ALINCO,INC.

SPECIFICATIONS

1) GENERAL

Frequency coverage

DR-135T, TG (U.S amature)	118.000 ~ 135.995MHz (AM RX)
	136.000 ~ 173.995MHz (RX)
	144.000 ~ 147.995MHz (TX)
DR-135E, EG (European amature)	144.000 ~ 145.995MHz (RX, TX)
DR-135TA, TAG (Commercial)	118.000 ~ 135.995MHz (AM RX)
	136.000 ~ 173.995MHz (RX, TX)
Operating mode	16K0F3E (Wide mode) 8K50F3E (Narrow mode)
Frequency resolution	5, 8.33, 10, 12.5, 15, 20, 25, 30, 50
Number of memory channels	100
Antenna impedance	50Ω unbalanced
Power requirement	13.8V DC ±15% (11.7 to 15.8V)
Ground Method	Negative ground
Current drain Recieve	0.6A (Max.) 0.4A (Squelched)
Transmit	11.0A
Operating temperature	-10 to 60°C
Frequency stability	±1.0k Hz
Dimensions	142 (w) × 40 (h) × 174 (d) mm
	(142 × 40 × 188mm for projection included)
Weight	Approx. 1.0kg

2) TRANSMITTER

Output power	High: 50W (T, TG/E, EG) more than 33W(TA, TAG)
	Mid:10W Low:5W
Modulation system	Variable reactance frequency modulation
Maximum frequency deviation	±5kHz (Wide mode) ±2.5kHz (Narrow mode)
Spurious emission	-60dB
Adjacent channel power	-60dB
Noise and hum ratio	-40dB (Wide mode) -34dB (Narrow mode)
Microphone impedance	2kΩ

3) RECEIVER

Sensitivity	-12dBu for 12dB SINAD
Receiver circuitry	Double conversion superheterodyne
Intermediate frequency	1st 21.7MHz 2nd 450kHz
Squelch sensitivity	-16dBu
Adjacent channel selectivity	-65dB (Wide mode) -55dB (Narrow mode)
Intermoduration rejection ratio	60dB
Spurious and image rejection ratio	70dB
Audio output power	2.0W (8Ω, 10% THD)

! Note: All spesifications are subject to change without notice or obligation.

CIRCUIT DESCRIPTION DR-135

1) Receiver System

The receiver system is a double superheterodyne system with a 21.7MHz first IF and a 450kHz second IF.

1. Front End

The received signal at any frequency in the 136.000MHz to 173.995MHz range is passed through the low-pass filter (L116, L115, L114, L113, C204, C203, C202, C216 and C215) and tuning circuit (L105, L104 and D105, D104), and amplified by the RF amplifier (Q107). The signal from Q107 is then passed through the tuning circuit (L103, L102, and varicaps D103 and D102) and converted into 21.7MHz by the mixer (Q106). The tuning circuit, which consists of L105, L104, varicaps D105 and D104, L103, L102, varicaps D103 and D102, is controlled by the tracking voltage form the VCO. The local signal from the VCO is passed through the buffer (IC112), and supplied to the source of the mixer (Q106). The radio uses the lower side of the superheterodyne system.

2. IF Circuit

The mixer mixes the received signal with the local signal to obtain the sum of and difference between them. The crystal filter (XF102, XF101) selects 21.7MHz frequency from the results and eliminates the signals of the unwanted frequencies. The first IF amplifier (Q105) then amplifies the signal of the selected frequency.

3. Demodulator Circuit

After the signal is amplified by the first IF amplifier (Q105), it is input to pin 24 of the demodulator IC (IC108). The second local signal of 21.25MHz (shared with PLL IC reference oscillation), which is oscillated by the internal oscillation circuit in IC116 and crystal (X103), is input through pin 1 of IC108. Then, these two signals are mixed by the internal mixer in IC108 and the result is converted into the second IF signal with a frequency of 450kHz. The second IF signal is output from pin 3 of IC108 to the ceramic filter (FL101 or FL102), where the unwanted frequency band of that signal is eliminated, and the resulting signal is sent back to the IC108 through pins 5.

The second IF signal input via pin 5 is demodulated by the internal limiter amplifier and quadrature detection circuit in IC108, and output as an audio signal through pin 12.

4. Audio Circuit

The audio signal from pin 12 of IC108 is amplified by the audio amplifier (IC104:A),and switched by the signal switch IC (IC111) and then input it to the de-emphasis circuit.

and is compensated to the audio frequency characteristics in the de-emphasis circuit (R203, R207, R213, R209, C191, C218, C217) and amplified by the AF amplifier (IC104:D). The signal is then input to volume (VR1) . The adjusted signal is sent to the audio power amplifier (IC117) through pin 1 to drive the speaker.

5. Squelch Circuit

The detected output which is outputted from the pin 12 of IC108 is inputted to pin 19 of IC108 after it was been amplified by IC104:A and it is outputted from pin 20 after the noise component was been eliminated from the composed band pass filter in the built in amplifier of the IC, then the signal is rectified by D106 to convert into DC component. The adjusted voltage level at VR101 is delivered to the comparator of the CPU.

The voltage is led to pin 2 of CPU and compared with the setting voltage. The squelch will open if the input voltage is lower than the setting voltage.

During open squelch, pin 30 (SQC) of the CPU becomes "L" level, AF control signal is being controlled and sounds is outputted from the speaker.)

6. AIR Band Reception (T only)

When the frequency is within 118 ~ 135.995MHz, Q110 automatically turns ON, pin 14 of IC108 becomes "L" level and the condition becomes in AM detection mode.

The receiver signal passed through the duplexer is let to the antenna switch (D107, D101). After passing through the band-pass filter, the signal is amplified by RF amplifier Q112. Secondly the signal is mixed with the signal from the first local oscillator in the first-mixer Q106, then converted into the first IF. Its unwanted signal is let to IC106, pin24. Then converted into the second IF. and is demodulated by AM decoder of IC106,and is output from pin13 as the AF signal.

7. WIDE/NARROW switching circuit

The 2nd IF 450 kHz signal which passes through filter FL101 (wide) and FL102 (narrow) during narrow, changes its width using the width control switching IC103 and IC102.

2) Transmitter System

1. Modulator Circuit

The audio signal is converted to an electric signal by the microphone, and input it to the microphone amplifier (Q6). Amplified signal which passes through mic-mute control IC109 is adjusted to an appropriate mic-volume by means of mic-gain adjust VR106.

IC114:A and B consists of two operational amplifiers; one amplifier (pins 1, 2, and 3) is composed of pre-emphasis and IDC circuits and the other (pins 5, 6, and 7) is composed of a splatter filter. The maximum frequency deviation is obtained by VR107. and input to the signal switch (IC113) (9600 bps packet signal input switch) and input to the cathode of the varicap of the VCO, to change the electric capacity in the oscillation circuit. This produces the frequency modulation.

4

2. Power Amplifier Circuit

The transmitted signal is oscillated by the VCO, amplified by the drive amplifier (IC112) and younger amplifier (Q115), and input to the final power module (IC110). The signal is then amplified by the final power module (IC110) and led to the antenna switch (D110) and low-pass filter (L113, L114, L115, L116, C215, C216, C202, C203 and C204), where unwanted high harmonic waves are reduced as needed, and the resulting signal is supplied to the antenna.

3. APC Circuit

Part of the transmission power from the low-pass filter is detected by D111 and D112, converted to DC. The detection voltage is passed through the APC circuit (Q118, Q117, Q116), then it controls the APC voltage supplied to the younger amplifier Q115 and the final power module IC110 to fix the transmission power.

3) PLL Synthesizer Circuit

1. PLL

The dividing ratio is obtained by sending data from the CPU (IC1) to pin 2 and sending clock pulses to pin 3 of the PLL IC (IC116). The oscillated signal from the VCO is amplified by the buffer (Q134 and Q135) and input to pin 15 of IC116. Each programmable divider in IC116 divides the frequency of the input signal by N according to the frequency data, to generate a comparison frequency of 5 or 6.25kHz.

2. Reference Frequency Circuit

The reference frequency appropriate for the channel steps is obtained by dividing the 21.25MHz reference oscillation (X103) by 4250 or 3400, according to the data from the CPU (IC1). When the resulting frequency is 5kHz, channel steps of 5, 10, 15, 20, 25, 30, and 50kHz are used. When it is 6.25kHz, the 12.5kHz channel step is used.

3. Phase Comparator Circuit

The PLL (IC116) uses the reference frequency, 5 or 6.25kHz. The phase comparator in the IC116 compares the phase of the frequency from the VCO with that of the comparison frequency, 5 or 6.25kHz, which is obtained by the internal divider in IC116.

4. PLL Loop Filter Circuit

If a phase difference is found in the phase comparison between the reference frequency and VCO output frequency, the charge pump output (pin 13) of IC116 generates a pulse signal, which is converted to DC voltage by the PLL loop filter and input to the varicap of the VCO unit for oscillation frequency control.

5. VCO Circuit

A Colpitts oscillation circuit driven by Q131 directly oscillates the desired frequency. The frequency control voltage determined in the CPU (IC1) and PLL circuit is input to the varicaps (D122 and D123). This change the oscillation frequency, which is amplified by the VCO buffer (Q134) and output from the VCO area.

6. VCO Shift Circuit

During transmission or the AIR band Reception (118 ~ 136 MHz), the VCO shift circuit turns ON Q138, change control the capacitance of L123 and safely oscillates the VCO by means of H signal from pin 16 of IC116.)

4) CPU and Peripheral Circuits

1. LCD Display Circuit

The CPU turns ON the LCD via segment and common terminals with 1/4 the duty and 1/3 the bias, at the frame frequency is 64Hz.

2. Dimmer Circuit

The dimmer circuit makes the output of pin 13 of CPU (IC1) into "H" level at set mode, so that Q9 and Q3 will turn ON to make the lamp control resistor R84 short and make its illumination bright. But on the other hand, if the dimmer circuit makes pin 13 into "L" level, Q9 and Q3 will turn OFF, R84's illumination will become dimmer as its hang on voltage falls down in the working LED (D11, D2, D5, D3 and D6).

3. Reset and Backup

When the power form the DC cable increases from Circuits 0 V to 2.5 or more, "H" level reset signal is output form the reset IC (IC4) to pin 33 of the CPU (IC1), causing the CPU to reset. The reset signal, however, waits at 100, and does not enter the CPU until the CPU clock (X1) has stabilized.

4. S(Signal) Meter Circuit

The DC potential of pin 16 of IC106 is input to pin 1 of the CPU (IC1), converted from an analog to a digital signal, and displayed as the S-meter signal on the LCD.

5. DTMF Encoder

The CPU (IC1) is equipped with an internal DTMF encoder. The DTMF signal is output from pin 10, through R35, R34 and R261 (for level adjustment), and then through the microphone amplifier (IC114:A), and is sent to the varicap of the VCO for modulation. At the same time, the monitoring tone passes through the AF circuit and is output form the speaker.

6. Tone Encoder

The CPU (IC1) is equipped with an internal tone encoder. The tone signal (67.0 to 250.3Hz) is output from pin 9 of the CPU to the varicap (D122 and D123) of the VCO for modulation.

7. DCS Encoder

The CPU (IC1) is equipped with an internal DCS code encoder. The code (023 to 754) is output from pin 9 of the CPU to the varicap (D124) of the PLL reference oscillator. When DCS is ON, DCS MUTE circuit (Q126-ON, Q133-ON, Q132-OFF) works. The modulation activates in X103 side only.

8. CTCSS, DCS Decoder

The voice band of the AF output signal from pin 1 of IC104:A is cut by sharp active filter IC104:B and C (VCVS) and amplified, then led to pin 4 of CPU. The input signal is compared with the programmed tone frequency code in the CPU. The squelch will open when they match. During DCS, Q108 is ON, C156 is working and cut off frequency is lowered.

5) Power Supply Circuit

When power supply is ON, there is a "L" signal being inputted to pin 39 (PSW) of CPU which enables the CPU to work. Then, "H" signal is outputted from the pin 41 (C5C) of CPU and drives ON the power supply switch control Q8 and Q7 which turns the 5VS ON.

5VS turns ON the PLL IC116, main power supply switch Q127 and Q122, AF POWER IC117 and the 8 V of AVR (IC115). During reception, pin 29 (R5) of CPU outputs "H" level, Q124 is ON, and the reception circuits supplied by 8 V.

While during transmission, pin 28 (T5) of CPU outputs "L" level which is reverse by Q11 so that the output in Q128 will be "H" level, Q123 is ON, and the transmission circuit is supplied by 8 V.

Or, in the case when the condition of PLL is UNLOCK, "H" level is outputted from pin 14 of IC106, UNLOCK switch Q129 is ON, transmission switch Q128 is OFF which makes the transmission to stop.

### 1. ACC External Power Supply Terminal

When optional power supply cord DEC-37 etc. is connected to the external power supply terminal JK101, with ACC power supply ON, switch Q101 will turn ON, 5 V of AVR IC101 pin 2 (STB) becomes "L" which makes C5V to turn ON. With this, it can turn the power supply of the radio ON.

ADJUSTMENT

## 1) Adjustment Spot

Power S upply Voltage 1 3 .8 V

Output of S S G is all E MF indication

If without instruction,WIDE mode

If without instruction,S S G output is MOD 1 KHz WIDE DE V 3 .5 KHz/DE V NARROW DE V 1 .7 5 KHz

S tandard Modulation is also based above.

S peaker load is 8Ω and Output is 5 01~0 0 mV.

Attention: Don't set the variable resistor into its open position.

2) VCO and RX Adjustment Specification

ITEM	CONDITION	UNIT	ADJ. SPOT	ADJUSTING METHOD
Adjustment Frequency	146.00MHz TX	MAIN	TC101	Adjust so that Tx Frequency becomes within 146.00MHz±100Hz
VCO Adjustment	136.00MHz RX	MAIN	L123	Adjust so that PD voltage becomes 1.5V
VCO Confirmation	173.99MHz RX	MAIN		Confirm if PD voltage becomes less than 7.3V
Rx Signal Sensitivity Adjustment	146.05MHz 136.05MHz 146.05MHz 173.95MHz	MAIN	L105, L104 L103, L102	Repeatedly adjust so that the Rx Sensitivity becomes in maximum. Confirm: At -7dBu SINAD more than 12dB At -8dBu SINAD more than 12dB At -6dBu SINAD more than 12dB
Squelch Adjustment	146.05MHz SSG OFF Indication 01	MAIN	VR 101	Adjust so that the squelch stops at perfectly close location
S Meter Adjustment	146.05MHz SSG20dBu 1KHz 3.5KHz/DEV	MAIN	VR102	Adjust so that all the indicator appears

3) Tx Adjustment Specification

| ITEM	CONDITION	UNIT	ADJ. SPOT	ADJUSTING METHOD	
HI POWER Adjustment	146.00MHz HI POWER	MAIN	VR103	Other	Adjust to 50.0 ± 1.0 W
				D, DG	Adjust to 20.0 ± 1.0 W
MID POWER Adjustment	146.00MHz MID POWER	MAIN	VR104	Other	Adjust to 10.0 ± 1.0 W
				D,DG	Adjust to 5.0 ± 1.0 W
LOW POWER Confirmation	146.00MHz LOW POWER	MAIN		Other	Confirm if it becomes 4.0 ± 1.0 W
				D,DG	Confirm if it becomes 1 ~2.5 W
Maximum Deviation Adjustment	146.00MHz MOD 1 KHz40 mVemf NARROW	MAIN	VR105	4.5 ± 0.1 KHz/DEV	
Mic Gain Adjustment	146.00MHz MOD 1 KHz4 mVemf WIDE	MAIN	VR106	3.0 ± 0.1 KHz/DEV	
CTCSS Modulation Level Confirmation	146.00MHz 88.5 Hz	MAIN		800 ±Hz/DEV 3 KHz LPF ON	
DCS Modulation Level Confirmation	146.00MHz 255 Code	MAIN		800 ±Hz/DEV 3 KHz LPF ON	
1750Hz Modulation Level Confirmation	146.00MHz 1750 Hz	MAIN		3.0 ± 0.5 KHz/DEV	
DTMF Modulation Level Confirmation	146.00MHz DTMF Press the V/M key during TX	MAIN		3.0 ± 0.5 KHz/DEV	

4) Rx Test Specification

TEST ITEM	CONDITION	ADJ STANDARD	NOTE
RX Sensitivity	136.05MHz 146.05MHz 173.95MHz	Less than -7dBu Less than -8dBu Less than -6dBu	12dBSINAD
	146.05MHz NARROW	Less than -8dBu	
	135.05MHz	Less than 9dBu	AM 10dB S/N
RX Distortion	WIDE	Less than 4%	SSG Output 30dBu
	NARROW		
RX S/N	WIDE	More than 40dB	SSG Output 30dBu
	NARROW	More than 34dB	0.3~3KHzBOF OFF
Squelch Sensitivity	146.05MHz Indication 02	Squelch Open	SSG Output -10dBu
		Squelch Close	SSG Output OFF
S Meter	146.05MHz 1KHz 3.5KHz/DEV	All appears at 20dBu	Decrease SSG level and decrease S Meter level
AF Output	146.05MHz	More than 2W	SSG Output 30 dBu
	WIDE	Open at 500Hz/DEV	SSG Output 0dBu 88.5Hz
	NARROW	Open at 250Hz/DEV	
CTCSS Sensitivity	WIDE	Opens when test Equipment is in Tx	255 code
	NARROW	Opens when test Equipment is in Tx	255 code
Drain Current	146.05MHz	Less than 0.65A	MAX VR
Power Off Current	146.05MHz	Less than 10mA	Power Off
Howling	146.05MHz	Don't occur	SSG Output 60dBu MOD OFF MAX VR

5) Tx Test Specification

TEST ITEM	CONDITION	ADJ STANDARD		NOTE
		Other	D, DG	
TX Output HI POWER	136.00MHz 144.00MHz 146.00MHz 148.00MHz 173.99MHz	More than 33W 50±1W More than 33W	20±1W	←TA, TAG ONLY ←T, TG ONLY ←TA, TAG ONLY
TX Output MID POWER	146.00MHz	10±1W	5±1W	
TX Output Low Power	146.00MHz	4±1W	1~2.5W	
Drain Current	146.00MHz	Less than 10A	Less than 7A	
Frequency Deviation	146.00MHz	Within±0.3KHz		
Spurious	136.00MHz 144.00MHz 146.00MHz 148.00MHz 173.99MHz	More than 60dB More than 65dB More than 65dB More than 65dB More than 60dB		M and L standard power is also the same as of H power level
Modulation level	WIDE 146.00MHz	3.0±0.1KHz/DEV 4.5±0.1KHz/DEV		MIC IN 4mVemf MIC IN 40mVemf
	NARROW 146.00MHz	2.2±0.1KHz/DEV		MIC IN 40mVemf
CTCSS Modulation level	WIDE 146.00MHz	800±200Hz/DEV		88.5Hz 3KHz LPF ON
DCS Modulation Level	WIDE 146.00MHz	800±200Hz/DEV		Code 255 3KHz LPF ON
	NARROW 146.00MHz	450±100Hz/DEV		Code 255 3KHz LPF ON
1750Hz Modulation Level	WIDE 146.00MHz	3.0±0.5KHz/DEV		
DTMF Modulation Level	WIDE 146.00MHz	3.0±0.5KHz/DEV		Presss the V/M key during TX
Modulation Distortion	146.00MHz	Less than 3%		
TX S/N	WIDE	More than 40dB		0.3~3KHz BPF ON
	NARROW	More than 34dB
