This TDS3012 came to me in an unusual state. At first I thought it was some sort of internal engineering build of the firmware, but while playing around in the menus I somehow managed to put the scope back in a "normal" state. I think I was messing around in the developer menu...

Weird... 😬

I really wish I hadn't put the scope back to default, I wanted to play some more.

Were you just in some part of the Service menu ?

Posts: 18386

For a TDS2k from the Service manual:

1. Power on the oscilloscope.
2. Push the front-panel MEASURE button to access the MEASURE menu.
3. Push the top option button to access the Measure 1 menu.
4. Push and hold the front-panel SINGLE SEQ button.
5. Push and hold the front-panel AUTOSSET button.
6. Wait at least two seconds.
7. Release the SINGLE SEQ button.
8. Release the AUTOSSET button. A message appears in the lower left corner of the screen stating "Service mode ON."
9. Push the front-panel UTILITY button. The last item in the Utility menu is now "Service."

At completion of the Adjust procedure disable the "Service" menu through the UTILITY front panel button, the "Service" option button, and the "Service" Mode Off" option button.

Were you just in some part of the Service menu ?

For a TDS2k from the Service manual:

1. Power on the oscilloscope.
2. Push the front-panel MEASURE button to access the MEASURE menu.
3. Push the top option button to access the Measure 1 menu.

At step 3, the TDS3K top menu button is "snapshot all measurements" I continued on anyway, but no service menu.

If this was a service menu, odd that it would survive a power cycle.

OK the 3k seems a bit different.

Factory Adjustment Procedure

To perform the factory adjustment procedure, do these steps:

1. Locate the hole that provides access to the CAL switch on the rear panel.
CAL
2. Put the adjustment tool into the CAL switch hole. Push and hold the CAL switch in while you power on the oscilloscope. Release the switch when the oscilloscope shows the power-on message with the oscilloscope graticule in the background.
3. Push the SAVE/RECALL button.
4. Push the Recall Factory Setup screen button.

5. Push the OK Confirm Factory Init screen button to restore factory settings prior to doing the factory calibration.
6. Push the MENU OFF button.
7. Push the UTILITY button.
8. Push the System screen button to select Cal.
9. Push the Factory screen button.
10. Push the OK Do Factory Calibration screen button to start the adjustment process
11. Connect signals from the DC voltage source, leveled sine wave, or fast-rise generator as instructed by the oscilloscope display. After you connect the correct signal, push the OK Do Next Step screen button to continue the process.

NOTE. The oscilloscope adjusts itself automatically using the reference signal from the DC voltage source, leveled sine wave, or fast-rise generator. There are no manual oscilloscope adjustments that you need to make.

If you make an error, such as connecting the wrong input signal, you can repeat the last step by pushing the Return to Previous Screen screen button.

12. Continue the adjustment process until it is complete. You can abort the process at any time by pushing the MENU OFF button or by changing to a different menu.

Thanks, but I don't want to take a chance of losing the factory calibration.

Thanks, but I don't want to take a chance of losing the factory calibration.

I remember once diving into my TDS2012B service menu and the 'adjustment' is just one part of the service menu.

A smart guy like you wouldn't be changing anything. 😊

Maybe with the Cal switch left OFF you can still enter the menus and just have a look around for the 'hidden' menu you were in.

OK, you talked me into it. I booted up with the cal button pressed in. I can now enter the factory

calibration menu, but I don't see those weird menus anywhere, nor does the scope show that pacmanBuildView on boot-up.

Jwalling, did you ever find out what that developer menu was and how to enable it again? My TDS3054B also came with a developer menu and while playing with it (not changing anything like DAC gain etc...) I managed to disable it and now it does not appear anymore. I was wondering how it can be activated again...I didn't get to see all the things that it can control...

Never saw it again or figured out how it happened, and I've worked on many of these since then.

strange 🤔
 seems hardly anybody have seen this. My guess is that there must be a remote command that puts the scope in that mode. or maybe a combination of keys during boot.
 I thought people who have worked on the firmware and found out all those passwords and way to upgrade the BW would know...

Just came across the same 'issue' (on a 3.27 FW version)
 And just as others, I (somehow unintentionally) managed to get back to 'normal' 😊

Would be really interested, it was definitely a developer menu, and was persistent, as described. There were LCD testing menus, DAC settings (gain, offset,...), and a bunch of other interesting things... can't believe no one here knows how to enter this DEV mode 🤔🤔🤔?

Anyone here knows how to extract the actual firmware file ?? (and/or would have one, version doesn't matter much).

I'm not too bad with PowerPC assembler, would really like to dig into this to find out how to activate that mode... but don't wanna spend hours trying to figure out how to extract/reconstruct the actual image from the 3-4 floppies (not even sure a still have a working floppy btw...)

User WigglerAway figured it out here:

<https://www.eevblog.com/forum/projects/tektronix-tds3000-oscilloscope-modules-tds3uam/msg288787/#msg288787>

but I don't see that the reconstructed version was posted anywhere. Should be simple enough to do it.
