the identity information from the Device Policy Manager. The Policy Engine tells the Protocol Layer to form a Discover Identity Command ACK response.
<u>11</u>		Protocol Layer creates the <i>Discover Identity</i> Command ACK response and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the <i>Discover Identity</i> Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Discover Identity Command ACK response.
<u>13</u>	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Discover Identity</i> Command ACK response information to the Policy Engine that consumes it.	
<u>14</u>	The Policy Engine stops the VDMResponseTimer and passes the identity information to the Device Policy Manager for evaluation.	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	

Page **394**

<u>Step</u>	Source Port	Cable Plug
<u>16</u>	<u>Physical Layer appends a CRC and sends the</u> <i>GoodCRC</i> <u>message.</u>	<u>Physical Layer receives <i>GoodCRC</i> message and</u> <u>compares the CRC it calculated with the one sent</u> <u>to verify the message.</u>
<u>17</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>18</u>	The Source uses the Cable Plug information as input to its offered capabilities.	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Accept message was successfully sent.

8.3.2.9.3 DFP to Cable Plug Discover Identity

This is an example of message sequence between a DFP and a Cable Plug both utilizing the Type -C connector.

Figure 8-25 shows an example sequence between a Type-C DFP and a Cable Plug, where the DFP attempts to discover identity information from the Cable Plug.

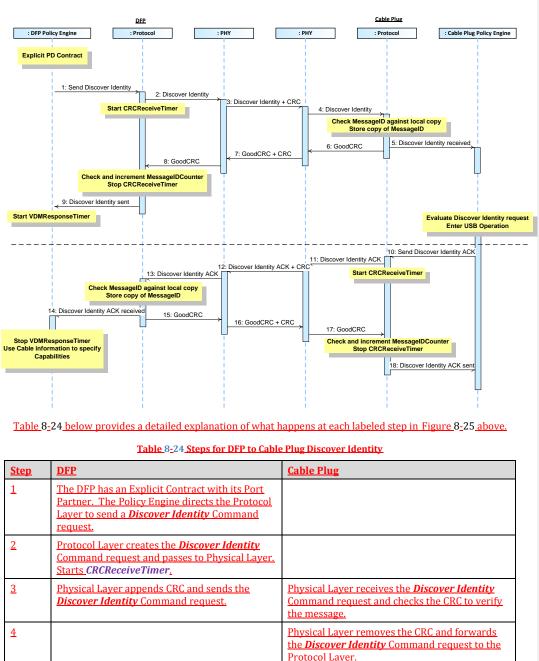

Figure 8-25 DFP to Cable Plug Discover Identity

Page **396**

<u>Step</u>	DFP	Cable Plug
<u>5</u>		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received Discover Identity Command request information to the Policy Engine that consumes
<u>6</u>		it. <u>Protocol Layer generates a <i>GoodCRC</i> message</u>
<u>Z</u>	Physical Layer receives the GoodCRC message and checks the CRC to verify the message.	and passes it Physical Layer. Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
<u>8</u>	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
9	Protocol Layer verifies and increments the MessagelDCounter and stops CRCReceiveTimerProtocol Layer informs the Policy Engine that the Discover Identity Command request was successfully sent. Policy Engine starts the VDMResponseTimer.	
<u>10</u>		Policy Engine requests the identity information from the Device Policy Manager. The Policy Engine tells the Protocol Layer to form a Discover Identity Command ACK response.
<u>11</u>		Protocol Layer creates the Discover Identity Command ACK response and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the Discover Identity Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Discover Identity Command ACK response.
<u>13</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received Discover Identity Command ACK response information to the Policy Engine that consumes it.	
<u>14</u>	The Policy Engine stops the <i>Discover Identity</i> Command ACK response and passes the identity information to the Device Policy Manager for evaluation.	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

<u>Step</u>	DFP	Cable Plug
<u>16</u>	Physical Layer appends a CRC and sends the GoodCRC message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.
<u>17</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>18</u>	The DFP when acting as a Source uses the Cable Plug information as input to its offered capabilities.	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Accept message was successfully sent.

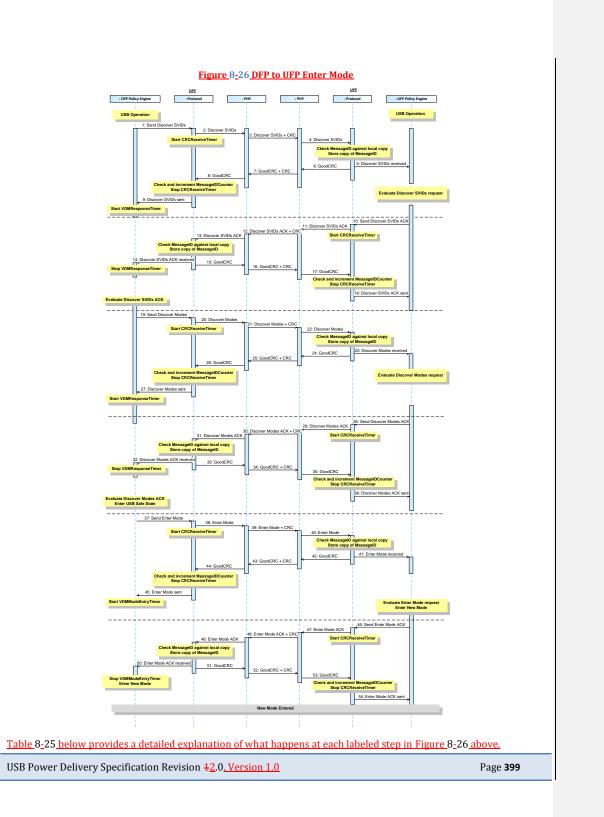

8.3.2.9.4 DFP to UFP Enter Mode

This is an example of message sequence between a DFP and a UFP both utilizing the Type-C connector.

Figure 8-26 shows an example sequence between a Type-C DFP and a UFP, where the DFP attempts to discover supported SVIDs, then Modes before selecting and entering a Mode.

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

Page **398**

<u>Step</u>	DFP	UFP
1	The DFP has an Explicit Contract. The Device Policy Manager requests the Policy Engine to discover SVID information. The Policy Engine directs the Protocol Layer to send a Discover SVIDs Command request.	The UFP has an Explicit Contract.
2	Protocol Layer creates the <i>Discover SVIDs</i> Command request and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>3</u>	Physical Layer appends CRC and sends the Discover SVIDs Command request.	Physical Layer receives the <i>Discover SVIDs</i> Command request and checks the CRC to verify the message.
<u>4</u>		Physical Layer removes the CRC and forwards the <i>Discover SVIDs</i> Command request to the Protocol Layer.
<u>5</u>		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.
		The Protocol Layer forwards the received Discover SVIDs Command request information to the Policy Engine that consumes it.
<u>6</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>7</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	<u>Physical Layer removes the CRC and forwards</u> the <i>GoodCRC</i> message to the Protocol Layer.	
9	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover SVIDs Command request was successfully sent. Policy Engine starts the VDMResponseTimer.	
<u>10</u>		Policy Engine requests the SVID information from the Device Policy Manager. The Policy Engine tells the Protocol Layer to form a Discover SVIDs Command ACK response.
<u>11</u>		Protocol Layer creates the Discover SVIDs Command ACK response and passes to Physica Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the Discover SVIDs Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Discover SVIDs Command ACK response.

Table 8-25 Steps for DFP to UFP Enter Mode

Page **400**

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

<u>Step</u>	DFP	UFP
<u>13</u>	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Discover SVIDs</i> Command ACK response information to the Policy Engine that consumes it.	
<u>14</u>	The Policy Engine stops the VDMResponseTimer and passes the SVIDs information to the Device Policy Manager for evaluation.	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the GoodCRC message.	<u>Physical Layer receives <i>GoodCRC</i> message and</u> compares the CRC it calculated with the one sent to verify the message.
<u>17</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer, Protocol Layer informs the Policy Engine that the Discover SVIDs Command ACK response was successfully sent.
<u>19</u>	The Device Policy Manager requests the Policy Engine to discover Mode information for a given SVID. The Policy Engine directs the Protocol Layer to send a Discover Modes Command request.	
<u>20</u>	Protocol Layer creates the <i>Discover Modes</i> Command request and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>21</u>	Physical Layer appends CRC and sends the Discover Modes Command request.	Physical Layer receives the Discover Modes Command request and checks the CRC to verify the message.
<u>22</u>		Physical Layer removes the CRC and forwards the <i>Discover Modes</i> Command request to the Protocol Layer.
23		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Discover Modes</i> Command request information to the Policy Engine that consumes it.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Page **401**

<u>Step</u>	DFP	<u>UFP</u>
<u>24</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>25</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	<u>Physical Layer appends CRC and sends the</u> <i>GoodCRC</i> <u>message</u> .
<u>26</u>	<u>Physical Layer removes the CRC and forwards</u> the <i>GoodCRC</i> message to the Protocol Layer.	
<u>27</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover Modes Command request was successfully sent. Policy Engine starts the VDMResponseTimer.	
<u>28</u>		Policy Engine requests the Mode information from the Device Policy Manager. The Policy Engine tells the Protocol Layer to form a Discover Modes Command ACK response.
<u>29</u>		Protocol Layer creates the Discover Modes Command ACK response and passes to Physica Layer. Starts CRCReceiveTimer.
<u>30</u>	Physical Layer receives the Discover Modes Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Discover Modes Command ACK response.
<u>31</u>	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Discover Modes</i> Command ACK response information to the Policy Engine that consumes	
<u>32</u>	it. The Policy Engine stops the VDMResponseTimer and passes the Modes information to the Device Policy Manager for evaluation.	
<u>33</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>34</u>	Physical Layer appends a CRC and sends the GoodCRC message.	<u>Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one se to verify the message.</u>
<u>35</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.

Page **402**

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

<u>Step</u>	DFP	<u>UFP</u>
<u>36</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover Modes Command ACK response was successfully sent.
<u>37</u>	The DFP goes to USB Safe State. The DevicePolicy Manager requests the Policy Engine toenter a Mode.The Policy Engine directs the Protocol Layer tosend an Enter Mode Command request.	
<u>38</u>	Protocol Layer creates the <i>Enter Mode</i> Command request and passes to Physical Layer. <u>Starts CRCReceiveTimer.</u>	
<u>39</u>	Physical Layer appends CRC and sends the Enter Mode Command request.	Physical Layer receives the <i>Enter Mode</i> Command request and checks the CRC to verify the message.
<u>40</u>		Physical Layer removes the CRC and forwards the <i>Enter Mode</i> Command request to the <u>Protocol Layer.</u>
41		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Enter</i> <i>Mode</i> Command request information to the Policy Engine that consumes it.
<u>42</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>43</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>44</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>45</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Enter Mode Command request was successfully sent. Policy Engine starts the VDMModeEntryTimer.	
<u>46</u>		Policy Engine requests the Device Policy Manager to enter the new Mode. The Policy Engine tells the Protocol Layer to form an Enter Mode Command ACK response.
<u>47</u>		Protocol Layer creates the Enter Mode Command ACK response and passes to Physical Layer. Starts CRCReceiveTimer.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

<u>Step</u>	DFP	<u>UFP</u>
<u>48</u>	Physical Layer receives the Enter Mode Command ACK response and compares the CRC it calculated with the one sent to verify the message.	<u>Physical Layer appends a CRC and sends the</u> <u>Enter Mode</u> Command ACK response.
<u>49</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.The Protocol Layer forwards the received Enter Mode Command ACK response information to the Policy Engine that consumes it.	
<u>50</u>	The Policy Engine stops the <u>VDMModeEntryTimer</u> and requests the Device Policy Manager to enter the new Mode.	
<u>51</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>52</u>	Physical Layer appends a CRC and sends the <i>GoodCRC</i> message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.
<u>53</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>54</u>		Protocol Layer verifies and increments the MessageIDCounter_and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the Enter Mode Command ACK response was successfully sent.
	DPF and UFP are operating in the new Mode	· · · · · · · · · · · · · · · · · · ·

8.3.2.9.5 DFP to UFP Exit Mode

This is an example of message sequence between a DFP and a UFP both utilizing the Type -C connector.

Figure 8-27 shows an example sequence between a Type-C DFP and a UFP, where the DFP commands the UFP to exit the only active Mode.

Page **404**

USB Power Delivery Specification Revision 2.0, Version 1.0.

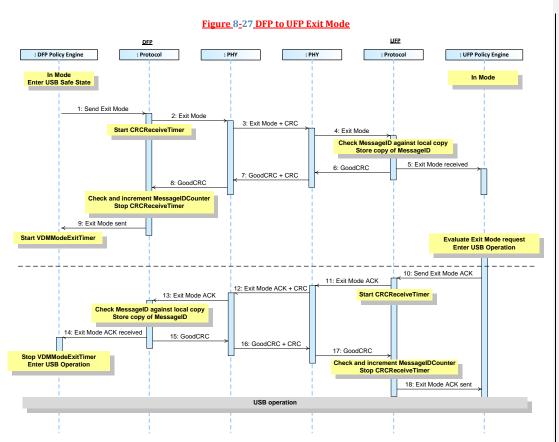

Table 8-26 below provides a detailed explanation of what happens at each labeled step in Figure 8-27 above.

Table 8-26 Steps for DFP to UFP Exit Mode

<u>Step</u>	DFP	UFP
1	The DFP is in a Mode and then enters USB Safe State. The Policy Engine directs the Protocol Layer to send a <i>Exit Mode</i> Command request.	<u>The UFP is in a Mode.</u>
2	Protocol Layer creates the <i>Exit Mode</i> Command request and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
<u>3</u>	Physical Layer appends CRC and sends the Exit Mode Command request.	<u>Physical Layer receives the Exit Mode Command</u> request and checks the CRC to verify the message.
<u>4</u>		Physical Layer removes the CRC and forwards the <i>Exit Mode</i> Command request to the Protocol Layer.

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

<u>Step</u>	DFP	<u>UFP</u>
<u>5</u>		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received Exit Mode Command request information to the Policy Engine that consumes it.
<u>6</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>Z</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>9</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Exit Mode Command request was successfully sent. Policy Engine starts the VDMModeExitTimer.	
<u>10</u>		Policy Engine requests the Device Policy Manager to enter USB operation. The Policy Engine tells the Protocol Layer to form an <i>Exit</i> <i>Mode</i> Command ACK response.
<u>11</u>		Protocol Layer creates the <i>Exit Mode</i> Command ACK response and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .
<u>12</u>	Physical Layer receives the <i>Exit Mode</i> Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Exit Mode Command ACK response.
<u>13</u>	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Exit</i> <i>Mode</i> Command ACK response information to the Policy Engine that consumes it.	
<u>14</u>	The Policy Engine that constitutes it. The Policy Engine stops the VDMModeExitTimer and requests the Device Policy Manager to enter USB Operation.	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the GoodCRC message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.

Page **406**

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

<u>Step</u>	DFP	UFP
<u>17</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Exit Mode Command ACK response was successfully sent.
	Both DFP and UFP are in USB Operation	

8.3.2.9.6 DFP to Cable Plug Enter Mode

This is an example of message sequence between a DFP and a Cable Plug both utilizing the Type -C connector.

Figure 8-28 shows an example sequence between a Type-C DFP and a Cable Plug, where the DFP attempts to discover supported SVIDs, then Modes before selecting and entering a Mode.

	Table 8-27 S	teps for DFP to	Cable Plug	Enter Mode
--	--------------	-----------------	------------	------------

<u>Step</u>	DFP	Cable Plug
1	The DFP has an Explicit Contract. The Device Policy Manager requests the Policy Engine to discover SVID information. The Policy Engine directs the Protocol Layer to send a Discover SVIDs Command request.	The UFP has an Explicit Contract.
<u>2</u>	Protocol Layer creates the Discover SVIDs Command request and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>3</u>	Physical Layer appends CRC and sends the Discover SVIDs Command request.	Physical Layer receives the Discover SVIDs Command request and checks the CRC to verify the message.
<u>4</u>		Physical Layer removes the CRC and forwards the Discover SVIDs Command request to the Protocol Layer.
<u>5</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Discover SVIDs</i> Command request information
<u>6</u>		to the Policy Engine that consumes it. Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>Z</u>	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
9	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover SVIDs Command request was successfully sent. Policy Engine starts the VDMResponseTimer.	
<u>10</u>		Policy Engine requests the SVID information from the Device Policy Manager. The Policy Engine tells the Protocol Layer to form a Discover SVIDs Command ACK response.
<u>11</u>		Protocol Layer creates the <i>Discover SVIDs</i> Command ACK response and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the <i>Discover SVIDs</i> Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Discover SVIDs Command ACK response.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

<u>Step</u>	DFP	Cable Plug
<u>13</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received Discover SVIDs Command ACK response information to the Policy Engine that consumes it.	
<u>14</u>	<u>The Policy Engine stops the</u> <u>VDMResponseTimer</u> and passes the SVIDs information to the Device Policy Manager for evaluation.	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the GoodCRC message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.
<u>17</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover SVIDs Comman ACK response was successfully sent.
<u>19</u>	The Device Policy Manager requests the Policy Engine to discover Mode information for a given SVID.The Policy Engine directs the Protocol Layer to send a Discover Modes Command request.	
<u>20</u>	Protocol Layer creates the <i>Discover Modes</i> Command request and passes to Physical Layer. Starts CRCReceiveTimer.	
<u>21</u>	Physical Layer appends CRC and sends the Discover Modes Command request.	Physical Layer receives the <i>Discover Modes</i> Command request and checks the CRC to verify the message.
<u>22</u>		Physical Layer removes the CRC and forwards the <i>Discover Modes</i> Command request to the Protocol Layer.
<u>23</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Discover Modes</i> Command request information to the Policy Engine that consumes it.

Page **410**

USB Power Delivery Specification Revision 2.0, Version 1.0.

<u>Step</u>	DFP	Cable Plug
<u>24</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>25</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>26</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>27</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover Modes Command request was successfully sent. Policy Engine starts the VDMResponseTimer.	
<u>28</u>		Policy Engine requests the Mode information from the Device Policy Manager. The Policy Engine tells the Protocol Layer to form a Discover Modes Command ACK response.
<u>29</u>		Protocol Layer creates the <i>Discover Modes</i> Command ACK response and passes to Physical Layer. Starts CRCReceiveTimer.
<u>30</u>	Physical Layer receives the Discover Modes Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Discover Modes Command ACK response.
<u>31</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.The Protocol Layer forwards the received Discover Modes Command ACK response information to the Policy Engine that consumes it.	
<u>32</u>	The Policy Engine stops the <u>VDMResponseTimer</u> and passes the Modes information to the Device Policy Manager for evaluation.	
<u>33</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>34</u>	Physical Layer appends a CRC and sends the GoodCRC message.	Physical Layer receives GoodCRC message and compares the CRC it calculated with the one sent to verify the message.
<u>35</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.

<u>Step</u>	DFP	Cable Plug
<u>36</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Discover Modes Command ACK response was successfully sent.
<u>37</u>	The DFP goes to USB Safe State. The DevicePolicy Manager requests the Policy Engine toenter a Mode.The Policy Engine directs the Protocol Layer tosend an Enter Mode Command request.	
<u>38</u>	Protocol Layer creates the <i>Enter Mode</i> Command request and passes to Physical Layer. <u>Starts</u> <i>CRCReceiveTimer</i> .	
<u>39</u>	Physical Layer appends CRC and sends the Enter Mode Command request.	Physical Layer receives the <i>Enter Mode</i> Command request and checks the CRC to verify the message.
<u>40</u>		Physical Layer removes the CRC and forwards the Enter Mode Command request to the Protocol Layer.
<u>41</u>		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Enter</i> <i>Mode</i> Command request information to the Policy Engine that consumes it.
<u>42</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>43</u>	Physical Layer receives the <i>GoodCRC</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>44</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>45</u>	Protocol Layer verifies and increments the MessageIDCounter and stopsCRCReceiveTimer.Protocol Layer informs the Policy Engine that the Enter Mode Command request was successfully sent.Policy Engine starts the VDMModeEntryTimer.	
<u>46</u>		Policy Engine requests the Device Policy Manager to enter the new Mode. The Policy Engine tells the Protocol Layer to form an Enter <u>Mode</u> Command ACK response.
<u>47</u>		Protocol Layer creates the <i>Enter Mode</i> Command ACK response and passes to Physical Layer. Starts CRCReceiveTimer.

Page **412**

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

<u>Step</u>	DFP	Cable Plug
<u>48</u>	Physical Layer receives the Enter Mode Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Enter Mode Command ACK response.
<u>49</u>	Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.The Protocol Layer forwards the received Enter Mode Command ACK response information to the Policy Engine that consumes it.	
<u>50</u>	The Policy Engine stops the <u>VDMModeEntryTimer</u> and requests the Device Policy Manager to enter the new Mode.	
<u>51</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>52</u>	Physical Layer appends a CRC and sends the GoodCRC message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.
<u>53</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>54</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Enter Mode Command ACK response was successfully sent.
	DPF and UFP are operating in the new Mode	

8.3.2.9.7 DFP to Cable Plug Exit Mode

This is an example of message sequence between a DFP and a Cable Plug both utilizing the Type-C connector.

Figure 8-29 shows an example sequence between a Type-C DFP and a Cable Plug, where the DFP commands the Cable Plug to exit an active Mode.

USB Power Delivery Specification Revision <u>42</u>.0<u>. Version 1.0</u>

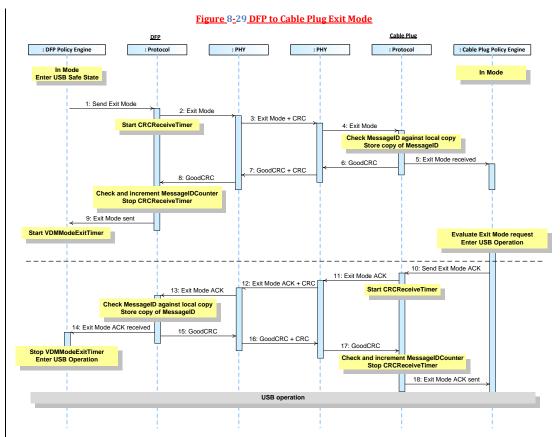

Table 8-28 below provides a detailed explanation of what happens at each labeled step in Figure 8-29 above.

<u>Step</u>	DFP	Cable Plug
1	The DFP is in a Mode and then enters USB Safe State. The Policy Engine directs the Protocol Layer to send a <i>Exit Mode</i> Command request.	The Cable Plug is in a Mode.
2	Protocol Layer creates the <i>Exit Mode</i> Command request and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
<u>3</u>	Physical Layer appends CRC and sends the <i>Exit</i> Mode Command request.	Physical Layer receives the <i>Exit Mode</i> Command request and checks the CRC to verify the message.
<u>4</u>		Physical Layer removes the CRC and forwards the Exit Mode Command request to the Protocol Layer.

Table 8-28 Steps for DFP to Cable Plug Exit Mode

Page **414**

USB Power Delivery Specification Revision 2.0, Version 1.0.

<u>Step</u>	DFP	Cable Plug
<u>5</u>		Protocol Layer checks the MessageID in the incoming message is different from the previously stored value and then stores a copy of the new value.
		The Protocol Layer forwards the received <i>Exit</i> <i>Mode</i> Command request information to the Policy Engine that consumes it.
<u>6</u>		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
<u>7</u>	<u>Physical Layer receives the <i>GoodCRC</i> message</u> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the GoodCRC message.
<u>8</u>	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	
<u>9</u>	Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Exit Mode Command request was successfully sent. Policy Engine starts the VDMModeExitTimer.	
<u>10</u>		Policy Engine requests the Device Policy Manager to enter USB operation. The Policy Engine tells the Protocol Layer to form an Exit Mode Command ACK response.
<u>11</u>		Protocol Layer creates the Exit Mode Command ACK response and passes to Physical Layer. Starts CRCReceiveTimer.
<u>12</u>	Physical Layer receives the <i>Exit Mode</i> Command ACK response and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the <i>Exit</i> <i>Mode</i> Command ACK response.
<u>13</u>	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value.	
	The Protocol Layer forwards the received <i>Exit</i> <i>Mode</i> Command ACK response information to the Policy Engine that consumes it.	
<u>14</u>	The Policy Engine stops the VDMModeExitTimer and requests the Device Policy Manager to enter USB Operation.	
<u>15</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
<u>16</u>	Physical Layer appends a CRC and sends the GoodCRC message.	Physical Layer receives <i>GoodCRC</i> message and compares the CRC it calculated with the one sent to verify the message.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

<u>Step</u>	DFP	Cable Plug
<u>17</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>18</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer_Protocol Layer informs the Policy Engine that the Exit Mode Command ACK response was successfully sent.
	Both DFP and Cable Plu	ug are in USB Operation

8.3.2.9.8 UFP to DFP Attention

This is an example of message sequence between a DFP and a UFP both utilizing the Type-C connector.

Figure 8-30 shows an example sequence between a Type-C DFP and a UFP, where the UFP requests attention from the DFP.

Figure 8-30 UFP to DFP Attention

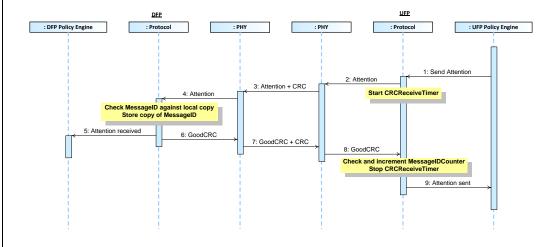

Table 8-29 below provides a detailed explanation of what happens at each labeled step in Figure 8-30 above.

Table 8-29 Steps for UFP to DFP Attention		
<u>Step</u>	DFP	<u>UFP</u>
1		<u>The Device Policy Manager requests attention.</u> <u>The Policy Engine tells the Protocol Layer to</u> <u>form an Attention Command request.</u>
2		Protocol Layer creates the Attention Command request and passes to Physical Layer. Starts CRCReceiveTimer.

Page 416

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

<u>Step</u>	DFP	<u>UFP</u>
3	Physical Layer receives the Attention Command request and compares the CRC it calculated with the one sent to verify the message.	Physical Layer appends a CRC and sends the Attention Command request.
<u>4</u>	Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>Attention</i> Command request information to the Policy Engine that consumes it.	
<u>5</u>	<u>The Policy Engine informs the Device Policy</u> <u>Manager</u>	
<u>6</u>	Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
Z	Physical Layer appends a CRC and sends the GoodCRC_message.	<u>Physical Layer receives <i>GoodCRC</i> message and</u> compares the CRC it calculated with the one sent to verify the message.
<u>8</u>		Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.
<u>9</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Attention Command request was successfully sent.

8.3.2.9.9 Cable Plug to DFP Attention

This is an example of message sequence between a DFP and a Cable Plug both utilizing the Type-C connector.

Figure 8-31 shows an example sequence between a Type-C DFP and a Cable Plug, where the Cable Plug requests attention from the DFP.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

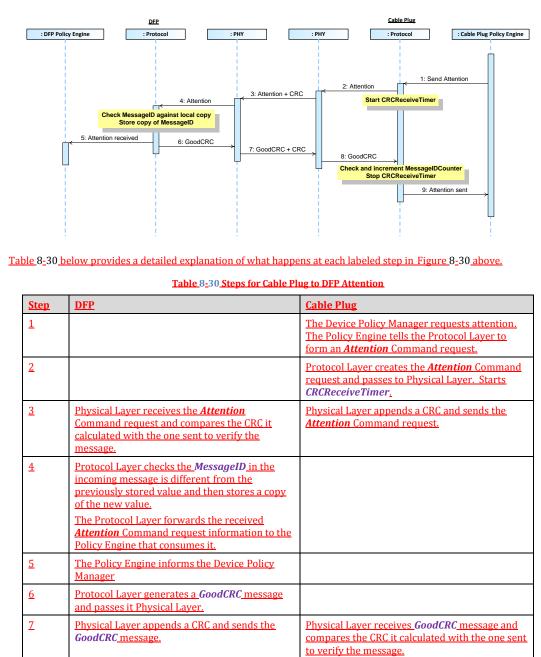

Figure 8-31 Cable Plug to DFP Attention

Page **418**

USB Power Delivery Specification Revision 2.0, Version 1.0.

<u>Step</u>	DFP	Cable Plug
<u>8</u>		Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.
<u>9</u>		Protocol Layer verifies and increments the MessageIDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the Attention Command request was successfully sent.

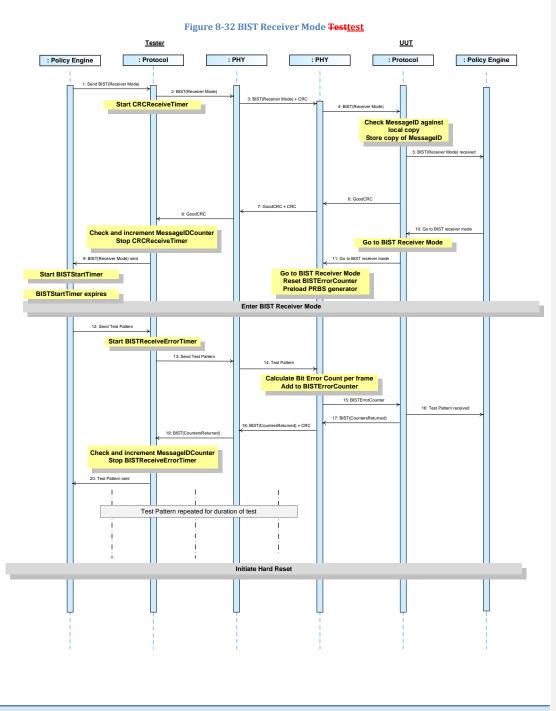

8.3.2.78.3.2.10 Built in Self-Test (BIST)

8.3.2.7.18.3.2.10.1 BIST Receiver Mode

This is an example of a BIST Receiver Mode test between a Tester and a Unit Under Test (UUT).

Figure 8-32 shows the messages as they flow across the bus and within the <u>Devicesdevices</u>. This test verifies that the UUT can receive data with a performance according this specification.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

USB Power Delivery Specification Revision 2.0, Version 1.0.

Page **420**

Table 8-31 Steps for BIST Receiver Mode Test

Step	Tester	UUT
1	The Policy Engine directs the Protocol Layer to generate a <i>BIST</i> message with Data Object <i>BIST Receiver Mode</i> to put the UUT into BIST receiver mode.	
2	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
3	Physical Layer appends CRC and sends the BIST message-over V _{BUS} .	Physical Layer receives the <i>BIST</i> message and compares <u>checks</u> the CRC it calculated with the one sent to verify the message.
4		Physical Layer removes the CRC and forwards the <i>BIST</i> message to the Protocol Layer.
5		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>BIST</i> message information to the Policy Engine that consumes it.
6		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.
7	Physical Layer receives the <i>GoodCRC</i> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.
8	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.	
9	Protocol Layer verifies and increments the MessagelDCounter and stops CRCReceiveTimer. Protocol Layer informs the Policy Engine that the BIST message was successfully sent. The Policy Engine initializes and runs the BISTStartTimer.	
10		Policy Engine tells Protocol Layer to go into Receiver Test Mode. The Protocol Layer goes to BIST receiver mode.
11		Protocol Layer tells Physical Layer to go into <u>BIST</u> Receiver Test Mode. The Physical Layer goes to BIST receiver modeReceiver Mode , resets the <i>BISTErrorCounter</i> and preloads the PRBS generator.
	UUT enters BIST Receiver Test Mode	
12	After the <i>BISTStartTimer</i> has expired the Policy Engine directs the Protocol Layer to generate a packet containing the next Test <u>PatternFrame</u> .	

USB Power Delivery Specification Revision <u>**42</u>**.0, <u>Version 1.0</u></u>

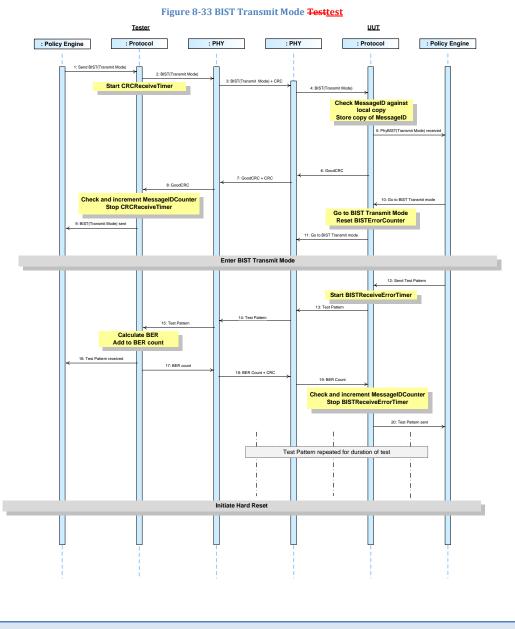

Step	Tester	UUT
13	Protocol Layer creates the message and passes to Physical Layer. Starts <i>BISTReceiveErrorTimer</i> .	
14	Physical Layer does not append a CRC and sends the Test Pattern packet over V _{BUS} Frame.	Physical Layer receives the Test Pattern packet.Frame. The Physical Layer calculates the Bit Error Count for the frameTest Frame and adds this to the BISTErrorCounter.
15		Physical Layer forwards the BISTErrorCounter value to the Protocol Layer.
16		The Protocol Layer informs the Policy Engine that a Test Frame has been received.
17		Protocol Layer generates a <i>BIST</i> message with Data Object of <i>Returned BIST Counters</i> and passes it Physical Layer.
18	Physical Layer receives <i>BIST</i> message and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>BIST</i> BER Count message.
19	Physical Layer removes the CRC and forwards the <i>BIST</i> message to the Protocol Layer.	
20	Protocol Layer verifies and increments the MessageIDCounter and stops BISTReceiveErrorTimer. Protocol Layer informs the Policy Engine that the Test Pattern packetFrame was successfully sent.	
	Steps 1012 to 1820 are repeated until <i>Hard Rese</i> returns to normal operation.	t signaling is generated at which point the UUT

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

Page **422**

This is an example of a BIST <u>TransmitterTransmit</u> Mode test between a Tester and a UUT. Figure 8-33 shows the messages as they flow across the bus and within the <u>Devicesdevices</u>. This test verifies that the UUT transmitter can transmit with sufficient quality (see Section 6.4.3.2).

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

Table 8-32 Steps for BIST TransmitterTransmit Mode Testtest

Step	Tester	UUT	
1	The Policy Engine directs the Protocol Layer to generate a <i>BIST</i> message, with Data Object <i>BIST Transmit Mode</i> , to put the UUT into BIST Transmit Mode.		
2	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .		
3	Physical Layer appends CRC and sends the <i>BIST</i> message over V_{BUS} .	Physical Layer receives the BIST message and compares <u>checks</u> the CRC it calculated with the one sent to verify the message.	
4		Physical Layer removes the CRC and forwards the <i>BIST</i> message to the Protocol Layer.	
5		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>BIST</i>	
		message information to the Policy Engine that consumes it.	
6		Protocol Layer generates a <i>GoodCRC</i> message and passes it Physical Layer.	
7	Physical Layer receives the <i>GoodCRC</i> and checks the CRC to verify the message.	Physical Layer appends CRC and sends the <i>GoodCRC</i> message.	
8	Physical Layer removes the CRC and forwards the <i>GoodCRC</i> message to the Protocol Layer.		
9	Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops <i>CRCReceiveTimer</i> . Protocol Layer informs the Policy Engine that the <i>BIST</i> message was successfully sent.		
10		Policy Engine tells Protocol Layer to go into <u>BIST</u> Transmit Test Mode. The Policy Engine goes to BIST Transmit mode and resets the <i>BISTErrorCounter</i> .	
11		Protocol Layer tells Physical Layer to go into <u>BIST</u> Transmit Test Mode.	
	UUT enters BIST Transmitter Test Transmit Mode		
12		The Policy Engine directs the Protocol Layer to generate a packet containing the next Test Pattern <u>Frame</u> .	
13		Protocol Layer creates the <u>messageTest Frame</u> and passes to Physical Layer. Starts <i>BISTReceiveErrorTimer</i> .	
	Physical Layer receives the Test Pattern	Physical Layer does not append a CRC and sends	

Step	Tester	UUT
15	Physical Layer forwards the Test Pattern packet<u>Frame</u> to the Protocol Layer.	
16	The Protocol Layer forwards the received Test Pattern packet<u>Frame</u> information to the Policy Engine that consumes it.	
17	Protocol Layer generates a <i>BIST</i> BER Count message <u>with Data Object of</u> <i>Returned BIST</i> <i>Counters</i> and passes it Physical Layer.	
18	Physical Layer appends CRC and sends the BISTBER Count message.	Physical Layer receives the <i>BIST</i> message and checks the CRC to verify the <i>BIST</i> message.
19		Physical Layer removes the CRC and forwards the <i>BIST</i> BER Count message to the Protocol Layer.
20		Protocol Layer verifies and increments the <i>MessageIDCounter</i> and stops <i>BISTReceiveErrorTimer</i> . Protocol Layer informs the Policy Engine that the Test Pattern packetFrame was successfully sent.
	Steps <u>1012</u> to <u>1820</u> are repeated until <i>Hard Reset</i> signaling is generated at which point the UUT returns to normal operation.	

8.3.2.7.38.3.2.10.3 **BIST Test Patterns**

In addition to the BIST transmit and receive test frames Test Frames there are various test patterns Test Patterns which the UUT can be made to send continuously in order to perform measurements on the transmission spectrum, eye pattern etc. (see Section 5.9.1). The following is an example of a *BIST Eye Pattern* test between a Tester and a UUT but the sequence applies equally to other continuous test patterns. Test Patterns. When the UUT is connected to the Tester the sequence below is executed.

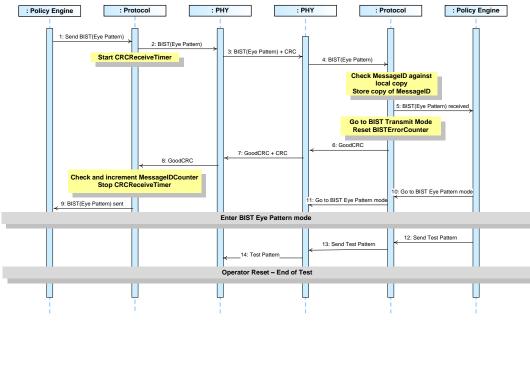

Figure 8-34 shows the messages as they flow across the bus and within the **Devices** devices. This test verifies the eye pattern and the spectrum of the transmitted signal.

- 1) Connection is established and stable.
- 2) Tester sends a BIST message with a BIST Eye Pattern Data Object.
- 3) UUT answers with a *GoodCRC* message.
- UUT starts sending the test pattern Test Pattern. 4)
- 5) Operator does the measurements.
- 6) Operator restarts the UUT. Note: that the method of operator restart for the UUT is outside the scope of this specification. This is assumed to be some mechanism whereby the operator restores the UUT to normal PD operation.

Figure 8-34 BIST Eye Pattern Test

Refer to Sections 6.4.3.4 through 6.4.3.8.

Tester : PHY : PHY

UUT

Table 8-33 Steps for BIST Eye Pattern Test

Step	Tester	UUT
1	The Policy Engine directs the Protocol Layer to generate a <i>BIST</i> message, with Data Object <i>BIST</i> <i>Eye Pattern</i> , to put the UUT into BIST Carrier Purity Mode 1.Eye Pattern Test.	
2	Protocol Layer creates the message and passes to Physical Layer. Starts <i>CRCReceiveTimer</i> .	
3	Physical Layer appends CRC and sends the BIST message over V _{BUS} .	Physical Layer receives the BIST message and compares <u>checks</u> the CRC it calculated with the one sent-to verify the message.
4		Physical Layer removes the CRC and forwards the <i>BIST</i> message to the Protocol Layer.
5		Protocol Layer checks the <i>MessageID</i> in the incoming message is different from the previously stored value and then stores a copy of the new value. The Protocol Layer forwards the received <i>BIST</i> message information to the Policy Engine that consumes it.
6		Protocol Layer generates a GoodCRCPolicy Engine tells Protocol Layer to go into BIST Eye Pattern Test Mode. The Policy Engine goes to BIST Eye Pattern Test Mode. message and passes it Physical Layer.
7	Physical Layer receives the <i>GoodCRC</i> and checks the CRC to verify the message.	Protocol Layer tells Physical Layer <u>appends CRC</u> and sends the <i>GoodCRC</i> to go into BIST Eye Pattern Test Mode message.
8	Physical Layer removes the CRC and forwards the GoodCRC message to the Protocol Layer.	Protocol Layer generates a message and passes it Physical Layer.
9	PhysicalProtocol Layer receives verifies and increments the MessageIDCounter and stops CRCReceiveTimerchecks, Protocol Layer informs the CRC to verifyPolicy Engine that the BIST message, was successfully sent.	Physical Layer appends CRC and sends the message.
10	Physical Layer removes the CRC and forwards the message to the Protocol Layer.	Policy Engine tells Protocol Layer to go into BIST Eye Pattern Test Mode. The Policy Engine goes to BIST Eye Pattern Test Mode.
11	Protocol Layer verifies and increments the and stops - Protocol Layer informs the Policy Engine that the message was successfully sent.	Protocol Layer tells Physical Layer to go into BIST Eye Pattern Test Mode.
	UUT enters BIST Eye Pattern Test Mode	
12		The Policy Engine directs the Protocol Layer to start generation of the Test Pattern.
13		Protocol Layer directs the PHY Layer to generate the test patternTest Pattern.

USB Power Delivery Specification Revision <u>**42</u>**.0, <u>Version 1.0</u></u>

Step	Tester	UUT
14	Physical Layer receives the Test Pattern stream.	Physical Layer generates a continuous test pattern<u>Test Pattern</u> stream over V_{BUS}.
	Operator reset of UUT terminates the test	

8.3.3 State Diagrams

8.3.3.1 Introduction to state diagrams used in Chapter 8

The state diagrams defined in Section 8.3.3 are normative and shall define the operation of the Power Delivery Policy Engine. <u>Note that these state diagrams are not intended to replace a well written and robust design.</u>

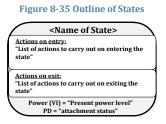

Figure 8-35 shows an outline of the states defined in the following sections. At the top there is the name of the state. This is followed by "Actions on entry" a list of actions carried out on entering the state. If there are also "Actions on exit" a list of actions carried out on exiting the state then these are listed as well; otherwise this box is omitted from the state. At the bottom the status of PD is listed:

- "Power" which indicates the present output power for a Source Port or input power for a Sink Port.
- "PD" which indicates the present attachment status either "attached", "unattached", or "unknown".

Transitions from one state to another are indicated by arrows with the conditions listed on the arrow. Where there are multiple conditions these are connected using either a logical OR "|" or a logical AND "&".

In some cases there are transitions which can occur from any state to a particular state. These are indicated by an arrow which is unconnected to a state at one end, but with the other end (the point) connected to the final state.

In some state diagrams it is necessary to enter or exit from states in other diagrams (e.g. Source Port or Sink Port state diagrams). Figure 8-36 indicates how such references are made. The reference is indicated with a hatched box. The box contains the name of the state and whether the state is in the Source or Sink Port state diagrams. <u>DFP or UFP</u>. It has also been necessary to indicate conditional entry to either Source Port or Sink Port state diagrams. This is achieved by the use of a bulleted list indicating the pre-conditions (see example in Figure 8-37). It is also possible that the entry and return states are the same. Figure 8-38)-indicates a state reference where each referenced state corresponds to either the entry state or the exit state.

Figure 8-36 References to states

Page 428

USB Power Delivery Specification Revision 2.0, Version 1.0.

Figure 8-37 Example of state reference with conditions

Figure 8-38 Example of state reference with the same entry and exit

Timers are included in many of the states. Timers are initialized (set to their starting condition) and run (timer is counting) in the particular state it is referenced. As soon as the state is exited then the timer is no longer active. Where the timers continue to run outside of the state (such as the *NoResponseTimer*), this is called out in the text. Timeouts of the timers are listed as conditions on state transitions.

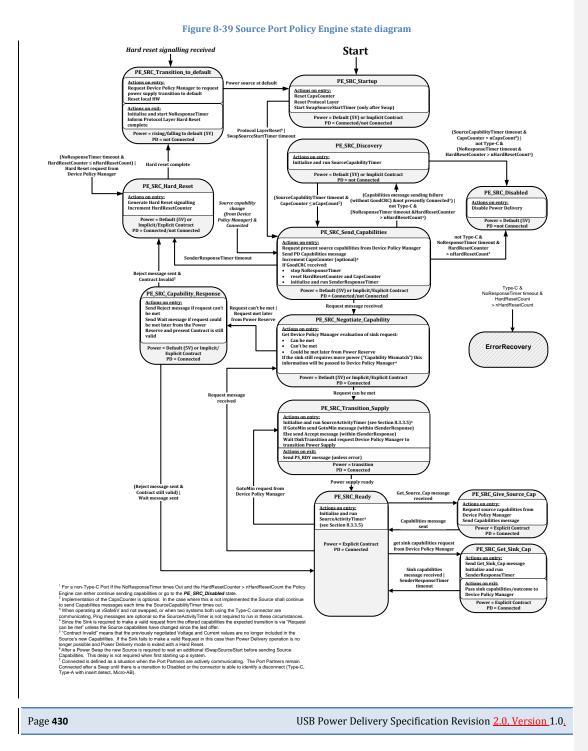

Conditions listed on state transitions will come from one of three sources and, when there is a conflict, should be serviced in the following order:

- 1. Message and related indications passed up to the Policy Engine from the Protocol Layer (message sent, message received etc.)
- 2. Events triggered within the Policy Engine e.g. timer timeouts.
- 3. Information and requests coming from the Device Policy manager relating either to Local Policy, or to other modules which the Device Policy Manager controls such as <u>Power Supplypower supply</u> and Cable Detection.

Note: The following state diagrams are not intended to cover all possible corner cases that may be encountered. For example where an outgoing message is discarded, due to an incoming message by the Protocol Layer (see Section 6.8.2.2) it will be necessary for the higher layers of the system to handle a retry of the message sequence that was being initiated, after first handling the incoming message.

8.3.3.2 Policy Engine Source Port State Diagram

Figure 8-39 below shows the state diagram for the Policy Engine in a Source Port. The following sections describe operation in each of the states.

8.3.3.2.1 <u>PE_SRC_Startup_state</u>

<u>PE SRC StartupStartup</u> shall be the starting state for a Source Policy Engine either on power up or after a Hard Reset. On entry to this state the Policy Engine shall reset the *CapsCounter* Protocol Layer and reset the <u>Protocol Layer</u>. Note that resetting the Protocol Layer will also reset the *MessageIDCounter* and stored *MessageID* (see Section 6.8.2.3).

Once the reset has completed the The Policy Engine shall transition to the <u>PE SRC Send Capabilities</u> Send Capabilities State:

- When the Protocol Layer reset has completed if the *PE_SRC_Startup* state was entered due to the system first starting <u>up.</u>
- When the *SwapSourceStartTimer* times out if the *PE SRC Startup* state was entered as the result of a Power Role
 Swap.

Note: Providers or Provider/Consumers with an insertion detection mechanism (<u>Type-C.</u>Standard-<u>AAn</u> insertion detect or Micro-A ID pin <u>or Attach Detection Protocol see [USBOTG2.0]</u>) and without an A-a plug attached mayshall remain in the <u>PE SRC StartupStartup</u> state, without sending any <u>Source Capabilities</u> messages until an A-a plug is attached.

8.3.3.2.2 <u>PE_SRC_Discovery_state</u>

On entry to the <u>PE SRC Discovery Discovery</u> state the Policy Engine shall initialize and run the SourceCapabilityTimer in order to trigger sending a Source Capabilities message.

The Policy Engine shall transition to the <u>PE SRC Send Capabilities</u> state when:

- The SourceCapabilityTimer times out and CapsCounter ≤ nCapsCount.
- The Policy Engine may optionally go to the <u>**PE SRC Disabled</u> Disabled** state when:</u>
- <u>The This is not a Type-C Port.</u>
- <u>And the SourceCapabilityTimer times out and CapsCounter > nCapsCount.</u>
- Or the *NoResponseTimer* times out and the *HardResetCounter* > *nHardResetCount*. Note in this case the
 attached device is assumed to be unresponsive. The Policy Engine operates as if the device is unattached until
 such time as a detach/reattach is detected.

The Policy Engine shall go to the *ErrorRecovery* state when:

- This is a Type-C Port.
- And the NoResponse Timer times out.
- <u>And the HardResetCounter > nHardResetCount.</u>

8.3.3.2.3 PE_SRC_Send_Capabilities_state

A capabilities change event from the Device Policy Manager while in any state when connected shall trigger the Policy Engine to enter the <u>PE SRC Send Capabilities</u> state. There is also a transition from the <u>PE SRC Soft Reset</u> state.

On entry to the <u>PE SRC Send Capabilities</u>Send Capabilities state the Policy Engine shall request the present <u>portPort</u> capabilities from the Device Policy Manager. The Policy Engine shall then request the Protocol Layer to send a Source Capabilities message containing these capabilities and increment the CapsCounter (if implemented).

If a *GoodCRC* message is received then the Policy Engine shall:

- stopStop the NoResponseTimer.
 - reset<u>Reset</u> the HardResetCounter and CapsCounter to zero. Note that the HardResetCounter shall only be
- resetset to zero in this state and at power up; its value shall be maintained during a Hard Reset.
- <u>initializeInitialize</u> and run the *SenderResponseTimer*.

Once a *Source Capabilities* message has been received and acknowledged by a *GoodCRC* message, the Sink is required to then send a *Request* message within *tSenderResponse*.

USB Power Delivery Specification Revision 42.0, Version 1.0

Page 431

The Policy Engine shall transition to the <u>**PE SRC Discovery**</u> state when:

• The Protocol Layer indicates that the message has not been sent and we are presently not connected. This is part of the Capabilities sending process whereby successful message sending indicates connection to a PD Sink Port.

The Policy Engine shall transition to the <u>**PE SRC Hard Reset</u>Hard Reset</u> state when:</u>**

The SenderResponseTimer times out. In this case a transition back to default powerUSB Default Operation is required.

When:

• This is not a Type-C Port

- And the NoResponseTimer times out and
- And the HardResetCounter > nHardResetCount the

The Policy Engine shall do one of the following:

- Transition to the <u>PE_SRC_DiscoveryDiscoveryState_state</u>.
- Transition to the <u>**PE SRC Disabled</u> Disabled</u> state.</u>**

Note that in either case the attached device is assumed to be unresponsive. The Policy Engine should operate as if the device is unattached until such time as a detach/reattach is detected.

The Policy Engine shall go to the *ErrorRecovery* state when:

• This is a Type-C Port.

• And the NoResponseTimer times out.

<u>And the HardResetCounter > nHardResetCount.</u>

8.3.3.2.4 PE SRC_Negotiate_Capability_state

On entry to the <u>PE SRC Negotiate Capability</u>Negotiate Capability state the Policy Engine shall ask the Device Policy Manager to evaluate the Request from the attached Sink. The response from the Device Policy Manager shall be one of the following:

- The Request can be met.
- The Request cannot be met
- The Request could be met later from the <u>reservePower Reserve</u>.

The Policy Engine shall transition to the <u>PE SRC Transition Supply Transition Supply</u> state when:

The Request can be met.

The Policy Engine shall transition to the <u>PE SRC Capability Response</u> state when:

- The Request cannot be met.
- Or the Request can be met later from the <u>reservePower Reserve</u>.

8.3.3.2.5 <u>PE_SRC_</u>Transition_Supply_state

The Policy Engine shall be in the <u>PE SRC Transition Supply</u>Transition Supply state while the <u>Power Supplypower</u> supply is transitioning from one power to another.

On entry to the <u>PE SRC Transition SupplyTransition Supply</u> state, the Policy Engine shall initialize and run the SourceActivityTimer (see Section 8.3.3.6 for details of *Ping* messaging for Source Ports), request the Protocol Layer to either send a *GotoMin* message (if this was requested by the Device Policy Manager) or otherwise an Accept message, wait for tSnkTransition, and inform the Device Policy Manager that it shall transition the Power <u>Supplypower supply</u> to the Requested value of power <u>level</u>. Note: that if the <u>Power Supplypower supply</u> is currently operating at the requested power no change will be necessary.

On exit from the <u>PE SRC Transition Supply</u> Transition Supply</u> state the Policy Engine shall request the Protocol Layer to send a <u>PS_RDY</u> message.

Page 432

USB Power Delivery Specification Revision 2.0, Version 1.0.

The Policy Engine shall transition to the <u>**PE SRC Ready**</u> state when:

• The Device Policy Manager informs the Policy Engine that the Power Supplypower supply is ready.

8.3.3.2.6 PE SRC Ready state

In the <u>PE SRC ReadyReady</u> state the PD Source shall operating at a stable power with no ongoing negotiation. It shall respond to requests from the Sink, events from the Device Policy Manager and shall send out <u>Ping</u> messages to maintain the PD link <u>if required (see Section 6.3.5–)</u>.

On entry to the <u>PE SRC Ready</u> state the Policy Engine shall initialize and run the <u>SourceActivityTimer</u> (see Section 8.3.3.6 for details of <u>Ping</u> messaging for Source Ports).

The Policy Engine shall transition to the <u>**PE SRC Transition Supply**</u> Transition supply</u> state when:

 A GoToMinGotoMin request is received from the Device Policy Manager for the attached Device to go to minimum power.

The Policy Engine shall transition to the <u>PE SRC Give Source Cap</u>Give Source Cap state when:

• A *Get_Source_Cap* message is received from the Sink.

The Policy Engine shall transition to the <u>PE SRC Get Sink CapGet Sink Cap state when:</u>

The Device Policy Manager asks for the Sink's capabilities.

8.3.3.2.7 PE SRC Disabled state

In the <u>**PE SRC Disabled Disabled</u>** state the PD Source supplies default power and is unresponsive to USB Power Delivery messaging, but not to *Hard Reset* signallingsignaling.</u>

8.3.3.2.8 <u>PE_SRC_</u>Capability_Response_<u>state</u>

The Policy Engine shall enter the <u>**PE SRC Capability Response Capability Response</u> state if there is a Request received from the Sink that cannot be met based on the present capabilities. When the currentpresent Contract is not within the present capabilities it is regarded as Invalid and a Hard Reset will be triggered.</u>**

On entry to the <u>PE SRC Capability Response</u>Capability Response state the Policy Engine shall request the Protocol Layer to send one of the following:

- Reject message if the request cannot be met or the present Contract is Invalid.
- *Wait* message if the request could be met later from the <u>reserve.Power Reserve.</u> A *Wait* message shall not be sent if the present Contract is Invalid.

The Policy Engine shall transition to the <u>**PE SRC Ready</u>Ready** state when:</u>

- A Reject message has been sent and the present Contract is still valid or
- A *Wait* message has been sent.

The Policy Engine shall transition to the <u>PE SRC Hard Reset</u> state when:

The *Reject* message has been sent and the present Contract is Invalid (i.e. the Sink had to request a new value so
instead we will return to default operation_USB Default Operation).

Note: The Policy Engine of a Consumer/Provider, acting as the Source, transitions to the <u>PE_SNK_Hard_ResetHard</u> <u>Reset (Sink Port)</u> state as described in the Section 8.3.3.6.1.4.

8.3.3.2.9 PE_SRC_Hard_Reset_state

The Policy Engine shall transition from any state to the <u>**PE_SRC_Hard_Reset**</u> state when

- The NoResponseTimer times out and the HardResetCounter ≤ nHardResetCount or
- The Device Policy Manager requests a Hard Reset.

On entry to the <u>PE SRC Hard Reset</u>Hard Reset state the Policy Engine shall request the generation of Hard Reset signaling by the PHY Layer and increment the HardResetCounter. Note that the shall continue to run in every state until it is stopped or times out.

The Policy Engine shall transition to the Transition to default state when:

The Hard Reset is complete.

1.2.11.2.1 Transition to default

The Policy Engine shall transition from any state to the Transition to default state when:

• signaling is detected.

On entry to the *Transition to default* state the Policy Engine shall indicate to the Device Policy Manager that the Power Supply shall transition to default (5V). The Policy Engine shall then request a reset of the local hardware.

On exit from the *Transition to default* state the Policy Engine shall initialize and run the and inform the Protocol Layer that the Hard Reset is complete. Note that the *NoResponseTimer* shall continue to run in every state until it is stopped or times out.

The Policy Engine shall transition to the <u>**PE SRC Transition to default**</u> state when:

• The Hard Reset is complete.

8.3.3.2.10 PE SRC Transition to default state

The Policy Engine shall transition from any state to the **PE SRC Transition to default** state when:

• Hard Reset signaling is detected.

On entry to the **PE SRC Transition to default** state the Policy Engine shall indicate to the Device Policy Manager that the power supply shall transition to default (*vSafe5V*). The Policy Engine shall then request a reset of the local hardware.

On exit from the **PE SRC Transition to default** state the Policy Engine shall initialize and run the **NoResponseTimer** and inform the Protocol Layer that the Hard Reset is complete. Note that the **NoResponseTimer** shall continue to run in every state until it is stopped or times out.

The Policy Engine shall transition to the PE SRC Startup state when:

• The Device Policy Manager indicates that the Power Supplypower supply has reached the default level.

8.3.3.2.108.3.3.2.11 PE SRC Give Source Cap state

On entry to the <u>PE SRC Give Source Cap</u>Give Source Cap state the Policy Engine shall request the Device Policy Manager for the current system capabilities. The Policy Engine shall then request the Protocol Layer to send a *Source Capabilities* message containing these capabilities.

The Policy Engine shall transition to the <u>**PE SRC Ready**</u> state when:

The Source Capabilities message has been successfully sent.

8.3.3.2.118.3.3.2.12 PE SRC Get Sink Cap state

In this state the Policy Engine, due to a request from the Device Policy Manager, shall request the capabilities from the attached Sink.

On entry to the <u>PE SRC Get Sink CapGet Sink Cap</u> state the Policy Engine shall request the Protocol Layer to send a Get_Sink_Cap message in order to retrieve the Sink's capabilities. The Policy Engine shall then start the SenderResponseTimer.

On exit from the <u>PE SRC Get Sink CapGet Sink Cap</u> state the Policy Engine shall inform the Device Policy Manager of the outcome (capabilities or response timeout).

Page 434

The Policy Engine shall transition to the <u>**PE SRC Ready</u>** state when:</u>

- A *Sink Capabilities* message is received.
- Or *SenderResponseTimer* times out.

8.3.3.3 Policy Engine Sink Port State Diagram

Figure 8-40 below shows the state diagram for the Policy Engine in a Sink Port. The following sections describe operation in each of the states.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

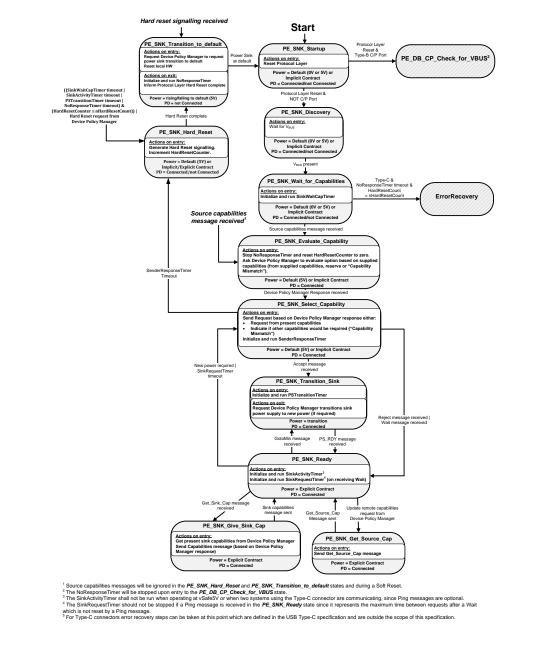

Figure 8-40 Sink Port state diagram

USB Power Delivery Specification Revision 2.0, Version 1.0.

8.3.3.3.1 PE SNK Startup state

<u>PE SNK Startup</u> shall be the starting state for a Sink Policy Engine either on power up or after a Hard Reset. On entry to this state the Policy Engine shall reset the Protocol Layer. Note that resetting the Protocol Layer will also reset the *MessageIDCounter* and stored *MessageID* (see Section 6.8.2.3).

Once the reset process completes, the Policy Engine shall transition to the <u>PE SNK Discovery Discovery</u> state for a Consumer only and to the <u>PE DB CP Check for VBUSCheck for VBUS</u> state for a <u>Type-B</u> Consumer/Provider (see Section).

1.2.11.2.2 Discovery

8.3.3.3.2 In the PE_SNK_Discovery_state

In the **PE_SNK_Discovery** state the Sink Policy Engine waits for V_{BUS} to be present.

The Policy Engine shall transition to the <u>PE SNK Wait for Capabilities</u>Wait for Capabilities state when:

• The Device Policy Manager indicates that V_{BUS} has been detected.

8.3.3.3.28.3.3.3.3 PE SNK Wait_for_Capabilities_state

On entry to the <u>PE SNK Wait for Capabilities</u> Wait for capabilities state the Policy Engine shall initialize and start the SinkWaitCapTimer.

The Policy Engine shall transition to the **<u>PE_SNK_Evaluate_Capability</u>Evaluate Capability** state when:

Source capabilities are received.

The Policy Engine shall transition to the ErrorRecovery state when:

- This is a Type-C connector and
- There has been a NoResponseTimer timeout and
- <u>The HardResetCounter > nHardResetCount.</u>

When the SinkWaitCapTimer times out, the Policy Engine will perform a Hard Reset.

8.3.3.3.388.3.3.3.4 PE_SNK_Evaluate_Capability_state

Whenever the Policy Engine receives a *Source Capabilities* message (except in the <u>PE SNK Hard ResetHard Reset</u> and <u>PE SNK Transition to default</u> transition to Default states or during a Soft Reset) it shall transition to the <u>PE SNK Evaluate Capability</u> state. At this point the Sink knows that it is attached to and communicating with a PD capable Source.

On entry to the <u>PE SNK Evaluate Capability Evaluate Capability</u> state the Policy Engine shall request the Device Policy Manager to evaluate the supplied Source capabilities based on Local Policy. The Device Policy Manager shall indicate to the Policy Engine which new power level is required:

- A selection from the present offered capabilities is to be made.
- Capability mismatch; offered power does not meet the device's requirements.

The Policy Engine shall transition to the <u>PE SNK Select CapabilitySelect Capability</u> state when:

A response is received from the Device Policy Manager.

8.3.3.3.48.3.3.3.5 PE SNK Select Capability state

On entry to the <u>PE SNK Select CapabilitySelect Capability</u> state the Policy Engine shall request the Protocol Layer to send a response message, based on the evaluation from the Device Policy Manager. The message shall be on e of the following:

• A Request from the offered Source Capabilities.

USB Power Delivery Specification Revision <u>42</u>.0, Version 1.0

• A Request from the offered Source Capabilities with an indication that another power level would be preferred ("Capability Mismatch" bit set).

The Policy Engine shall initialize and run the SenderResponseTimer.

The Policy Engine shall transition to the <u>PE SNK Transition Sink</u> state when:

• An Accept message is received from the Source.

The Policy Engine shall transition to the <u>PE SNK Ready</u> state when:

- A *Reject* message is received from the Source.
- A *Wait* message is received from the Source.

The Policy Engine shall transition to the <u>PE SNK Hard Reset</u> state when:

<u>A</u> SenderResponse Timer timeout occurs.

Note: The Policy Engine of the Provider/Consumer, acting as the Sink, transitions to the <u>PE SRC Hard Reset</u>Hard Reset (Source Port) state as described in the Section 8.3.3.6.1.3.

8.3.3.3.58.3.3.3.6 PE SNK Transition Sink state

On entry to the <u>PE SNK Transition Sink</u>Transition Sink state the Policy Engine shall initialize and run the **PSTransitionTimer** (timeout will lead to a Hard Reset see Section 8.3.3.3.8 and shall then request the Device Policy Manager to transition the Sink's <u>Power Supplypower supply</u> to the new power level. Note that if there is no power level change the Device Policy Manager should not affect any change to the <u>Power Supplypower supply</u>.

On exit from the <u>PE SNK Transition Sink</u> Transition Sink state the Policy Engine shall request the Device Policy Manager to transition the Sink's <u>Power Supplypower supply</u> to the new power level.

The Policy Engine shall transition to the <u>**PE SNK Ready</u>Ready** state when:</u>

• A **PS_RDY** message is received from the Source.

8.3.3.3.68.3.3.3.7 PE SNK Ready state

In the <u>PE SNK ReadyReady</u> state the PD Sink shall be operating at a stable power level with no ongoing negotiation. It shall respond to requests from the Source, events from the Device Policy Manager and may monitor for <u>Ping</u> messages to maintain the PD link.

On entry to the **<u>PE SNK Ready</u>** state as the result of a wait the Policy Engine should do the following:

Initialize and run the SinkRequestTimer.

On entry to the <u>**PE SNK Ready**</u> state the Policy Engine shall do the following:

- Initialize and run the SinkActivityTimer (except if in default operation see Section 6.5.4.2), for exceptions).
- The Policy Engine shall transition to the <u>PE SNK Select Capability</u> state when:
- A new power level is requested by the Device Policy Manager.
- A *SinkRequestTimer* timeout occurs.

The Policy Engine shall transition to the **<u>PE SNK_Transition Sink</u>** state when:

A GotoMin message is received.

The Policy Engine shall transition to the <u>**PE_SNK_Hard_Reset**</u> state when:

• A *SinkActivityTimer* timeout occurs.

The Policy Engine shall transition back to the **<u>PE_SNK_ReadyReady</u>** state when:

A Ping message is received. Note this should not cause the SinkRequestTimer to be reinitialized.

Page 438

The Policy Engine shall transition to the <u>PE SNK Give Sink CapGive Sink Cap</u> state when:

- A *Get_Sink_Cap* message is received from the Protocol Layer.
- The Policy Engine shall transition to the <u>**PE SNK Get Source Cap**Get Source Cap</u> state when:
- The Device Policy Manager requests an update of the remote Source's capabilities.

8.3.3.3.78.3.3.3.8 PE SNK Hard Reset state

The Policy Engine shall transition to the <u>PE SNK Hard ResetHard Reset</u> state from any state when:

- ((SinkWaitCapTimer timeout |
- SinkActivityTimer timeout
- PSTransitionTimer timeout |
- NoResponseTimer timeout) &
- (HardResetCounter ≤ nHardResetCount)) |
- Hard Reset request from Device Policy Manager

Note: if the *NoResponseTimer* times out and the *HardResetCounter* is greater than *nHardResetCount* the Sink shall assume that the Source is non-responsive.

Note: The *nHardResetCount* is reset on a power cycle or detach.

On entry to the <u>PE SNK Hard ResetHard Reset</u> state the Policy Engine shall request the generation of Hard Reset signaling by the PHY <u>Layer</u> and increment the HardResetCounter.

The Policy Engine shall transition to the <u>**PE SNK Transition to default</u> Transition to default</u> state when:</u>**

• The Hard Reset is complete.

8.3.3.3.888.3.3.3.9 PE_SNK_Transition_to_default_state

The Policy Engine shall transition from any state to <u>PE SNK Transition to default</u>Transition to default state when:

• *Hard Reset* signaling is detected.

When *Hard Reset* signaling is detected or message sending in the Protocol Layer fails after retries (i.e. a *GoodCRC* message is not received) then the Policy Engine shall transition from any state to
<u>PE SNK Transition to defaultTransition to default</u>. This state can also be entered from the
<u>PE SNK Hard ResetHard Reset</u> state.

On entry to the <u>**PE SNK Transition to default Transition to default</u> state the Policy Engine shall indicate to the Device Policy Manager that the Sink shall transition to default. The Policy Engine shall then request a reset of the local hardware.</u>**

On exit from the <u>PE SNK Transition to defaultTransition to default</u> state the Policy Engine shall initialize and run the *NoResponseTimer* and inform the Protocol Layer that the Hard Reset is complete. Note that the *NoResponseTimer* shall continue to run in every state until it is stopped or times out.

The Policy Engine shall transition to the <u>PE SNK Startup</u>Startup state when:

• The Device Policy Manager indicates that the Sink has reached the default level.

8.3.3.3.98.3.3.3.10 PE SNK_Give_Sink_Cap_state

On entry to the <u>PE SNK Give Sink CapGive Sink Cap</u> state the Policy Engine shall request the Device Policy Manager for the current system capabilities. The Policy Engine shall then request the Protocol Layer to send a *Sink Capabilities* message containing these capabilities.

The Policy Engine shall transition to the **<u>PE SNK Ready</u>Ready** state when:

<u>The Sink Capabilities message has been successfully sent.</u>

USB Power Delivery Specification Revision <u>42.0, Version 1.0</u>

The message has been successfully sent.

8.3.3.3.108.3.3.11 PE SNK Get_Source_Cap_state

In this the *PE SNK Get Source Cap* state the Policy Engine, due to a request from the Device Policy Manager, shall request the capabilities from the attached Source.

On entry to the <u>PE SNK Get Source CapGet Source Cap</u> state the Policy Engine shall request the Protocol Layer to send a Get_Source_Cap message in order to retrieve the Source's capabilities.

The Policy Engine shall transition to the <u>**PE SNK Ready</u>** state when:</u>

• The Get_Source_Cap message is sent.

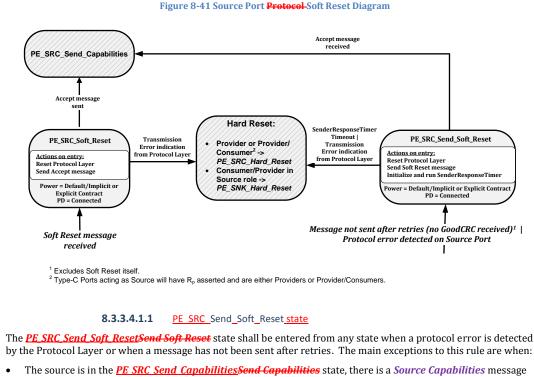

8.3.3.4 Soft Reset State Diagrams

8.3.3.4.1 Source Port Soft Reset State Diagram

8.3.3.41.1.1.1 Soft Reset State Disgrams

8.3.3.4.11.1.1.1.1.1 Source Port Soft Reset State Diagram

Figure 8-41 below shows the state diagram for the Policy Engine in a Source Port when performing a Soft Reset. The following sections describe operation in each of the states.

The source is in the <u>PE SRC Send Capabilities</u>Send Capabilities state, there is a Source Capabilities message sending failure (without GoodCRC) and the source is not presently attached (as indicated in Figure 8-39). In this case, the <u>PE SRC Discovery</u> Discovery state is entered (see Section 8.3.3.2.3).

Page 440

USB Power Delivery Specification Revision 2.0, Version 1.0.

Field Code Changed

- During a <u>Power Role</u> Swap when the power supply is in transition (see <u>SectionSections</u> 8.3.3.6.3.1<u>and</u> 8.3.3.6.3.2). In this case a hard reset will be triggered directly.
- During a Data Role Swap when the DFP/UFP roles are changing. In this case Type-C error recovery will be triggered directly.

Note that there are corner cases that are not shown in the defined state diagrams that could be handled without generating a protocol error.

On entry to the <u>PE SRC Send Soft ResetSend Soft Reset</u> state the Policy Engine shall request the Protocol Layer to perform a Soft Reset, then shall send a *Soft Reset* message to the Sink, and initialize and run the *SenderResponseTimer*.

The Policy Engine shall transition to the <u>PE SRC Send Capabilities</u>Send Capabilities (Source) state when:

• An Accept message has been received.

The Policy Engine shall transition to the <u>PE SRC Hard ResetHard Reset</u> or <u>PE SNK Hard Reset</u> state <u>depending on</u> <u>its default role as either a Source or Sink Port (see Section 6.7.2when:) when:</u>

- A SenderResponseTimer timeout occurs.
- Or the Protocol Layer indicates that a transmission error has occurred.

The decision as to whether to go to <u>PE SRC Hard ResetHard Reset (Source)</u> or <u>PE SNK Hard ResetHard Reset</u> (Sink) shall depend on the type of device:

- The Source portPort in a Provider or Provider/Consumer shall go to <u>PE SRC Hard Reset (Source).</u>
- The Source portPort in a Consumer/Provider shall go to <u>PE SNK Hard ResetHard Reset (Sink)</u> i.e. revert to default operation<u>USB Default Operation</u> as Sink Port.

1.2.11.2.2.1 PE SRC Soft-Reset

8.3.3.4.1.2 The Soft_Reset state

The *PE SRC Soft Reset* state shall be entered from any state when a *Soft Reset* message is received from the Protocol Layer.

On entry to the <u>PE SRC Soft Reset</u>Soft Reset state the Policy Engine shall reset the Protocol Layer and shall then request the Protocol Layer to send an *Accept* message.

The Policy Engine shall transition to the <u>**PE SRC Send CapabilitiesSend Capabilities** state for a Source Port (see Section 8.3.3.2.3) when:</u>

• The Accept message has been sent.

The Policy Engine shall transition to the <u>PE SRC Hard ResetHard Reset or PE SNK Hard Reset</u> state <u>depending on</u> <u>its default role as either a Source or Sink Port (see Section 6.7.2)</u> when:

• The Protocol Layer indicates that a transmission error has occured occurred.

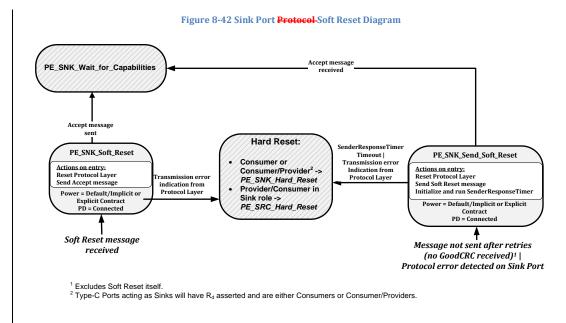

The decision as to whether to go to <u>PE SRC Hard Reset Hard Reset (Source) or Hard Reset (Sink) or</u> <u>PE SNK Hard Reset</u> shall depend on the type of device:

- The Source portPort in a Provider or Provider/Consumer shall go to <u>PE SRC Hard Reset Hard Reset (Source).</u>
 The Source portPort in a Consumer/Provider shall go to <u>PE SNK Hard Reset Hard Reset (Sink)</u> i.e. revert to
- default operation USB Default Operation as Sink Port.

8.3.3.4.2 Sink Port-Protocol Soft Reset State Diagram

Figure 8-42 below shows the state diagram for the Policy Engine in a Sink Port when performing a Soft Reset. The following sections describe operation in each of the states.

USB Power Delivery Specification Revision <u>42.0, Version 1.0</u>

8.3.3.4.2.1 PE SNK_Send_Soft_Reset_state

The <u>PE SNK Send Soft ResetSend Soft Reset</u> state shall be entered from any state when a protocol error is detected by the Protocol Layer or when a message has not been sent after retries. <u>An exceptionThe main exceptions</u> to this rule is duringare when:

- <u>During a Power Role</u> Swap when the power supply is in transition (see <u>SectionSections</u> 8.3.3.6.3.1 <u>and</u> 8.3.3.6.3.2). In this case a hard reset will be triggered directly.
- During a Data Role Swap when the DFP/UFP roles are changing. In this case Type-C error recovery will be triggered directly.

Note that there are corner cases that are not shown in the defined state diagrams that could be handled without generating a protocol error.

On entry to the <u>PE SNK Send Soft ResetSend Soft Reset</u> state the Policy Engine shall request the Protocol Layer to perform a Soft Reset, then shall send a *Soft Reset* message to the Source, and initialize and run the *SenderResponseTimer*.

The Policy Engine shall transition to the PE SNK Wait for Capabilities Wait for Capabilities (Sink) state when:

An Accept message has been received.

The Policy Engine shall transition to the <u>PE SRC Hard Reset</u> or <u>PE SNK Hard Reset</u> state when:

A SenderResponseTimer timeout occurs.

• <u>A</u> SenderResponse Timer timeout occurs.

Or the Protocol Layer indicates that a transmission error has occurred.

The decision as to whether to go to <u>PE SRC Hard ResetHard Reset (Source)</u> or <u>PE SNK Hard ResetHard Reset</u> (Sink) shall depend on the type of device:

• The <u>Sink portSource Port</u> in a <u>Provider or Provider</u>/Consumer <u>shall go to **PE SRC Hard Reset**or</u>.

<u>The Source Port in a Consumer/Provider shall go to</u> <u>PE SNK Hard Reset</u>Hard Reset (Sink).

Page 442

 The Sink port in a Provider/Consumer shall go to *Hard Reset (Source)* i.e. revert to default operation<u>USB Default</u> <u>Operation</u> as <u>SourceSink</u> Port.

1.2.11.2.2.2 PE SNK Soft Reset

8.3.3.4.2.2 The Soft_Reset state

The **PE SNK Soft Reset** state shall be entered from any state when a **Soft Reset** message is received from the Protocol Layer.

On entry to the <u>PE SNK Soft ResetSoft Reset</u> state the Policy Engine shall reset the Protocol Layer and shall then request the Protocol Layer to send an *Accept* message.

The Policy Engine shall transition to the *PE SNK Wait for Capabilities*Wait for Capabilities state when:

• The *Accept* message has been sent.

The Policy Engine shall transition to the <u>PE SRC Hard Reset</u> or <u>PE SNK Hard Reset</u> state depending on its default role as either a Source or Sink Port (see Section 6.7.2<u>Hard Reset</u> state) when:

• The Protocol Layer indicates that a transmission error has occured<u>occurred</u>.

The decision as to whether to go to <u>PE SRC Hard Reset (Source) or Hard Reset (Sink) or</u> <u>PE SNK Hard Reset</u> shall depend on the type of device:

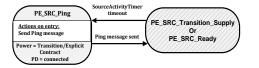

The Source Port in a Provider or Provider/Consumer shall go to PE SRC Hard Reset

- <u>The Source Port</u> in a Consumer-or Consumer/Provider shall go to Hard Reset (Sink).
- The Sink port in a Provider/Consumer shall go to <u>PE SNK Hard Reset (Source)</u> i.e. revert to default operationUSB Default Operation as <u>SourceSink</u> Port.

8.3.3.5 Source Port Ping State Diagram

Figure 8-43 shows the state diagram for a *Ping* message from a Source Port. Note: Pings are optional under certain operating conditions (see Section 6.3.5).

Figure 8-43 Source Port Ping State Diagram

8.3.3.5.1 PE SRC Ping state

On entry to the <u>PE SRC PingPing</u> state (from the <u>PE SRC Transition Supply</u>Transition Supply</u> or <u>PE SRC ReadyReady</u> states) the Policy Engine shall request the Protocol Layer to send a Ping message.

The Policy Engine shall transition back to the previous state (*Transition Supply*[*PE SRC Transition Supply* or <u>PE SRC ReadyReady</u>) state (see Figure 8-39) when:

• The *Ping* message has been successfully sent.

On re-entry to the *PE_SRC_Transition Supply*Transition Supply or *PE_SRC_Ready*Ready states the Policy Engine shall not perform any of the "Actions on Entry" except for initializing and running the SourceActivityTimer.

8.3.3.6 Dual-Role Port State Diagrams

Dual-Role Ports that combine Source and Sink capabilities shall comprise Source and Sink Policy Engine state machines. In addition they shall have the capability to <u>perform a Power Role</u> Swap roles from the <u>PE SRC Ready or</u>

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

<u>PE SNK Ready Ready</u> state states and shall return to default operation<u>USB Default Operation</u> on a Hard Reset. The following sections describe how the Source and Sink state diagrams shall be combined in the case of Hard Reset, the role swap process and the operation in the case of a dead battery.

8.3.3.6.1 Type-A/B Dual-Role State Diagrams

The State Diagrams in this section shall apply to all Type-A/B Dual-Role Ports.

8.3.3.6.1.1 <u>Type-A/B</u> Dual-Role (initially Source Port) Ping State Diagram

Figure 8-44 shows the state diagram for a Dual-Role Port which is initially a Source Port. Note: Pings are optional under certain operating conditions (see Section 6.3.5).

Figure 8-44 Dual-Role (initially Source Port) Ping State Diagram

8.3.3.6.1.1.1 PE PRS SRC SNK Ping state

The Policy Engine shall transition to the <u>PE PRS SRC SNK Ping</u>Ping state, from the <u>PE PRS SRC SNK Transition to off</u>Transition to off</u> state, due to a SourceActivityTimer timeout.

On entry to the <u>PE PRS SRC SNK Ping</u> state the Policy Engine shall request the Protocol Layer to send a **Ping** message.

The Policy Engine shall transition back to the <u>**PE PRS SRC SNK Transition to off</u> state (see Figure 8-52)-1 when:**</u>

• The *Ping* message has been successfully sent.

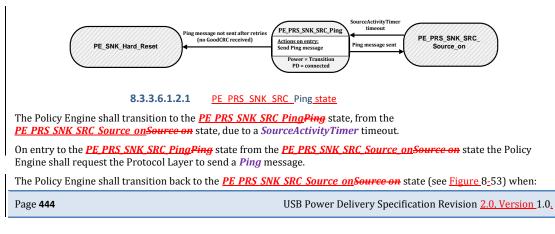

The Policy Engine shall transition to the **<u>PE SRC Hard Reset Hard Reset</u> state for a Source Port** when:

The *Ping* message has not been sent after retries (a *GoodCRC* message has not been received). A soft reset shall not be initiated in this case.

8.3.3.6.1.2 <u>Type-A/B</u> Dual-Role (initially Sink Port) Ping State Diagram

Figure 8-45 shows the state diagram for a Dual-Role Port which is initially a Sink Port. Note: Pings are optional under certain operating conditions (see Section 6.3.5).

Figure 8-45 Dual-Role (initially Sink Port) Ping State Diagram

• The *Ping* message has been successfully sent.

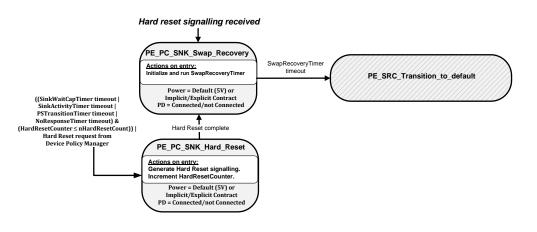

The Policy Engine shall transition to the <u>**PE SNK Hard Reset</u>Hard Reset</u> state for a Sink Port-when:</u>**

• The *Ping* message has not been sent after retries (a *GoodCRC* message has not been received). A soft reset shall not be initiated in this case.

8.3.3.6.1.3 <u>Type-A/B</u> Hard Reset of Policy Engine in a Provider/Consumer in Sink Role

Figure 8-46 shows the state diagram in the case where a Provider/Consumer with a portPort operating in Sink Role is required to perform a Hard Reset.

Figure 8-46 State Diagram for Hard Reset of P/C in Sink Role

8.3.3.6.1.3.1 PE PC SNK Hard Reset state

The Policy Engine shall transition to the <u>PE PC SNK Hard Reset</u>Hard Reset state for a Provider/Consumer Port in Sink Role from any state when:

- ((SinkWaitCapTimer timeout |
- SinkActivityTimer timeout
- PSTransitionTimer timeout |
- NoResponseTimer timeout) &
- (HardResetCounter ≤ nHardResetCount)) |
- Hard Reset request from Device Policy Manager

1.2.11.2.2.3 Swap Recovery

The Policy Engine shall transition to the <u>PE PC SNK Swap Recovery state when:</u>
 The Hard Reset is complete.

8.3.3.6.1.3.2 PE PC SNK Swap Recovery state

The Policy Engine shall transition to the **PE PC SNK Swap Recovery** state from any state when:

Hard Reset signaling is received.

On entry to the <u>PE PC SNK Swap RecoverySwap Recovery</u> state the Policy Engine shall initialize and run the SwapRecoveryTimer.

USB Power Delivery Specification Revision 42.0, Version 1.0

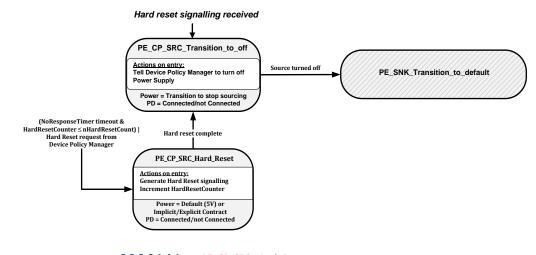

The Policy Engine shall transition to the *Transition* to *default* the *PE SRC Transition to default* state for a Source Port when:

• The SwapRecoveryTimer times out.

8.3.3.6.1.4 <u>Type-A/B</u> Hard Reset of Policy Engine in a Consumer/Provider in Source Role

Figure 8-47 shows the state diagram in the case where a Consumer/Provider with a portPort operating in Source Role is required to perform a Hard Reset.

Figure 8-47 State Diagram for the Hard Reset of a C/P in Source Role

8.3.3.6.1.4.1 <u>PE_CP_SRC_</u>Hard_Reset<u>state</u>

The Protocol Engine shall transition from any state to the <u>PE_CP_SRC_Hard_Reset</u> state for a Consumer/Provider in Source Role when

- The NoResponseTimer times out and the HardResetCounter ≤ nHardResetCount or
- The Device Policy Manager requests a Hard Reset.

1.2.11.2.2.4 The Policy Engine shall transition to the PE_CP_SRC_Transition_to_offTransition to off

state when:

• The Hard Reset is complete.

8.3.3.6.1.4.2 PE CP SRC Transition to off state

The Policy Engine shall transition from any state to the <u>PE_CP_SRC_Transition_to_off</u>Transition to off state for a Consumer/Provider in Source Role when:

Hard Reset signaling is detected.

On entry to the <u>PE_CP_SRC_Transition to offTransition tooff</u> state the Policy Engine shall tell the Device Policy Manager to turn off the <u>Power Supplypower supply</u>.

The Policy Engine shall transition to the Transition to default state for a Sink Port when:

The Power Supply has been turned off.

Page 446

1.2.11.2.3 Policy Engine in Source to Sink Swap State Diagram

shows the additional state diagram required to swap from Source to Sink roles and the changes that shall be followed for error and Hard Reset handling.

Figure -: Dual-Role Port in a Provider/Consumer State Diagram

1.2.11.2.3.1 Ready

The Role Swap process shall start only from the Ready state where power is stable.

The Policy Engine shall transition to the **<u>PE_SNK_Transition to defaultEvaluate Swap state</u> when:**

A message is received.

The Policy Engine shall transition to the Send Swap state when:

The Device Policy Manager indicates that a Role Swap is required.

1.2.11.2.3.2 Evaluate Swap

On entry to the *Evaluate Swap* state the Policy Engine shall ask the Device Policy Manager whether a Swap can be made.

The Policy Engine shall transition to the *Accept Swap* state when:

The Device Policy Manager indicates that a Role Swap is ok.

The Policy Engine shall transition to the *Reject Swap* state when:

The Device Policy Manager indicates that a Role Swap is not ok.

• Or further evalution of the Role Swap request is needed.

1.2.11.2.3.3 Accept Swap

On entry to the Accept Swap state the Policy Engine shall request the Protocol Layer to send an message.

The Policy Engine shall transition to the *Transition to off* state when:

The message has been sent.

1.2.11.2.3.4 Transition to off

On entry to the *Transition to off* state the Policy Engine shall wait and then request the Device Policy Manager to turn off the Source and shall initialize and run the (see Section for use of messaging for Dual Role Ports which are initially Source Ports).

The Policy Engine shall transition to the Source off state when:

<u>The Device Policy Manager indicates that the Source power supply</u> has been turned off.

1.2.11.2.3.5 Source off

On entry to the *Source off* state the Policy Engine shall request the Protocol Layer to send a message and shall start the .

On exit from the Source off state the Policy Engine shall stop the -

The Policy Engine shall transition to the *Startup* state for a Sink Port when:

• A PS_RDV message is received indicating that the remote Source is now supplying power.

The Policy Engine shall transition to the *Hard Reset* state for a Source Port when:

USB Power Delivery Specification Revision 42.0, Version 1.0

The PSSourceOnTimer times out or

— The PS_RDY message is not sent after retries (a CoodCRC message has not been received). A soft reset shall not be initiated in this case.

1.2.11.2.3.6 Send Swap

On entry to the **Send Swap** state the Policy Engine shall request the Protocol Layer to send a message and shall start the.

On exit from the Send Swap state the Policy Engine shall stop the .

The Policy Engine shall transition to the Ready state for a Source Port when:

A Reject message is received.

Or a Wait message is received.

Or the SenderResponseTimer times out.

The Policy Engine shall transition to the *Transition to off* state when:

An message is received.

1.2.11.2.3.7 Reject Swap

On entry to the *Reject Swap* state the Policy Engine shall request the Protocol Layer to send:

A message if the device is unable to perform a swap at this time.

• A message if further evaluation of the swap request is required. Note: in this case it is expected that one of the Port Partners will send a message at a later time (see Section).

The Policy Engine shall transition to the *Ready* state for a Source Port when:

The or message has been sent.

1.2.11.2.4 Policy Engine in Sink to Source swap State Diagram

Dual-Role Ports that combine Sink and Source capabilities shall comprise Sink and Source Policy Engine state machines. In addition they shall have the capability to do a Role Swap from the *Ready* state and shall return to default operation on a Hard Reset. shows the additional state diagram required to swap from Sink to Source roles and the changes that shall be followed for error and Hard Reset handling.

Figure -: Dual-role port in a Consumer/Provider state diagram

1.2.11.2.4.1 Ready

The Swap process shall start only from the *Ready* state where power is stable.

The Policy Engine shall transition to the *Evaluate Swap* state when:

A message is received.

The Policy Engine shall transition to the Send Swap state when:

The Device Policy Manager indicates that a Role Swap is required.

1.2.11.2.4.2 Evaluate Swap

On entry to the *Evaluate Swap* state the Policy Engine shall ask the Device Policy Manager whether a Role Swap can be made.

The Policy Engine shall transition to the Accept Swap state when:

Page 448

The Device Policy Manager indicates that a Role Swap is ok.

The Policy Engine shall transition to the *Reject Swap* state when:

The Device Policy Manager indicates that a Role Swap is not ok.

1.2.11.2.4.3 Accept Swap

On entry to the Accept Swap state the Policy Engine shall request the Protocol Layer to send an message.

The Policy Engine shall transition to the *Transition to off* state when:

The message has been sent.

1.2.11.2.4.4 Transition to off

On entry to the *Transition to off* state the Policy Engine shall initialize and run the and then request the Device Policy Manager to turn off the Sink.

The Policy Engine shall transition to the Hard Reset state for a Sink Port when:

The times out.

1.2.11.2.4.5 Source on

On entry to the *Source on* state the Policy Engine shall request the Device Policy Manager to turn on the Source and shall initialize and run the (see Section for details of messaging for Dual Role ports which are initially Sink Ports).

On exit from the Source on state (except if the exit is due to a timeout) the Policy Engine shall send a message.

The Policy Engine shall transition to the *Startup* state for a Source Port when:

The Source Port has been turned on.

The Policy Engine shall transition to the Hard Reset state for a Sink Port when:

 The PS_RDY message is not sent after retries (a CoodCRC message has not been received). A soft reset shall not be initiated in this case.

1.2.11.2.4.6 Send Swap

On entry to the **Send Swap** state the Policy Engine shall request the Protocol Layer to send a message and shall initialize and run the.

The Policy Engine shall transition to the *Ready* state for a Sink Port when:

- A message is received.
- Or a message is received.
- Or the times out.

The Policy Engine shall transition to the *Transition to off* state when:

An message is received.

1.2.11.2.4.7 Reject Swap

On entry to the *Reject Swap* state the Policy Engine shall request the Protocol Layer to send: A message if the device is unable to perform a swap at this time.

USB Power Delivery Specification Revision 42.0, Version 1.0

 A message if further evaluation of the swap request is required. Note: in this case it is expected that one of the Port Partners will send a message at a later time (see Section).

The Policy Engine shall transition to the *Ready* state for a Sink Port when:

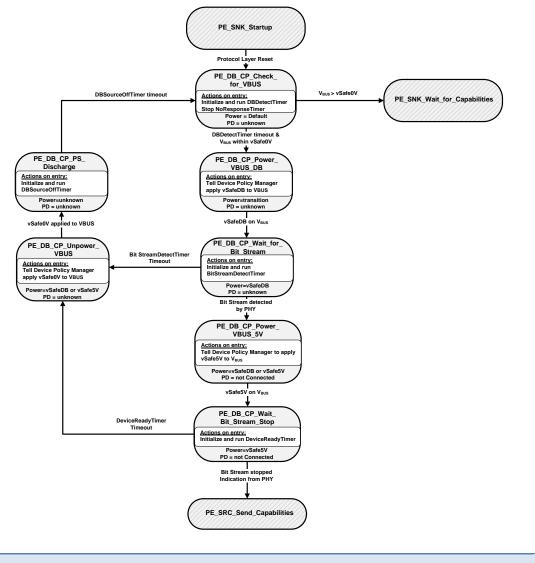

• The or message has been sent.

USB Power Delivery Specification Revision 2.0, Version 1.0.

8.3.3.6.1.5 Type-A/B Consumer/Provider Dead Battery/Power Loss State Diagram

Figure 8-48 shows the additional state diagram required for a Consumer/Provider to handle <u>dead batteryDead</u> <u>Battery</u> detection. After the Consumer/Provider Policy Engine has transitioned to the <u>PE SRC Send Capabilities</u> <u>Capabilities</u> state for a <u>Source Port</u>, its subsequent state operation shall conform to that of a Consumer/Provider which has completed a <u>Power</u> Role Swap (see Section 8.3.3.6.3.2). The Consumer/Provider has effectively undergone a <u>Power</u> Role Swap without the requirement of protocol negotiation. The Consumer/Provider will not respond to received <u>Source Capabilities</u> messages until it transitions to the <u>PE SNK Wait for Capabilities</u><u>Wait for Capabilities</u> <u>(Sink Port)</u> state.

8.3.3.6.1.5.1 PE DB CP Check for VBUS state

The Policy Engine for a Consumer/Provider shall initially start in the <u>PE SNK Startup</u> state for a Sink Port. Once the Protocol Layer has been reset it shall transition to the <u>PE DB CP Check for VBUSCheck for VBUS</u> state.

On entry to the <u>PE DB CP Check for VBUSCheck for VBUS</u> state the Policy Engine shall initialize and run the DBDetectTimer and stop the NoResponseTimer.

The Policy Engine shall transition to the **PE_SNK_Wait_for_Capabilities** state when:

V_{BUS} is greater than

vSafe0V Safe operating voltage at "zero volts".	0		0. <u>8</u>	V	Section 7.1.6
---	---	--	-------------	---	---------------

•

The Policy Engine shall transition to the <u>**PE_DB_CP_Power_VBUS_DB**</u> state when:

- The *DBDetectTimer* has timed out and
- V_{BUS} is within

vSafe0V Safe operating voltage at "zero volts <u>".</u>	0		0. <u>8</u>	v	Section 7.1.6
--	---	--	-------------	---	---------------

•

8.3.3.6.1.5.2 PE DB CP Power_VBUS_DB state

On entry to the <u>PE DB CP Power VBUS DB</u>Power V_{BUS} at the Policy Engine shall tell the Device Policy Manager to apply vSafeDB to V_{BUS}.

The Policy Engine shall transition to the <u>PE DB CP Wait For Bit Stream</u>Wait For Bit Stream state when:

vSafeDB is on V_{BUS}.

8.3.3.6.1.5.3 <u>PE_DB_CP_Wait_For_Bit_Stream_state</u>

On entry to the <u>PE_DB_CP_Wait_For_Bit_StreamWait For Bit Stream</u> state the Policy Engine shall initialize and run the *BitStreamDetectTimer*.

The Policy Engine shall transition to the <u>PE DB CP Power VBUS 5V</u> Power VBUS 5V state when:

• The PHY Layer indicates that Bit Stream signaling has been received.

The Policy Engine shall transition to the <u>PE DB CP Unpower VBUS</u>Unpower VBUS state when:

The BitStreamDetectTimer times out.

8.3.3.6.1.5.4 <u>PE_DB_CP_Power_VBUS_5V_state</u>

On entry to the <u>PE DB CP Power VBUS 5V</u> Power V_{BUS} 5V state the Policy Engine shall request the Device Policy Manager to apply *vSafe5V* to V_{BUS}.

The Policy Engine shall transition to the <u>PE DB CP Wait Bit Stream Stop</u>Wait Bit Stream Stop

vSafe5V is present on V_{BUS}.

1.2.11.2.4.8 Wait Bit Stream Stop

8.3.3.6.1.5.5 On entry to the PE_DB_CP_Wait_Bit_Stream_Stop_state

<u>On entry to the **PE DB CP Wait Bit Stream Stop**</u> state the Policy Engine shall initialize and run the **DeviceReadyTimer**.

Page 452

The Policy Engine shall transition to the <u>PE SRC Send Capabilities</u>Send Capabilities state for a Source Port-when:

• An indication is received from the PHY Layer that the Bit Stream has stopped.

The Policy Engine shall transition to the <u>PE DB CP Unpower VBUS</u>Unpower VBUS state when:

• The DeviceReadyTimer times out.

8.3.3.6.1.5.58.3.3.6.1.5.6 PE DB CP Unpower_VBUS state

On entry to the <u>PE DB CP Unpower VBUSUnpower VBUS</u> state the Policy Engine shall tell the Device Policy Manager to apply

vSafe0V Safe operating voltage at "zero volts <u>".</u>	0		0. <u>8</u>	V	Section 7.1.6
--	---	--	-------------	---	---------------

to V_{BUS} .

The Policy Engine shall transition to the <u>PE DB CP PS Discharge</u> State when:

vSafe0V	Safe operating voltage at "zero volts <u>".</u>	0	0. <u>8</u>	V	Section 7.1.6

 $\bullet \qquad has been applied to V_{\text{BUS}}.$

Note: the intention of applying

vSafe0V Safe operating voltage at "zero volts".	0	0. <mark>8</mark>	V	Section 7.1.6
--	---	-------------------	---	---------------

is that the Consumer/Provider will utilize the same mechanism to unpower V_{BUS} as it uses to remove V_{BUS} power during a role swapPower Role Swap.

8.3.3.6.1.5.68.3.3.6.1.5.7 PE DB CP PS_Discharge_state

On entry to the <u>PE DB CP PS Discharge</u>PS Discharge state the Policy Engine shall initialize and run the DBSourceOffTimer.

The Policy Engine shall transition to the <u>**PE_DB_CP_Check_for_VBUS**Check for VBUS</u> state when:

• The DBSourceOffTimer times out.

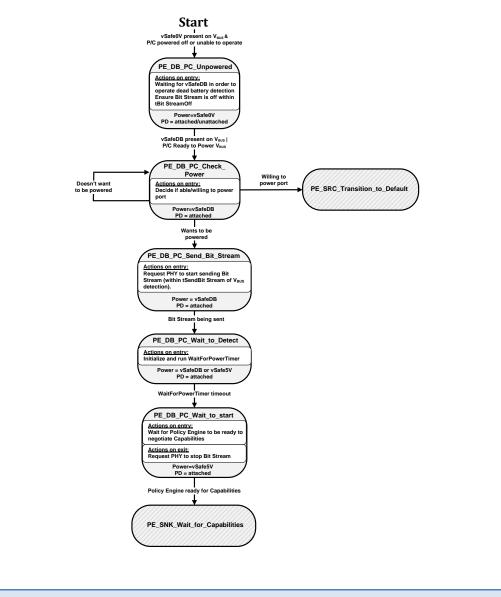

Note: the *DBSourceOffTimer* is used to ensure that the Consumer/Provider is not powering V_{BUS} when it proceeds to check the voltage on V_{BUS} . This assumes that the discharge of V_{BUS} follows the same process as when removing power during a role swapPower Role Swap.

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

8.3.3.6.1.6 Type-A/B Provider/Consumer Dead Battery/Power Loss State Diagram

Figure 8-49 shows the additional state diagram required for a <u>BFSK</u> Provider/Consumer to handle <u>dead batteryDead</u> <u>Battery</u> detection. The Provider/Consumer is assumed to startup in a state where it is either powered off or is unable to power its <u>portPort</u> (e.g. due to a <u>dead batteryDead Battery</u>). If the Provider/Consumer is powered on and has sufficient power to power <u>its portit's Port</u> it should start up as a Source Port.

Figure 8-49<u>BFSK</u> Provider/Consumer Dead Battery/Power Loss State Diagram

USB Power Delivery Specification Revision 2.0, Version 1.0.

8.3.3.6.1.6.1 PE DB PC Unpowered state

The <u>PE DB PC Unpowered</u> state is the startup state for a Provider/Consumer at power up when either there is no power to the Provider/Consumer (in this case there may be no physical "state" as such) or when the Provider/Consumer has some sort of power supply but is inactive.

The <u>**PE DB PC Unpowered Unpowered</u>** state shall be entered from any state when:</u>

V_{BUS} is within

vSafe0V Safe operating voltage at "zero volts".	0		0. <u>8</u>	V	Section 7.1.6
---	---	--	-------------	---	---------------

- and
- The Provider/Consumer is powered off or has insufficient power to operate.

On entry to the <u>**PE DB PC Unpowered Unpowered</u>** state the Policy Engine shall wait for **vSafeDB** to appear on V_{BUS} in order to start the <u>dead battery</u><u>Dead Battery</u> detection process. If a Bit Stream is currently being transmitted then this shall be stopped within *tBitStreamOff* of</u>

	operating voltage ero volts".	0		0. <mark>8</mark>	V	Section 7.1.6
--	----------------------------------	---	--	-------------------	---	---------------

appearing on V_{BUS}.

The Policy Engine shall transition to the **<u>PE_DB_PC_Check_PowerCheck_Power</u>** state when:

- vSafeDB is present on V_{BUS}.or
- The Provider/Consumer is ready to power V_{BUS}

8.3.3.6.1.6.2 <u>PE_DB_PC_</u>Check_Power<u>state</u>

On entry to the <u>**PE DB PC Check Power Check Power**</u> state the Policy Engine shall decide whether it is able and willing to supply power to the portPort.

The Policy Engine shall transition to the *PE_SRC_Transition to_defaultTransition to Default* state for a Source port when:

• It is willing to power V_{BUS}.

The Policy Engine shall transition to the <u>**PE DB PC Send Bit StreamSend Preamble**</u> state when:

• It wants to be powered by the Consumer/Provider.

The Policy Engine shall stay in the <u>**PE_DB_PC_Check_Power**</u> state when:

The Provider/Consumer does not want to either power the powered.

8.3.3.6.1.6.3 <u>PE_DB_PC_Send_Bit_Stream_state</u>

On entry to the <u>PE DB PC Send Bit StreamSend Bit Stream</u> state the Policy Engine shall request the PHY Layer to start sending the Bit Stream (see Section 4.1.1).

The Policy Engine shall transition to the <u>**PE_DB_PC_Wait_to_Detect**</u> state when:

• The Bit Stream is being sent.

8.3.3.6.1.6.4 PE DB PC Wait to Detect state

On entry to the <u>**PE DB PC Wait to DetectWait to Detect</u>** state the Policy Engine shall initialize and run the **WaitForPowerTimer** to allow the Consumer/Provider time to detect the Bit Stream and apply power to V_{BUS} .</u>

The Policy Engine shall transition to the **<u>PE_DB_PC_Wait_to_Start</u>** state when:

• The DeadBatteryTimer times out.

USB Power Delivery Specification Revision 42.0, Version 1.0

8.3.3.6.1.6.5 <u>PE_DB_PC_</u>Wait_to_Start_state

On entry to the <u>PE DB PC Wait to Start</u> wait to Start state the Policy Engine shall wait until it is ready to negotiate Capabilities.

On exit from the <u>**PE DB PC Wait to StartWait to Start</u>** state the Policy Engine shall request the PHY <u>Layer</u> to stop sending the Bit Stream.</u>

The Policy Engine shall transition to the <u>PE_SNK_Wait for Capabilities</u> state for a Sink Port when:

• The Policy Engine is ready to negotiate Capabilities.

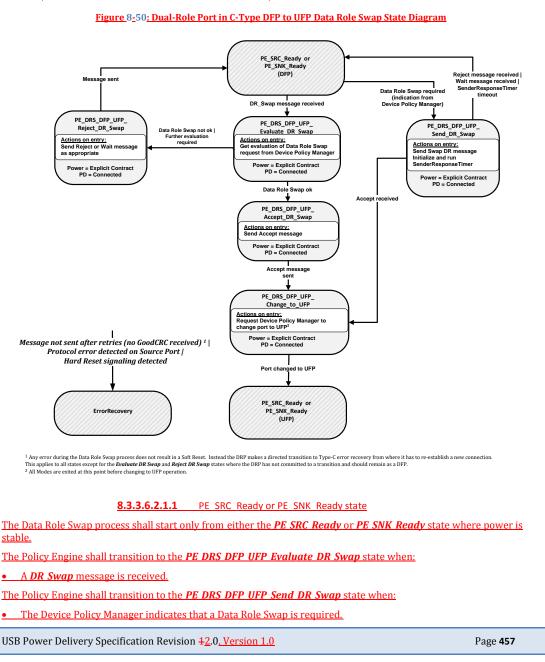

8.3.3.6.2 Type-C DRP State Diagrams

The State Diagrams in this section shall apply to all Dual-Role Ports that are [USBType-C1.0] DRPs.

USB Power Delivery Specification Revision 2.0, Version 1.0.

Figure 8-50 shows the additional state diagram required to perform a Data Role Swap from Type-C DFP to UFP operation and the changes that shall be followed for error and Hard Reset handling. If successful a Provider or Provider/Consumer will become a Consumer or Consumer/Provider.

•

٠

8.3.3.6.2.1.2 PE DRS DFP UFP Evaluate DR Swap state

On entry to the *PE DRS DFP UFP Evaluate DR Swap* state the Policy Engine shall ask the Device Policy Manager whether a Data Role Swap can be made.

The Policy Engine shall transition to the **PE DRS DFP UFP Accept DR Swap** state when:

• The Device Policy Manager indicates that a Data Role Swap is ok.

The Policy Engine shall transition to the **PE DRS DFP UFP Reject DR Swap** state when:

• The Device Policy Manager indicates that a Data Role Swap is not ok.

Or further evaluation of the Data Role Swap request is needed.

8.3.3.6.2.1.3 PE DRS DFP UFP Accept DR Swap state

On entry to the **PE DRS DFP UFP Accept DR Swap** state the Policy Engine shall request the Protocol Layer to send an **Accept** message.

The Policy Engine shall transition to the PE DRS DFP UFP Change to UFP state when:

• The Accept message has been sent.

8.3.3.6.2.1.4 PE DRS DFP UFP Change to UFP state

On entry to the *PE DRS DFP UFP Change to UFP* state the Policy Engine shall request the Device Policy Manager to change the Port from a DFP to a UFP.

The Policy Engine shall transition to either the **PE_SRC_Ready** or **PE_SNK_Ready** state when:

The Device Policy Manager indicates that the Type-C Port has been changed to a UFP.

8.3.3.6.2.1.5 PE DRS DFP UFP Send DR Swap state

On entry to the **PE DRS DFP UFP Send DR Swap** state the Policy Engine shall request the Protocol Layer to send a **DR Swap** message and shall start the **SenderResponseTimer**.

On exit from the PE DRS DFP UFP Send DR Swap state the Policy Engine shall stop the SenderResponseTimer.

The Policy Engine shall continue as a DFP and shall transition to either the **PE SRC Ready** or **PE SNK Ready** state when:

• <u>A Reject message is received.</u>

Or a Wait message is received.

Or the SenderResponseTimer times out.

The Policy Engine shall transition to the **PE DRS DFP UFP Change to UFP** state when:

• An Accept message is received.

8.3.3.6.2.1.6 PE DRS DFP UFP Reject DR Swap state

On entry to the **PE DRS DFP UFP Reject DR Swap** state the Policy Engine shall request the Protocol Layer to send:

• A Reject message if the device is unable to perform a Data Role Swap at this time.

• A *Wait* message if further evaluation of the Data Role Swap request is required. Note: in this case it is expected that one of the Port Partners will send a *DR Swap* message at a later time (see Section 6.3.12.3).

The Policy Engine shall continue as a DFP and shall transition to either the **PE SRC Ready** or **PE SNK Ready** state when:

• The Reject or Wait message has been sent.

8.3.3.6.2.1.7 ErrorRecovery state

The Policy Engine shall transition to the *ErrorRecovery* state (see Section 8.3.3.11.1) when:

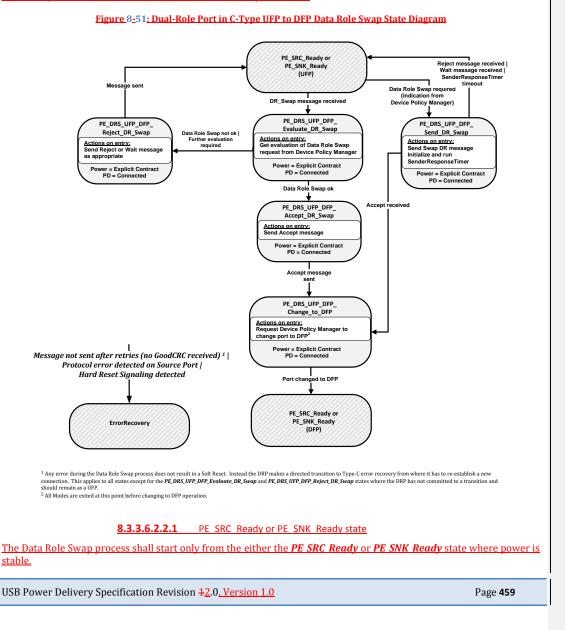

Page **458**

•

- A protocol error is detected by the Protocol Layer or
- A message has not been sent after retries or
- Hard Reset signaling is received.

8.3.3.6.2.2 Type-C DRP Policy Engine in UFP to DFP Data Role Swap State Diagram

Figure 8-51 shows the additional state diagram required to perform a Data Role Swap from Type-C DRP UFP to DFP operation and the changes that shall be followed for error and Hard Reset handling. If successful a Consumer or Consumer/Provider will become a Provider or Provider/Consumer.

The Policy Engine shall transition to the **PE DRS UFP DFP Evaluate DR Swap** state when:

• A DR Swap message is received.

The Policy Engine shall transition to the **PE DRS UFP DFP Send DR Swap** state when:

• The Device Policy Manager indicates that a Data Role Swap is required.

8.3.3.6.2.2.2 PE DRS UFP DFP Evaluate DR Swap state

On entry to the **PE DRS UFP DFP Evaluate DR Swap** state the Policy Engine shall ask the Device Policy Manager whether a Data Role Swap can be made.

The Policy Engine shall transition to the **PE DRS UFP DFP Accept DR Swap** state when:

• The Device Policy Manager indicates that a Data Role Swap is ok.

The Policy Engine shall transition to the **PE DRS UFP DFP Reject DR Swap** state when:

• The Device Policy Manager indicates that a Data Role Swap is not ok.

• Or further evaluation of the Data Role Swap request is needed.

8.3.3.6.2.2.3 PE DRS UFP DFP Accept DR Swap state

On entry to the **PE DRS UFP DFP Accept DR Swap** state the Policy Engine shall request the Protocol Layer to send an **Accept** message.

The Policy Engine shall transition to the **PE DRS UFP DFP Change to DFP** state when:

• The Accept message has been sent.

8.3.3.6.2.2.4 PE DRS UFP DFP Change to DFP state

On entry to the *PE DRS UFP DFP Change to DFP* state the Policy Engine shall request the Device Policy Manager to change the Port from a UFP to a DFP.

The Policy Engine shall transition to either the **PE_SRC_Ready** or **PE_SNK_Ready** state when:

• The Device Policy Manager indicates that the Type-C Port has been changed to a DFP.

8.3.3.6.2.2.5 PE DRS UFP DFP Send DR Swap state

On entry to the **PE_DRS_UFP_DFP_Send_DR_Swap** state the Policy Engine shall request the Protocol Layer to send a **DR_Swap** message and shall start the **SenderResponseTimer**.

On exit from the **PE DRS UFP DFP Send DR Swap** state the Policy Engine shall stop the SenderResponseTimer.

The Policy Engine shall continue as a UFP and shall transition to either the PE SRC Ready or PE SNK Ready state

<u>when:</u>

<u>A Reject message is received.</u>

Or a Wait message is received.

• Or the SenderResponseTimer times out.

The Policy Engine shall transition to the **PE DRS UFP DFP Change to DFP** state when:

• An Accept message is received.

8.3.3.6.2.2.6 PE DRS UFP DFP Reject DR Swap state

On entry to the **PE DRS UFP DFP Reject DR Swap** state the Policy Engine shall request the Protocol Layer to send:

<u>A Reject message if the device is unable to perform a Data Role Swap at this time.</u>

A *Wait* message if further evaluation of the Data Role Swap request is required. Note: in this case it is expected that one of the Port Partners will send a *DR Swap* message at a later time (see Section 6.3.12.3).

Page 460

The Policy Engine shall continue as a UFP and shall transition to the either the **PE SRC Ready** or **PE SNK Ready** state when:

• The Reject or Wait message has been sent.

8.3.3.6.2.2.7 ErrorRecovery state

The Policy Engine shall transition to the *ErrorRecovery* state (see Section 8.3.3.11.1) when:

• A protocol error is detected by the Protocol Layer or

A message has not been sent after retries or

•____Hard Reset_signaling is received.

8.3.3.6.3 Common Dual-Role Port State Diagrams

The State Diagrams in this section shall apply to all Dual-Role Ports: both Type-A/B and [USBType-C1.0] DRP.

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

Dual-Role Ports that combine Source and Sink capabilities shall comprise Source and Sink Policy Engine state machines. In addition they shall have the capability to do a Power Role Swap from the **PE SRC Ready** state and shall return to USB Default Operation on a Hard Reset.

Figure 8-52 shows the additional state diagram required to perform a Power Role Swap from Source to Sink roles and the changes that shall be followed for error and Hard Reset handling.

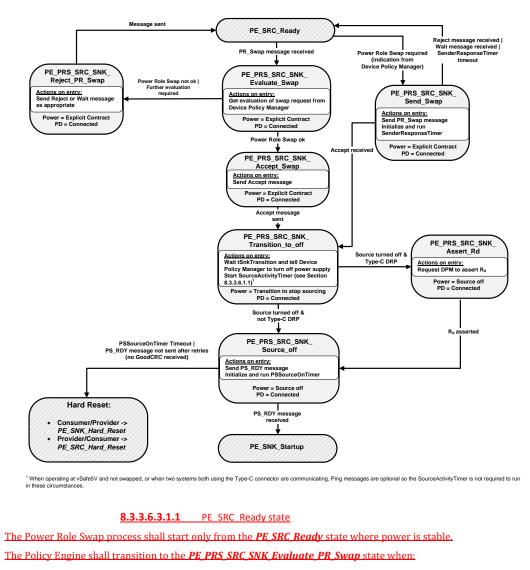

Figure 8-52: Dual-Role Port in Source to Sink Power Role Swap State Diagram

Page 462

• A PR Swap message is received.

The Policy Engine shall transition to the **PE PRS SRC SNK Send PR Swap** state when:

• The Device Policy Manager indicates that a Power Role Swap is required.

8.3.3.6.3.1.2 PE PRS SRC SNK Evaluate Swap state

On entry to the **PE PRS SRC SNK Evaluate PR Swap** state the Policy Engine shall ask the Device Policy Manager whether a Power Role Swap can be made.

The Policy Engine shall transition to the **PE PRS SRC SNK Accept PR Swap** state when:

The Device Policy Manager indicates that a Power Role Swap is ok.

The Policy Engine shall transition to the **PE PRS SRC SNK Reject PR Swap** state when:

- The Device Policy Manager indicates that a Power Role Swap is not ok.
- Or further evaluation of the Power Role Swap request is needed.

8.3.3.6.3.1.3 PE PRS SRC SNK Accept Swap state

On entry to the **PE PRS SRC SNK Accept PR Swap** state the Policy Engine shall request the Protocol Layer to send an **Accept** message.

The Policy Engine shall transition to the **PE PRS SRC SNK Transition to off** state when:

• The Accept message has been sent.

8.3.3.6.3.1.4 PE PRS SRC SNK Transition to off state

On entry to the *PE PRS SRC SNK Transition to off* state the Policy Engine shall wait *tSnkTransition* and then request the Device Policy Manager to turn off the Source and shall initialize and run the *SourceActivityTimer* (see Section 8.3.3.6.1.1.1 for use of *Ping* messaging for Dual-Role Ports which are initially Source Ports).

The Policy Engine shall transition to the PE PRS SRC SNK Source off state when:

- The Device Policy Manager indicates that the Source has been turned off and
- The Port is not a [USBType-C1.0] DRP

The Policy Engine shall transition to the PE PRS SRC SNK Assert Rd state when:

- The Device Policy Manager indicates that the Source has been turned off and
- The Port is a *[USBType-C1.0]* DRP

8.3.3.6.3.1.5 PE PRS SRC SNK Assert Rd

On entry to the *PE PRS SRC SNK Assert Rd* state the Policy Engine shall request the Device Policy Manager to change the resistor asserted on the CC wire from R_p to R_d.

The Policy Engine shall transition to the **PE PRS SRC SNK Source off** state when:

• The Device Policy Manager indicates that R_d is asserted.

8.3.3.6.3.1.6 PE PRS SRC SNK Source off state

On entry to the **PE PRS SRC SNK Source off** state the Policy Engine shall request the Protocol Layer to send a **PS_RDY** message and shall start the **PSSourceOnTimer**.

On exit from the Source off state the Policy Engine shall stop the **PSSourceOnTimer**.

The Policy Engine shall transition to the **PE SNK Startup** when:

• <u>A PS_RDY message is received indicating that the remote Source is now supplying power.</u>

The Policy Engine shall transition to the *PE SRC Hard Reset* or *PE SNK Hard Reset* state depending on its default role as either a Source or Sink Port (see Section 6.7.2) when:

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

• The **PSSourceOnTimer** times out or

• <u>The PS_RDY message is not sent after retries (a</u> *GoodCRC* <u>message has not been received)</u>. A soft reset shall not <u>be initiated in this case.</u>

The decision as to whether to go to **PE SRC Hard Reset** or **PE SNK Hard Reset** shall depend on the type of device:

• The Source Port in a Provider or Provider/Consumer shall go to **PE SRC Hard Reset**.

 The Source Port in a Consumer/Provider shall go to **PE SNK Hard Reset** i.e. revert to USB Default Operation as <u>Sink Port.</u>

8.3.3.6.3.1.7 PE PRS SRC SNK Send Swap state

On entry to the *PE PRS SRC SNK Send PR Swap* state the Policy Engine shall request the Protocol Layer to send a *PR Swap* message and shall start the *SenderResponseTimer*.

On exit from the PE PRS SRC SNK Send PR Swap state the Policy Engine shall stop the SenderResponseTimer.

The Policy Engine shall transition to the PE SRC Ready state when:

• <u>A Reject message is received.</u>

Or a Wait message is received.

• Or the SenderResponseTimer times out.

The Policy Engine shall transition to the **PE PRS SRC SNK Transition to off** state when:

• An Accept message is received.

8.3.3.6.3.1.8 PE PRS SRC SNK Reject Swap state

On entry to the PE PRS SRC SNK Reject PR Swap state the Policy Engine shall request the Protocol Layer to send:

• A *Reject* message if the device is unable to perform a Power Role Swap at this time.

• <u>A Wait message if further evaluation of the Power Role Swap request is required. Note: in this case it is expected</u> that one of the Port Partners will send a **PR Swap** message at a later time (see Section 6.3.12.2).

The Policy Engine shall transition to the PE SRC Ready when:

• The Reject or Wait message has been sent.

8.3.3.6.3.2 Policy Engine in Sink to Source Power Role Swap State Diagram

Dual-Role Ports that combine Sink and Source capabilities shall comprise Sink and Source Policy Engine state machines. In addition they shall have the capability to do a Power Role Swap from the **PE SNK Ready** state and shall return to USB Default Operation on a Hard Reset.

Figure 8-53 shows the additional state diagram required to perform a Power Role Swap from Sink to Source roles and the changes that shall be followed for error and Hard Reset handling.

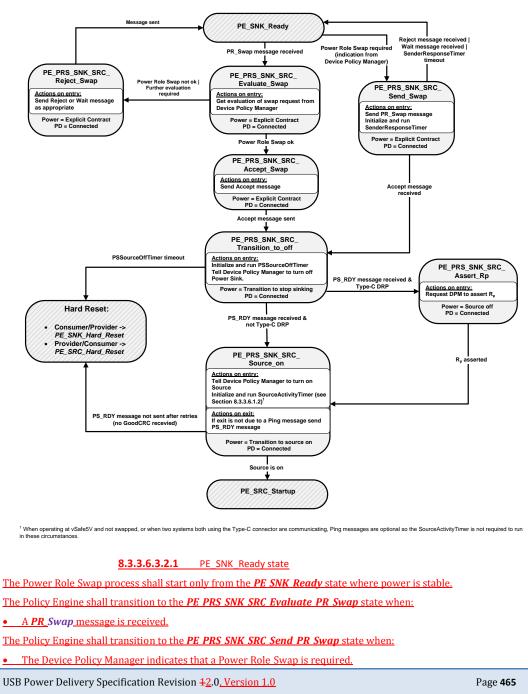

Figure 8-53: Dual-role Port in Sink to Source Power Role Swap State Diagram

8.3.3.6.3.2.2 PE PRS SNK SRC Evaluate Swap state

On entry to the *PE PRS SNK SRC Send PR Swap* state the Policy Engine shall ask the Device Policy Manager whether a Power Role Swap can be made.

The Policy Engine shall transition to the **PE PRS SNK SRC Accept PR Swap** state when:

• The Device Policy Manager indicates that a Power Role Swap is ok.

The Policy Engine shall transition to the **PE PRS SNK SRC Reject PR Swap** state when:

The Device Policy Manager indicates that a Power Role Swap is not ok.

8.3.3.6.3.2.3 PE PRS SNK SRC Accept Swap state

On entry to the **PE PRS SNK SRC Accept PR Swap** state the Policy Engine shall request the Protocol Layer to send an **Accept** message.

The Policy Engine shall transition to the **PE_PRS_SNK_SRC_Transition_to_off** state when:

The Accept message has been sent.

8.3.3.6.3.2.4 PE PRS SNK SRC Transition to off state

On entry to the **PE PRS SNK SRC Transition to off** state the Policy Engine shall initialize and run the **PSSourceOffTimer** and then request the Device Policy Manager to turn off the Sink.

The Policy Engine shall transition to the *PE SRC Hard Reset* or *PE SNK Hard Reset* state depending on its default role as either a Source or Sink Port (see Section 6.7.2) when:

• The **PSSourceOffTimer** times out.

The decision as to whether to go to PE SRC Hard Reset or PE SNK Hard Reset shall depend on the type of device:

The Source Port in a Provider or Provider/Consumer shall go to PE SRC Hard Reset.

The Source Port in a Consumer/Provider shall go to **PE SNK Hard Reset** i.e. revert to USB Default Operation as
 <u>Sink Port.</u>

The Policy Engine shall transition to the PE PRS SNK SRC Source on state when:

• <u>A PS_RDY message is received and</u>

This is not a [USBType-C1.0] DRP

The Policy Engine shall transition to the **PE PRS SNK SRC Assert Rp** state when:

• <u>A PS_RDY message is received and</u>

This is a [USBType-C1.0] DRP

8.3.3.6.3.2.5 PE_PRS_SNK_SRC_Assert_Rp state

On entry to the *PE PRS SNK SRC Assert Rp* state the Policy Engine shall request the Device Policy Manager to change the resistor asserted on the CC wire from Rd to Rp.

The Policy Engine shall transition to the PE PRS SNK SRC Source on state when:

The Device Policy Manager indicates that R_d is asserted.

8.3.3.6.3.2.6 PE PRS SNK SRC Source on state

On entry to the *PE PRS SNK SRC Source on* state the Policy Engine shall request the Device Policy Manager to turn on the Source and shall initialize and run the *SourceActivityTimer* (see Section 8.3.3.6.1.2.1 for details of *Ping* messaging for Dual-Role ports which are initially Sink Ports).

On exit from the **PE PRS SNK SRC Source on** state (except if the exit is due to a **SourceActivityTimer** timeout) the Policy Engine shall send a **PS_RDY** message.

The Policy Engine shall transition to the **PE_SRC_Startup** state when:

Page 466

• The Source Port has been turned on.

The Policy Engine shall transition to the *PE SRC Hard Reset* or *PE SNK Hard Reset* state depending on its default role as either a Source or Sink Port (see Section 6.7.2) when:

• <u>The PS_RDY message is not sent after retries (a GoodCRC message has not been received). A soft reset shall not be initiated in this case.</u>

The decision as to whether to go to PE SRC Hard Reset or PE SNK Hard Reset shall depend on the type of device:

- The Source Port in a Provider or Provider/Consumer shall go to PE SRC Hard Reset.
- The Source Port in a Consumer/Provider shall go to *PE SNK Hard Reset* i.e. revert to USB Default Operation as <u>Sink Port.</u>

8.3.3.6.3.2.7 PE PRS SNK SRC Send Swap state

On entry to the **PE PRS SNK SRC Send PR Swap** state the Policy Engine shall request the Protocol Layer to send a **PR Swap** message and shall initialize and run the **SenderResponseTimer**.

The Policy Engine shall transition to the **PE SNK Ready** state when:

- A Reject message is received.
- Or a Wait message is received.

Or the SenderResponseTimer times out.

The Policy Engine shall transition to the **PE_PRS_SNK_SRC_Transition_to_off** state when:

• An Accept message is received.

8.3.3.6.3.2.8 PE PRS SNK SRC Reject Swap state

On entry to the PE PRS SNK SRC Reject PR Swap state the Policy Engine shall request the Protocol Layer to send:

- A Reject message if the device is unable to perform a Power Role Swap at this time.
- A Wait message if further evaluation of the Power Role Swap request is required. Note: in this case it is expected that one of the Port Partners will send a PR Swap message at a later time (see Section 6.3.12.2).

The Policy Engine shall transition to the **PE SNK Ready** state when:

• The Reject or Wait message has been sent.

8.3.3.6.1.78.3.3.6.3.3 Dual-Role (Source Port) Get Source Capabilities State Diagram

Figure 8-54 shows the state diagram for a Dual-Role device, presently operating as a Source, on receiving a request from the Device Policy Manager to get the Port Partner's Source capabilities. See also Section 6.4.1.1.3.

Figure 8-54 Dual-Role (Source) Get Source Capabilities diagram

PE_SRC Ready	get source capabilities request from Device Policy Manager	PE_DR_SRC_Get_Source_Cap
	Source capabilities	Send Get_Source_Cap message Initialize and run SenderResponseTimer
	message received SenderResponseTimer Timeout Reject message received	Actions on exit: Pass source capabilities/outcome to Device Policy Manager
	/	Power = Explicit Contract PD = Connected

8.3.3.6.1.7.18.3.3.6.3.3.1 PE DR SRC Get_Source_Cap state

The Policy Engine shall transition to the <u>PE DR SRC Get Source Cap</u>Get Source Cap <u>PE SRC ReadyReady (Source Port)</u> state, due to a request to get the remote source capabilities from the Device Policy Manager.

USB Power Delivery Specification Revision <u>42</u>.0, <u>Version 1.0</u>

On entry to the <u>PE DR SRC Get Source CapGet Source Cap</u> state the Policy Engine shall send a <u>Get_Source_Cap</u> message and initialize and run the <u>SenderResponseTimer</u>.

On exit from the *PE_DR_SRC_Get_Source_CapGet Source_Cap* state the Policy Engine shall inform the Device Policy Manager of the outcome (capabilities or response timeout).

The Policy Engine shall transition back to the <u>PE SRC Ready (Source Port)</u> state (see Figure 8-39)-] when:

- A Source Capabilities message is received
- Or SenderResponseTimer times out
- Or a *Reject* message is received

8.3.3.6.1.88.3.3.6.3.4 Dual-Role (Source Port) Give Sink Capabilities State Diagram

Figure 8-55 shows the state diagram for a Dual-Role device, presently operating as a Source, on receiving a *Get_Sink_Cap* message. See also Section 6.4.1.1.3.

Figure 8-55 Dual-Role (Source) Give Sink Capabilities diagram

8.3.3.6.1.8.18.3.3.6.3.4.1 PE_DR_SRC_Give_Sink_Cap_state

The Policy Engine shall transition to the <u>PE DR SRC Give Sink Cap</u>Give Sink Cap state, from the <u>PE SRC Ready</u> (Source Port) state, when a Get_Sink_Cap message is received.

On entry to the <u>PE DR SRC Give Sink CapGive Sink Cap</u> state the Policy Engine shall request the present capabilities from the Device Policy Manager and then send a *Sink Capabilities* message based on these capabilities.

The Policy Engine shall transition back to the <u>PE SRC Ready Ready (Source Port)</u> state (see Figure 8-39). when:

The **Sink Capabilities** message has been successfully sent.

The Sink Capabilities message has been successfully sent.

8.3.3.6.1.98.3.3.6.3.5 Dual-Role (Sink Port) Get Sink Capabilities State Diagram

Figure 8-56 shows the state diagram for a Dual-Role device, presently operating as a Sink, on receiving a request from the Device Policy Manager to get the Port Partner's Sink capabilities. See also Section 6.4.1.1.3.

Figure 8-56 Dual-Role (Sink) Get Sink Capabilities State Diagram

USB Power Delivery Specification Revision 2.0, Version 1.0.

8.3.3.6.1.9.18.3.3.6.3.5.1 PE DR SNK Get_Sink_Cap state

The Policy Engine shall transition to the <u>PE DR SNK Get Sink Cap</u>Get Sink Cap State, from the <u>PE SNK Ready</u>Ready (Sink Port) state, due to a request to get the remote source capabilities from the Device Policy Manager.

On entry to the <u>**PE_DR_SNK_Get_Sink_CapGet Sink_Cap</u>** state the Policy Engine shall send a <u>**Get_Sink_Cap**</u> message and initialize and run the <u>**SenderResponseTimer**</u>.</u>

On exit from the <u>PE_DR_SNK_Get_Sink_CapGet Sink Cap</u> state the Policy Engine-shall shall inform the Device Policy Manager of the outcome (capabilities or response timeout).

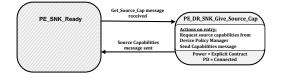

The Policy Engine shall transition back to the <u>PE_SNK_ReadyReady (Sink Port)</u> state (see Figure 8-40 and Figure 8-45] when:

- A Source Capabilities message is received
- Or *SenderResponseTimer* times out
- Or a *Reject* message is received

8.3.3.6.1.108.3.3.6.3.6 Dual-Role (Sink Port) Give Source Capabilities State Diagram

Figure 8-57 shows the state diagram for a Dual-Role device, presently operating as a Sink, on receiving a *Get_Source_Cap* message. See also Section 6.4.1.1.3.

Figure 8-57 Dual-Role (Sink) Give Source Capabilities State Diagram

8.3.3.6.1.10.18.3.3.6.3.6.1 PE DR SNK Give Source Cap state

The Policy Engine shall transition to the <u>PE DR SNK Give Source Cap</u>Give Source Cap</u> state, from the <u>PE SNK ReadyReady (Sink Port) or Send Swap (Initially Sink)</u> state, when a Get_Source_Cap message is received.

On entry to the <u>PE DR SNK Give Source CapGive Source Cap</u> state the Policy Engine shall request the present capabilities from the Device Policy Manager and then send a Source Capabilities message based on these capabilities.

The Policy Engine shall transition back to the <u>*PE SNK ReadyReady (Sink Port)*</u> state (see Figure 8-40 and Figure 8-45<mark>-)</mark> when:

• The Source Capabilities message has been successfully sent.

8.3.3.7 Type-C VCONN State Diagrams

The State Diagrams in this section shall apply to **[USBType-C1.0]** Ports that supply VCONN.

8.3.3.7.1 Type-C DFP VCONN Swap State Diagram

Figure 8-58 shows the state operation for a Downstream Facing Port (DFP) on initiating VCONN Swap.

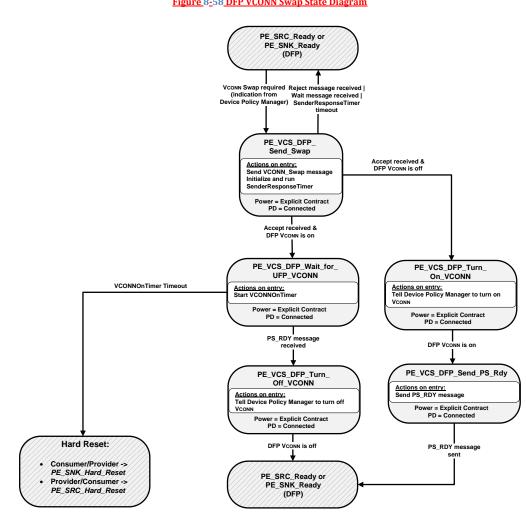

Figure 8-58 DFP VCONN Swap State Diagram

8.3.3.7.1.1 PE VCS DFP Send Swap state

The PE VCS DFP Send Swap state is entered from either the PE SRC Ready or PE SNK Ready state for a DFP when the Policy Engine receives a request from the Device Policy Manager to perform a V CONN Swap.

On entry to the **PE VCS DFP Send Swap** state the Policy Engine shall send a **VCONN Swap** message and start the SenderResponseTimer.

The Policy Engine shall transition to the **PE VCS DFP Wait for UFP VCONN** state when:

An Accept message is received and ٠

DFP current has VCONN turned on. ٠

The Policy Engine shall transition to the PE VCS DFP Turn On VCONN state when:

Page 470

• An Accept message is received and

• DFP current has VCONN turned off.

The Policy Engine shall transition back to either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

• <u>A Reject message is received or</u>

<u>A</u> Wait message is received or

• The SenderResponseTimer times out.

8.3.3.7.1.2 PE VCS DFP Wait for UFP VCONN state

On entry to the **PE VCS DFP Wait for UFP VCONN** state the Policy Engine shall start the **VCONNOnTimer**.

The Policy Engine shall transition to the **PE VCS DFP Turn Off VCONN** state when:

• <u>A PS_RDY message is received.</u>

The Policy Engine shall transition to either the **PE SRC Hard Reset** or **PE SNK Hard Reset** state when:

• The VCONNOnTimer times out.

8.3.3.7.1.3 PE_VCS_DFP_Turn_Off_VCONN state

On entry to the *PE VCS DFP Turn Off VCONN* state the Policy Engine shall tell the Device Policy Manager to turn off <u>VCONN</u>.

The Policy Engine shall transition back to the either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

• The DFP's VCONN is off.

8.3.3.7.1.4 PE VCS DFP Turn On VCONN state

On entry to the *PE VCS DFP Turn On VCONN* state the Policy Engine shall tell the Device Policy Manager to turn on <u>VCONN</u>.

The Policy Engine shall transition to the **PE VCS DFP Send PS Rdy** state when:

The DFP's VCONN is on.

8.3.3.7.1.5 PE VCS DFP Send PS Rdy state

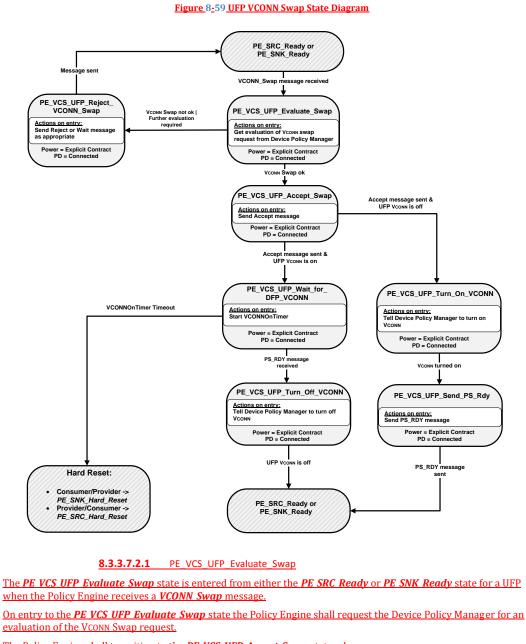

On entry to the **PE VCS DFP Send PS Rdy** the Policy Engine shall send a **PS_RDY** message.

The Policy Engine shall transition back to the either the PE SRC Ready or PE SNK Ready state for a DFP when:

• The **PS_RDY** message has been sent.

8.3.3.7.2 Type-C UFP VCONN Swap State Diagram

Figure 8-59 shows the state operation for an Upstream Facing Port (UFP) on receiving a V CONN Swap request.

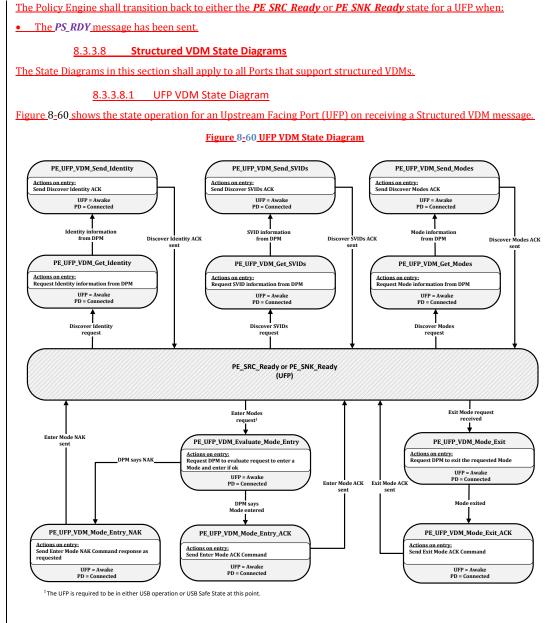

The Policy Engine shall transition to the **PE VCS UFP Accept Swap** state when:

The Device Policy Manager indicates that a VCONN Swap is ok. •

Page 472

The Policy Engine shall transition to the PE VCS UFP Reject Swap state when:				
 <u>The Device Policy Manager indicates that a VCONN Swap is ok or</u> <u>The Device Policy Manager indicates that a VCONN Swap cannot be done at this time.</u> 				
8.3.3.7.2.2 PE_VCS_UFP_Accept_Swap				
On entry to the PE VCS UFP Accept Swap state the Policy Engine shall send an Accept message.				
The Policy Engine shall transition to the PE VCS UFP Wait for DFP VCONN state when:				
<u>The Accept message has been sent and</u> <u>The UFP's VCONN is on.</u>				
The Policy Engine shall transition to the PE_VCS_UFP_Turn_On_VCONN state when:				
The Accept message has been sent and The UFP's VCONN is off.				
8.3.3.7.2.3 PE_VCS_UFP_Reject_Swap				
On entry to the PE VCS UFP Reject Swap state the Policy Engine shall request the Protocol Layer to send:				
 <u>A Reject message if the device is unable to perform a VCONN Swap at this time.</u> <u>A Wait message if further evaluation of the VCONN Swap request is required. Note: in this case it is expected that the DFP will send a VCONN Swap message at a later time.</u> 				
The Policy Engine shall transition back to either the PE SRC Ready or PE SNK Ready state when:				
• <u>The Reject or Wait message has been sent.</u>				
8.3.3.7.2.4 PE VCS UFP Wait for DFP VCONN				
On entry to the PE VCS UFP Wait for DFP VCONN state the Policy Engine shall start the VCONNOnTimer .				
The Policy Engine shall transition to the PE VCS UFP Turn Off VCONN state when:				
• <u>A PS_RDY_message is received.</u>				
The Policy Engine shall transition to either the PE SRC Hard Reset or PE SNK Hard Reset state when:				
• The <i>VCONNOnTimer</i> times out.				
8.3.3.7.2.5 PE VCS UFP Turn Off VCONN				
On entry to the <i>PE VCS UFP Turn Off VCONN</i> state the Policy Engine shall tell the Device Policy Manager to turn off <u>VCONN</u> .				
The Policy Engine shall transition back to either the PE_SRC_Ready or PE_SNK_Ready state for a UFP when:				
• The UFP's VCONN is off.				
8.3.3.7.2.6 PE VCS UFP Turn On VCONN				
<u>On entry to the PE VCS UFP Turn On VCONN state the Policy Engine shall tell the Device Policy Manager to turn on <u>VCONN.</u></u>				
The Policy Engine shall transition to the PE VCS UFP Send PS Rdy state when:				
• The UFP's VCONN is on.				
8.3.3.7.2.7 PE VCS UFP Send PS Rdy				
On entry to the PE VCS UFP Send PS Rdy state the Policy Engine shall send a PS_RDY message.				
USB Power Delivery Specification Revision <u>42</u> .0 <u>Version 1.0</u> Page 473				

8.3.3.8.1.1 PE UFP VDM Get Identity state

The Policy Engine transitions to the **PE UFP VDM Get Identity** state from either the **PE SRC Ready** or **PE SNK Ready** state for a UFP when:

Page 474

A Structured VDM Discover Identity Command request is received from the DFP.

On entry to the **PE UFP VDM Get Identity** state the UFP shall request identity information from the Device Policy Manager.

The Policy Engine shall transition to the **PE UFP VDM Send Identity** state when:

• Identity information is received from the Device Policy Manager.

8.3.3.8.1.2 PE UFP VDM Send Identity state

On entry to the **PE UFP VDM Send Identity** state the UFP shall send the Structured VDM **Discover Identity** ACK Command response.

The Policy Engine shall transition to either the PE SRC Ready or PE SNK Ready state for a UFP when:

The Structured VDM Discover Identity ACK Command response has been sent.

8.3.3.8.1.3 PE UFP VDM Get SVIDs state

The Policy Engine transitions to the *PE UFP VDM Get SVIDs* state from either the *PE SRC Ready* or *PE SNK Ready* state for a UFP when:

A Structured VDM Discover SVIDs Command request is received from the DFP.

On entry to the **PE UFP VDM Get SVIDs** state the UFP shall request SVIDs information from the Device Policy Manager.

The Policy Engine shall transition to the **PE UFP VDM Send SVIDs** state when:

• SVIDs information is received from the Device Policy Manager.

8.3.3.8.1.4 PE UFP VDM Send SVIDs state

On entry to the **PE UFP VDM Send SVIDs** state the UFP shall send the Structured VDM **Discover SVIDs** ACK Command response.

The Policy Engine shall transition to either the **PE SRC Ready** or **PE SNK Ready** state for a UFP when:

The Structured VDM Discover SVIDs ACK Command request has been sent.

8.3.3.8.1.5 PE UFP VDM Get Modes state

The Policy Engine transitions to the **PE_UFP_VDM_Get_Modes** state from either the **PE_SRC_Ready** or **PE_SNK_Ready** state for a UFP when:

• A Structured VDM *Discover Modes* Command request is received from the DFP.

On entry to the **PE UFP VDM Get Modes** state the UFP shall request Modes information from the Device Policy Manager.

The Policy Engine shall transition to the PE UFP VDM Send Modes state when:

Modes information is received from the Device Policy Manager.

8.3.3.8.1.6 PE UFP VDM Send Modes state

On entry to the **PE UFP VDM Send Modes** state the UFP shall send the Structured VDM **Discover Modes** ACK Command response.

The Policy Engine shall transition to either the **PE SRC Ready** or **PE SNK Ready** state for a UFP when:

The Structured VDM Discover Modes ACK Command response has been sent.

USB Power Delivery Specification Revision <u>+2</u>.0<u>, Version 1.0</u>

8.3.3.8.1.7 PE UFP VDM Evaluate Mode Entry state

The Policy Engine transitions to the **PE UFP VDM Evaluate Mode Entry** state from either the **PE SRC Ready** or **PE SNK Ready** state for a UFP when:

• A Structured VDM Enter Mode Command request is received from the DFP.

On Entry to the **PE UFP VDM Evaluate Mode Entry** state the Policy Engine shall request the Device Policy Manager to evaluate the **Enter Mode** Command request and enter the Mode indicated in the Command request if the request is acceptable.

The Policy Engine shall transition to the **PE UFP VDM Mode Entry ACK** state when:

• The Device Policy Manager indicates that the Mode has been entered.

The Policy Engine shall transition to the **PE UFP VDM Mode Entry NAK** state when:

The Device Policy Manager indicates that the Command response to the Enter Mode Command request is NAK.

8.3.3.8.1.8 PE UFP VDM Mode Entry ACK state

On entry to the **PE UFP VDM Mode Entry ACK** state the Policy Engine shall send a Structured VDM **Enter Mode** ACK Command response.

The Policy Engine shall transition to either the **PE SRC Ready** or **PE SNK Ready** state for a UFP when:

• The Structured VDM *Enter Mode* ACK Command response has been sent.

8.3.3.8.1.9 PE UFP VDM Mode Entry NAK state

On entry to the **PE UFP VDM Mode Entry NAK** state the Policy Engine shall send a Structured VDM **Enter Mode** NAK Command response as indicated by the Device Policy Manager.

The Policy Engine shall transition to either the **PE SRC Ready** or **PE SNK Ready** state for a UFP when:

The Structured VDM Enter Mode NAK Command response has been sent.

8.3.3.8.1.10 PE UFP VDM Mode Exit state

The Policy Engine transitions to the **PE UFP VDM Mode Exit** state from either the **PE SRC Ready** or **PE SNK Ready** state for a UFP when:

• A Structured VDM Exit Mode Command request is received from the DFP.

On entry to the **PE UFP VDM Mode Exit** state the Policy Engine shall request the Device Policy Manager to exit the Mode indicated in the Command.

The Policy Engine shall transition to the **PE UFP VDM Mode Exit ACK** state when:

• The indicated Mode has been exited.

8.3.3.8.1.11 PE UFP VDM Mode Exit ACK state

On entry to the **PE UFP VDM Mode Exit ACK** state the Policy Engine shall send a Structured VDM **Exit Mode** ACK Command response.

The Policy Engine shall transition to either the PE SRC Ready or PE SNK Ready state for a UFP when:

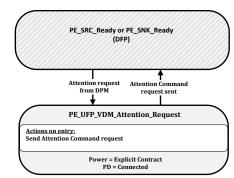

• The Structured VDM Exit Mode ACK Command response has been sent.

8.3.3.8.2 UFP VDM Attention State Diagram

Figure 8-68 shows the state diagram for a UFP when sending an *Attention* Command request.

Page **476**

8.3.3.8.2.1 PE UFP VDM Attention Request

The Policy Engine transitions to the **PE UFP VDM Attention Request** state from either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

• When the Device Policy Manager requests attention from the DFP.

On entry to the PE UFP VDM Attention Request state the Policy Engine shall send an Attention Command request.

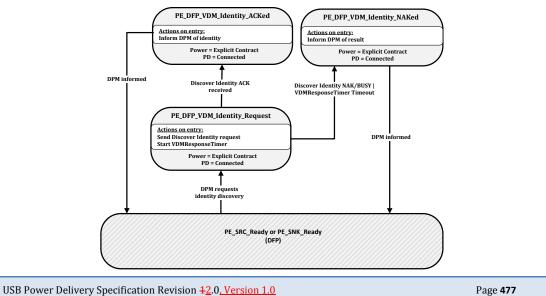

The Policy Engine shall transition to either the PE SRC Ready or PE SNK Ready state for a DFP when:

• The Attention Command request has been sent.

8.3.3.8.3 DFP VDM Discover Identity State Diagram

Figure 8-62 shows the state diagram for a DFP when discovering identity.

Figure 8-62 DFP VDM Discover Identity State Diagram

8.3.3.8.3.1 PE DFP VDM Identity Request state

The Policy Engine transitions to the **PE DFP VDM Identity Request** state from either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

• The Device Policy Manager requests the discovery of the identity of the Port Partner or a Cable Plug.

On entry to the **PE DFP VDM Identity Request** state the Policy Engine shall send a Structured VDM **Discover Identity** Command request and shall start the **VDMResponseTimer**.

The Policy Engine shall transition to the **PE DFP VDM Identity ACKed** state when:

A Structured VDM Discover Identity ACK Command response is received.

The Policy Engine shall transition to the **PE DFP VDM Identity NAKed** state when:

A Structured VDM *Discover Identity* NAK or BUSY Command response is received or

• The VDMResponseTimer times out.

8.3.3.8.3.2 PE_DFP_VDM_Identity_ACKed state

On entry to the **PE DFP VDM Identity ACKed** state the Policy Engine shall inform the Device Policy Manager of the Identity information.

The Policy Engine shall transition to either the PE SRC Ready or PE SNK Ready state for a DFP when:

• The Device Policy Manager has been informed.

8.3.3.8.3.3 PE DFP VDM Identity NAKed state

On entry to the *PE DFP VDM Identity NAKed* state the Policy Engine shall inform the Device Policy Manager of the result (NAK, BUSY or timeout).

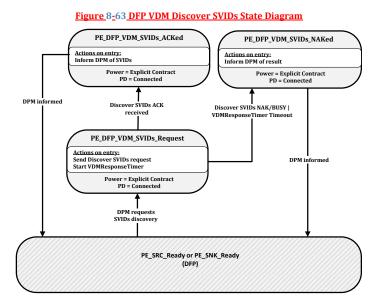

The Policy Engine shall transition to either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

• The Device Policy Manager has been informed.

8.3.3.8.4 DFP VDM Discover SVIDs State Diagram

Figure 8-63 shows the state diagram for a DFP when discovering SVIDs.

Page 478

8.3.3.8.4.1 PE DFP VDM SVIDs Request state

The Policy Engine transitions to the **PE DFP VDM SVIDs Request** state from either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

The Device Policy Manager requests the discovery of the SVIDs of the Port Partner or a Cable Plug.

On entry to the **PE DFP VDM SVIDs Request** state the Policy Engine shall send a Structured VDM **Discover SVIDs** Command request and shall start the **VDMResponseTimer**.

The Policy Engine shall transition to the **PE DFP VDM SVIDs ACKed** state when:

A Structured VDM Discover SVIDs ACK Command response is received.

The Policy Engine shall transition to the **PE DFP VDM SVIDs NAKed** state when:

A Structured VDM Discover SVIDs NAK or BUSY Command response is received or

• The VDMResponseTimer times out.

8.3.3.8.4.2 PE DFP VDM SVIDs ACKed state

On entry to the **PE DFP VDM SVIDs ACKed** state the Policy Engine shall inform the Device Policy Manager of the SVIDs information.

The Policy Engine shall transition to either the PE SRC Ready or PE SNK Ready state for a DFP when:

• The Device Policy Manager has been informed.

8.3.3.8.4.3 PE_DFP_VDM_SVIDs_NAKed state

On entry to the *PE DFP VDM SVIDs NAKed* state the Policy Engine shall inform the Device Policy Manager of the result (NAK, BUSY or timeout).

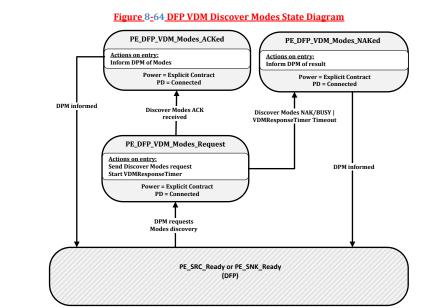

The Policy Engine shall transition to either the PE SRC Ready or PE SNK Ready state for a DFP when:

• The Device Policy Manager has been informed.

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

8.3.3.8.5 DFP VDM Discover Modes State Diagram

Figure 8-64 shows the state diagram for a DFP when discovering Modes.

8.3.3.8.5.1 PE DFP VDM Modes Request state

The Policy Engine transitions to the **PE DFP VDM Modes Request** state from either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

The Device Policy Manager requests the discovery of the Modes of the Port Partner or a Cable Plug.

On entry to the **PE DFP VDM Modes Request** state the Policy Engine shall send a Structured VDM **Discover Modes** Command request and shall start the **VDMResponseTimer**.

The Policy Engine shall transition to the **PE DFP VDM Modes ACKed** state when:

• A Structured VDM Discover Modes ACK Command response is received.

The Policy Engine shall transition to the **PE DFP VDM Modes NAKed** state when:

A Structured VDM *Discover Modes* NAK or BUSY Command response is received or
 The *VDMResponseTimer* times out.

8.3.3.8.5.2 PE DFP VDM Modes ACKed state

On entry to the **PE DFP VDM Modes ACKed** state the Policy Engine shall inform the Device Policy Manager of the Modes information.

The Policy Engine shall transition to either the PE SRC Ready or PE SNK Ready state for a DFP when:

• The Device Policy Manager has been informed.

Page 480

8.3.3.8.5.3 PE DFP VDM Modes NAKed state

On entry to the PE DFP VDM Modes NAKed state the Policy Engine shall inform the Device Policy Manager of the result (NAK, BUSY or timeout).

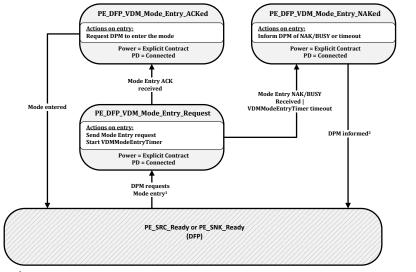

The Policy Engine shall transition to either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

The Device Policy Manager has been informed. •

8.3.3.8.6 DFP VDM Mode Entry State Diagram

Figure 8-65 shows the state operation for a DFP when entering a Mode.

Figure 8-65 DFP VDM Mode Entry State Diagram

¹ The Device Policy Manager is required to have place the system into USB Safe State before issuing this request when ² The Device Policy Manager is required to return the system to USB operation if not in Modal operation at this point.

8.3.3.8.6.1 PE DFP VDM Mode Entry Request state

The Policy Engine transitions to the PE DFP VDM Mode Entry Request state from either the PE SRC Ready or **PE SNK Ready** state for a DFP when:

The Device Policy Manager requests that the Port Partner or a Cable Plug enter a Mode. •

On entry to the PE DFP VDM Mode Entry Request state the Policy Engine shall send a Structured VDM Enter Mode Command request and shall start the VDMModeEntryTimer.

The Policy Engine shall transition to the **PE DFP VDM Mode Entry ACKed** state when:

A Structured VDM Enter Mode ACK Command response is received.

The Policy Engine shall transition to the **PE DFP VDM Mode Entry NAKed** state when:

A Structured VDM Enter Mode NAK or BUSY Command response is received or

The VDMModeEntryTimer times out.

USB Power Delivery Specification Revision 42.0, Version 1.0

8.3.3.8.6.2 PE DFP VDM Mode Entry ACKed state

On entry to the *PE DFP VDM Mode Entry ACKed* state the Policy Engine shall request the Device Policy Manager to enter the Mode.

The Policy Engine shall transition to either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

• The Device Policy Manager has been informed.

8.3.3.8.6.3 PE DFP VDM Mode Entry NAKed state

On entry to the **PE DFP VDM Mode Entry NAKed** state the Policy Engine shall inform the Device Policy Manager of the result (NAK, BUSY or timeout).

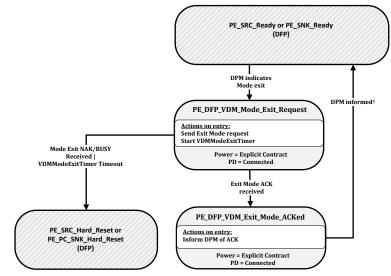

The Policy Engine shall transition to either the PE SRC Ready or PE SNK Ready state for a DFP when:

• The Device Policy Manager has been informed.

8.3.3.8.7 DFP VDM Mode Exit State Diagram

Figure 8-66 shows the state diagram for a DFP when exiting a Mode.

Figure 8-66 DFP VDM Mode Exit State Diagram

¹ The Device Policy Manager is required to return the system to USB operation at this point when exiting Modal Operation.

8.3.3.8.7.1 PE DFP VDM Mode Exit Request state

The Policy Engine transitions to the **PE DFP VDM Mode Exit Request** state from either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

• The Device Policy Manager requests that the Port Partner or a Cable Plug exit a Mode.

On entry to the **PE DFP VDM Mode Exit Request** state the Policy Engine shall send a Structured VDM **Exit Mode** Command request and shall start the **VDMModeExitTimer**.

Page 482

The Policy Engine shall transition to the **PE DFP VDM Mode Exit ACKed** state when:

• A Structured VDM Exit Mode ACK Command response is received.

- The Policy Engine shall transition to either the **PE SRC Hard Reset** or **PE PC SNK Hard Reset** state for a DFP when:
- A Structured VDM Exit Mode NAK or BUSY Command response is received or
- The VDMModeExitTimer times out.

8.3.3.8.7.2 PE DFP VDM DFP Mode Exit ACKed state

On Exit to the *PE DFP VDM Mode Exit ACKed* state the Policy Engine shall request the Device Policy Manager to exit the Mode.

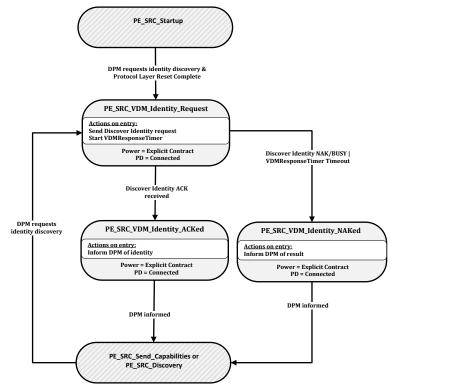

The Policy Engine shall transition to either the **PE_SRC_Ready** or **PE_SNK_Ready** state for a DFP when:

• The Device Policy Manager has been informed.

8.3.3.8.8 Source Startup VDM Discover Identity Diagram

Figure 8-67 shows the state diagram for Source discovery of identity information during the startup sequence.

Figure 8-67 Source Startup VDM Discover Identity Diagram

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

8.3.3.8.8.1 PE SRC VDM Identity Request state

The Policy Engine transitions to the PE SRC VDM Identity Request state from the PE SRC Startup state when:

• The Device Policy Manager requests the discovery of the identity of the Port Partner or a Cable Plug.

On entry to the **PE SRC VDM Identity Request** state the Policy Engine shall send a Structured VDM **Discover Identity** Command request and shall start the **VDMResponseTimer**.

The Policy Engine shall transition to the **PE SRC VDM Identity ACKed** state when:

A Structured VDM Discover Identity ACK Command response is received.

The Policy Engine shall transition to the PE SRC VDM Identity NAKed state when:

A Structured VDM Discover Identity NAK or BUSY Command response is received or

• The *VDMResponseTimer* times out.

8.3.3.8.8.2 PE SRC VDM Identity ACKed state

On entry to the *PE SRC VDM Identity ACKed* state the Policy Engine shall inform the Device Policy Manager of the Identity information.

The Policy Engine shall transition to the PE SRC Ready state when:

The Device Policy Manager has been informed.

8.3.3.8.8.3 PE SRC VDM Identity NAKed state

On entry to the *PE SRC VDM Identity NAKed* state the Policy Engine shall inform the Device Policy Manager of the result (NAK, BUSY or timeout).

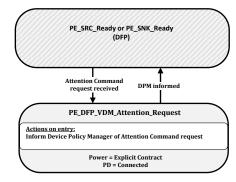

The Policy Engine shall transition to the PE SRC Ready state when:

• The Device Policy Manager has been informed.

8.3.3.8.9 DFP VDM Attention State Diagram

Figure 8-68 shows the state diagram for a DFP when receiving an Attention Command request.

Figure 8-68 DFP VDM Attention State Diagram

8.3.3.8.9.1 PE_DFP_VDM_Attention_Request

The Policy Engine transitions to the PE DFP VDM Attention Request state from either the PE SRC Ready or

PE SNK Ready state for a DFP when:

USB Power Delivery Specification Revision 2.0, Version 1.0.

• An Attention Command request is received.

On entry to the **PE DFP VDM Attention Request** state the Policy Engine shall inform the Device Policy Manager of the attention request.

The Policy Engine shall transition to either the **PE SRC Ready** or **PE SNK Ready** state for a DFP when:

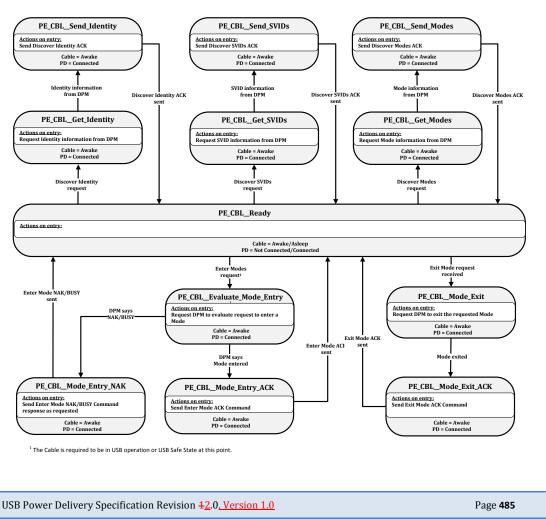

• The Device Policy Manager has been informed.

8.3.3.9 USB to USB Cable State Diagrams

The State Diagrams in this section shall apply to all Cable Plugs that support Structured VDMs.

8.3.3.9.1 General Cable VDM State Diagram

Figure 8-69 shows the general state diagram for a Cable Plug in response to Discover and Mode related requests.

8.3.3.9.1.1 PE CBL Ready state

The **PE CBL Ready** state is the normal operational state for a Cable Plug and where it starts after power up or a Hard/Cable Reset.

8.3.3.9.1.2 PE CBL Get Identity state

The Policy Engine transitions to the **PE CBL Get Identity** state from the **PE CBL Ready** state when:

A Structured VDM Discover Identity Command request is received from the DFP.

On entry to the **PE CBL Get Identity** state the Cable shall request identity information from the Device Policy Manager.

The Policy Engine shall transition to the **PE CBL Send Identity** state when:

Identity information is received from the Device Policy Manager.

8.3.3.9.1.3 PE CBL Send Identity state

On entry to the **PE CBL Send Identity** state the Cable shall send the Structured VDM **Discover Identity** ACK Command response.

The Policy Engine shall transition to the **PE CBL Ready** state when:

The Structured VDM *Discover Identity* ACK Command response has been sent.

8.3.3.9.1.4 PE CBL Get SVIDs state

The Policy Engine transitions to the **PE CBL Get SVIDs** state from the **PE CBL Ready** state when:

A Structured VDM *Discover SVIDs* Command request is received from the DFP.

On entry to the PE CBL Get SVIDs state the Cable shall request SVIDs information from the Device Policy Manager.

The Policy Engine shall transition to the PE CBL Send SVIDs state when:

• SVIDs information is received from the Device Policy Manager.

8.3.3.9.1.5 PE CBL Send SVIDs state

On entry to the **PE CBL Send SVIDs** state the Cable shall send the Structured VDM **Discover SVIDs** ACK Command response.

The Policy Engine shall transition to the **PE CBL Ready** state when:

• The Structured VDM *Discover SVIDs* ACK Command response has been sent.

8.3.3.9.1.6 PE CBL Get Modes state

The Policy Engine transitions to the **PE CBL Get Modes** state from the **PE CBL Ready** state when:

A Structured VDM Discover Modes Command request is received from the DFP.

On entry to the PE CBL Get Modes state the Cable shall request Modes information from the Device Policy Manager.

The Policy Engine shall transition to the **PE CBL Send Modes** state when:

Modes information is received from the Device Policy Manager.

8.3.3.9.1.7 PE CBL Send Modes state

On entry to the *PE CBL Send Modes* state the Cable shall send the Structured VDM *Discover Modes* ACK Command response.

Page **486**

The Policy Engine shall transition to the **PE CBL Ready** state when:

• The Structured VDM Discover Modes ACK Command response has been sent.

8.3.3.9.1.8 PE CBL Evaluate Mode Entry state

The Policy Engine transitions to the PE CBL Evaluate Mode Entry state from the PE CBL Ready state when:

A Structured VDM Enter Mode Command request is received from the DFP.

On Entry to the **PE CBL Evaluate Mode Entry** state the Policy Engine shall request the Device Policy Manager to evaluate the **Enter Mode** Command request and enter the Mode indicated in the Command request if the request is acceptable.

The Policy Engine shall transition to the **PE CBL Mode Entry ACK** state when:

• The Device Policy Manager indicates that the Mode has been entered.

The Policy Engine shall transition to the **PE CBL Mode Entry NAK** state when:

• The Device Policy Manager indicates that the response to the Mode request is NAK.

8.3.3.9.1.9 PE CBL Mode Entry ACK state

On entry to the **PE CBL Mode Entry ACK** state the Policy Engine shall send a Structured VDM **Enter Mode** ACK Command response.

The Policy Engine shall transition to the **PE_CBL_Ready** state when:

• The Structured VDM Enter Mode ACK Command response has been sent.

8.3.3.9.1.10 PE CBL Mode Entry NAK state

On entry to the **PE CBL Mode Entry NAK** state the Policy Engine shall send a Structured VDM **Enter Mode** NAK Command response as indicated by the Device Policy Manager.

The Policy Engine shall transition to the **PE CBL Ready** state when:

The Structured VDM Enter Mode NAK Command response has been sent.

8.3.3.9.1.11 PE CBL Mode Exit state

The Policy Engine transitions to the **PE CBL Mode Exit** state from the **PE CBL Ready** state when:

A Structured VDM *Exit Mode* Command request is received from the DFP.

On entry to the **PE CBL Mode Exit** state the Policy Engine shall request the Device Policy Manager to exit the Mode indicated in the Command.

The Policy Engine shall transition to the **PE CBL Mode Exit ACK** state when:

• The indicated Mode has been exited.

8.3.3.9.1.12 PE CBL Mode Exit ACK state

On entry to the **PE CBL Mode Exit ACK** state the Policy Engine shall send a Structured VDM **Exit Mode** ACK Command response.

The Policy Engine shall transition to the **PE CBL Ready** state when:

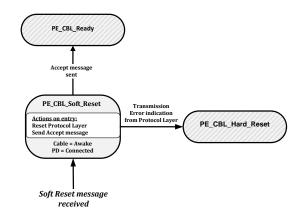

• The Structured VDM Exit Mode ACK Command response has been sent.

8.3.3.9.2 Cable Soft Reset State Diagram

Figure 8-70 shows the Cable Plug state diagram on reception of a Soft Reset message.

USB Power Delivery Specification Revision <u>42</u>.0, Version 1.0

Figure 8-70 Cable Soft Reset State Diagram

8.3.3.9.2.1 PE_CBL_Soft_Reset state

The **PE CBL Soft Reset** state shall be entered from any state when a Reset message is received from the Protocol Layer.

On entry to the **PE CBL Soft Reset** state the Policy Engine shall reset the Protocol Layer in the Cable Plug and shall then request the Protocol Layer to send an **Accept** message.

The Policy Engine shall transition to the **PE CBL Ready** state when:

• The Accept message has been sent.

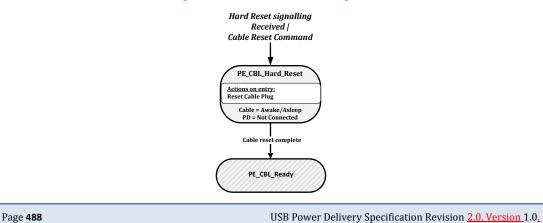

The Policy Engine shall transition to the **PE CBL Hard Reset** state when:

• The Protocol Layer indicates that a transmission error has occurred.

8.3.3.9.3 Cable Hard Reset State Diagram

Figure 8-71 shows the Cable Plug state diagram for a Hard Reset or Cable Reset.

Figure 8-71 Cable Hard Reset State Diagram

8.3.3.9.3.1 PE CBL Hard Reset state

The **PE CBL Hard Reset** state shall be entered from any state when either **Hard Reset** signaling or **Cable Reset** signaling is detected.

On entry to the **PE CBL Hard Reset** state the Policy Engine shall reset the Cable Plug (equivalent to a power cycle).

The Policy Engine shall transition to the **PE CBL Ready** state when:

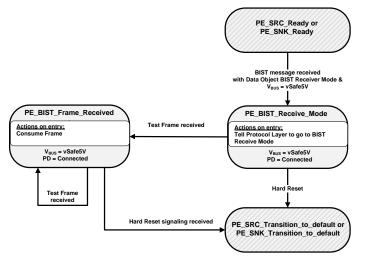

• The Cable Plug reset is complete.

8.3.3.10 BIST State diagrams

8.3.3.6.28.3.3.10.1 BIST Receive Mode State Diagram

Figure 8-72 shows the state diagram required by a UUT, which can be either a Source or Sink, when operating in BIST Receive Mode. Transitions to <u>PE BIST Receive ModeBIST Receive Mode</u> state shall be from the <u>Ready</u> state for either <u>Sourcethe PE SRC Ready</u> or <u>PE SNK Ready</u>Sink operation state.

Figure 8-72 BIST Receive Mode State Diagram

8.3.3.6.2.18.3.3.10.1.1 PE_BIST_Receive_Mode_state

The Source or Sink shall enter the <u>PE BIST Receive ModeBIST Receive Mode</u> state from <u>either</u> the <u>PE SRC ReadyReady or PE SNK Ready</u> state when a:

• <u>A</u> BIST message is received with a BIST Receiver Mode data object and V_{BUS} is at vSafe5V.

On entry to the <u>**PE BIST Receive ModeBIST Receive Mode</u>** state the Policy Engine shall tell the Protocol Layer to go to BIST Receive Mode.</u>

The Policy Engine shall transition to the <u>PE BIST Frame Received</u> State when:

• A test frame<u>Test Frame</u> is received.

The Policy Engine shall transition to <u>either</u> the <u>PE SRC Transition to default</u> state for <u>Source</u> or <u>PE SNK Transition to default</u> state (as appropriate) when:

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

• Hard Reset signaling is received.

8.3.3.6.2.28.3.3.10.1.2 PE_BIST_Frame_Received state

On entry to the <u>PE BIST Frame Received</u>BIST Frame Received state the Policy Engine shall consume a BIST Transmit Test Frame if one has been received.

The Policy Engine shall transition back to the **<u>PE BIST Frame Received</u>BIST Frame Received** state when:

The BIST Receive Test Frame has been received.

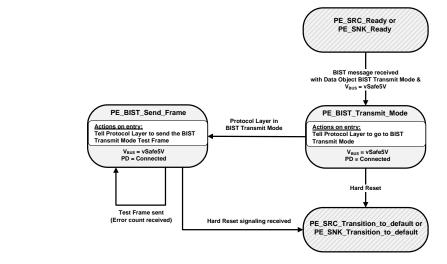

The Policy Engine shall transition to <u>either the **PE SRC Transition to default**</u> state for Source or <u>**PE SNK Transition to default**</u> state (as appropriate) when:

Hard Reset signaling is received.

8.3.3.6.38.3.3.10.2 BIST Transmit Mode State Diagram

Figure 8-73 shows the state diagram required by a UUT that can be either a Source or Sink, when operating in BIST Transmit Mode. Transitions to <u>PE BIST Transmit ModeBIST Transmit Mode</u> state shall be from <u>either</u> the <u>PE SRC ReadyReady</u> state for either Source or <u>PE SNK ReadySink operation state</u>.

Figure 8-73 BIST Transmit Mode State Diagram

8.3.3.6.3.18.3.3.10.2.1 PE_BIST_Transmit_Mode_state

The Source or Sink shall enter the <u>PE BIST Transmit ModeBIST Transmit Mode</u> state from <u>either</u> the <u>PE SRC ReadyReady</u> or <u>PE SNK Ready</u> state when a:

<u>A</u> BIST message is received with a BIST Transmit Mode data object and V_{BUS} is at vSafe5V.

On entry to the <u>PE BIST Transmit Mode</u>BIST Transmit Mode state the Policy Engine shall tell the Protocol Layer to go to BIST Transmit Mode.

The Policy Engine shall transition to the <u>PE BIST Send Frame</u> state when:

The Protocol Layer is in BIST Transmit Mode.

The Policy Engine shall transition to <u>either</u> the <u>PE SRC Transition to default</u> state for Source or <u>PE SNK Transition to defaultSink state</u> (as appropriate) when:

Page 490

• Hard Reset signaling is received.

8.3.3.6.3.28.3.3.10.2.2 PE_BIST_Send_Frame_state

On entry to the <u>**PE BIST Send FrameBIST Send Frame</u>** state the Policy Engine shall tell the Protocol Layer to send the next BIST Transmit Test Frame in the PRBS sequence.</u>

The Policy Engine shall transition back to the <u>PE BIST Send Frame</u>BIST Send Frame state when:

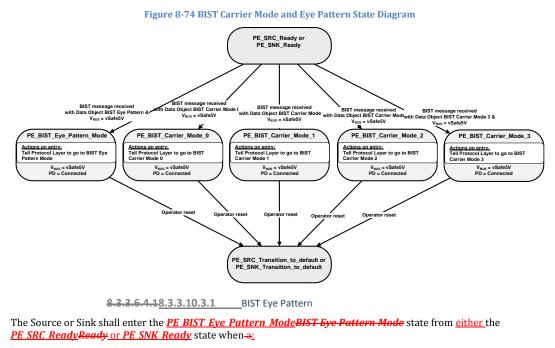

The BIST Transmit Test Frame has been sent (a *BIST* message with a *BISTErrorCounter* data object has been received).

The Policy Engine shall transition to <u>either</u> the <u>PE SRC Transition to default</u> state for Source or <u>PE SNK Transition to default</u> state (as appropriate) when:

• Hard Reset signaling is received.

8.3.3.6.48.3.3.10.3 BIST Carrier Mode and Eye Pattern State Diagram

Figure 8-74 shows the state diagram required by a UUT, which can be either a Source or Sink, when operating in *BIST Eye Pattern, BIST Carrier Mode 0, BIST Carrier Mode 1, BIST Carrier Mode 2* or *BIST Carrier Mode 3*. Transitions to any of the Test Mode states shall be from the *Ready* state for either <u>Source the PE SRC Ready</u> or <u>PE SNK ReadySink</u> operation state.

- <u>A</u> BIST message is received with a BIST Eye Pattern data object and $\frac{V_{BUS}}{V_{BUS}}$ is at.
- V_{BUS} is at vSafe5V.

On entry to the <u>PE BIST Eye Pattern ModeBIST Eye Pattern</u> state the Policy Engine shall tell the Protocol Layer to go to BIST Eye Pattern Test Mode.

USB Power Delivery Specification Revision <u>42</u>.0. Version <u>1.0</u>

The Policy Engine shall transition to <u>either</u> the <u>PE SRC Transition to default</u> state for Source or <u>PE SNK Transition to default</u> state (as appropriate) when:

• There is an operator reset of the UUT.

8.3.3.6.4.28.3.3.10.3.2 BIST Carrier Mode 0

The Source or Sink shall enter the <u>PE BIST Carrier Mode 0</u> state from <u>either</u> the <u>PE SRC ReadyReady</u> or <u>PE SNK Ready</u> state when a:

• <u>A BIST message is received with a BIST Carrier Mode 0 data object and $\frac{V_{BUS}}{V_{BUS}}$ is at.</u>

• V_{BUS} is at vSafe5V.

On entry to the <u>PE BIST Carrier Mode OBIST Carrier Mode O</u> state the Policy Engine shall tell the Protocol Layer to go to BIST Carrier Purity Mode 0.

The Policy Engine shall transition to <u>either</u> the <u>PE SRC Transition to defaultTransition to default</u> state for <u>Source</u> or <u>PE SNK Transition to defaultSink state</u> (as appropriate) when:

• There is an operator reset of the UUT.

8.3.3.6.4.38.3.3.10.3.3 BIST Carrier Mode 1

The Source or Sink shall enter the <u>PE BIST Carrier Mode 1BIST Carrier Mode 1</u> state from <u>either</u> the <u>PE SRC ReadyReady</u> or <u>PE SNK Ready</u> state when a:

- <u>A</u> BIST message is received with a BIST Carrier Mode 1 data object and ¥_{BUS} is at.
- V_{BUS} is at vSafe5V.

On entry to the <u>PE BIST Carrier Mode 1BIST Carrier Mode 1</u> state the Policy Engine shall tell the Protocol Layer to go to BIST Carrier Purity Mode 1.

The Policy Engine shall transition to <u>either</u> the <u>PE SRC Transition to default</u> state for <u>Source</u> or <u>PE SNK Transition to default</u> state (as appropriate) when:

• There is an operator reset of the UUT.

8.3.3.6.4.48.3.3.10.3.4 BIST Carrier Mode 2

The Source or Sink shall enter the <u>PE BIST Carrier Mode 2BIST Carrier Mode 2</u> state from <u>either</u> the <u>PE SRC ReadyReady</u> or <u>PE SNK Ready</u> state when a:

- <u>A</u> BIST message is received with a BIST Carrier Mode 2 data object and ¥_{BUS} is at.
- V_{BUS} is at vSafe5V.

On entry to the <u>PE BIST Carrier Mode 2BIST Carrier Mode 2</u> state the Policy Engine shall tell the Protocol Layer to go to BIST Carrier Purity Mode 2.

The Policy Engine shall transition to <u>either the **PE SRC Transition to default Transition to default**</u> state for Source or <u>**PE SNK Transition to default**</u> state (as appropriate) when:

• There is an operator reset of the UUT.

8.3.3.6.4.58.3.3.10.3.5 BIST Carrier Mode 3

The Source or Sink shall enter the <u>PE BIST Carrier Mode 3BIST Carrier Mode 3</u> state from <u>either</u> the <u>PE SRC ReadyReady</u> or <u>PE SNK Ready</u> state when a:

<u>A</u> BIST message is received with a BIST Carrier Mode 3 data object and <u>V_{BUS} is at</u>.
 V_{BUS} is at vSafe5V.

On entry to the <u>PE BIST Carrier Mode 3BIST Carrier Mode 3</u> state the Policy Engine shall tell the Protocol Layer to go to BIST Carrier Mode 3.

Page **492**

The Policy Engine shall transition to <u>either</u> the <u>PE SRC Transition to default</u> state for Source or <u>PE SNK Transition to default</u> state (as appropriate) when:

• There is an operator reset of the UUT.

8.3.3.11 Type-C Referenced States

This section contains states cross-referenced from the [USBType-C1.0] specification.

8.3.3.11.1 ErrorRecovery state

The *ErrorRecovery* state is used to electronically disconnect Port Partners using the Type-C connector. The *ErrorRecovery* state shall be entered when there are errors on Type-C Ports which cannot be recovered by Hard Reset.

On entry to the ErrorRecovery state the Contract and PD Connection shall be ended.

On exit from the *ErrorRecovery* state a new Explicit Contract should be established once the Port Partners have reconnected over the CC wire.

8.3.3.12 Policy Engine States

Table 8-34 lists the states used by the various state machines.

Table 8-34 Policy Engine States

<u>State name</u>	Section
Source Port	
PE_SRC_Startup	8.3.3.2.1
<u>PE_SRC_Discovery</u>	8.3.3.2.2

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

9. System Policy

9.1 Overview

This chapter describes the requirements of the USB Power Delivery Specification's System Policy and Status mechanisms for devices with data connections (e.g. D+/D- and or SSTx+/- and SSRx+/-). The Policies themselves are not described here; these are left to the implementers of the relevant products and systems to define. The aim of these mechanisms is to support a System USB Power Delivery Policy Manager (SPM) which:

- Provides feedback of system power status to the end user as and when appropriate
- Provides co-ordination of system power resources based on a system wide policy when enabled
- · Exposes relevant policy settings to the end user
- Allows a device to report its capabilities in relation to the power it draws

All PD Capable USB (PDUSB) Devices shall report themselves as self-powered devices (over USB) when plugged into a PD capable portPort even if they are entirely powered from V_{BUS} . However, there are some differences between PD and [USB2.0] / [USB3.1]_{ri} for example, the presence of V_{BUS} alone does not mean that the device (Consumer) moves from the USB Attached state to the USB Powered state. Similarly the removal of V_{BUS} alone does not move the device (Consumer) from any of the USB states to the Attached state. See Section 9.1.2 for details.

PDUSB Devices shall follow the PD requirements when it comes to suspend (see Section 6.4.1.2.3.2), configured, and operational power. The PD requirements when the device is configured, or operational are defined in this section (see Table 9-4). Note that the power requirements reported in the PD Consumer Port descriptor of the device shall override the power draw reported in the *bMaxPower* field in the configuration descriptor. A PDUSB Device shall report zero in the *bMaxPower* field after successfully negotiating a mutually agreeable power contractContract and shall disconnect and re-enumerate when it switches operation back to operating in standard [USB2.0], [USB3.1], [USBType-C1.0] or [BC1.2] mode it shall report its power draw via the *bMaxPower* field.

As shown in Figure 9-1, each Provider and Consumer will have their own Local Policies which operate between directly connected ports. An example of a typical PD system is shown in Figure 9-1. This example consists of a Provider, Consumer/Providers and Consumers connected together in a tree topology. Between directly connected devices there is both a flow of Power and also Communication consisting of both Status and Control information.

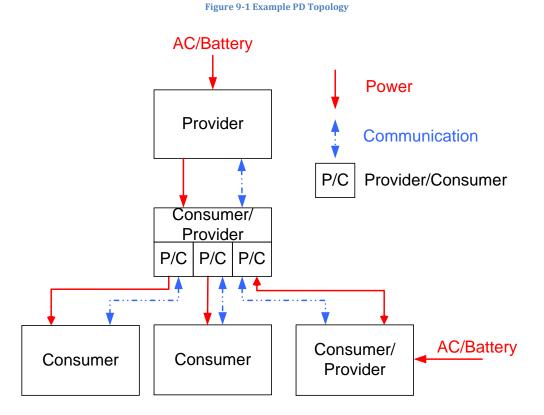

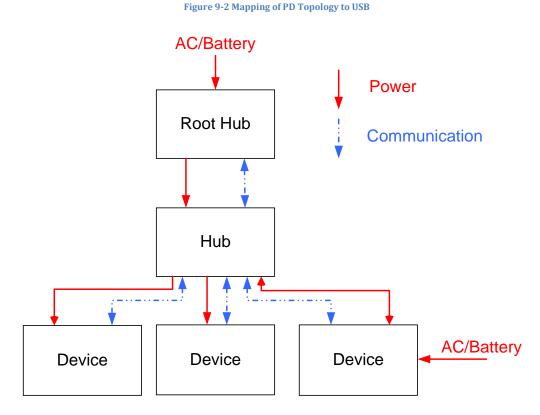

Figure 9-2 shows how this same topology can be mapped to USB. In a USB based system, policy is managed by the host and communication of system level policy information is via standard USB data line communication. This is a separate mechanism to the USB Power Delivery V_{BUS} protocol which is used to manage Local Policy. When USB data line communication is used, status information and control requests are passed directly between the System Policy Manager (SPM) on the host and the Provider or Consumer.

Status information comes from a Provider or Consumer to the SPM so it can better manage the resources on the host and provide feedback to the end user. Control information comes from the SPM to the Provider or Consumer allowing the SPM to manage resources at a system level and expose relevant settings to the end user.

Real systems will be a mixture of devices which in terms of power management support may have implemented PD, [USB3.0]_[USB3.1].[

Information which will be communicated to the SPM is as follows:

- Versions of <u>Type-C Current</u>, PD and BC supported
- Capabilities of each Provider/Consumer including a per portPort summary for Providers
- Current operational state of each Port e.g. Standard, Type-C Current, BC, PD and negotiated power level
- Status of AC or Battery Power for each PDUSB Device in the system

The SPM can negotiate with Providers or Consumers in the system in order to request a different Local Policy, or to request the amount of power to be delivered by the Provider to the Consumer. Any change in Local Policy could trigger a renegotiation of the <u>USB Power Delivery contractContract</u>, using USB Power Delivery protocols, between a directly connected Provider and Consumer. A change in how much power is to be delivered will, for example, cause a renegotiation.

9.1.1 PDUSB Device and Hub Requirements

All PDUSB Devices with data lines shall return all relevant descriptors mentioned in this chapter. PDUSB Hubs shall also support a PD notification capability as defined in this chapter. In addition, a PDUSB Hubs shall support the capability to return the PD specific capabilities of a device that is attached to any of its downstream ports. <u>PDUSB Hubs shall support Local Policy Mode and shall report the appropriate status information in response to any status requests from the System Policy Manager when operating in Local Policy Mode. In addition PDUSB Hubs may support Hybrid and/or Intrusive Policy Modes (see Section 0Additionally, a PDUSB Hubs may reject System Policy manager</u>

requests, but should make a reasonable effort to comply if it is able to do so.). Note that in a USB Hub, the notifications are sent over the USB Hub notification endpoint.

9.1.2 Mapping to USB Device States

As mentioned in Section 9.1 a PDUSB Device reports itself as a self-powered device. However, the device shall determine whether or not it is in the USB Attached or USB Powered states as described in Figure 9-3, Figure 9-4 and Figure 9-5. All other USB states of the PDUSB Device shall be as described in Chapter 9 of *[USB2.0]* and *[USB3.1]*.

Figure 9-3 shows how a PDUSB Device determines when to transition from the USB Attached to the USB Powered state.

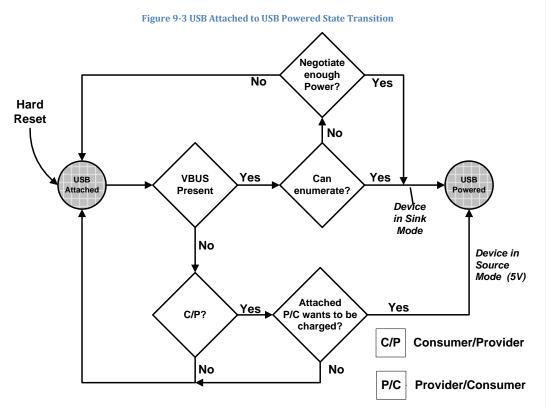

Figure 9-4 shows how a PDUSB Device determines when to transition from the USB Powered state to the USB Attached state when the device is a Consumer. A PDUSB Device determines that <u>it</u> is <u>swapping rolesperforming a</u> <u>Power Role Swap</u> as described in Sections 8.3.2.7.1.1 and 8.3.2.7.1.2. <u>See Section 7.1.6-for additional information on device behavior during Hard Resets.</u>

Page 502

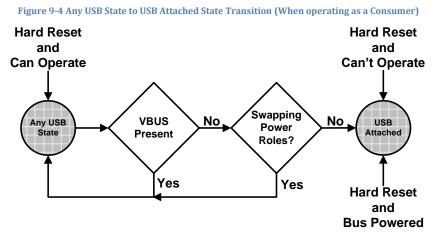

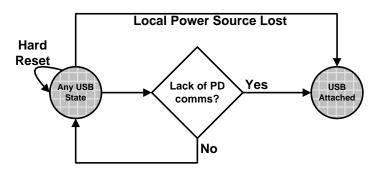

Figure 9-5 shows how a PDUSB Device determines when to transition from the USB Powered state to the USB Attached state when the device is a Provider.

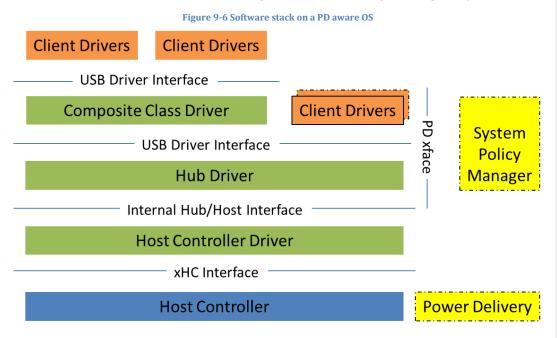

Figure 9-5 Any USB State to USB Attached State Transition (When operating as a Provider)

9.1.3 PD Software Stack

Figure 9-6 gives an example of the software stack on a PD aware OS. In this stack we are using the example of a system with an xHCl based controller. The USB Power Delivery hardware may or may not be a part of the xHC. The software that controls the USB Power Delivery hardware is called the System Policy Manager (SPM) in this specification.

It is expected that the SPM will expose an interface that can be used by an updated hub driver and updated client drivers that wish to interact with PDUSB Hubs and <u>Peripheral DevicesPDUSB Peripherals</u> respectively.

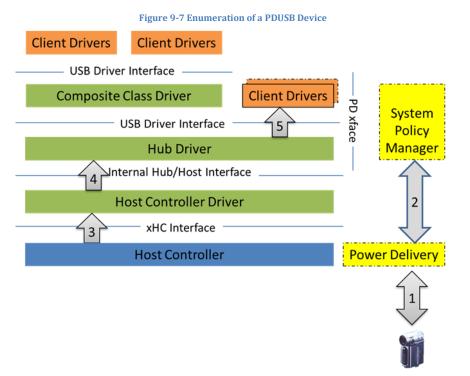

9.1.4 PDUSB Device Enumeration

As described earlier, a PDUSB Device acts as a self-powered device with some caveats with respect to how it transitions from the USB Attached state to USB Powered state. Figure 9-7 gives a high level overview of the enumeration steps involved due to this change. A PDUSB Device will first (Step1) interact with the Power Delivery hardware and the Local Policy manager to determine whether or not it can get sufficient power to enumerate/operate. Note: PD is likely to have established a <u>contractContract</u> prior to enumeration. The SPM will be notified (Step 2) of the result of this negotiation between the Power Delivery hardware and the PDUSB Device. It may request changes to the Local Policy manager if it deems it necessary. After successfully negotiating a mutually agreeable <u>power contractContract</u> the device will signal a connect to the xHC. The standard USB enumeration process (Steps 3, 4 and 5) is then followed to load the appropriate driver for the function(s) that the PD USB Device exposes.

It is the responsibility of the SPM to ensure that the total amount of power supplied to a PDUSB Device is sufficient to run as many of the functions exposed by the device as software needs to operate at the same time.

Note that the interfaces between the SPM and USB Power Delivery blocks in Figure 9-6 are outside scope of this specification.

If a PDUSB Device cannot perform its intended function with the amount of power that it can get from the **portPort** it is connected to then the host system should display a message (on a PD aware OS) about the failure to provide sufficient power to the device. In addition the device shall follow the requirements listed in Section 8.2.5.2.1.

9.2 PD Class Specific Descriptors

A PDUSB Device shall return all relevant descriptors mentioned in this section.

The device shall return its capability descriptors as part of the device's Binary Object Store (BOS) descriptor set. Table 9-1 lists the type of PD device capabilities.

Capability Code	Value	Description
POWER_DELIVERY_CAPABILITY	06H	Defines the various PD Capabilities of this device
BATTERY_INFO_CAPABILITY	07H	Provides information on each battery supported by the device
PD_CONSUMER_PORT_CAPABILITY	08H	The consumer<u>Consumer</u> characteristics of a portPort on the device
PD_PROVIDER_PORT_CAPABILITY	09H	The provider characteristics of a portPort on the device

Table 9-1 USB Power Delivery Type Codes

9.2.1 USB Power Delivery Capability Descriptor

Table 9-2 USB Power Delivery Capability Descriptor

Field	Size	Value	Description			
bLength	1	Number	Size of descriptor			
bDescriptorType	1	Constant	DEVICE CAPABILITY Descriptor type			
bDevCapabilityType	1	Constant	Capability type: POWER_DELIVERY_CAPABILITYPOWER_DELIVERY_CAPABIL ITY			
bReserved	1	Reserved	Shall be set to zero.			
bmAttributes	4	Bitmap	Bitmap encoding of supported device level features. A value of one in a bit location indicates a feature is supported; a value of zero indicates it is not supported. Encodings are: Bit Description 0 Reserved. Shall be set to zero. 1 Battery Charging. This bit shall be set to one to indicate this device supports the Battery Charging Specification as per the value reported in the <i>bcdBCVersion</i> field. 2 USB Power Delivery. This bit shall be set to one to indicate this device supports the USB Power Delivery Specification as per the value reported in the <i>bcdPDVersion</i> field. 3 Provider. This bit shall be set to one to indicate this device is capable of providing power. This field is only valid if Bit 2 is set to one. 4 Consumer. This bit shall be set to one to indicate that this device is a consumer of power. This field is only valid if Bit 2 is set to one. 5 This bit shall be set to 1 to indicate that this device supports the EARGING POLICY feature does not require a BC or PD mechanism to be implemented. 6 USB Type-C Current. This bit shall be set to an et to indicate this device supports power capabilities defined in the USB Type-C Specification as per the value reported.			
	bLength bDescriptorType bDevCapabilityType bReserved	bLength 1 bDescriptorType 1 bDevCapabilityType 1 bReserved 1	bLength 1 Number bDescriptorType 1 Constant bDevCapabilityType 1 Constant bReserved 1 Reserved			

Page **506**

Offset	Field	Size	Value	Descrip	tion			
				 7:5 Reserved. Shall be set to zero. 15:8 bmPowerSource. At least one of the following bits 8, 9 and 14 shall be set to indicate which power sources are supported. 				
					Bit Description			
					8	AC Supply		
					9	Battery		
					10	Other		
					13:11	NumBatteries. This field shall only be valid when the Battery field is set to one and shall be used to report the number of batteries in the device.		
					14	Uses V _{BUS}		
					15	Reserved and shall be set to zero.		
				31:16	Reserved	d and shall be set to zero.		
8	bmProviderPorts	2	Bitmap	The bit corresponding to the portPort shall be set to one to indicate that this device is capable of providing power on that portPort . (Either BC 1.2. <u>USB Type-C Current</u> or PD) Bit zero refers to the upstream port<u>UFP</u> of the device. Bits one through fifteen are only valid for hubs and refers to the downstream ports of the hub.				
10	bmConsumerPorts	2	Bitmap	downstream ports of the hub. The bit corresponding to the portPort shall be set to one to indicate that this device is capable of consuming power on that portPort . (Either BC 1.2, <u>USB Type-C Current</u> or PD). Bit zero refers to the <u>upstream portUFP</u> of the device. Bits one through fifteen are only valid for hubs and refers to the downstream ports of the hub.				
12	bcdBCVersion	2	BCD	Battery Charging Specification Release Number in Binary- Coded Decimal (i.e., 2.10, g., V1.20 is 210H120H). This field shall only be valid if the device indicates that it supports BC in the <i>bmAttributes</i> field.				
14	bcdPDVersion	2	BCD	Coded Dec	imal. This	Specification Release Number in Binary- field shall only be valid if the device orts PD in the <i>bmAttributes</i> field.		
<u>16</u>	bcdUSBTypeCVersion	2	BCD	Decimal. T	his field sh	tion Release Number in Binary-Coded tall only be valid if the device indicates Type-C in the <i>bmAttributes</i> field.		

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

9.2.2 Battery Info Capability Descriptor

A PDUSB Device shall support this capability descriptor if it reported that one of its power sources was a Battery in the *bmPowerSource* field in its Power Deliver Capability Descriptor. It shall return one Battery Info Descriptor per battery it supports.

Offset	Field	Size	Value	Description
0	bLength	1	Number	Size of descriptor
1	bDescriptorType	1	Constant	DEVICE CAPABILITY Descriptor type
2	bDevCapabilityType	1	Constant	Capability type: BATTERY_INFO_CAPABILITYBATTERY_INFO_CAPABILITY
3	iBattery	1	Index	Index of string descriptor shall contain the user friendly name for this battery.
4	iSerial	1	Index	Index of string descriptor shall contain the Serial Number String for this battery.
5	iManufacturer	1	Index	Index of string descriptor shall contain the name of the Manufacturer for this battery.
6	bBatteryId	1	Number	Value shall be used to uniquely identify this battery in status messages.
7	bReserved	1	Number	Reserved and shall be set to zero.
8	dwChargedThreshold	4	mWh	Shall contain the Battery Charge value above which this battery is considered to be fully charged but not necessarily "topped off."
12	dwWeakThreshold	4	mWh	Shall contain the minimum charge level of this battery such that above this threshold, a device can be assured of being able to power up successfully (see Battery Charging 1.2).
16	dwBatteryDesignCapacity	4	mWh	Shall contain the design capacity of the battery.
20	dwBatteryLastFullcharge Capacity	4	mWh	Shall contain the maximum capacity of the battery when fully charged.

Table 9-3 Battery Info Capability Descriptor

9.2.3 PD Consumer Port Capability Descriptor

A PDUSB Device shall support this capability descriptor if it reported that one, or more, of its ports are a Consumer **portPort**, as described in the *bmConsumerPorts* field in its Power Deliver Capability Descriptor. It shall return one PD Consumer Port Capability descriptor per **portPort** that is a Consumer. The order of the descriptors shall be **portPort** order number (low to high).

A PDUSB Peripheral Device shall have at most one Consumer or Consumer/Provider portPort. A PDUSB Hub may have a maximum of sixteen Consumer capable ports (Consumer, Consumer/Provider or Provider/Consumer).

Offset	Field	Size	Value	Description			
0	bLength	1	Number	Size of descriptor			
1	bDescriptorType	1	Constant	DEVICE CAPABILITY Descriptor type			
2	bDevCapabilityType	1	Constant	Capability type: PD_CONSUMER_PORT_CAPABILITYPD_CONSUMER_PORT_CA PABILITY			
3	bReserved	1	Number	Reserved and shall be set to zero.			
4	bmCapabilities	2	Bitmap	Capability: This field shall indicate the specification the Consumer port<u>Port</u> will operate under.			
				Bit Description			
				0 Battery Charging (BC)			
				1 USB Power Delivery (PD)			
				2 USB Type-C Current			
				15:23 Reserved and shall be set to zero.			
6	wMinVoltage	2	Number	Shall contain the minimum voltage in 50mV units that this Consumer is capable of operating at.			
8	wMaxVoltage	2	Number	Shall contain the maximum voltage in 50mV units that this Consumer is capable of operating at.			
10	wReserved	2	Number	Reserved and shall be set to zero.			
12	dwMaxOperatingPower	4	Number	Shall contain the maximum power in 10mW units this Consumer can draw when it is in a steady state operating mode.			
16	dwMaxPeakPower	4	Number	Shall contain the maximum power in 10mW units this Consumer can draw for a short duration of time (dwMaxPeakPowerTime) before it falls back into a steady state.			
20	dwMaxPeakPowerTime	4	Number	Shall contain the time in 100ms units that this Consumer can draw peak current.			
				A device shall set this field to 0xFFFF if this value is unknown.			

Table 9-4 PD Consumer Port Descriptor

9.2.4 PD Provider Port Capability Descriptor

A PDUSB Device shall support this capability descriptor if it reported that one or more of its ports is a Provider portPort, as described in the *bmProviderPorts* field in its Power Deliver Capability Descriptor. It shall return one PD Provider Port Capability descriptor per portPort that is a Provider. The order of the descriptors will be portPort order number (low to high).

A PDUSB Peripheral Device-shall have at most one Provider portPort. A PDUSB Hub can have a maximum of sixteen Provider ports.

USB Power Delivery Specification Revision <u>42</u>.0, <u>Version 1.0</u>

Offset	Field	Size	Value	Description			
0	bLength	1	Number	Size of descriptor			
1	bDescriptorType	1	Constant	DEVICE CAPABILITY Descriptor type			
2	bDevCapabilityType	1	Constant	Capability type: PD_PROVIDER_PORT_CAPABILITYPD_PROVIDER_PORT_CAP ABILITY ABILITY			
3	bReserved	1	Number	Reserved and shall be set to zero.			
4	bmCapabilities	2	Bitmap	This field shall indicate the specification the Provider portPort will operation under.			
				Bit Description			
				0 Battery Charging (BC)			
				1 USB Power Delivery (PD)			
				2 USB Type-C Current			
				15:2 <u>3</u> Reserved. Shall be set to zero.			
6	bNum0fPD0bjects	1	Number	Shall indicate the number of Power Data Objects.			
7	bReserved	1	Number	Reserved and shall be set to zero.			
8	wPowerDataObject1	4	Bitmap	Shall contain the first Power Data Object supported by this Provider port <u>Port</u> . See Section 6.4.1 for details of the Power Data Objects.			
N+4	wPowerDataObjectN	4	Bitmap	Shall contain the 2 nd and subsequent Power Data Objects supported by this Provider port <u>Port</u> . See Section 6.4.1 for details of the Power Data Objects.			

Table 9-5 PD Provider Port Descriptor

9.3 PD Class Specific Requests and Events

A PDUSB Hub that is compliant to this specification shall support the PD specific requests and events detailed in this section irrespective of whether the PDUSB Hub is a Power Provider, a Power Consumer, or both.

A PDUSB Device that is compliant to this specification shall support the battery related requests if it has a battery.

The events shall be sent to the system software in response to changes on the PDUSB Hub ports that are not a direct result of a request from system software. These notifications shall be sent over the Interrupt endpoint of a PDUSB Hub.

Note that a PDUSB Hub shall only send these notifications, or respond to PD requests (except for GetBatteryStatus); if it has been made aware that the SPM is active on the host as detailed in Section 9.4.4.

9.3.1 Class-specific Requests

The PD class defines requests to which PDUSB Devices shall respond as outlined in Table 9-6. All<u>valid</u> requests in Table 9-6 shall be implemented by PDUSB devices with data lines and PDUSB hubs<u>Devices</u>.

Page 510

C_PORT_PD_CHANGE	Port	49
<u>CABLE PD_RESET</u>	Port	<u>50</u>
CHARGING POLICY	Device	<u>54</u>

9.3.2 PDUSB Hub Event Reporting

PDUSB Hubs shall report events back to the system via the "Port N change detected" bit in the PDUSB Hub Status Change bitmap returned via the PDUSB Hub notification endpoint. 'N' refers to the portPort number of the portPort on which a PD change has occurred.

In order to indicate that a PD change occurred, a PDUSB Hub compliant to the PD class shall set Bit 15 *C_PORT_PD_CHANGE*^{"C_PORT_PD_CHANGE"} in the Port Change field when queried using the standard Get Port Status <u>commandrequest</u>.

A PDUSB Hub shall send these notifications for all downstream ports irrespective of whether it is a Consumer or Provider on that <u>portPort</u>. For example, if a PDUSB Peripheral-<u>Device</u> is a Provider on one of the downstream ports and it starts a negotiation to change the amount of power it will deliver – the PDUSB Hub sends a Port Change notification to the SPM. However, if the PDUSB Hub loses all power (e.g. the power Provider is unplugged) then it is

USB Power Delivery Specification Revision 2.0, Version 1.0.

sufficient if the PDUSB Hub disconnects from the downstream portPort it is attached to without sending any notifications.

9.4 PDUSB Hub and PDUSB Peripheral Device Requests

9.4.1 Clear Port PD Feature Clear Port PD Feature (PDUSB Hub)

This request resets a value reported in the PDUSB Hub status. This request is only valid for hubs.

bmRequestType	bRequest	WValue	wIndex	wLength	Data	
00100011B	CLEAR_FEATURE	Feature Selector	Port Number	Two	Clear Change Mask	

The **portPort** number shall be a valid **portPort** number for that PDUSB Hub, greater than zero. The **portPort** field is located in bits 7..0 of the *wIndex* field.

Refer to Table 9-8 for the feature selector definitions that shall apply to the <u>portPort</u> as a recipient. If the feature selector is associated with a status change, the Clear Change Mask shall define the status changes that are being acknowledged by the SPM. Only when all the status changes in PD Status Change field (see Table 9-11) are acknowledged shall the hub clear the *C_PORT_PD_CHANGEG_PORT_PD_CHANGE* bit in the <u>port'sPort's</u> Port Change field. The Clear Change Mask is defined in Table 9-9.

Table 9-9 Clear Change Mask

Bit	Change Acknowledged when bit is set	
0	Reserved	
1	External supply.	
2	Port operation mode	
3	Supported Provider Capabilities	
4	Negotiated power level	
5	New power direction	
6	PD Reset Complete	
7	Insertion Detect	
8	PD Capable Cable	
9	9 Request Rejected	
10	Reserved	
11	HybridModeHybrid Mode Request

<u>13</u>	VDM Received	
13- 14	13-14 Reserved	
15	Error	

USB Power Delivery Specification Revision <u>+2</u>.0. Version <u>1.0</u>

It shall be a Request Error if *wValue* is not a feature selector listed in Table 9-8, or if *wIndex* specifies a portPort that does not exist, or if *wLength* is not as specified above.

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

9.4.2 Get Battery Status GetBattery Status (PDUSB Hub/Peripheral Device)

This request returns the current status of the battery in a PDUSB Hub/Peripheral-Device.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
10100000B<u>1</u>0000000 B	GET_BATTERY_STATUS <mark>GE</mark> T <u>-BATTERY_STATUS</u>	Zero	Battery ID	Eight	Battery Status

The PDUSB Hub/Peripheral-Device shall return the Battery Status of the Battery identified by the value of *wIndex* field.

Every PDUSB Device that has a battery shall return its Battery Status when queried with this request. For Providers or Consumers with multiple batteries, the status of each battery shall be reported per battery.

Offset	Field	Size	Value	Description		
0	bBatteryAttributes	1	Number	Shall indicate whether a battery is installed and whether this is charging or discharging.		
				Value	Description	
				0	There is no battery	
				1	The battery is charging	
				2	The battery is discharging	
				3	The battery is neither discharging nor charging	
				255-4	Reserved and shall not be used	
1	bBatterySOC	1	Number		cate the Battery State of Charge given as percentage n Battery Remaining Capacity.	

Table 9-10 Battery Status Structure

Offset	Field	Size	Value	Descrip	tion	
2	bBatteryStatus	1	Number	If a batter battery.	y is present shall indicate the present status of the	
				Value	Meaning	
				0	No error	
				1	Battery required and not present	
				2	Battery non-chargeable/wrong chemistry	
				3	Over-temp shutdown	
				4	Over-voltage shutdown	
				5	Over-current shutdown	
				6	Fatigued battery	
				7	Unspecified error	
				255-8	Reserved and shall not be used	
	bRemoteWakeCapStatus		Bitmap	If the device supports remote wake, then the device shall support Battery Remote wake events. The default value for the Remote wake events shall be turned off (set to zero) and can be enable/disabled by the host as required. <u>If set to one</u> <u>the device shall generate a wake event when a change of</u> <u>status occurs.</u> See Section 0 for more details.		
				Bit	Description	
				0	Battery present event	
				1	Charging flow	
				2	Battery error	
				7:3	Reserved and shall be set to zero	
4	wRemainingOperatingTime	2	Number	Shall contain the operating time (in minutes) until the Weak Battery threshold is reached, based on Present Battery Strength and the device's present operational power needs. Note: this value shall exclude any additional power received from charging. A battery that is not capable of returning this information		
6	wRemainingChargeTime	2	Number	shall return a value of 0xFFF. Shall contain the remaining time (in minutes) until the Charged Battery threshold is reached based on Present Battery Strength, charging power and the device's present operational power needs. Value shall only be valid if the Charging Flow is "Charging".		
				-	that is not capable of returning this information rn a value of 0xFFFF.	

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

If *wValue* or *wLength* are not as specified above, then the behavior of the PDUSB Device is not specified. If *wIndex* refers to a Battery that does not exist, then the PDUSB Device shall respond with a Request Error. If the PDUSB Device is not configured, the PDUSB Hub's response to this request is undefined.

9.4.3 Get Port Partner PD Objects GetPortPartner PD Objects (PDUSB Hub)

This request returns the Provider/Consumer PD Objects of the PDUSB Device attached to the downstream portPort on a PDUSB Hub.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
10100011B	GET_PARTNER_PDO GET_PARTNER_PDO	Zero or one	Port Number	Variable	Power Data Objects

The *wIndex* field shall indicate the <u>portPort</u> number to which a PDUSB Device is attached. The <u>portPort</u> number shall be a valid <u>portPort</u> number for that PDUSB Hub, greater than zero.

When this request is received by the PDUSB Hub it shall return the Consumer PDOs (if wValue is set to zero) or Provider PDOs (if wValue is set to one) for the PDUSB Device connected on the downstream **portPort** indicated by the *wIndex* field. The PDUSB Hub shall use PD mechanisms (see Section 6.3.8) to retrieve the Power Data Objects from the PDUSB Device.

The *wLength* field shall specify the number of bytes to return. The maximum length of this field is a function of the maximum number of PDOs a PDUSB <u>deviceDevice</u> can return as defined in Section 6.2.1.2. If the device on the Partner Port does not support PD, then the PDUSB Hub shall respond with a Request Error.

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

9.4.4 Get Port PD Status GetPortPDStatus (PDUSB Hub)

This request returns the PD Status of the specified portPort on a PDUSB Hub.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
10100011B	GET_ STATUS	One	Port Number	Eight	PD Status

The *wIndex* field shall indicate the PD capable **port**Port that is being queried. The **port**Port number shall be a valid **port**Port number for that PDUSB Hub, greater than zero.

If wValue or wLength are not as specified above, then the behavior of the PDUSB Hub is not specified.

If a Port is specified that does not exist, then the PDUSB Hub shall respond with a Request Error. The PD status changes on the **portPort** are indicated in the PD Status Change field. The SPM can acknowledge the Port Change notifications via the Clear Port PD Feature (See Section 9.4.1).

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

A GetPDStatus () request to a PDUSB Hub shall return the information as shown in Table 9-11.

Table 9-11 Port PD Status

Bit	Description				
0:15	PD Status Change: A one in the bit position shall indicate the types of status changes that have occurred on the Port.				
	Bit Change Indicated				
	0	Reserved and shall not be used.			

Page 516

it		Description
	1	External supply. When set, the Supply field shall indicate the current status of the supply.
	2	Port operation mode. When set the Port Operation Mode field shall indicated the current operational mode of the port <u>Port</u> .
	3	Supported Provider Capabilities. When set, the SPM shall <u>useget</u> the <u>Get PD descriptor to</u> get further details on this notification <u>updated Power Data Objects from by retrieving the</u> <u>BOS Descriptor from the PDUSB Hub</u> .
	4	Negotiated power level. When set, the Request Data Object field shall <u>indicated</u> the newly negotiated power level if the PDUSB Hub was operating in Non-Intrusive mode. If the PDUSB Hub is working in intrusive mode then, when set, the Request Data Object field shall indicate the power level that the portPort partner wants to operate at.
	5	New power direction. When set, this field shall indicate that the power direction has changed if the PDUSB Hub was operating in Non-Intrusive mode. If the PDUSB Hub is working in intrusive mode then, when set, this field shall indicate the portPort partner wants to perform a power swapPower Role Swap.
	6	PD Reset Complete. When set, this field shall indicate that a PD Hard <u>Reset or a Cable</u> Reset has completed. When this bit is set, then the other bits in the PD Status Change field shall report their change status as if the PDUSB Hub was working in Non-Intrusive mode.
	7	Insertion Detect. When set, the Insertion Detect field shall indicate the current status of whether a cable is plugged into this port <u>Port</u> .
	8	PD Capable Cable. When set, the PD Capable Cable field shall indicate the current status of whether a PD Capable Cable is plugged into this port Port.
	9	Request Rejected. This bit shall be only valid if the PDUSB Hub is operating in Non- Intrusive mode. When set, this field shall indicate one of two conditions:
		 the PDUSB Hub received a request to change the power level (Negotiated power level (Bit 4) bit in this field shall be set) that was rejected or the PDUSB Hub received a request to role swapperform a Power Role Swap (New power direction bit (Bit 5) in this field shall be set) that was rejected.
	10	Reserved and shall be set to zero.
	11	HybridModeHybrid Mode Request. This bit shall only be set by the PDUSB Hub when it is operating in Hybrid mode. If this bit is set, then bits 4 and 5 (Negotiated power level and New power direction) shall be interpreted as if the hub was operating in Intrusive mode.
	12	<u>Power Role</u> Swap Completed. This shall be set when the hub completes a <u>Power Role</u> Swap requested by the SPM. The SPM can determine if the Swap request was successful or unsuccessful based on the PD Direction bit.
	<u>13</u>	<u>VDM Received. When set, the SPM shall use the Get VDMs command (see section 9.4.8) to</u> get further details on this notification.
	13- 14	Reserved and shall be set to zero.
	15	Error. When set, this field shall indicate that an unknown error has occurred on the port <u>Port</u> .
16		Il indicate the type of supply that is attached to this portPort . This field shall map directly to the bit provided as part of the Source or Sink Capabilities message (see Section 6.4.1).

9.4.5 Set PD Feature Set PDFeature (PDUSB Hub/Peripheral Device)

This request sets the value requested in the PDUSB Hub/Peripheral-Device.

Page **518**

bmRequestType	bRequest	wValue	wIndex	wLength	Data
00100000B0000000 0B	SET_ FEATURE	Feature Selector	Feature Specific	Zero	None

Setting a feature enables that feature or starts a process associated with that feature; see Table 9-8 for the feature selector definitions. Features that may be set with this request are:

- BATTERY_WAKE_MASK
- OS_IS_PD_AWAREBATTERY_WAKE_MASK
- OS_IS_PD_AWARE (Only valid for PDUSB Hubs)
- POLICY_MODEPOLICY_MODE (Only valid for PDUSB Hubs)
- CHARGING POLICY

9.4.5.1 BATTERY_WAKE_MASK Feature Selector

When the feature selector is set to **BATTERY_WAKE_MASKBATTERY_WAKE_MASK**, then the *wIndex* field is structured as shown in the following table.

Table 9-12 Battery Wake Mask

Bit	Description
0	Battery Present : When this bit is set then the PDUSB Device shall generate a wake event if it detects that a battery has been attached.
1	Charging Flow : When this bit is set then the PDUSB Device shall generate a wake event if it detects that a battery switched from charging to discharging or vice versa.
2	Battery Error : When this bit is set then the PDUSB Device shall generate a wake event if the battery has detected an error condition.
15:3	Reserved and shall not be used.

The SPM may Enable or Disable the wake events associated with one or more of the above events by using this feature. This feature shall be the only feature that may be set by the SPM for a PDUSB Peripeheral Device. The other features that may be set by this request are only valid for PDUSB Hubs.

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

9.4.5.2 OS_IS_PD_AWARE Feature Selector

When the feature selector is set to **OS_IS_PD_AWAREOS_IS_PD_AWARE**, then if the *wIndex* field is set to one it informs the PDUSB Hub that the SPM is active on the host. If the *wIndex* field is set to zero then it informs the PDUSB Hub that the SPM is not active on the host. The default state for this feature shall be zero. The PDUSB Hub shall respond to all PD requests (except GetBatteryStatus) or send any PD notifications only after the **OS_IS_PD_AWAREOS_IS_PD_AWARE** feature is set.

This is a valid command for the PDUSB Hub/Peripheral Device in the Address or Configured USB states.

9.4.5.3 POLICY MODE Feature Selector

When the feature selector is set to **POLICY_MODE**^{POLICY_MODE}₇, the *wIndex* field shall be set to one of the values in Table 9-13.

USB Power Delivery Specification Revision <u>**1**</u>2.0<u>, Version 1.0</u>

Table 9-13 Policy Mode Encoding

Value	Description
00H	Local: Status Reporting only (Default)
01H	Intrusive: All requests are sent to the SPM
02H	Hybrid: Send only requests that cannot be accommodated to the SPM
03H-FFFFH	Reserved and shall not be used

If the Policy Mode is set to Intrusive, then the PDUSB Hub shall be set to operate in Intrusive mode. If the Policy Mode is set to Local or Hybrid, the hub shall be set to operate in Non-Intrusive mode.

When the Policy Mode is set to Intrusive then the PDUSB Hub shall pass any requests that need policy decisions to be made to the SPM and use PD mechanisms to delay the completion of PD Requests (e.g. using the Wait Message) over PD. When the Policy Mode is set to Hybrid then only requests which cannot be accommodated by the PDUSB Hub shall be sent to the SPM.

Some requests are only valid when the PDUSB Hub is operating in Intrusive mode. The requests that are valid in Intrusive mode are indicated as such in the description for those requests. In addition notifications that operate differently in Intrusive mode are also called out in the description of those notifications.

It shall be a Request Error if *wValue* is not a feature selector listed in Table 9-8 or if *wIndex* is not set to a value as specified above.

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

9.4.5.4 Set Port PD_CHARGING_POLICY_Feature Selector

When the feature selector is set to **CHARGING POLICY**, the windex field shall be set to one of the values defined in Table 9-14. If the device is using USB Type-C Current above the default value or is using PD then this feature setting has no effect and the rules for power levels specified in the **[USBType-C1.0]** or USB PD specifications shall apply.

Value	Description
<u>оон</u>	The device shall follow the default current limits as defined in the USB 2.0 or USB 3.1 specification, or as negotiated through other USB mechanisms such as BC. This is the default value.
<u>01H</u>	 The Device may draw additional power during the unconfigured and suspend states for the purposes of charging. For charging the device itself, the device shall limit its current draw to the higher of these two values: ICCHPF as defined in the USB 2.0 or USB 3.1 specification. regardless of its USB state. Current limit as negotiated through other USB mechanisms such as BC.
<u>02H</u>	The Device may draw additional power during the unconfigured and suspend states for the purposes of charging. For charging the device itself, the device shall limit its current draw to the higher of these two values: LICLPF as defined in the USB 2.0 or USB 3.1 specification, regardless of its USB state, Current limit as negotiated through other USB mechanisms such as BC.
<u>03H</u>	The device shall not consume any current for charging the device itself regardless of its USB state.

Table 9-14 (Charging Policy Encoding

Page 520

<u>Value</u>	Description
04H-FFFFH	Reserved and shall not be used

This is a valid command for the PDUSB Hub-//Peripheral in the Address or Configured USB states. Further, it is only valid if the device reports a USB PD capability descriptor in its BOS descriptor and Bit 6 of the bmA ttributes in that descriptor is set to 1. The device will go back to the wIndex default value of 0 whenever it is reset.

9.4.6 SetPortPDFeature (PDUSB Hub)

This request sets the feature for a portPort in a PDUSB Hub. This request shall only be valid when the PDUSB Hub is operating in Intrusive mode. If the PDUSB Hub is not operating in Intrusive mode, the PDUSB Hub's response to this request is undefined. If the PDUSB Hub cannot satisfy a request then it shall respond with a Request Error to the SPM.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
00100011B	SET_ FEATURE	Feature Selector	Port Number	Zero	None

The *wIndex* field shall indicate the PD capable **portPort** that is being queried. The **portPort** number shall be a valid **portPort** number for that hub, greater than zero.

Setting a feature enables that feature or starts a process associated with that feature; see Table 9-8 for the feature selector definitions. Features that may be set with this request are:

- <u>PR_SWAP</u>
- GOTO_MIN
- **RETURN_POWER**
- ACCEPT_PD_REQUEST
- REJECT_PD_REQUEST
- PORT_PD_RESET
- <u>CABLE PD RESET</u>
 - SWAP
 - GOTO MIN
 - RETURN POWER
 - ACCEPT_PD_REQUEST
 - REJECT_PD_REQUEST
 - PORT_PD_RESET

When operating in intrusive mode the PDUSB Hub shall respond with a *Wait* message when it receives any *Request* message.

When the feature selector is set to **PR_SWAP** then the PDUSB Hub shall **intiate**<u>initiate</u> a <u>Power</u> Role Swap with the **port**<u>Port</u> partner on the specified **port**<u>Port</u>. See Section 7.3.9 and Section 7.3.10 for details on <u>Swapthe PR_Swap</u> message.

When the feature selector is set to *GOTO_MINGOTO_MIN* and the downstream <u>portPort</u> is operating as a Provider, then the PDUSB Hub shall send the *GotoMin* <u>requestmessage</u> to the <u>portPort</u> partner on the specified <u>portPort</u>. See Section 6.3.2 for details on <u>the *GotoMin* requestmessage</u>.

When the feature selector is set to *RETURN_POWER* and the downstream portPort is operating as a Provider, then the PDUSB Hub shall return the power that it borrowed from the PD Device on that portPort.

When the feature selector is set to *ACCEPT_PD_REQUEST* ACCEPT_PD_REQUEST then the PDUSB Hub shall accept the request that was previously made by the <u>portPort</u> partner on this downstream <u>portPort</u>.

When the feature selector is set to *REJECT_PD_REQUEST* Then the PDUSB Hub shall reject the request that was previously made by the portPort partner on this downstream portPort.

When the feature selector is set to *PORT_PD_RESET* the <u>portPort</u> shall be sent a Hard Reset. Once the Hard Reset is complete, as described in Section 8.3.2.6, the hub shall set the *C_PORT_PD_CHANGE* bit in the <u>portPort</u> change field.

When the feature selector is set to **CABLE PD RESET**, the hub shall send a Cable Reset to the cable attached on that Port. Once the Cable Reset is complete, as described in Section 6.7.3, the hub shall set the <u>C_PORT_PD_CHANGE bit in the Port change field</u>.

It shall be a Request Error if *wValue* is not a feature selector listed in Table 9-8, or if *wIndex* specifies a **portPort** that does not exist or if the **portPort** is operating as a Consumer, or if *wLength* is not as specified above.

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

Set Port PDOsIf the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

9.4.69.4.7 SetPortPDOs (PDUSB Hub)

This request sets the PDOs that a portPort in a PDUSB Hub shall send to its Port Partner if the portPort on the PDUSB Hub is operating as a Provider. Setting the PDO shall cause the Provider to send an updated *Source Capabilities* message. The PDOs sent shall consistuteconstitute a subset of the capabilities supported by the PDUSB Hub as defined in the PD Provider Port Capability Descriptor (see Section 9.2.4). When any PDO set exceeds the capabilities of the PDUSB Hub this request shall be rejected.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
00100011B	SET_PDO SET_PDO	Zero	Port Number	Variable	Provider Power Data Objects

The *wIndex* field shall indicate the PD capable **port**<u>Port</u> that is being queried. The **port**<u>Port</u> number shall be a valid **port**<u>Port</u> number for that hub, greater than zero.

The *wLength* field shall be a multiple of 4 and shall include all the PDOs (see Section 6.4.1) that the **portPort** may send to its **portPort** partner when sending its PD capabilities. The **portPort** shall send the PDOs in the order that they are included in this request. It is the responsibility of the PDUSB Hub to **verifiyverify** that the contents of the PDOs sent by the SPM are valid for this **portPort**. A PDUSB Hub shall respond with a Request Error if the PDOs sent by the SPM are not valid for the **portPort** specified.

It shall be a Request Error if *wValue* is not set to zero or if *wIndex* specifies a portPort that does not exist, or if *wLength* is not as specified above.

If the **portPort** on the PDUSB Hub is not operating as a Provider, the PDUSB Hub's response to this request is undefined.

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

9.4.8 GetVDM (PDUSB Hub)

This request instructs the PDUSB Hub to return the VDMs that it received from a cable or device attached to a Port in a PDUSB Hub. The response to each request shall contain only one VDM. VDMs shall be returned in the order they were received by the Port. If there are no VDMs to return for the Port the PDUSB Hub shall return a zero length packet.

<u>bmRequestType</u>	<u>bRequest</u>	<u>wValue</u>	wIndex	<u>wLength</u>	<u>Data</u>
<u>10100011B</u>	<u>GET VDM</u>	Zero	Port Number	<u>Variable</u>	<u>VDM</u>

<u>The *wIndex* field shall indicate the PD capable Port that is being queried. The Port number shall be a valid Port number for that PDUSB Hub, greater than zero.</u>

The *wLength* field shall be a multiple of 4 and shall include all the VDOs that the PDUSB Hub received on that Port (see Section 6.4.4).

Page 522

It shall be a Request Error if *wIndex* specifies a Port that does not exist, or if *wValue* or *wLength* is not as specified above.

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

9.4.9 SendVDM (PDUSB Hub)

This request instructs the PDUSB Hub to send a VDM to the one of three possible recipients (SOP. SOP' or SOP'') attached to a Port in a PDUSB Hub.

<u>bmRequestType</u>	<u>bRequest</u>	<u>wValue</u>	<u>wIndex</u>	<u>wLength</u>	<u>Data</u>
<u>00100011B</u>	<u>SEND_VDM</u>	<u>SOP/SOP'/SOP"</u>	Port Number	Variable	<u>VDM</u>

The *wIndex* field shall indicate the PD capable Port that is being queried. The Port number shall be a valid Port number for that PDUSB Hub, greater than zero.

The *wValue* field indicates the recipient. If the value is 0 it shall be sent to its Port partner. If the value is 1 it shall be sent to SOP'. If the value is 2 it shall be sent to SOP''. No other values in *wValue* are allowed.

The *wLength* field shall be a multiple of 4 and shall include one VDM (see Section 6.4.4) that the Port shall send to the recipient indicated by *wValue*.

It shall be a Request Error if *wIndex* specifies a Port that does not exist, or if *wValue* or *wLength* is not as specified above.

If the PDUSB Hub is not configured, the PDUSB Hub's response to this request is undefined.

A. Power Profiles

Power Profiles are optional normative. They define a standardized set of voltages at several current ranges that are offered by USB Power Delivery Sources. The profiles are defined for Sources only.

The Power Profiles are optional but are intended to provide a finite set of power levels to:

- Limit the number of voltages and current combinations a Source has to supply
- Provide a well-defined set of voltage and current combinations from which a Sink can choose
- Provide a selection of power ranging from 10W to 100W in approximately 2x steps
- Limit the number of valid combinations

A.1 Profile Definitions

There are the following profiles based on Fixed Supply Objects:

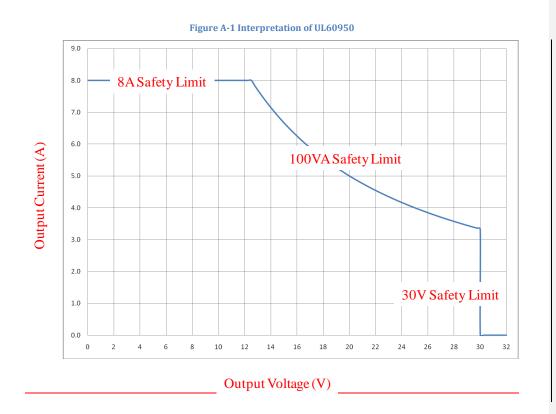

- Profile 0 reserved
- Profile 1 capable of supplying <u>at least 5V @ 2.0A</u>
- Profile 2 ports are capable of supplying <u>at least</u> 5V@ 2.0A, 12V @ 1.5A.
- Profile 3 ports are capable of supplying <u>at least</u> 5V @ 2.0A, 12V @ 3A.
- Profile 4 ports are capable of supplying <u>at least</u> 5V @ 2.0A, 12V and 20V at 3A respectively.
- Profile 5 ports are capable of supplying at least 5V @ 2.0A, 12V and 20V at 5A respectively.

Power Profiles are defined to overlap such that a Device that requires a Profile 2 Source will operate equally well when connected to a Profile 2 or any higher Profile Source.

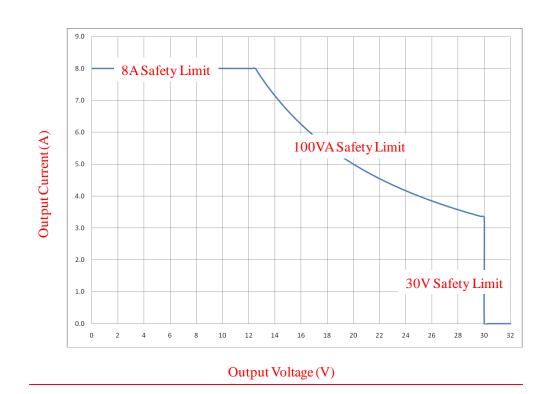

Sources may have additional capabilities. For example a Source might advertise 5V @ 23.0A, 12V and 15V at 1.5A respectively. It is a Profile 2 Source because it meets the Profile 2 requirements to supply 5V @ 2.0A and 12V @ 1.5A. The fact that it can also supply 5V @ 3.0A and 15V will have no effect on a Device that wants a Profile 2 source.

Profile 5 Sources that are capable of 100W operation are subject to various worldwide safety standards. In order to meet the most common safety standards, the continuous output power cannot exceed 100W and the continuous output current cannot exceed 5A. The industry is well versed in meeting the safety requirements for such power sources (e.g. Wall Warts). Refer to Figure A-1 for an interpretation of the safety requirements imposed by IEC/UL60950 Table 2B.

Page 524

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

A.2 Voltage Selection Rationale

Voltages used by the profiles were not picked randomly; this section describes the rationale behind the choices.

5V is the USB default that must be supported to provide interoperability with existing Devices. However, higher voltages are needed to provide more power through USB connectors because of their current carrying capability.

12V was selected because it is very common in PCs and many other systems. The current limitation of the Micro USB Connector family is 3A for the enhanced PD version. The use of 12V with 3A provides sufficient power to charge tablets in the 20-30W range that use the Micro USB Connector.

20V was selected because larger systems, such as notebooks, often have 4 lit hium cells in series and require charging voltages in the 18-20V range. A sampling of systems showed that chargers for these systems were typically 19.5-20V. Typical systems had chargers that supplied between 60W and 100W with the exception of a few very high-end performance systems that were well over 100W. The 5A current limit of the PD enhanced Standard-A and Standard-B connectors, with 20V allows up to 100W to be delivered to charge this class of Devices.

A.3 Relevance of Profiles to Sink Ports

Sinks do not have Power Profiles per se. A Sink <u>portPort</u> only need to be compatible with the voltage and current offered in one or more Power Profiles. This can lead to some interesting cases where <u>dual roleDual-Role</u> ports are involved (see Appendix 0 for examples). A dual- role <u>portPort</u> may offer one Profile when operating as a Source and request power from another Profile when operating as a Sink. For example, a tablet might offer Profile 1 (5V @ 2.0A) when operating as a Source, but request power (12V @ 3A) supplied by a Profile 3 Source when operating as a Sink. Another example is a notebook computer with a Profile 2 Source <u>portPort</u> it also uses as a Sink for charging which requires it be supplied with 20V @ 5A from <u>a</u> Profile 5 Source.System Level Examples

Page 526

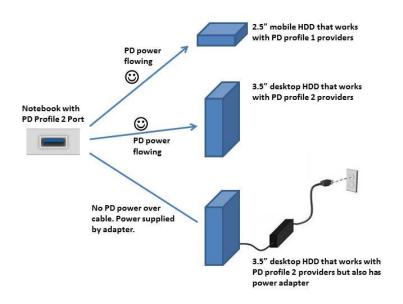

A.4 System Level Examples

The following examples are provided to help illustrate some typical system use cases. Examples using a notebook and HDDs have been selected but the principles apply equally to other types of USB Power Delivery devices (e.g. printers, scanners, tablets, phones, mp3 players etc.).

A.3.1A.4.1 Notebook and HDD Examples

In the following two examples, the user has varying experiences attaching his hard disk-drive to a PD portPort on his notebook computer.

Figure A-2 Notebook is Capable of Meeting User's Requirements

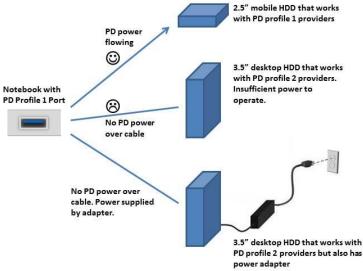

The notebook shown in Figure A-2 is able to supply up to PD profile 2. The larger HDD is able to successfully operate without a separate power adapter since it gets adequate power from the PD portPort. In the case of the HDD with separate power adapter plugged in, the HDD should not draw power from the notebook's portPort.

USB Power Delivery Specification Revision <u>42.0, Version 1.0</u>

Figure A-3 Notebook is not Capable of Meeting User's Requirements

Note that in the case shown in Figure A-3, the experience for the user is not unlike their experience today. USB HDDs that attempt to rely only on USB bus power only will often fail because not all notebooks on the market are capable of supplying adequate current.

A.3.2A.4.2 Display with Hub Example

The following example is for a display dock where the integrated hub also provides power and at least one of the hub ports is of high enough power capacity to power the host platform.

Page 528

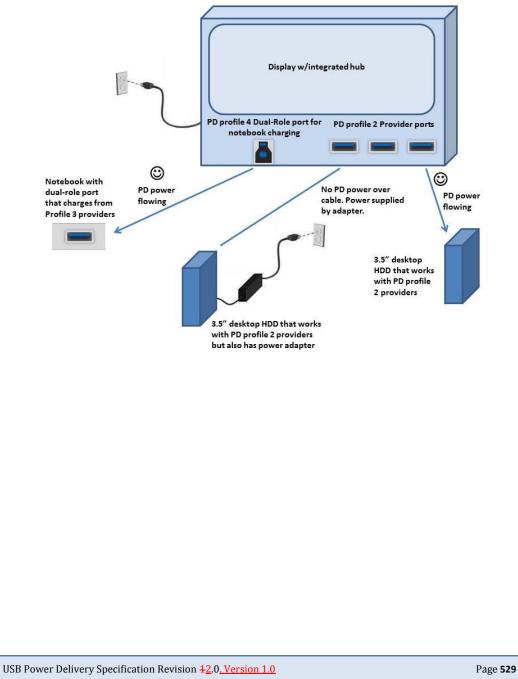

Figure A-4 Display with Integrated Hub Capable of Meeting User's Requirements

B. CRC calculation

```
B.1
                   C code example
//
// USB PD CRC Demo Code.
11
#include <stdio.h>
int crc;
//-----
void crcBits(int x, int len) {
 const int poly = 0x04C11DB6; //spec 04C1 1DB7h
 int newbit,newword,rl_crc;
 for(int i=0;i<len;i++) {</pre>
   newbit = ((crc>>31) ^ ((x>>i)&1)) & 1;
   if(newbit) newword=poly; else newword=0;
   rl_crc = (crc<<1) | newbit;</pre>
   crc = rl_crc ^ newword;
   printf("%2d newbit=%d, x>>i=0x%x, crc=0x%x\n",i,newbit,(x>>i),crc);
 }
}
int crcWrap(int c){
 int ret = 0;
 int j, bit;
 c = ~c;
 printf("~crc=0x%x\n",c);
 for(int i=0;i<32;i++) {</pre>
   j = 31-i;
   bit = (c>>i) & 1;
   ret |= bit<<j;</pre>
Page 530
                                                USB Power Delivery Specification Revision 2.0, Version 1.0.
```

} return ret;

}

//-----

int main(){

int txCrc=0,rxCrc=0,residue=0,data;

printf("using packet data 0x%x\n", data=0x0101);

crc = 0xfffffff; crcBits(data,16); txCrc = crcWrap(crc);

printf("crc=0x%x, txCrc=0x%x\n",crc,txCrc);

printf("received packet after decode= 0x\$x, $0x\$x\n$ ", data, txCrc);

crc = 0xfffffff; crcBits(data,16); rxCrc = crcWrap(crc);

printf("Crc of the received packet data is (of course) =0x%x \n",rxCrc);

printf("continue by running the transmit crc through the crc\n"); crcBits(rxCrc,32);

printf("Now the crc residue is $0x%x\n", crc$);

printf("should be 0xc704dd7b\n");

}

B.2 Table showing the full calculation over one message

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

C. Power Implementation Considerations

This section has been added as an informative guide for implementers of the PD specification. Expansion of USB Power Delivery to higher voltage and power levels with its AC coupled communication over V_{BUS} requires new design considerations to the power delivery system. Many of these may not have been as important in legacy USB systems, but should be considered when implementing the PD specification. Component labels within this Appendix are specific to the Appendix unless otherwise stated.

C.1 Managing Isolation Impedance (BFSK)

The isolation impedance outlined in the PD Specification Section 5.8.2.2 is used to block specific frequency bands and pass others in order to provide a communication path on the V_{BUS} conductor. This impedance will likely be inductive in nature (for example a 1µH inductor see <u>Table 5-</u>17). The following section describes potential problems that may arise due to this impedance. Measurement techniques to validate conducted noise will be discussed.

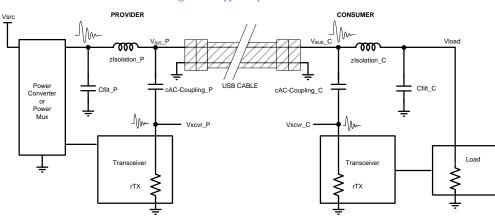

Figure C-1 Typical System Electrical Model

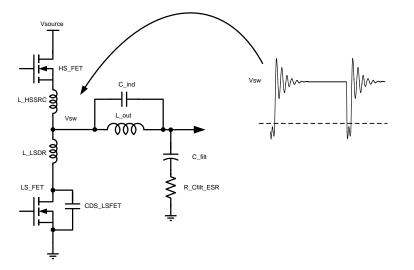

C.1.1 In-band fCarrier Spurious Noise

The output stage of a switch mode power converter can typically produce high frequency noise. This noise is differentiated from fundamental switching ripple. The noise tends to be a high frequency damped sinusoid occurring regularly at the converter power switch transitions. It is likely that some *imlementationsimplementations* will produce noise that coincides with the fCarrier frequency band of the transceivers.

Figure C-2 shows parasitic elements within a basic synchronous buck power stage that can generate high frequency conducted noise which may interfere with the PD Transceiver. A basic synchronous buck stage is shown that is comprised of two power MOSFETs, HS_FET and LS_FET, an inductor, L_out, and output filter capacitor, C_filt. Also shown are the parasitic elements that create damped sinusoid noise that may be in contention with fCarrier. L_HSSRC, L_LSDRV, and CDS_LSFET are typically responsible for creating resonant noise on the VSW node. Other topologies may have different parasitic elements to consider. This waveform can couple to the output through C_ind and or circuit board parasitics and impose a voltage across R_Cfilr_ESR. This section is meant to help implementers identify and resolve noise problems in the design process before submitting PD designs to compliance testing.

C.1.2 Spurious Noise Test Setup and Calibration

Figure C-2 Typical Synchronous Buck Power Stage with Parasitics

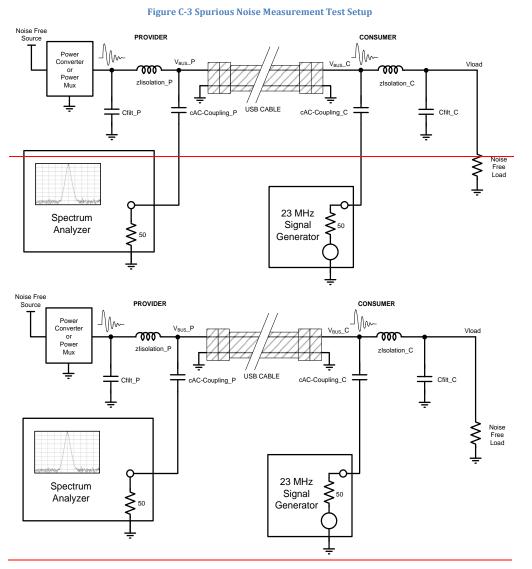

Measurement of in-band spurious noise from the power converter involves setting up measurement<u>measurement</u> equipment with the correct scales and impedances. The process involves calibrating a known carrier signal in a test setup containing the correct source and load impedances with the power converter connected, but not operational. Once the test setup is calibrated, the operational noise can be evaluated. In order to simplify this test and to match industry standard communication test equipment, 50 Ohm terminations and dBm scaled measurements will be used.

Measurement of in-band spurious noise will require the use of:

- An RF signal generator capable of providing a *vTX* nominal (150mVrms), *fCarrier* nominal (23MHz) carrier sine wave into a 50 ohm load.
- An oscilloscope with at least 200MHz Bandwidth.
- A spectrum analyzer with better than -80dBm measurement capability and 2MHz/div scale capability at 23MHz center frequency setting.
- A low noise environment with less than -60dBm of RF noise at 13 to 33MHz.

Figure C-3 shows the test setup which includes both the Provider and Consumer to be connected using PD USB cables. During calibration the power converter and load impedances should be in place with the power converter turned off.

- 1) Using appropriately matched RF cabling configure the test setup as shown in Figure C-3 set the termination for both the signal generator and the spectrum analyzer to 50 ohms.
- Set the signal generator to ((vTX minimum x 1.414) x 2) Peak to Peak (~282mV) at <u>fCarrier</u> nominal (23MHz). Confirm the level using an oscilloscope.
- 3) Set the spectrum analyzer to *fCarrier* nominal (23MHz) Center Frequency, fCarrier nominal ± 10MHz span and set the Resolution Bandwidth (RBW) to 10 KHz.
- Confirm that the measured level on the Spectrum Analyzer is approximately 7 to -13 dBm (dBMilliwatts on 50 Ohms). Record the Baseline level (dBM Baseline).

- 5) Confirm that no spurious noise levels are present above -60dBm. If the noise floor is higher, it may be necessary to test in an environment with EMI shielding from radio noise sources.
- 6) Turn on the power converter and turn off the *<u>fCarrier</u>* nominal signal from the signal generator.
- 7) Confirm that the noise floor has not increased beyond (dBm_Baseline snrSrc). Reference Figure 7-5 for inband noise. The (dBm_Baseline - snrSrc) represents the 0dB level in Figure 7-5. Confirm that all measured noise falls below the curve.

The same measurement can be made from the perspective of the Sink using a quiet source. In this case the frequency generator is placed on the Provider side and the signal generator is placed on the Consumer side. The levels would be compared to Figure 7-8 in this case.

* Noise levels should be validated across expected line and load conditions including expected combinations of USB Cable types and lengths.

C.2 Connector Detach Transients

The presence of inductive elements *zlsolation_P* and *zlsolation_C* will cause transient voltages to be presented to the transceiver inputs. This section describes this behavior and some protection methods that can be considered.

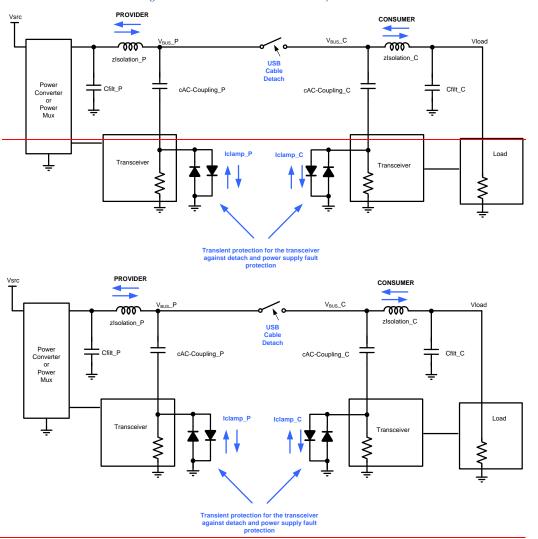

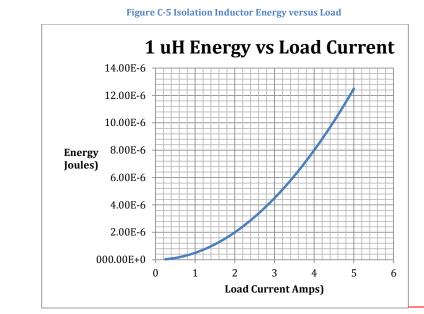

Figure C-4 Current Transients when Cable/Load Removed

As shown in Figure C-4, equal current is flowing in both isolation elements (*zIsolation_P* and *zIsolation_C*) within the Provider and Consumer just prior to detach. Inductive elements resist changes in current and will force voltage transients on V_{BUS_P} and V_{BUS_C} terminals just following detach. These high dv/dt rate voltages will AC couple through the coupling capacitors cAC-Coupling_P and cAC-Coupling_C. A positive going voltage transient will be presented on the Provider side and a negative going voltage transient will be presented on the Consumer side. Clamping elements

USB Power Delivery Specification Revision <u>+2</u>.0, <u>Version 1.0</u>

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

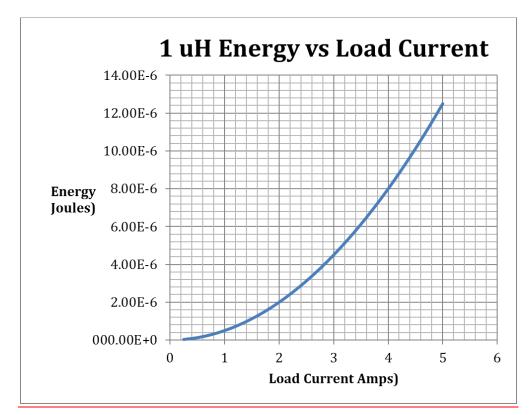

Figure C-5 shows the total energy that could be delivered during a detach event with the example $1\mu H$ inductor where:

$$Energy = \frac{LI^2}{2}$$

An external or integrated clamp should be implemented to absorb this energy and limit the applied voltage at the transceiver input.

C.3 Closed Loop Stability Effects

Addition of the isolation inductor as well as cable inductance will affect the small signal power stage response of a switch mode power converter PD implementation.

C.3.1 Basic Power Stage Small Signal AC Model

Figure C-6 shows a simplified diagram of the small signal power stage AC response including the parasitic elements that should be considered. Power stage response refers to the voltage regulation system around which a feedback loop will be applied. This model does not include modulator gain or dc gain in the power stage as it is only meant to display exemplary parasitic poles and zeroszeroes in the typical system.

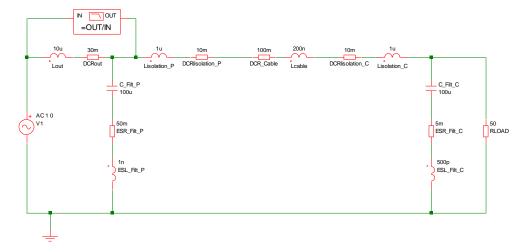

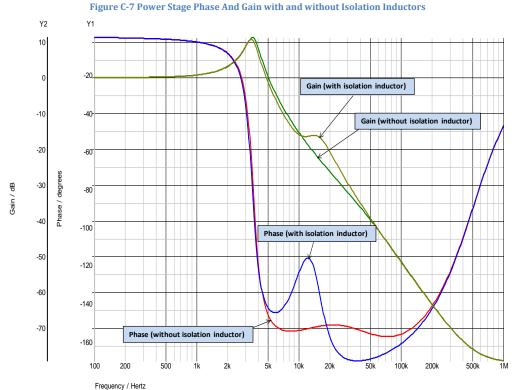

Figure C-6 Simplified Small Signal AC Model

The dominant pole of the power converter is set by Lout and C_Filt_P assuming the value of Lout is larger than (*zlsolation_P* + Lcable + *zlsolation_C*). Parasitic ESR (Equivalent Series Resistance) and ESL (Equivalent Series Inductance) form high frequency *zeroszeroes* in the power stage response gain and phase. Phase distortion is introduced into the power stage response from (*zlsolation_P* + Lcable + *zlsolation_C*) interacting with C_Filt_C. Secondary high frequency poles and *zeroszeroes* can degrade phase margin in the feedback loop of the power converter. These effects need to be modeled and accounted for when designing the feedback loop for stability and transient performance. Figure C-7 shows the resulting phase and gain impacts of the parasitics using the model in Figure C-6.

These traces compare the power stage phase and gain with and without isolation inductance. In this case, a phase boost is introduced which is not necessarily bad for compensation; however it is important for the designer to be aware of these effects to maintain predictable stability and transient response.

Page 540

It is important to note that worst case conditions tend to occur at:

- Light load (high Q Condition)
- Load capacitance highly tuned to series isolation inductance (high Q Condition)
- Main power converter LC pole (Lout, C_Filt_P) is selected too close to the parasitic LC ((zlsolation_P+zlsolation_C), C_Filt_C)

It is also important to note that selection of a C_Filt_C capacitor network that has parasitic ESR large enough to detune the dominant pole will help reduce the negative phase effects.

C.3.2 Feedback Past Isolation Inductor

It may be desirable to compensate the voltage loop past the Provider isolation inductor (*zlsolation_P* in order to eliminate the IR voltage drop due to the DC Resistance of the inductor. This further complicates the power stage response curve by placing the inductors reactance in series with the feedback path. Figure C-7 shows the same simple model with feedback measured past the isolation inductor.

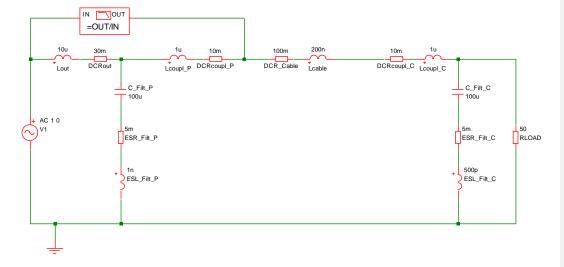

Figure C-8 Simplified Small Signal AC Model (Feedback before and after Inductor zIsolation_P)

Figure C-8 compares power stage response with compensation taken before and after the *zlsolation_P* Provider isolation inductor. As can be seen in in Figure C-9, the phase and gain impacts are larger. A pole is created by the *zlsolation_P* inductor that forces a phase reduction beyond 180 degrees which will have to be accounted for in the compensation network.

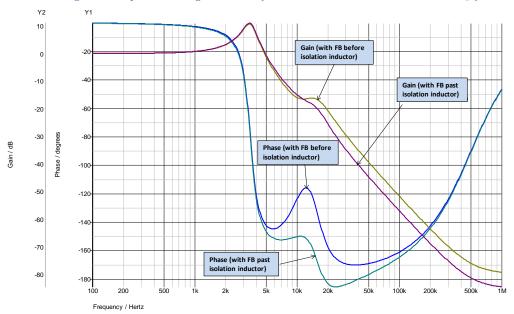

Figure C-9 Simplified Small Signal AC Model (Feedback before and after Inductor zIsolation_P)

Page 542

D. Standard-A Mating Illustrations

The following illustrations show the mating configurations between PD and non-PD Standard-A connectors. All dimensions are in mm.

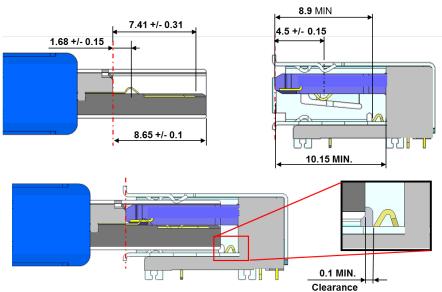

Figure D-1 USB 3.1 Standard-A Plug with USB 2.0 PD or 3.1 PD Standard-A Receptacle

Conclusion

1) Plug does not contact to detect pins, then is identified as legacy USB3 plug.

2) The minimum clearance would be 0.1mm in the worst case which includes angled insertion case.

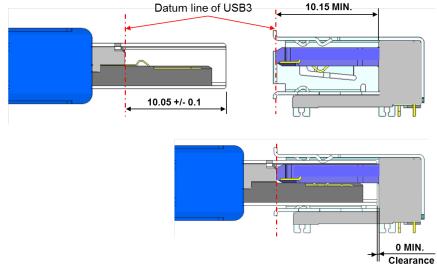

Figure D-2 USB 3.1 PD Standard-A Plug with USB 2.0 or 3.1 Standard-A Receptacle

Conclusion

1) Legacy receptacle does not have detect pins, so PD plug will work as normal USB3 plug.

2) Wipe length will be same as legacy USB combination since there would be clearance (0 MIN.) between receptacle and plug after completing mating.

Page **544**

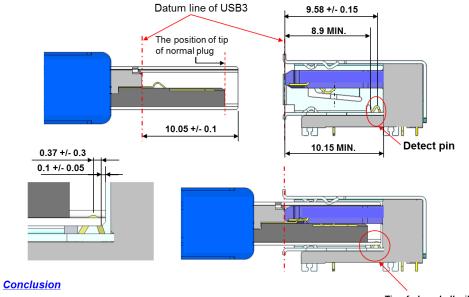

Figure D-3 USB 2.0 PD or 3.1 PD Standard-A plug with USB 2.0 PD or 3.1 PD Standard-A receptacle

Connectors are identified as PD connectors due to connecting with detect pin.
 Wipe length of detect pin is 0.37 +/- 0.3mm in normal mating condition.

Tip of plug shell will contact detect pin.

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

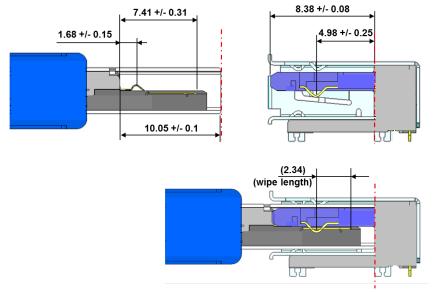

Figure D-4 USB 2.0 PD or 3.1 PD Standard-A Plug with USB 2.0 Standard-A Receptacle

Conclusion

USB2 legacy receptacle does not have detect pins, so PD plug will work as normal USB2 plug.

USB Power Delivery Specification Revision 2.0, Version 1.0.

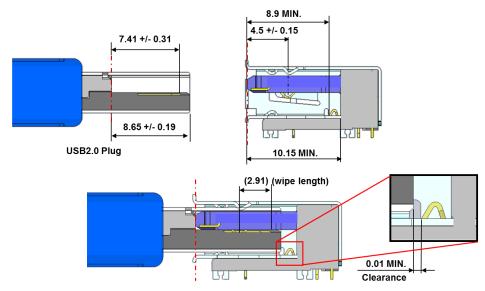

Figure D-5 USB 2.0 Standard-A Plug with USB 2.0 or USB3.1 PD Standard-A Receptacle

Conclusion

USB2 legacy plug does not contact to detect pins, so plug is identified as legacy plug then perform as USB2.
 There would be 0.33mm clearance. The minimum clearance would be 0.01mm in the worst case which includes angled insertion case.

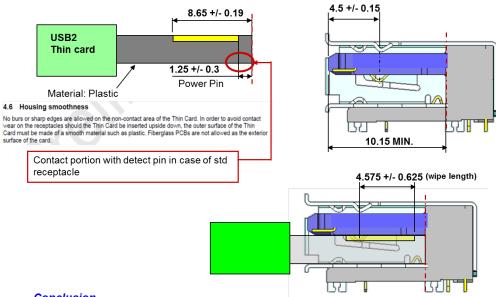

Figure D-6 USB 2.0 Thin Card with USB 2.0 PD or 3.1 PD Standard-A Receptacle

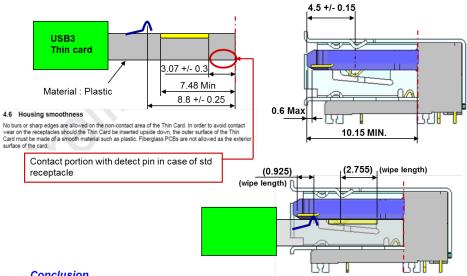

Conclusion

1) USB2 thin card would be identified as thin card due to discontinuity with detect pin.

2) Detect pin would be displaced in case of standard receptacle. However it will not make electric connection as long as contact portion of thin card is insulator.

Page 548

Figure D-7 USB 3.1 Thin Card with USB 2.0 PD or 3.1 PD Standard-A Receptacle

Conclusion

1) USB3 thin card would be identified as thin card due to discontinuity with detect pin.

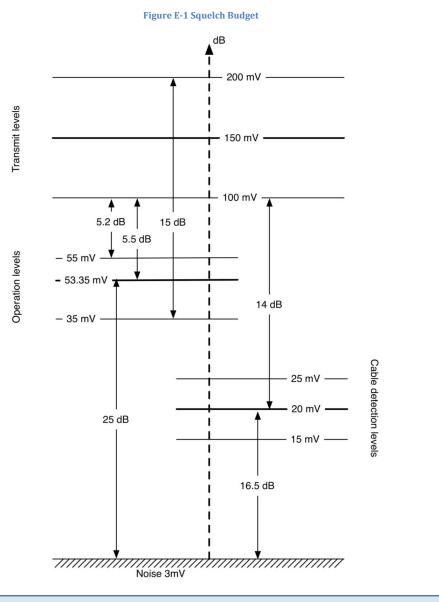

2) Detect pin would be displaced in case of standard receptacle. However it will not make electric connection as long as contact portion of thin card is insulator.

USB Power Delivery Specification Revision <u>42</u>.0, <u>Version 1.0</u>

E. Physical Layer Informative Material

This section contains informative material about the Physical Layer.

E.1 Squelch Budget

USB Power Delivery Specification Revision 2.0, Version 1.0.

Figure E-1 shows the signal levels in mV (rms) needed to illustrate the squelch budget for normal operation (*vSquelchOperating*) and cable-type detection operation (*vSquelchDetecting*). The transmission level of the signal is between 100mV and 200mV, or at least 26.5dB above a 3mV noise floor. During normal operation the nominal SNR is 25dB, packets with a signal level below 55mV may be discarded, and packets with a signal level below 35mV are discarded. This allows for at least 5.2dB of attenuation in the channel and at most 15dB. During plug-type detection the nominal SNR is 16.5dB, a signal level below 25mV may be discarded, and a signal level below 15mV must be discarded. This allows for at least 12dB of attenuation in the channel and at most 22.5dB.

F. PD Message Sequence Examples

The following examples are intended to show how the Device Policy Manager may operate and the sequence of Power Delivery messaging which will result. The aim of this section is to inform implementer's how some of the mechanisms detailed in this specification may be applied; it does not contain any normative requirements.

In these illustrations all A-Ports are assumed to implement the optional cold-socket functionality. V_{BUS} is only applied when an A-plug is inserted. In all cases Providers indicate all of the power they have available in their Capabilities and Consumers only take the power they need and give back what they cannot use. In the case of Hubs this means only taking sufficient power for the ports with A-plugs inserted.

All ports are assumed to be Enhanced SuperSpeed capable, with a default operating voltage of 5V and a unit load of 150mA. This 0.75W is assumed to be enough power to enable an externally powered device to maintain communication over USB and is enough to allow such a device to enumerate but not operate until more power is negotiated.

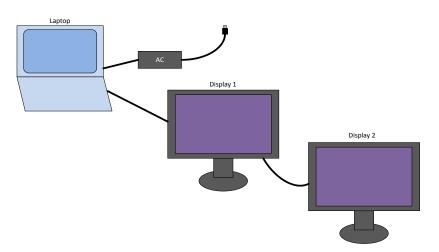

Although the Hubs in these illustrations support Power Delivery on both their UpstreamUFPs and Downstream portsDFPs this is only one possible Hub implementation.

HDDs are assumed to spin up immediately after they are attached. This follows the typical operation of current systems.

Ideal power transmission is assumed so that there are no power losses through a device; in practice these would need to be taken into account when requesting power.

F.1 External power is supplied downstream

Figure F-1 External Power supplied downstream

Configuration:

1. Laptop with an AC supply. AC supply provides sufficient power to charge the laptop and, in addition, to provide up to 60W downstream via its Profile 4 Enhanced SuperSpeed portPort.

Page **552**

 Display 1 and Display 2 each require 30W to operate. Display 1 contains a Hub allowing Display 2 to be connected to Display 1. In USB suspend each Display will power down but can maintain USB connection using the PD power provided.

<u>Table r-1 External power is supplied dowlistream</u>										
Step	Laptop	Display 1	Display 2	Device Policy Manager	PD Power (W)					
Display 1										
1	Connected to wall supply	Unattached	Unattached		0					
2	Display 1 attached, V _{BUS} powered.	Attached, drawing 5V@150mA.	Unattached		0 <u>.75</u>					
3	Set of Source Capabilities sent including: 5V@2A (10W), 12V@3A (36W) and 20V@3A (60W). The externally powered and USB suspend bits are set.	Source Capabilities received	Unattached	Laptop determines its Source Capabilities based on its needs and the presence of a wall supply.	0 <u>.75</u>					
4	Request received	Requests 20V@1.5A (30W) from laptop	Unattached	Display 1 knows it needs 20v@1.5A (30W) for its own operation, evaluates the supplied capabilities and determines that this is available.	0 <u>.75</u>					
<u>5</u>	Sends Accept	Accept received	<u>Unattached</u>	Waiting for PS RDY before drawing additional power.	<u>0.75</u>					
5 <u>6</u>	Sends Accept <u>PS RDY</u>	Accept <u>PS RDY</u> received. Starts drawing 20V@1.5A. Display 1 turns on and starts operating.	Unattached	Laptop evaluates the request, finds that it can meet this and so sends an accept.	30					
Displa	y 2									
6 <u>7</u>	Powering Display 1	Detects attach	Attached, no V _{BUS}		30					

Table F-1 External power is supplied downstream

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

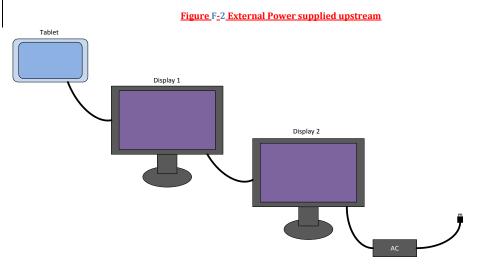

Step	Laptop	Display 1	Display 2	Device Policy Manager	PD Power (W)
7 <u>8</u>	Request received	Display 1 requests 20V@1.73A (34.6W) from Laptop.	Attached, no V _{BUS}	Display 1 detects attach and requests additional 4.5W of power for USB 3.1 port<u>Port</u>.	30
8 <u>9</u>	Sends Accept	Accept received.	Attached, no V _{BUS}		34.6
<u>10</u>	Sends PS RDY	PS RDY received	Attached, no V _{BUS}		
9<u>11</u>		Powers V _{BUS}	Attached, drawing 5V@150mA.		34.6
10<u>12</u>		Sends out Source Capabilities including: 5V@0.9A to Display 2. The externally powered and USB suspend bits are set.	Source Capabilities received	Display 1 has 4.5W to allocate to Display 1. This is offered as a standard USB 3.1 port <u>Port</u> .	34.6
11<u>13</u>		Request received	Display 2 requests 5V@0.15A but indicates a Capability Mismatch. Display 2 remains off.	Display 2 decides it can manage to run its USB/PD function with 1 unit load but needs more power to function as a display.	34.6
<u>14</u>		Sends Accept	Accept received		<u>34.6</u>
12<u>15</u>		Sends Accept<u>PS_RDY</u>	Accept <u>PS_RDY</u> received	Display 2 indicates a capability mismatch to the user.	34.6
13<u>16</u>		Get Sink Capabilities sent	Get Sink Capabilities received	Display 1 needs to assess the capability mismatch by first determining what Display 2 actually needs.	34.6
44 <u>17</u>		Sink Capabilities received	Display 2 returns Sink Capabilities indicating operation at 20V@1.5A.		34.6

Step	Laptop	Display 1	Display 2	Device Policy Manager	PD Power (W)
15<u>18</u>	Request received	Display 1 requests 20V@3A (60W) from Laptop.		Display1 now knows what Display 2 needs and requests the additional power from the laptop.	34.6
16<u>19</u>	Sends Accept	Accept received.			60<u>34.6</u>
<u>20</u>	Sends PS_RDY	PS_RDY received		An additional 30W is now available to Display 1 to offer to Display 2.	<u>60</u>
17<u>21</u>		Sends out Source Capabilities including: 5V@0.9A and 20V@1.5A to Display 2. The externally powered and USB suspend bits are set.	Source Capabilities received	Now that Display 1 can power Display 2 correctly this power is offered by Display 1 via a new capabilities message.	60
18<u>22</u>		Request received	Display 2 requests 20V@1.5A.		60
19<u>23</u>		Sends Accept	Accept received	Display 1 determines that the request by Display 2 is within the offered capabilities so the request is accepted.	60
20<u>24</u>		Sends PS_RDY. Drawing 20V@3A from laptop.	PS_RDY received. Starts drawing 20V@1.5A, turns on and starts operating.	Display 2 now has the power it needs and can start working.	60
USB Si	uspend				
21 25	Laptop OS goes into suspend (S3), V _{BUS} remains on but USB bus is also suspended.	Display 1 turns off but draws 50mW, 25mW to maintain USBPDUSB Hub and PDUSBHUB functions. The additional 25mW is used to supply the portPort used by Display 2.	Display 2 turns off but draws 25mW to maintain USB/PD functions.	No changes in PD contractContract . This is a power reduction purely based on the USB state.	60

USB Power Delivery Specification Revision <u>+2</u>.0<u>. Version 1.0</u>

Step	Laptop	Display 1	Display 2	Device Policy Manager	PD Power (W)
22 26	Laptop OS wakes up. USB is woken up.	Display 1 turns on and returns to drawing 20V@3A.	Display 2 turns on and returns to drawing 20V@1.5A.	No changes in PD contract<u>Contract</u>. This purely relates to USB bus state.	60

F.2 External power is supplied upstream

Configuration:

- 1. Tablet with no AC supply. Tablet is a USB host and can use 12V@0.2A (1W) during normal operation and up to 12V@1A (12W) in order to charge.
- Display 1 and Display 2 each require 30W to operate. Display 1 contains a Hub allowing Display 2 to be connected to Display 1. In USB suspend each Display will power down but can maintain USB connection using the PD power provided.
- Display 2 has an AC supply connected. AC supply provides sufficient power to power Display 2 and, in addition, to provide up to 60W upstream via a Profile 4 portPort.

Step	Tablet	Display 1	Display 2	Device Policy Manager	PD Power (W)
Displa	y 1 - Dead Battery				
1	Unattached	Unattached	Connected to the wall supply and outputs vSafeDB every 10-15s on its upstream port <u>UFP</u>		0
Page 5	56		USB Power I	Delivery Specificatio	n Revision <u>2.</u>

Table F-2 External power is supplied downstream

Step	Tablet	Display 1	Display 2	Device Policy Manager	PD Power (W)
2		Attached to Display 2	Display 1 attached		0
3		Dead battery negotiation	Dead battery negotiation		0
4		Attached to Display 2, drawing 5V@150mA (0.75W)	Providing 1 unit load to Display 1.		0.75
5		Source Capabilities received	Display2 sends out a set of capabilities including: 5V@2A (10W), 12V@3A (36W) and 20V@3A (60W). The externally powered and USB suspend bits are set.	Based on the capabilities of the wall supply and its own needs Display 2 calculates what it can offer upstream.	0.75
6		Display 1 requests 20V@1.5A (30W) from Display 2.	Request received	Display 1 knows it needs 30W to operate so it requests this amount.	0.75
<u>Z</u>		Accept received	Sends Accept	Display 2 accepts the offer since it is within its capabilities.	<u>0.75</u>
7 <u>8</u>		Accept <u>PS RDY</u> received. Display 1 starts drawing power and turns on.	Sends Accept <u>PS_RDY</u>	Display 2 indicates its power supply is ready to offer the power.	30
Tablet	- <u>– Power Role</u> Swap				
8 <u>9</u>	Tablet is attached to Display 1.	Attached, V _{BUS} powered.			30
9 10	Tablet sends out a set of capabilities including: 5V@0.5A (2.5W). The externally powered bit cleared and USB suspend bit set.	Capabilities received			30

USB Power Delivery Specification Revision <u>**42</u>**.0, <u>Version 1.0</u></u>

Step	Tablet	Display 1	Display 2	Device Policy Manager	PD Power (W)
10<u>11</u>	Request received	Display 1 requests 5V@0A from the Tablet. The externally powered and dual- roleDual-Role Power bits are set.		Display 1 has external power providing everything it needs so it does not request any more.	30
11 12	Sends Accept	Accept received.		No power has been requested from the Tablet so the tablet has no reason to Reject this.	30
<u>13</u>	<u>Sends PS_RDY</u>	PS_RDY received.		Table completes the Explicit Contract by sending PS_RDY.	<u>30</u>
12<u>14</u>	Get Sink Capabilities received.	Sends Get Sink Capabiliites<u>Capabilities</u>		Display 1 has access to an external supply so it needs to check whether the Tablet upstream, which has no external supply, could use some power. Display 1 also knows that there is excess capacity, based on the last capabilities it received, which it is not currently using from Display 2.	30
13 15	The Tablet returns Sink Capabilities indicating that it is a Dual-Role and that it can use 12V@0.2A (2.4W) as a Sink.	Sink Capabilities received			30
14<u>16</u>		Display 1 requests 20V@1.62A (32.4W) from Display 2.	Request received		30
15<u>17</u>		Accept received	Sends Accept	Request is within the available power so Display 2 sends an accept.	32.4<u>30</u>

Step	Tablet	Display 1	Display 2	Device Policy Manager	PD Power (W)
<u>18</u>		PS_RDY received	Sends PS_RDY	Display 2 indicates that the power supply is ready to supply the power.	<u>32.4</u>
16<u>19</u>	PR_Swap received	Requests swap<u>PR_Swap</u> from Tablet.		Display 1 now offers to provide power to the Tablet by initiating a swapPower Role Swap.	32.4
17<u>20</u>	Accept sent <u>. Tablet</u> <u>turns off its V_{aus} supply.</u>	Accept received.		Tablet is happy to accept a swapPower Role <u>Swap</u> from any device offering it power.	32.4
<u>21</u>	Send PS_RDY	<u>PS_RDY received.</u> Display 1 turns on its V _{BUS} supply		Tablet indicates that its supply has been turned off.	<u>32.4</u>
<u>22</u>	PS RDY received.	<u>PS_RDY sent.</u>		Display 1 indicates that its power supply is ready so the Tablet starts drawing power.	<u>32.4</u>
18<u>23</u>	Source Capabilities received	Display 1 sends out a set of capabilities to the Tablet including: 5V@0.48A (2.4W), 12V@0.2A (2.4W) and 20V@0.12 (2.4W). The externally powered and USB suspend bits are set.			32.4
19<u>24</u>	The Tablet requests 12V@0.2A.	Request received.		Tablet can now request the power it needs.	32.4
20 25	Accept received	Accept sent		Power is within the capabilities of Display 1 so it accepts the request.	32.4

Step	Tablet	Display 1	Display 2	Device Policy Manager	PD Power (W)
21<u>26</u>	PS_RDY receivedThe Tablet starts drawing 12V@0.2A.	PS_RDY sent		Display 1 indicates that its power supply is ready so the tablet starts drawing the power.	32.4
Tablet	- <u>-</u> Charge				
2227	Tablet requests 12V@0.2A (2.4W) from Display 1. The Tablet needs to charge and so sets the Capability Mismatch bit and the No USB Suspend bit.	Request received.		Tablet needs to charge but the power offered is not sufficient. Since Display 1 claims to have an external supply the Tablet will try to get more power using the Capability Mismatch Flag.	32.4
<u>28</u>	Accept received	Accept sent		A valid request has been made so Display 1 accepts the request.	<u>32.4</u>
23 29	AcceptPS RDY received	Accept sent PS_RDY received		Tablet indicates a capability mismatch to the user.	32.4
2 4 <u>30</u>	Get Sink Capabilities received.	Get Sink Capabilities sent		Due to the Capability Mismatch Flag Display 1 requests Sink Capabilities from the Tablet.	32.4
25<u>31</u>	The Tablet returns Sink capabilities containing: 12V@1A (12W). The externally powered bit is cleared.	Sink Capabilities received			32.4

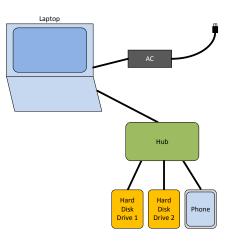

Step	Tablet	Display 1	Display 2	Device Policy Manager	PD Power (W)
2632		Display 1 requests 20V@2.1A (42W) from Display 2. The No Suspend Bit is set to reflect the request from the Tablet.	Request received	Since the Tablet requires an additional 12W of power, and Display 1 knows that this is available from Display 2 based on the last Capabilities received so it requests it. In addition the Request from the Tablet indicated that it wanted No Suspend so this is reflected upwards.	32.4
<u>33</u>		Accept received	Sends Accept	Display 2 has 42W available and so accepts the request.	<u>42</u>
<u>34</u>		PS RDY received	Sends PS_RDY	Display 2 completes the Explicit Contract but at this point has not accepted that power can be drawn during suspend.	<u>42</u>
27 <u>35</u>		AcceptSource Capabilities received	Sends AcceptDisplay2 sends out a new set of capabilities including: 5V@2A (10W), 12V@3A (36W) and 20V@3A (60W). The externally powered and USB suspend bits is now set to zero.	Based on the capabilities of the wall supply and its own needs Display 2 has 42W available and so accepts the request-calculates what it can offer upstream. It decides that it can continue to supply the power even during USB suspend and so resets the USB suspend bit.	42

USB Power Delivery Specification Revision <u>**42</u>**.0, <u>Version 1.0</u></u>

Step	Tablet	Display 1	Display 2	Device Policy Manager	PD Power (W)
<u>36</u>		Display 1 requests 20V@2.1A (42W) from Display 2. The No Suspend Bit is set to reflect the request from the Tablet.	<u>Request received</u>	Display 1 repeats its request since a new set of Capabilities have been sent out.	<u>42</u>
37		Accept received	Sends Accept	Display 2 has 42W available, even during suspend, and so accepts the request.	<u>42</u>
<u>38</u>		PS RDY received	Sends PS RDY	Display 2 completes the Explicit Contract.	<u>42</u>
28<u>39</u>	Capabilities received	Display 1 sends out a set of capabilities to the Tablet including: 5V@0.5A (2.5W), 12V@1A (12W) and 20V@0.6A (12W). The externally powered bit is set and USB suspend bit is cleared.		Display 1 now has the additional power available and so offers this to the Tablet.	42
29<u>40</u>	Tablet requests 12V@1A (12W) from Display 1.	Request received.		Tablet is being offered the power it needs to charge and so the Tablet requests this from Display 1.	42
30<u>41</u>	Accept received	Sends Accept		Request is within the available Display 1's available power and so it accepts the request.	42
31<u>42</u>	PS_RDY received. Tablet starts drawing 12V@1A from Display 1 and starts to charge.	Sends PS_RDY		Display 1 indicates its supply is ready to supply power.	42

F.3 Giving back power

Figure F-3 Giving Back Power

Configuration:

- 1. Laptop with an AC supply. AC supply provides sufficient power to charge the laptop and, in addition, to provide up to 60W downstream via a Profile 4 portPort.
- 2. A Hub with 4 downstream ports which initially provides 1 unit load (150mA) per portPort plus 1 unit load for its internal functions.
- 3. Two Hard Disk Drives both of which require 20V@0.5A (10W) to spin up and 20V@0.25A (5W) while being accessed.
- 4. A phone which uses 5V@2A (10W) to charge and can give back all of this power when requested.

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
Connect H	lub				
1	Connected to wall supply	Unattached	Unattached		Default
2	Hub is attached	Attached, V _{BUS} powered			Default

Table F-3 Giving back power

	Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
	3	Laptop sends out a set of capabilities including: 5V@2A (10W), 12V@3A (36W), 20V@3A (60W). The externally powered and USB suspend bits are set.	Source Capabilities received		Laptop sends out details of all available power via external supply	Default
	4	The Hub requests 5V@0.15A. This is the power for the Hubs internal operation.	Request received		Hub needs 1 unit load for its own operation and so requests this amount.	Default
	5	<u>Send</u> Accept received	Send- Accept <u>received</u>		Laptop evaluates request and it is within its available power.	0.75
	6	<u>Send PS_RDY</u>	<u>PS_RDY received.</u> Starts to draw 5V@0.15A		Laptop indicates that its power supply is ready.	0.75
	Connect H	ard Disk Drive 1				
	7		Attached detected.	Hard Disk Drive 1 is attached to one of the downstream ports of the Hub.		0.75
	8	Request received	The Hub requests 5V@0.3A (1.5W) from the Laptop.		Hub needs 0.75W for its own operation plus 0.75W for USB communication on one <u>portPort</u> .	0.75
•	9	Accept sent	Accept received		Request is within available power so the laptop accepts.	1.5
	<u>10</u>	<u>PS_RDY sent</u>	PS_RDY received		Laptop indicates that its power supply is ready	<u>1.5</u>

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
10<u>11</u>		Hub turns on V _{BUS} and sends out a set of capabilities to Hard Disk Drive 1 including: 5V@0.15A. The externally powered and USB suspend bits are set.	Source Capabilities received		1.5
11 12		Request received	Hard Disk Drive 1 requests 5V@0.15A from the Hub.	Hard Disk Drive 1 only needs one unit load when not operating so requests this.	1.5
12 13		Accept sent	Accept received	Request is within available power so the Hub accepts.	1.5
13<u>14</u>		PS_RDY sent	PS RDY received. The Hard Disk Drive starts drawing 1 unit load 5V@0.15A.	Laptop indicates its power supply is ready and the Hard Disk Drive starts drawing power.	1.5
Hard Disk	Drive 1 spin up		•		
14<u>15</u>		Request received	Hard Disk Drive 1 requests 5V@0.15A from the Hub but sets the Capability Mismatch bit.	Hard Disk Drive 1 needs 20V@0.5A to spin up but this is not available so it re-requests the available power flagging a capability mismatch.	1.5
<u>16</u>		Accept sent	Accept received	Request is within available power so the Hub accepts.	<u>1.5</u>
15 17		Accept <u>PS_RDY</u> sent	AcceptPS RDY received	Hard Disk Drive 1 indicates a capability mismatch to the user.	<u>1.5</u>

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
16<u>18</u>		The Hub requests the Sink Capabilities from Hard Disk Drive 1.	Get Sink Capabilities received	Due to the Capability Mismatch the Hub needs to determine what Hard Disk Drive 1 actually needs	1.5
17<u>19</u>		Sink Capabilities received	Hard Disk Drive 1 returns capabilities indicating that it requires 20V@0.5A.		1.5
18 20	Request received	The Hub requests 20V@0.54A (10.8W) from the Laptop.		The Hub evaluates that it now needs 0.75W for the Hub and 10W for Hard Disk Drive 1.	1.5
19<u>21</u>	Accept sent	Accept received		Power request from the Hub is within the Laptop's capabilities so the Laptop accepts the request.	10.8
<u>22</u>	PS_RDY sent	PS RDY received		Laptop completes the Explicit Contract.	<u>10.8</u>
20<u>23</u>		Hub sends out a set of capabilities to Hard Disk Drive 1 including: 5V@0.5A and 20V@0.5A. The externally powered and USB suspend bits are set.	Source Capabilities received	Hub now offers Hard Disk Drive 1 what it needs.	10.8
21<u>24</u>		Request received	Hard Disk Drive 1 requests 20V@0.5A operating current and indicates 20V@0.5A maximum current.	Hard Disk Drive 1 is operating at its maximum current to spin up so sets operating current = maximum current.	10.8
22 25		Accept sent	Accept received	Request is within the Hubs capabilities so it accepts.	10.8

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
2326		P <u>S_RDY sent</u>	PS_RDY received. Hard Disk Drive 1 starts to draw 20V@0.5A and spins up.	Hub indicates its power supply is ready so Hard Disk Drive 1 is operating at its maximum current <u>starts</u> to spin up so sets operating current = maximum current <u>draw</u> power.	10.8
2 4 <u>27</u>		Request received	Once spun up Hard Disk Drive 1 requests 20V@0.25A operating current and 20V@0.5A maximum current.	Hard Disk Drive 1 is operating at a lower current so sets operating current < maximum current.	10.8
25<u>28</u>		Accept sent	Accept received	The Hub will maintain a reservePower Reserve of 20V@0.25A (5W) for Hard Disk Drive 1 in addition to the 20V@0.25A (5W) it is currently using.	10.8
<u>29</u>		<u>PS_RDY sent</u>	PS_RDY received	Hub completes the Explicit Contract.	<u>10.8</u>
Hard Disk	Drive 2 spin up				
26<u>30</u>		Attach detected	Hard Disk Drive 2 is attached to one of the downstream ports of the Hub.		10.8

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
27<u>31</u>	Request received	The Hub requests 20V@0.58A (11.6W) from the Laptop.		The Hub needs 0.75W for itself, 0.75W for USB communication on one portPort , 5W for Hard Disk Drive 1 operation and 5W for the reservePower <u>Reserve</u> .	11.6<u>10.</u>8
28 <u>32</u>	Accept sent	Accept received		Power request from the Hub is within the Laptop's capabilities so it accepts the request.	11.6<u>10.</u>3
<u>33</u>	<u>PS_RDY sent</u>	PS RDY received		Laptop indicates its power supply is ready.	<u>11.</u>
29<u>34</u>		Hub sends out a set of capabilities to Hard Disk Drive 2 including: 5V@0.15A. The externally powered and USB suspend bits are set.	Source Capabilities received by Hard Disk Drive 2	Hub offers Hard Disk Drive 2 enough power to enumerate.	11.
30<u>35</u>		Request received	Hard Disk Drive 2 requests 5V@0.15A from the Hub.		11.
31<u>36</u>		Accept sent to Hard Disk Drive 2	Accept received by Hard Disk Drive 2	Request is within available capabilities so the Hub accepts	11.
32 37		PS RDY sent to Hard Disk Drive 2.	PS RDY received. Hard Disk Drive 2 starts drawing 5V@0.15A.	Hard Disk Drive 2 takes the power that it needs	11.

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
33<u>38</u>		Attach detected	The phone is attached to one of the downstream ports of the Hub.		11.6
34<u>39</u>	Request received	The Hub Requests 20V@0.62A (12.4W) from the Laptop.		The Hub needs 0.75W for itself, 1.5W for USB communications on two ports (Hard Disk Drive 1 and the Phone), 5W for Hard Disk Drive 1 operation and 5W for the reserve.Power Reserve.	11.6
35<u>40</u>	Accept sent	Accept received		Request is within available capabilities so the Laptop accepts	12.4
<u>41</u>	PS_RDY sent	PS_RDY received		Laptop indicates that its power supply is ready.	<u>12.4</u>
36<u>42</u>		The Hub powers V _{BUS} and sends out a set of capabilities to the Phone including: 5V@0.15A. The externally powered and USB suspend bits are set.	Source Capabilities received by the Phone	The Hub offers the Phone 1 unit load to enumerate.	12.4
37<u>43</u>		Request received from the Phone	The Phone requests 5V@0.15A from the Hub but sets the Capability Mismatch bit.	The Phone would like to charge and so indicates this fact through the Capability Mismatch bit.	12.4
38<u>44</u>		Accept sent	Accept received	Request is within available capabilities so the Laptop<u>Hub</u> accepts	12.4
<u>45</u>		PS_RDY sent	PS_RDY received	Hub indicates that its power supply is ready	<u>12.4</u>

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
39<u>46</u>		The Hub requests the Sink Capabilities from the phone.	Get Sink Capabilities received by the Phone	Due to the Capability Mismatch the Hub needs to determine what the Phone actually needs	12.4
40<u>47</u>		Sink Capabilities received from the Phone	The Phone returns capabilities indicating that it requires 5V@2A.	Phone returns the Capabilities it needs to charge	12.4
4 <u>148</u>	Request received	The Hub Requests 20V@1.12A (22.4W) from the Laptop.		The Hub needs 0.75W for itself, 0.75W for Hard Disk Drive 2, 10W for the phone, 5W for Hard Disk Drive 1 operation and 5W for the reserve.Power Reserve.	12.4
4 <u>249</u>	Accept sent	Accept received		Request is within available capabilities so the Laptop accepts	22<u>12</u>.4
<u>50</u>	<u>PS_RDY sent</u>	PS RDY received		Laptop indicates that its power supply is ready.	<u>22.4</u>
4 <u>351</u>		The Hub sends out a set of capabilities to the Phone including: 5V@2A. The externally powered and USB suspend bits are set.	Source Capabilities received by the Phone	The Hub now has the power that the Phone needs and so sends out a new set of Capabilities.	22.4

USB Power Delivery Specification Revision <u>2.0, Version</u> 1.0.

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
44 <u>52</u>		Request received from the Phone	The Phone requests 5V@2A from the Hub and sets the No USB Suspend bit since it needs to charge constantly. It sets the GiveBack flag and sets the Minimum Operating Current to 5V@0A.	The Phone requests the power it needs to charge. It asks for the USB Suspend requirement to be removed.	22.4
4 5 53		Accept sent to the Phone	Accept received by the Phone		22.4
46 <u>54</u>		PS RDY sent to the phone.	PS RDY received by the phone. Phone starts to charge 5V@2A but has to follow USB Suspend rules		<u>22.4</u>
47 <u>55</u>	Request received	The Hub Requests 20V@0.83A (16.6W) from the Laptop but sets the No USB Suspend bit.		The Hub needs 0.75W for itself, 0.75W for Hard Disk Drive 2, 10W for the phone (includes the reservePower Reserve of 5W), and 5W for Hard Disk Drive 1 operation. It requests for USB Suspend rule to be removed.	22.4

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
48 <u>56</u>	Accept sent	Accept received		Request is within available capabilities so the Laptop accepts. Note that the request for No Suspend has not been acted on by the Laptop. USB Suspend rules apply until the Laptop sends out new Source Capabilities with the USB Suspend bit cleared.	16.6 22.4
<u>57</u>	PS RDY sent	PS RDY received		Laptop indicates that its power supply is ready.	<u>16.6</u>
Hard Disk	Drive 2 spin up		1		
49<u>58</u>		Request received from Hard Disk Drive 2	Hard Disk Drive 2 requests 5V@0.15A from the Hub but sets the Capability Mismatch bit.	Hard Disk Drive 2 needs more power to spin up and so indicates a Capability Mismatch	16.6
<u>59</u>		Accept sent	Accept received	<u>The request is</u> within its capabilities so the Hub accepts.	<u>16.6</u>
<u>60</u>		PS_RDY sent	PS_RDY received	<u>The Hub indicates</u> <u>that its power</u> supply is ready.	<u>16.6</u>
50<u>61</u>		The Hub requests the Sink Capabilities from Hard Disk Drive 2.	Get Sink Capabilities received by Hard Disk Drive 2	Due to the Capability Mismatch the Hub has to determine what Hard Disk Drive 2 needs	16.6
51<u>62</u>		Sink Capabilities received	Hard Disk Drive 2 returns capabilities indicating that it requires 20V@0.5A maximum current.		16.6

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
52<u>63</u>		The Hub instructs the Phone to Goto Minimum operation.	Goto Min received by the Phone	Hub assess that there is additional power available from the Phone and so tells it to Goto Min. In this case it is reallocating the Phone's Charging power as the power reservePower <u>Reserve</u> for the Hard Disk Drives.	16.6
53<u>64</u>			The Phone drops to zero current draw.		16.6
<u>65</u>		PD RDY sent	PS RDY received.	Hub indicates that its power supply has changed to the new level.	<u>16.6</u>
54<u>66</u>	Request received	The Hub Requests 20V@1.04A (20.8W) from the Laptop		The Hub has an additional 10W from the Phone but needs 5W more to maintain its reserve.Power <u>Reserve.</u> The Hub needs 0.75W for itself, 10W for Hard Disk Drive 2, 5W for the <u>reservePower</u> <u>Reserve</u> , 5W for Hard Disk Drive 1 operation.	16.6
55 67	Accept sent	Accept received		Request is within available capabilities so the Laptop accepts.	20.8<u>16.6</u>
<u>68</u>	PS RDY sent	PS RDY received		Laptop indicates that its power supply is ready.	<u>20.8</u>

USB Power Delivery Specification Revision <u>**1**2</u>.0<u>. Version 1.0</u>

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
56<u>69</u>		Hub sends out a set of capabilities to Hard Disk Drive 2 including: SV@0.5A and 20V@0.5A. The externally powered and USB suspend bits are set.	Source Capabilities received by Hard Disk Drive 2	The Hub now has the power that Hard Disk Drive 2 needs so it sends out new Capabilities.	20.8
57<u>70</u>		Request received from Hard Disk Drive 2	Hard Disk Drive 2 requests 20V@0.5A operating current and 20V@0.5A.	Hard Disk Drive 2 requests what it needs to spin up.	20.8
58<u>71</u>		Accept sent to Hard Disk Drive 2	Accept received by Hard Disk Drive 2	The Hub assesses that the request is within its Capabilities so it accepts.	20.8
59 72		PS_RDY sent.	PS_RDY sent. Hard Disk Drive 2 starts to draw 20V@0.5A and spins up.		20.8
60<u>73</u>		Request received from Hard Disk Drive 2	Once spun up Hard Disk Drive 2 requests 20V@0.25A operating current and 20V@0.5A maximum current.	Hard Disk Drive 2 no longer needs the additional power so it gives back what it does not need.	20.8
61<u>74</u>		Accept sent to Hard Disk Drive 2	Accept received by Hard Disk Drive 2	The Hub assesses that the request is within its Capabilities so it accepts.	20.8
<u>75</u>		PS_RDY sent to Hard Disk Drive 2.	PS_RDY received by Hard Disk Drive 2.	The Hub indicates that its power supply is ready.	<u>20.8</u>
62<u>76</u>		The Hub sends out a set of capabilities to the Phone including: 5V@2A. The externally powered bit is set and the USB suspend bit is set.	Source Capabilities received by the Phone	The Hub now has the power available to charge the phone so it sends out new Capabilities	20.8

Step	Laptop	Hub	Peripherals	Device Policy Manager	Hub Power (W)
63<u>77</u>		Request received from the Phone	The Phone requests 5V@2A operating current from the Hub and sets the No USB Suspend bit since it needs to charge constantly. It sets the GiveBack flag and sets the Minimum Operating Current to 5V@0A.	The Phone requests the power it needs to charge. It asks for the USB Suspend requirement to be removed.	20.8
6 4 <u>78</u>		Accept sent to the Phone	Accept received by the Phone	The Hub assesses that the request is within its Capabilities so it accepts but maintains USB Suspend rules.	20.8
65<u>79</u>		PS RDY sent to the Phone.	PS RDY received by the Phone. The phone starts to draw 5V@2A but has to follow USB Suspend.	The Hub has allocated 0.75W for itself, 5W for Hard Disk Drive 2, 10W for the Phone (including 5W for the <u>reserve</u>), <u>Power</u> <u>Reserve</u>), and 5W for Hard Disk Drive 1 operation.	20.8

G.3 Discover Modes Example

G.3.1 Discover Modes Command request

Table G-6 shows the contents of the key fields in the Message Header and VDM header for an Initiator sending a **Discover Modes** Command request. The Initiator of the **Discover Modes** Command sequence sends a Message Header with the Number of Data Objects field set to 1 followed by a VDM Header with the Command Type (B7..6) set to zero indicating the Command is from an Initiator and the Command (B4..0) is set to 3 indicating Mode discovery.

Table G-6 Discover Modes Command request from Initiator Example

<u>Bit(s)</u>	<u>Field</u>	<u>Value</u>

<u>B5</u>	Reserved	<u>0</u>	
<u>B40</u>	Command ¹	<u>3 (Discover Modes)</u>	

G.3.2 Discover Modes Command response

The Responder to the *Discover Modes* Command request returns a Message Header with the Number of Data Objects field set to a value of 1 to 7 (the actual value is the number of Mode objects plus one) followed by a VDM Header with the Message Source (B5) set to 1 indicating the Command is from a Responder and the Command (B4.0) set to 2 indicating the following objects describe the Modes the device supports. If the ID is a VID, the structure and content of the VDO is left to the vendor. If the ID is a SID, the structure and content of the VDO is defined by the Standard.

Table G-7 shows the contents of the key fields in the Message Header and VDM header for a Responder returning VDOs in response to a *Discover Modes* Command request. In this illustration, the value 2 in the Message Header indicates that the device is returning one VDO describing the Mode it supports. It is possible for a Responder to report up to six different Modes.

Table G-7 Discover Modes Command response from Responder Example

G.4 Enter Mode Example

G.4.1 Enter Mode Command request

The Initiator of the *Enter Mode* Command request sends a Message Header with the Number of Data Objects field set to 1 followed by a VDM Header with the Message Source (B5) set to zero indicating the Command is from an Initiator and the Command (B4..0) set to 4 to request the Responder to enter its mode of operation and sets the Object Position field to the desired functional VDO based on its offset as received during Discovery.

Table G-8 shows the contents of the key fields in the Message Header and VDM header for an Initiator sending an *Enter Mode* Command request.

Table G-8 Enter Mode Command request from Initiator Example

<u>B108</u>	<u>Object Position</u>	<u>001b (a one in this field indicates a request to enter the first Mode in list returned by Discover Modes)</u>
<u>B76</u>	<u>Command Type</u>	<u>00b (Initiator)</u>
<u>B5</u>	Reserved	<u>0</u>
<u>B40</u>	Command ¹	<u>4 (Enter Mode)</u>

G.4.2 Enter Mode Command response

The Responder that is the target of the *Enter Mode* Command request shall send a Message Header with the Number of Data Objects field set to a value of 1 followed by a VDM Header with the Command Source (B5) set to 1 indicating the response is from a Responder and the Command (B4..0) set to 4 indicating the Responder has entered the Mode and is ready to operate.

Table G-9 shows the contents of the key fields in the Message Header and VDM header for a Responder sending an *Enter Mode* Command response with an ACK.

Table G-9 E	nter Mode Com	mand response fr	rom Responder	Example

Bit(s)	<u>Field</u>	<u>Value</u>			
Message	Message Header				
<u>15</u>	Reserved	<u>0</u>			
<u>1412</u>	Number of Data Objects	<u>1 (VDM Header)</u>

<u>B3116</u>	Standard or Vendor ID (SVID)	SVID for the Mode entered			
<u>B15</u>	<u>VDM Type</u>	<u>1 (Structured VDM)</u>			
<u>B1413</u>	Structured VDM Version	<u>00b (Version 1.0)</u>			
<u>B1211</u>	<u>Reserved</u>	<u>00b</u>			
<u>B108</u>	Object Position	001b (offset of the Mode entered)			
<u>B76</u>	Command Type	01b (Responder ACK)			
<u>B5</u>	Reserved	<u>0</u>			
<u>B40</u>	<u>Command</u>	<u>4 (Enter Mode)</u>			

G.5 Exit Mode Example

G.5.1 Exit Mode Command request

The Initiator of the *Exit Mode* Command request sends a Message Header with the Number of Data Objects field set to 1 followed by a VDM Header with the Message Source (B5) set to zero indicating the Command is from an Initiator and the Command (B4..0) set to 5 to request the Responder to exit its Mode of operation.

Table G-10 shows the contents of the key fields in the Message Header and VDM header for an Initiator sending an *Exit Mode* Command request.

Bit(s)	<u>Field</u>	Value		
Message Header				
<u>15</u>	Reserved	<u>0</u>		
<u>1412</u>	Number of Data Objects	<u>1 (VDM Header)</u>		
<u>119</u>	MessageID	<u>07</u>		
<u>8</u>	Port <u>Power</u> Role	<u>0 or 1</u>		
<u>76</u>	Specification Revision	<u>01b</u>		
<u>54</u>	Reserved	<u>0</u>		
<u>30</u>	Message Type	1111b (Vendor Defined Message)		
VDM He	<u>ader</u>			
<u>B3116</u>	<u>Standard or Vendor ID (SVID)</u>	SVID for the Mode being exited		
<u>B15</u>	<u>VDM Type</u>	<u>1 (Structured VDM)</u>		
<u>B1413</u>	Structured VDM Version	<u>00b (Version 1.0)</u>		
<u>B1211</u>	Reserved	<u>00b</u>		
<u>B108</u>	<u>Object Position</u>	001b (identifies the previously entered Mode by its Object Potision that is to be exited)		
<u>B76</u>	<u>Command Type</u>	<u>00b (Initiator)</u>		
<u>B5</u>	Reserved	Ω		
<u>B40</u>	Command ¹	<u>5 (Exit Mode)</u>		

Table G-10 Exit Mode Command request from Initiator Example

G.5.2 Exit Mode Command response

The Responder that receives the *Exit Mode* Command request sends a Message Header with the Number of Data Objects field set to a value of 1 followed by a VDM Header with the Message Source (B5) set to 1 indicating the Command is from a Responder and the Command (B4.0) set to 5 indicating the Responder has exited the Mode and has returned to normal USB operation.

Table G-11 shows the contents of the key fields in the Message Header and VDM header for a Responder sending an *Exit Mode* Command ACK response.

Table G-11	Exit Mode Comman	d response from	Responder Example

<u>Bit(s)</u>	Field	Value			
Message	Message Header				
<u>15</u>	Reserved	<u>0</u>			
<u>1412</u>	Number of Data Objects	<u>1 (VDM Header)</u>			
<u>119</u>	MessageID	<u>07</u>			
<u>8</u>	Port <u>Power R</u> ole	<u>0 or 1</u>			
<u>76</u>	Specification Revision	<u>01b</u>			
<u>54</u>	Reserved	<u>0</u>			
<u>30</u>	Message Type	<u>1111b (Vendor Defined Message)</u>			
VDM He	<u>ader</u>				
<u>B3116</u>	Standard or Vendor ID (SVID)	SVID for the Mode exited

<u>B1413</u>	Structured VDM Version	<u>00b (Version 1.0)</u>			
<u>B1211</u>	Reserved	<u>00b</u>			
<u>B108</u>	Object Position	001b (offset of the Mode to be exited)			
<u>B76</u>	Command Type	<u>01b (Responder ACK)</u>			
<u>B5</u>	Reserved	<u>0</u>			
<u>B40</u>	<u>Command</u>	<u>5 (Exit Mode)</u>			

G.6 Attention Example

G.6.1 Attention Command request

The Initiator of the *Attention* Command request sends a Message Header with the Number of Data Objects field set to 1 followed by a VDM Header with the Message Source (B5) set to zero indicating the Command is from an Initiator and the Command (B4..0) set to 6 to request attention from the Responder.

Table G-10 shows the contents of the key fields in the Message Header and VDM header for an Initiator sending an *Attention* Command request.
