

# DDR3 SDRAM

**MT41J256M4 – 32 Meg x 4 x 8 banks**

**MT41J128M8 – 16 Meg x 8 x 8 banks**

**MT41J64M16 – 8 Meg x 16 x 8 banks**

## Features

- $V_{DD} = V_{DDQ} = +1.5V \pm 0.075V$
- 1.5V center-terminated push/pull I/O
- Differential bidirectional data strobe
- 8n-bit prefetch architecture
- Differential clock inputs (CK, CK#)
- 8 internal banks
- Nominal and dynamic on-die termination (ODT) for data, strobe, and mask signals
- CAS READ latency (CL): 5, 6, 7, 8, 9, 10, or 11
- POSTED CAS ADDITIVE latency (AL): 0, CL - 1, CL - 2
- CAS WRITE latency (CWL): 5, 6, 7, 8, based on  $t_{CK}$
- Fixed burst length (BL) of 8 and burst chop (BC) of 4 (via the mode register set [MRS])
- Selectable BC4 or BL8 on-the-fly (OTF)
- Self refresh mode
- $T_C$  of 0°C to +95°C
  - 64ms, 8192 cycle refresh at 0°C to +85°C
  - 32ms, 8192 cycle refresh at +85°C to +95°C
- Clock frequency range of 300–800 MHz
- Self refresh temperature (SRT)
- Automatic self refresh (ASR)
- Write leveling
- Multipurpose register
- Output driver calibration

## Options<sup>1</sup>

- Configuration
  - 256 Meg x 4
  - 128 Meg x 8
  - 64 Meg x 16
- FBGA package (Pb-free) – x4, x8
  - 78-ball (8mm x 11.5mm) Rev. F
  - 78-ball (9mm x 11.5mm) Rev. D
  - 86-ball (9mm x 15.5mm) Rev. B
- FBGA package (Pb-free) – x16
  - 96-ball (9mm x 15.5mm) Rev. B
- Timing – cycle time
  - 1.25ns @ CL = 11 (DDR3-1600) -125
  - 1.25ns @ CL = 10 (DDR3-1600) -125E
  - 1.5ns @ CL = 10 (DDR3-1333) -15
  - 1.5ns @ CL = 9 (DDR3-1333) -15E
  - 1.87ns @ CL = 8 (DDR3-1066) -187
  - 1.87ns @ CL = 7 (DDR3-1066) -187E
- Operating temperature
  - Commercial (0°C ≤  $T_C$  ≤ +95°C) None
  - Industrial (-40°C ≤  $T_C$  ≤ +95°C) IT
  - Automotive (-40°C ≤  $T_C$  ≤ +105°C) AT
- Revision :B/:D/:F

## Marking

Note: 1. Not all options listed can be combined to define an offered product. Use the part catalog search on <http://www.micron.com> for available offerings.

**Table 1: Key Timing Parameters**

Speed Grade	Data Rate (MT/s)	Target $t_{RCD}$ - $t_{RP}$ -CL	$t_{RCD}$ (ns)	$t_{RP}$ (ns)	CL (ns)
-125 <sup>1, 2</sup>	1600	11-11-11	13.75	13.75	13.75
-125E <sup>1, 2</sup>	1600	10-10-10	12.5	12.5	12.5
-15 <sup>3</sup>	1333	10-10-10	15	15	15
-15E <sup>1</sup>	1333	9-9-9	13.5	13.5	13.5
-187	1066	8-8-8	15	15	15
-187E	1066	7-7-7	13.1	13.1	13.1

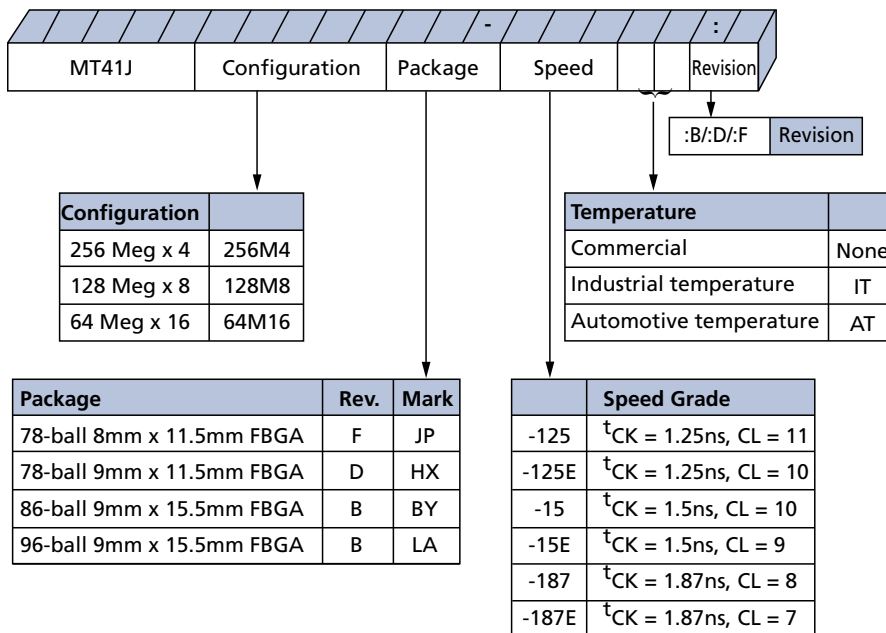

- Notes: 1. Backward compatible to 1066, CL = 7 (-187E).  
 2. Backward compatible to 1333, CL = 9 (-15E).  
 3. Backward compatible to 1066, CL = 8 (-187).

**Table 2: Addressing**

Parameter	256 Meg x 4	128 Meg x 8	64 Meg x 16
Configuration	32 Meg x 4 x 8 banks	16 Meg x 8 x 8 banks	8 Meg x 16 x 8 banks
Refresh count	8K	8K	8K
Row addressing	16K (A[13:0])	16K (A[13:0])	8K (A[12:0])
Bank addressing	8 (BA[2:0])	8 (BA[2:0])	8 (BA[2:0])
Column addressing	2K (A[11, 9:0])	1K (A[9:0])	1K (A[9:0])

**Figure 1: DDR3 Part Numbers**

Example Part Number: MT41J256M4BY-15:B

Note: 1. Not all options listed can be combined to define an offered product. Use the part catalog search on <http://www.micron.com> for available offerings.

### FBGA Part Marking Decoder

Due to space limitations, FBGA-packaged components have an abbreviated part marking that is different from the part number. For a quick conversion of an FBGA code, see the FBGA Part Marking Decoder on Micron's Web site: <http://www.micron.com>.

## Functional Description

DDR3 SDRAM uses a double data rate architecture to achieve high-speed operation. The double data rate architecture is an  $8n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access consists of a single  $8n$ -bit-wide, one-clock-cycle data transfer at the internal DRAM core and eight corresponding  $n$ -bit-wide, one-half-clock-cycle data transfers at the I/O pins.

The differential data strobe (DQS, DQS#) is transmitted externally, along with data, for use in data capture at the DDR3 SDRAM input receiver. DQS is center-aligned with data for WRITES. The read data is transmitted by the DDR3 SDRAM and edge-aligned to the data strobes.

The DDR3 SDRAM operates from a differential clock (CK and CK#). The crossing of CK going HIGH and CK# going LOW is referred to as the positive edge of CK. Control, command, and address signals are registered at every positive edge of CK. Input data is registered on the first rising edge of DQS after the WRITE preamble, and output data is referenced on the first rising edge of DQS after the READ preamble.

Read and write accesses to the DDR3 SDRAM are burst-oriented. Accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVATE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVATE command are used to select the bank and row to be accessed. The address bits registered coincident with the READ or WRITE commands are used to select the bank and the starting column location for the burst access.

The device uses a READ and WRITE BL8 and BC4. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst access.

As with standard DDR SDRAM, the pipelined, multibank architecture of DDR3 SDRAM allows for concurrent operation, thereby providing high bandwidth by hiding row precharge and activation time.

A self refresh mode is provided, along with a power-saving, power-down mode.

## Industrial Temperature

The industrial temperature (IT) device requires that the case temperature not exceed  $-40^{\circ}\text{C}$  or  $+95^{\circ}\text{C}$ . JEDEC specifications require the refresh rate to double when  $T_C$  exceeds  $+85^{\circ}\text{C}$ ; this also requires use of the high-temperature self refresh option. Additionally, ODT resistance and the input/output impedance must be derated when  $T_C$  is  $< 0^{\circ}\text{C}$  or  $> +95^{\circ}\text{C}$ .

## Automotive Temperature

The automotive temperature (AT) device requires that the case temperature not exceed  $-40^{\circ}\text{C}$  or  $+105^{\circ}\text{C}$ . JEDEC specifications require the refresh rate to double when  $T_C$  exceeds  $+85^{\circ}\text{C}$ ; this also requires use of the high-temperature self refresh option. Additionally, ODT resistance and the input/output impedance must be derated when  $T_C$  is  $< 0^{\circ}\text{C}$  or  $> +95^{\circ}\text{C}$ .

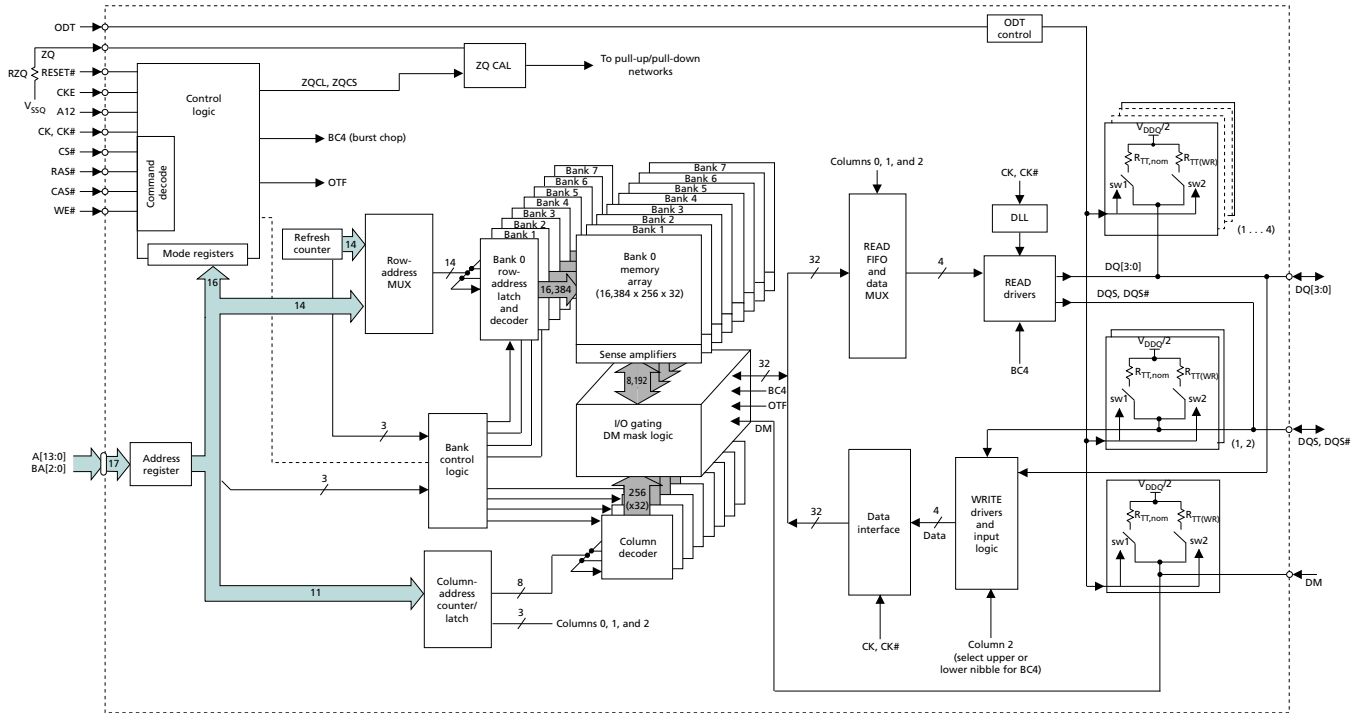

## General Notes

- The functionality and the timing specifications discussed in this data sheet are for the DLL enable mode of operation (normal operation).
  - Throughout this data sheet, various figures and text refer to DQs as “DQ.” DQ term is to be interpreted as any and all DQ collectively, unless specifically stated otherwise.
  - The terms “DQS” and “CK” found throughout this data sheet are to be interpreted as DQS, DQS# and CK, CK# respectively, unless specifically stated otherwise.
  - Complete functionality may be described throughout the document; any page or diagram may have been simplified to convey a topic and may not be inclusive of all requirements.
  - Any specific requirement takes precedence over a general statement.
  - Any functionality not specifically stated is considered undefined, illegal, and not supported, and can result in unknown operation.
  - Row addressing is denoted as A[n:0]. *For example*, 1Gb: n = 12 [x16]; 1Gb: n = 13 [x4, x8]; 2Gb: n = 13 [x16] and 2Gb: n = 14 [x4, x8]; . 4Gb: n = 14 [x16] and 4Gb: n = 15 [x4, x8].
  - A x16 device's DQ bus is comprised of two bytes. If only one of the bytes needs to be used, use the lower byte for data transfers and terminate the upper byte as noted:
    - Connect UDQS to ground via 1K\* resistor.
    - Connect UDQS# to V<sub>DD</sub> via 1K\* resistor.
    - Connect UDM to V<sub>DD</sub> via 1K\* resistor.
    - Connect DQ 8–15 individually to either V<sub>SS</sub>, V<sub>DD</sub>, or V<sub>REF</sub> via 1K resistors, or float DQ 8–15.
- \*If ODT is used, 1K resistor should be changed to 4X that of the selected ODT.

## Functional Block Diagrams

DDR3 SDRAM is a high-speed, CMOS dynamic random access memory. It is internally configured as an 8-bank DRAM.

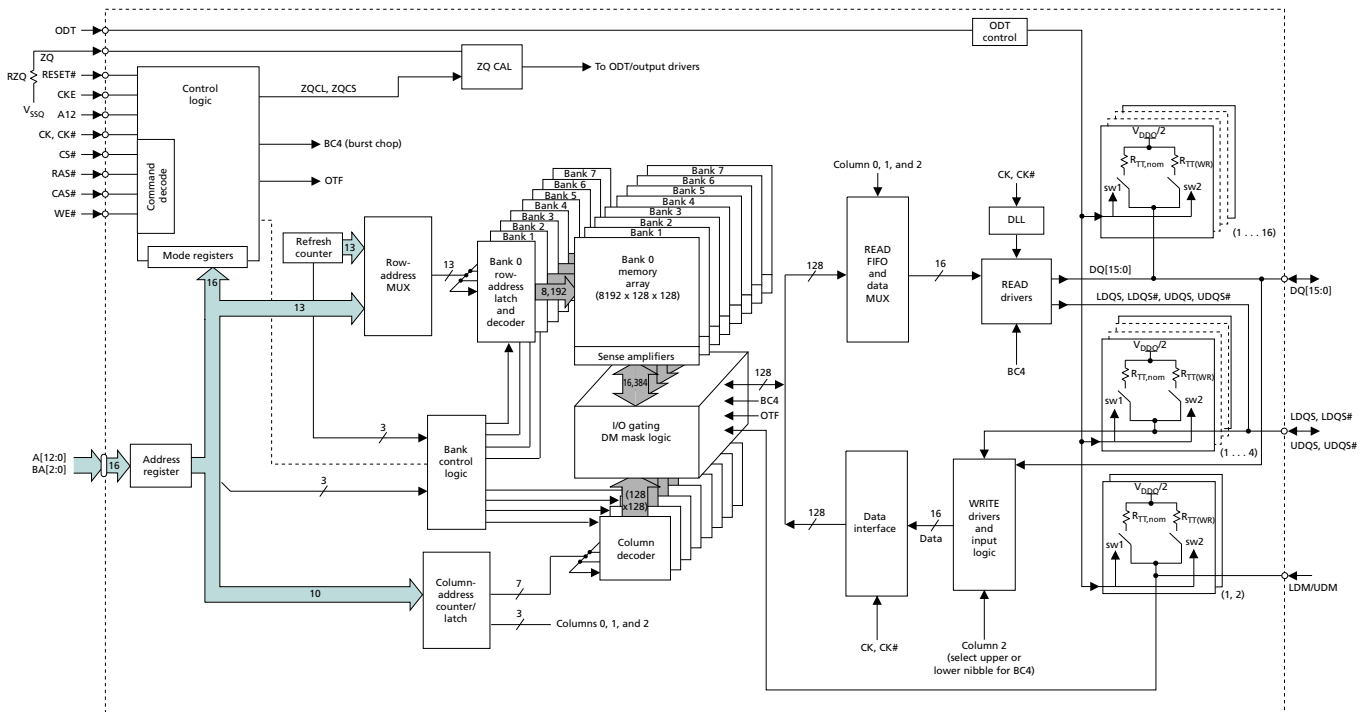

**Figure 3: 256 Meg x 4 Functional Block Diagram**

- Notes:
- Ball descriptions listed in Table 3 (page 19) are listed as “x4, x8” if unique; otherwise, x4 and x8 are the same.
  - A comma separates the configuration; a slash defines a selectable function.  
Example D7 = NF, NF/TDQS#. NF applies to the x4 configuration only. NF/TDQS# applies to the x8 configuration only—selectable between NF or TDQS# via MRS (symbols are defined in Table 3).

**Figure 7: 86-Ball FBGA – x4, x8 (Top View)**

- Notes:
- Ball descriptions listed in Table 4 (page 21) are listed as “x4, x8” if unique; otherwise, x4 and x8 are the same.
  - A comma separates the configuration; a slash defines a selectable function.  
Example D7 = NF, NF/TDQS#. NF applies to the x4 configuration only. NF/TDQS# applies to the x8 configuration only—selectable between NF or TDQS# via MRS (symbols are defined in Table 4).

**Figure 8: 96-Ball FBGA – x16 (Top View)**

- Notes:
- Ball descriptions listed in Table 5 (page 23) are listed as “x4, x8” if unique; otherwise, x4 and x8 are the same.
  - A comma separates the configuration; a slash defines a selectable function.  
Example D7 = NF, NF/TDQS#. NF applies to the x4 configuration only. NF/TDQS# applies to the x8 configuration only—selectable between NF or TDQS# via MRS (symbols are defined in Table 5).

**Table 3: 78-Ball FBGA – x4, x8 Ball Descriptions**

Symbol	Type	Description
A0, A1, A2, A3, A4, A5, A6, A7, A8, A9, A10/AP, A11, A12/BC#, A13	Input	<b>Address inputs:</b> Provide the row address for ACTIVATE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one bank (A10 LOW, bank selected by BA[2:0]) or all banks (A10 HIGH). The address inputs also provide the op-code during a LOAD MODE command. Address inputs are referenced to $V_{REFCA}$ . A12/BC#: When enabled in the mode register (MR), A12 is sampled during READ and WRITE commands to determine whether burst chop (on-the-fly) will be performed (HIGH = BL8 or no burst chop, LOW = BC4). See Table 63 (page 98).
BA0, BA1, BA2	Input	<b>Bank address inputs:</b> BA[2:0] define the bank to which an ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. BA[2:0] define which mode register (MR0, MR1, MR2, or MR3) is loaded during the LOAD MODE command. BA[2:0] are referenced to $V_{REFCA}$ .
CK, CK#	Input	<b>Clock:</b> CK and CK# are differential clock inputs. All control and address input signals are sampled on the crossing of the positive edge of CK and the negative edge of CK#. Output data strobe (DQS, DQS#) is referenced to the crossings of CK and CK#.
CKE	Input	<b>Clock enable:</b> CKE enables (registered HIGH) and disables (registered LOW) internal circuitry and clocks on the DRAM. The specific circuitry that is enabled/disabled is dependent upon the DDR3 SDRAM configuration and operating mode. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operations (all banks idle), or active power-down (row active in any bank). CKE is synchronous for power-down entry and exit and for self refresh entry. CKE is asynchronous for self refresh exit. Input buffers (excluding CK, CK#, CKE, RESET#, and ODT) are disabled during POWER-DOWN. Input buffers (excluding CKE and RESET#) are disabled during SELF REFRESH. CKE is referenced to $V_{REFCA}$ .
CS#	Input	<b>Chip select:</b> CS# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when CS# is registered HIGH. CS# provides for external rank selection on systems with multiple ranks. CS# is considered part of the command code. CS# is referenced to $V_{REFCA}$ .
DM	Input	<b>Input data mask:</b> DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with the input data during a write access. Although the DM ball is input-only, the DM loading is designed to match that of the DQ and DQS balls. DM is referenced to $V_{REFDQ}$ . DM has an optional use as TDQS on the x8.
ODT	Input	<b>On-die termination:</b> ODT enables (registered HIGH) and disables (registered LOW) termination resistance internal to the DDR3 SDRAM. When enabled in normal operation, ODT is only applied to each of the following balls: DQ[7:0], DQS, DQS#, and DM for the x8; DQ[3:0], DQS, DQS#, and DM for the x4. The ODT input is ignored if disabled via the LOAD MODE command. ODT is referenced to $V_{REFCA}$ .
RAS#, CAS#, WE#	Input	<b>Command inputs:</b> RAS#, CAS#, and WE# (along with CS#) define the command being entered and are referenced to $V_{REFCA}$ .
RESET#	Input	<b>Reset:</b> RESET# is an active LOW CMOS input referenced to $V_{SS}$ . The RESET# input receiver is a CMOS input defined as a rail-to-rail signal with DC HIGH $\geq 0.8 \times V_{DD}$ and DC LOW $\leq 0.2 \times V_{DDQ}$ . RESET# assertion and desertion are asynchronous.
DQ0, DQ1, DQ2, DQ3	I/O	<b>Data input/output:</b> Bidirectional data bus for the x4 configuration. DQ[3:0] are referenced to $V_{REFDQ}$ .

**Table 3: 78-Ball FBGA – x4, x8 Ball Descriptions (Continued)**

Symbol	Type	Description
DQ0, DQ1, DQ2, DQ3, DQ4, DQ5, DQ6, DQ7	I/O	<b>Data input/output:</b> Bidirectional data bus for the x8 configuration. DQ[7:0] are referenced to $V_{REFDQ}$ .
DQS, DQS#	I/O	<b>Data strobe:</b> Output with read data. Edge-aligned with read data. Input with write data. Center-aligned to write data.
TDQS, TDQS#	Output	<b>Termination data strobe:</b> Applies to the x8 configuration only. When TDQS is enabled, DM is disabled, and the TDQS and TDQS# balls provide termination resistance.
$V_{DD}$	Supply	<b>Power supply:</b> 1.5V $\pm$ 0.075V.
$V_{DDQ}$	Supply	<b>DQ power supply:</b> 1.5V $\pm$ 0.075V. Isolated on the device for improved noise immunity.
$V_{REFCA}$	Supply	<b>Reference voltage for control, command, and address:</b> $V_{REFCA}$ must be maintained at all times (including self refresh) for proper device operation.
$V_{REFDQ}$	Supply	<b>Reference voltage for data:</b> $V_{REFDQ}$ must be maintained at all times (excluding self refresh) for proper device operation.
$V_{SS}$	Supply	Ground.
$V_{SSQ}$	Supply	<b>DQ ground:</b> Isolated on the device for improved noise immunity.
ZQ	Reference	<b>External reference ball for output drive calibration:</b> This ball is tied to an external 240 $\Omega$ resistor (RZQ), which is tied to $V_{SSQ}$ .
NC	–	<b>No connect:</b> These balls should be left unconnected (the ball has no connection to the DRAM or to other balls).
NF	–	<b>No function:</b> When configured as a x4 device, these balls are NF. When configured as a x8 device, these balls are defined as TDQS#, DQ[7:4].

**Table 4: 86-Ball FBGA – x4, x8 Ball Descriptions**

Symbol	Type	Description
A0, A1, A2, A3, A4, A5, A6, A7, A8, A9 A10/AP, A11, A12/ BC#, A13	Input	<b>Address inputs:</b> Provide the row address for ACTIVATE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one bank (A10 LOW, bank selected by BA[2:0]) or all banks (A10 HIGH). The address inputs also provide the op-code during a LOAD MODE command. Address inputs are referenced to $V_{REFCA}$ . A12/BC#: When enabled in the mode register (MR), A12 is sampled during READ and WRITE commands to determine whether burst chop (on-the-fly) will be performed (HIGH = BL8 or no burst chop, LOW = BC4). See Table 63 (page 98).
BA0, BA1, BA2	Input	<b>Bank address inputs:</b> BA[2:0] define the bank to which an ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. BA[2:0] define which mode register (MR0, MR1, MR2, or MR3) is loaded during the LOAD MODE command. BA[2:0] are referenced to $V_{REFCA}$ .
CK, CK#	Input	<b>Clock:</b> CK and CK# are differential clock inputs. All control and address input signals are sampled on the crossing of the positive edge of CK and the negative edge of CK#. Output data strobe (DQS, DQS#) is referenced to the crossings of CK and CK#.
CKE	Input	<b>Clock enable:</b> CKE enables (registered HIGH) and disables (registered LOW) internal circuitry and clocks on the DRAM. The specific circuitry that is enabled/disabled is dependent upon the DDR3 SDRAM configuration and operating mode. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operations (all banks idle), or active power-down (row active in any bank). CKE is synchronous for power-down entry and exit and for self refresh entry. CKE is asynchronous for self refresh exit. Input buffers (excluding CK, CK#, CKE, RESET#, and ODT) are disabled during POWER-DOWN. Input buffers (excluding CKE and RESET#) are disabled during SELF REFRESH. CKE is referenced to $V_{REFCA}$ .
CS#	Input	<b>Chip select:</b> CS# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when CS# is registered HIGH. CS# provides for external rank selection on systems with multiple ranks. CS# is considered part of the command code. CS# is referenced to $V_{REFCA}$ .
DM	Input	<b>Input data mask:</b> DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with the input data during a write access. Although the DM ball is input-only, the DM loading is designed to match that of the DQ and DQS balls. DM is referenced to $V_{REFDQ}$ . DM has an optional use as TDQS on the x8.
ODT	Input	<b>On-die termination:</b> ODT enables (registered HIGH) and disables (registered LOW) termination resistance internal to the DDR3 SDRAM. When enabled in normal operation, ODT is only applied to each of the following balls: DQ[7:0], DQS, DQS#, and DM for the x8; DQ[3:0], DQS, DQS#, and DM for the x4. The ODT input is ignored if disabled via the LOAD MODE command. ODT is referenced to $V_{REFCA}$ .
RAS#, CAS#, WE#	Input	<b>Command inputs:</b> RAS#, CAS#, and WE# (along with CS#) define the command being entered and are referenced to $V_{REFCA}$ .
RESET#	Input	<b>Reset:</b> RESET# is an active LOW CMOS input referenced to $V_{SS}$ . The RESET# input receiver is a CMOS input defined as a rail-to-rail signal with DC HIGH $\geq 0.8 \times V_{DD}$ and DC LOW $\leq 0.2 \times V_{DDQ}$ . RESET# assertion and desertion are asynchronous.
DQ0, DQ1, DQ2, DQ3	I/O	<b>Data input/output:</b> Bidirectional data bus for the x4 configuration. DQ[3:0] are referenced to $V_{REFDQ}$ .

**Table 4: 86-Ball FBGA – x4, x8 Ball Descriptions (Continued)**

Symbol	Type	Description
DQ0, DQ1, DQ2, DQ3, DQ4, DQ5, DQ6, DQ7	I/O	<b>Data input/output:</b> Bidirectional data bus for the x8 configuration. DQ[7:0] are referenced to $V_{REFDQ}$ .
DQS, DQS#	I/O	<b>Data strobe:</b> Output with read data. Edge-aligned with read data. Input with write data. Center-aligned to write data.
TDQS, TDQS#	Output	<b>Termination data strobe:</b> Applies to the x8 configuration only. When TDQS is enabled, DM is disabled, and the TDQS and TDQS# balls provide termination resistance.
$V_{DD}$	Supply	<b>Power supply:</b> 1.5V $\pm$ 0.075V.
$V_{DDQ}$	Supply	<b>DQ power supply:</b> 1.5V $\pm$ 0.075V. Isolated on the device for improved noise immunity.
$V_{REFCA}$	Supply	<b>Reference voltage for control, command, and address:</b> $V_{REFCA}$ must be maintained at all times (including self refresh) for proper device operation.
$V_{REFDQ}$	Supply	<b>Reference voltage for data:</b> $V_{REFDQ}$ must be maintained at all times (excluding self refresh) for proper device operation.
$V_{SS}$	Supply	Ground.
$V_{SSQ}$	Supply	<b>DQ ground:</b> Isolated on the device for improved noise immunity.
ZQ	Reference	<b>External reference ball for output drive calibration:</b> This ball is tied to an external 240 $\Omega$ resistor (RZQ), which is tied to $V_{SSQ}$ .
NC	–	<b>No connect:</b> These balls should be left unconnected (the ball has no connection to the DRAM or to other balls).
NF	–	<b>No function:</b> When configured as a x4 device, these balls are NF. When configured as a x8 device, these balls are defined as TDQS#, DQ[7:4].

**Table 5: 96-Ball FBGA – x16 Ball Descriptions**

Symbol	Type	Description
A0, A1, A2, A3, A4, A5, A6, A7, A8, A9, A10/AP, A11, A12/BC#	Input	<b>Address inputs:</b> Provide the row address for ACTIVATE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one bank (A10 LOW, bank selected by BA[2:0]) or all banks (A10 HIGH). The address inputs also provide the op-code during a LOAD MODE command. Address inputs are referenced to $V_{REFCA}$ . A12/BC#: When enabled in the mode register (MR), A12 is sampled during READ and WRITE commands to determine whether burst chop (on-the-fly) will be performed (HIGH = BL8 or no burst chop, LOW = BC4). See Table 63 (page 98).
BA0, BA1, BA2	Input	<b>Bank address inputs:</b> BA[2:0] define the bank to which an ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. BA[2:0] define which mode register (MR0, MR1, MR2, or MR3) is loaded during the LOAD MODE command. BA[2:0] are referenced to $V_{REFCA}$ .
CK, CK#	Input	<b>Clock:</b> CK and CK# are differential clock inputs. All control and address input signals are sampled on the crossing of the positive edge of CK and the negative edge of CK#. Output data strobe (DQS, DQS#) is referenced to the crossings of CK and CK#.
CKE	Input	<b>Clock enable:</b> CKE enables (registered HIGH) and disables (registered LOW) internal circuitry and clocks on the DRAM. The specific circuitry that is enabled/disabled is dependent upon the DDR3 SDRAM configuration and operating mode. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operations (all banks idle), or active power-down (row active in any bank). CKE is synchronous for power-down entry and exit and for self refresh entry. CKE is asynchronous for self refresh exit. Input buffers (excluding CK, CK#, CKE, RESET#, and ODT) are disabled during POWER-DOWN. Input buffers (excluding CKE and RESET#) are disabled during SELF REFRESH. CKE is referenced to $V_{REFCA}$ .
CS#	Input	<b>Chip select:</b> CS# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when CS# is registered HIGH. CS# provides for external rank selection on systems with multiple ranks. CS# is considered part of the command code. CS# is referenced to $V_{REFCA}$ .
LDM	Input	<b>Input data mask:</b> LDM is a lower-byte, input mask signal for write data. Lower-byte input data is masked when LDM is sampled HIGH along with the input data during a write access. Although the LDM ball is input-only, the LDM loading is designed to match that of the DQ and DQS balls. LDM is referenced to $V_{REFDQ}$ .
ODT	Input	<b>On-die termination:</b> ODT enables (registered HIGH) and disables (registered LOW) termination resistance internal to the DDR3 SDRAM. When enabled in normal operation, ODT is only applied to each of the following balls: DQ[15:0], LDQS, LDQS#, UDQS, UDQS#, LDM, and UDM for the x16; DQ0[7:0], DQS, DQS#, DM/TDQS, and NF/TDQS# (when TDQS is enabled) for the x8; DQ[3:0], DQS, DQS#, and DM for the x4. The ODT input is ignored if disabled via the LOAD MODE command. ODT is referenced to $V_{REFCA}$ .
RAS#, CAS#, WE#	Input	<b>Command inputs:</b> RAS#, CAS#, and WE# (along with CS#) define the command being entered and are referenced to $V_{REFCA}$ .
RESET#	Input	<b>Reset:</b> RESET# is an active LOW CMOS input referenced to $V_{SS}$ . The RESET# input receiver is a CMOS input defined as a rail-to-rail signal with DC HIGH $\geq 0.8 \times V_{DD}$ and DC LOW $\leq 0.2 \times V_{DDQ}$ . RESET# assertion and desertion are asynchronous.

**Table 5: 96-Ball FBGA – x16 Ball Descriptions (Continued)**

Symbol	Type	Description
UDM	Input	<b>Input data mask:</b> UDM is an upper-byte, input mask signal for write data. Upper-byte input data is masked when UDM is sampled HIGH along with that input data during a WRITE access. Although the UDM ball is input-only, the UDM loading is designed to match that of the DQ and DQS balls. UDM is referenced to $V_{REFDQ}$ .
DQ0, DQ1, DQ2, DQ3, DQ4, DQ5, DQ6, DQ7	I/O	<b>Data input/output:</b> Lower byte of bidirectional data bus for the x16 configuration. DQ[7:0] are referenced to $V_{REFDQ}$ .
DQ8, DQ9, DQ10, DQ11, DQ12, DQ13, DQ14, DQ15	I/O	<b>Data input/output:</b> Upper byte of bidirectional data bus for the x16 configuration. DQ[15:8] are referenced to $V_{REFDQ}$ .
LDQS, LDQS#	I/O	<b>Lower byte data strobe:</b> Output with read data. Edge-aligned with read data. Input with write data. Center-aligned to write data.
UDQS, UDQS#	I/O	<b>Upper byte data strobe:</b> Output with read data. Edge-aligned with read data. Input with write data. DQS is center-aligned to write data.
$V_{DD}$	Supply	<b>Power supply:</b> 1.5V $\pm$ 0.075V.
$V_{DDQ}$	Supply	<b>DQ power supply:</b> 1.5V $\pm$ 0.075V. Isolated on the device for improved noise immunity.
$V_{REFCA}$	Supply	<b>Reference voltage for control, command, and address:</b> $V_{REFCA}$ must be maintained at all times (including self refresh) for proper device operation.
$V_{REFDQ}$	Supply	<b>Reference voltage for data:</b> $V_{REFDQ}$ must be maintained at all times (excluding self refresh) for proper device operation.
$V_{SS}$	Supply	Ground.
$V_{SSQ}$	Supply	<b>DQ ground:</b> Isolated on the device for improved noise immunity.
ZQ	Reference	<b>External reference ball for output drive calibration:</b> This ball is tied to an external 240 $\Omega$ resistor (RZQ), which is tied to $V_{SSQ}$ .
NC	–	<b>No connect:</b> These balls should be left unconnected (the ball has no connection to the DRAM or to other balls).

## Package Dimensions

**Figure 9: 78-Ball FBGA – x4, x8 (JP)**

Note: 1. All dimensions are in millimeters.

**Figure 10: 78-Ball FBGA – x4, x8 (HX)**

Note: 1. All dimensions are in millimeters.

**Figure 11: 86-Ball FBGA – x4, x8 (BY)**

Note: 1. All dimensions are in millimeters.

**Figure 12: 96-Ball FBGA – x16 (LA)**

Note: 1. All dimensions are in millimeters.

## Electrical Specifications

### Absolute Ratings

Stresses greater than those listed in Table 6 may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may adversely affect reliability.

**Table 6: Absolute Maximum Ratings**

Symbol	Parameter	Min	Max	Units	Notes
$V_{DD}$	$V_{DD}$ supply voltage relative to $V_{SS}$	-0.4	1.975	V	1
$V_{DDQ}$	$V_{DDQ}$ supply voltage relative to $V_{SSQ}$	-0.4	1.975	V	
$V_{IN}, V_{OUT}$	Voltage on any pin relative to $V_{SS}$	-0.4	1.975	V	
$T_C$	Operating case temperature	0	95	°C	2, 3
$T_{STG}$	Storage temperature	-55	150	°C	

- Notes:
- $V_{DD}$  and  $V_{DDQ}$  must be within 300mV of each other at all times, and  $V_{REF}$  must not be greater than  $0.6 \times V_{DDQ}$ . When  $V_{DD}$  and  $V_{DDQ}$  are less than 500mV,  $V_{REF}$  may be  $\leq 300$ mV.
  - MAX operating case temperature.  $T_C$  is measured in the center of the package.
  - Device functionality is not guaranteed if the DRAM device exceeds the maximum  $T_C$  during operation.

## Input/Output Capacitance

**Table 7: Input/Output Capacitance**

Note 1 applies to the entire table

Capacitance Parameters	Symbol	DDR3-800		DDR3-1066		DDR3-1333		DDR3-1600		Units	Notes
		Min	Max	Min	Max	Min	Max	Min	Max		
CK and CK#	$C_{CK}$	0.8	1.6	0.8	1.6	0.8	1.4	0.8	1.4	pF	
$\Delta C$ : CK to CK#	$C_{DCK}$	0	0.15	0	0.15	0	0.15	0	0.15	pF	
Single-end I/O: DQ, DM	$C_{IO}$	1.5	3.0	1.5	3.0	1.5	2.5	1.5	2.3	pF	2
Differential I/O: DQS, DQS#, TDQS, TDQS#	$C_{IO}$	1.5	3.0	1.5	3.0	1.5	2.5	1.5	2.3	pF	3
$\Delta C$ : DQS to DQS#, TDQS, TDQS#	$C_{DDQS}$	0	0.2	0	0.2	0	0.15	0	0.15	pF	3
$\Delta C$ : DQ to DQS	$C_{DIO}$	-0.5	0.3	-0.5	0.3	-0.5	0.3	-0.5	0.3	pF	4
Inputs (CTRL, CMD, ADDR)	$C_I$	0.75	1.4	0.75	1.35	0.75	1.3	0.75	1.3	pF	5
$\Delta C$ : CTRL to CK	$C_{DI\_CTRL}$	-0.5	0.3	-0.5	0.3	-0.4	0.2	-0.4	0.2	pF	6
$\Delta C$ : CMD_ADDR to CK	$C_{DI\_CMD\_ADDR}$	-0.5	0.5	-0.5	0.5	-0.4	0.4	-0.4	0.4	pF	7
ZQ pin capacitance	$C_{ZO}$	-	3.0	-	3.0	-	3.0	-	3.0	pF	

- Notes:
1.  $V_{DD} = +1.5V \pm 0.075mV$ ,  $V_{DDQ} = V_{DD}$ ,  $V_{REF} = V_{SS}$ ,  $f = 100$  MHz,  $T_C = 25^\circ C$ .  $V_{OUT(DC)} = 0.5 \times V_{DDQ}$ ,  $V_{OUT}$  (peak-to-peak) = 0.1V.
  2. DM input is grouped with I/O pins, reflecting the fact that they are matched in loading.
  3. Includes TDQS, TDQS#.  $C_{ddqs}$  is for DQS vs. DQS# and TDQS vs. TDQS# separately.
  4.  $C_{DIO} = C_{IO} (DQ) - 0.5 \times (C_{IO} [DQS] + C_{IO} [DQS\#])$ .
  5. Excludes CK, CK#; CTRL = ODT, CS#, and CKE; CMD = RAS#, CAS#, and WE#; ADDR = A[n:0], BA[2:0].
  6.  $C_{DI\_CTRL} = C_I (CTRL) - 0.5 \times (C_{CK} [CK] + C_{CK} [CK\#])$ .
  7.  $C_{DI\_CMD\_ADDR} = C_I (CMD\_ADDR) - 0.5 \times (C_{CK} [CK] + C_{CK} [CK\#])$ .

## Thermal Characteristics

**Table 8: Thermal Characteristics**

Parameter/Condition		Value	Units	Symbol	Notes
Operating case temperature		0 to +85	°C	$T_C$	1, 2, 3
		0 to +95	°C	$T_C$	1, 2, 3, 4
Junction-to-case (TOP)	78-ball "HX"	3.2	°C/W	$\Theta_{JC}$	5
	78-ball "JP"	tbd			
	86-ball "BY"	2.8			
	96-ball "LA"	2.8			

- Notes:
1. MAX operating case temperature.  $T_C$  is measured in the center of the package.
  2. A thermal solution must be designed to ensure the DRAM device does not exceed the maximum  $T_C$  during operation.
  3. Device functionality is not guaranteed if the DRAM device exceeds the maximum  $T_C$  during operation.
  4. If  $T_C$  exceeds +85°C, the DRAM must be refreshed externally at 2X refresh, which is a 3.9µs interval refresh rate. The use of SRT or ASR (if available) must be enabled.
  5. The thermal resistance data is based off of a number of samples from multiple lots and should be viewed as a typical number.

**Figure 13: Thermal Measurement Point**

## Electrical Specifications – I<sub>DD</sub> Specifications and Conditions Definitions

Within the following I<sub>DD</sub> measurement tables, the following definitions and conditions are used, unless stated otherwise:

- LOW:  $V_{IN} \leq V_{IL(AC)max}$ ; HIGH:  $V_{IN} \geq V_{IH(AC)min}$
- Midlevel: Inputs are  $V_{REF} = V_{DD}/2$
- R<sub>ON</sub> set to RZQ/7 (34Ω)
- R<sub>TT,nom</sub> set to RZQ/6 (40Ω)
- R<sub>TT(WR)</sub> set to RZQ/2 (120Ω)
- Qoff is enabled in MR1
- ODT is enabled in MR1 (R<sub>TT,nom</sub>) and MR2 (R<sub>TT(WR)</sub>)
- TDQS is disabled in MR1
- External DQ/DQS/DM load resistor is 25Ω to V<sub>DDQ</sub>/2
- Burst lengths are BL8 fixed
- AL equals 0 (except in I<sub>DD7</sub>)
- I<sub>DD</sub> specifications are tested after the device is properly initialized
- Input slew rate is specified by AC parametric test conditions
- Optional ASR is disabled
- Read burst type uses nibble sequential (MR0 [3] 0)
- Loop patterns must be executed at least once before current measurements begin

**Table 9: Timing Parameters Used for I<sub>DD</sub> Measurements – Clock Units**

- Notes:
1. T<sub>C</sub> = +85°C; SRT and ASR are disabled.
  2. Enabling ASR could increase I<sub>DDx</sub> by up to an additional 2mA.
  3. Restricted to T<sub>C</sub> (MAX) = +85°C.
  4. Rev B, x4 and x8 maximum limit is 7mA.
  5. T<sub>C</sub> = +85°C; ASR and ODT are disabled; SRT is enabled.
  6. The I<sub>DD</sub> values must be derated (increased) on IT-option and AT-option devices when operated outside of the range 0°C ≤ T<sub>C</sub> ≤ +85°C:

## 1Gb: x4, x8, x16 DDR3 SDRAM Electrical Characteristics – I<sub>DD</sub> Specifications

6a. When  $T_C < 0^\circ\text{C}$ :  $I_{DD2P}$  and  $I_{DD3P}$  must be derated by 4%;  $I_{DD4R}$  and  $I_{DD5W}$  must be derated by 2%; and  $I_{DD6}$  and  $I_{DD7}$  must be derated by 7%.

6b. When  $T_C > +85^\circ\text{C}$ :  $I_{DD0}$ ,  $I_{DD1}$ ,  $I_{DD2N}$ ,  $I_{DD2NT}$ ,  $I_{DD2Q}$ ,  $I_{DD3N}$ ,  $I_{DD3P}$ ,  $I_{DD4R}$ ,  $I_{DD4W}$ , and  $I_{DD5W}$  must be derated by 2%;  $I_{DD2Px}$  must be derated by 30%; and  $I_{DD6}$  must be derated by 80%.

## Electrical Specifications – DC and AC

### DC Operating Conditions

**Table 21: DC Electrical Characteristics and Operating Conditions**

All voltages are referenced to  $V_{SS}$

Parameter/Condition	Symbol	Min	Nom	Max	Units	Notes
Supply voltage	$V_{DD}$	1.425	1.5	1.575	V	1, 2
I/O supply voltage	$V_{DDQ}$	1.425	1.5	1.575	V	1, 2
Input leakage current Any input $0V \leq V_{IN} \leq V_{DD}$ , $V_{REF}$ pin $0V \leq V_{IN} \leq 1.1V$ (All other pins not under test = 0V)	$I_I$	-2	-	2	$\mu A$	
$V_{REF}$ supply leakage current $V_{REFDQ} = V_{DD}/2$ or $V_{REFCA} = V_{DD}/2$ (All other pins not under test = 0V)	$I_{VREF}$	-1	-	1	$\mu A$	4

- Notes:
- $V_{DD}$  and  $V_{DDQ}$  must track one another.  $V_{DDQ}$  must be less than or equal to  $V_{DD}$ .  $V_{SS} = V_{SSQ}$ .
  - $V_{DD}$  and  $V_{DDQ}$  may include AC noise of  $\pm 50mV$  (250 kHz to 20 MHz) in addition to the DC (0Hz to 250 kHz) specifications.  $V_{DD}$  and  $V_{DDQ}$  must be at same level for valid AC timing parameters.
  - $V_{REF}$  (see Table 22).
  - The minimum limit requirement is for testing purposes. The leakage current on the  $V_{REF}$  pin should be minimal.

### Input Operating Conditions

**Table 22: DC Electrical Characteristics and Input Conditions**

All voltages are referenced to  $V_{SS}$

Parameter/Condition	Symbol	Min	Nom	Max	Units	Notes
$V_{IN}$ low; DC/commands/address busses	$V_{IL}$	$V_{SS}$	n/a	See Table 23	V	
$V_{IN}$ high; DC/commands/address busses	$V_{IH}$	See Table 23	n/a	$V_{DD}$	V	
Input reference voltage command/address bus	$V_{REFCA(DC)}$	$0.49 \times V_{DD}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD}$	V	1, 2
I/O reference voltage DQ bus	$V_{REFDQ(DC)}$	$0.49 \times V_{DD}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD}$	V	2, 3
I/O reference voltage DQ bus in SELF REFRESH	$V_{REFDQ(sr)}$	$V_{SS}$	$0.5 \times V_{DD}$	$V_{DD}$	V	4
Command/address termination voltage (system level, not direct DRAM input)	$V_{TT}$	-	$0.5 \times V_{DDQ}$	-	V	5

- Notes:
- $V_{REFCA(DC)}$  is expected to be approximately  $0.5 \times V_{DD}$  and to track variations in the DC level. Externally generated peak noise (noncommon mode) on  $V_{REFCA}$  may not exceed  $\pm 1\% \times V_{DD}$  around the  $V_{REFCA(DC)}$  value. Peak-to-peak AC noise on  $V_{REFCA}$  should not exceed  $\pm 2\%$  of  $V_{REFCA(DC)}$ .
  - DC values are determined to be less than 20 MHz in frequency. DRAM must meet specifications if the DRAM induces additional AC noise greater than 20 MHz in frequency.
  - $V_{REFDQ(DC)}$  is expected to be approximately  $0.5 \times V_{DD}$  and to track variations in the DC level. Externally generated peak noise (noncommon mode) on  $V_{REFDQ}$  may not exceed  $\pm 1\% \times V_{DD}$  around the  $V_{REFDQ(DC)}$  value. Peak-to-peak AC noise on  $V_{REFDQ}$  should not exceed  $\pm 2\%$  of  $V_{REFDQ(DC)}$ .

# 1Gb: x4, x8, x16 DDR3 SDRAM Electrical Specifications – DC and AC

4.  $V_{REFDQ(DC)}$  may transition to  $V_{REFDQ(sr)}$  and back to  $V_{REFDQ(DC)}$  when in SELF REFRESH, with-in restrictions outlined in the SELF REFRESH section.
5.  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors. MIN and MAX values are system-dependent.

**Table 23: Input Switching Conditions**

Parameter/Condition	Symbol	DDR3-800 DDR3-1066	DDR3-1333 DDR3-1600	Units
<b>Command and Address</b>				
Input high AC voltage: Logic 1	$V_{IH(AC175)min}$	+175	175	mV
Input high AC voltage: Logic 1	$V_{IN(AC150)min}$	+150	+150	mV
Input high DC voltage: Logic 1	$V_{IH(DC100)min}$	+100	+100	mV
Input low DC voltage: Logic 0	$V_{IL(DC100)max}$	-100	-100	mV
Input low AC voltage: Logic 0	$V_{IL(AC150)max}$	-150	-150	mV
Input low AC voltage: Logic 0	$V_{IL(AC175)max}$	-175	-175	mV
<b>DQ and DM</b>				
Input high AC voltage: Logic 1	$V_{IH(AC175)min}$	+175	-	mV
Input high AC voltage: Logic 1	$V_{IH(AC150)min}$	+150	+150	mV
Input high DC voltage: Logic 1	$V_{IH(DC100)min}$	+100	+100	mV
Input low DC voltage: Logic 0	$V_{IL(DC100)max}$	-100	-100	mV
Input low AC voltage: Logic 0	$V_{IL(AC150)max}$	-150	-150	mV
Input low AC voltage: Logic 0	$V_{IL(AC175)max}$	-175	-	mV

- Notes:
1. All voltages are referenced to  $V_{REF}$ .  $V_{REF}$  is  $V_{REFCA}$  for control, command, and address. All slew rates and setup/hold times are specified at the DRAM ball.  $V_{REF}$  is  $V_{REFDQ}$  for DQ and DM inputs.
  2. Input setup timing parameters ( $t_{IS}$  and  $t_{DS}$ ) are referenced at  $V_{IL(AC)}/V_{IH(AC)}$ , not  $V_{REF(DC)}$ .
  3. Input hold timing parameters ( $t_{IH}$  and  $t_{DH}$ ) are referenced at  $V_{IL(DC)}/V_{IH(DC)}$ , not  $V_{REF(DC)}$ .
  4. Single-ended input slew rate = 1 V/ns; maximum input voltage swing under test is 900mV (peak-to-peak).

**Figure 14: Input Signal**

Note: 1. Numbers in diagrams reflect nominal values.

## AC Overshoot/Undershoot Specification

**Table 24: Control and Address Pins**

Parameter	DDR3-800	DDR3-1066	DDR3-1333	DDR3-1600
Maximum peak amplitude allowed for overshoot area (see Figure 15)	0.4V	0.4V	0.4V	0.4V
Maximum peak amplitude allowed for undershoot area (see Figure 16)	0.4V	0.4V </td <td>0.4V</td> <td>0.4V</td>	0.4V	0.4V
Maximum overshoot area above $V_{DD}$ (see Figure 15)	0.67 Vns	0.5 Vns	0.4 Vns	0.33 Vns
Maximum undershoot area below $V_{SS}$ (see Figure 16)	0.67 Vns	0.5 Vns	0.4 Vns	0.33 Vns

**Table 25: Clock, Data, Strobe, and Mask Pins**

Parameter	DDR3-800	DDR3-1066	DDR3-1333	DDR3-1600
Maximum peak amplitude allowed for overshoot area (see Figure 15)	0.4V	0.4V	0.4V	0.4V
Maximum peak amplitude allowed for undershoot area (see Figure 16)	0.4V	0.4V	0.4V	0.4V
Maximum overshoot area above $V_{DD}/V_{DDQ}$ (see Figure 15)	0.25 Vns	0.19 Vns	0.15 Vns	0.13 Vns
Maximum undershoot area below $V_{SS}/V_{SSQ}$ (see Figure 16)	0.25 Vns	0.19 Vns	0.15 Vns	0.13 Vns

**Figure 15: Overshoot**

**Figure 16: Undershoot**

**Table 26: Differential Input Operating Conditions (CK, CK# and DQS, DQS#)**

Parameter/Condition	Symbol	Min	Max	Units	Notes
Differential input voltage logic high - slew	$V_{IH,diff(AC)SLEW}$	+200	n/a	mV	4
Differential input voltage logic low - slew	$V_{IL,diff(AC)SLEW}$	n/a	-200	mV	4
Differential input voltage logic high	$V_{IH,diff(AC)}$	$2 \times (V_{IH(AC)} - V_{REF})$	$V_{DD}/V_{DDQ}$	mV	5
Differential input voltage logic low	$V_{IL,diff(AC)}$	$V_{SS}/V_{SSQ}$	$2 \times (V_{REF} - V_{IL(AC)})$	mV	6
Differential input crossing voltage relative to $V_{DD}/2$ for DQS, DQS#; CK, CK#	$V_{IX}$	$V_{REF(DC)} - 150$	$V_{REF(DC)} + 150$	mV	7
Differential input crossing voltage relative to $V_{DD}/2$ for CK, CK#	$V_{IX} (175)$	$V_{REF(DC)} - 175$	$V_{REF(DC)} + 175$	mV	7, 8
Single-ended high level for strobes	$V_{SEH}$	$V_{DDQ}/2 + V_{IH(AC)}$	$V_{DDQ}$	mV	5
Single-ended high level for CK, CK#		$V_{DD}/2 + V_{IH(AC)}$	$V_{DD}$	mV	5
Single-ended low level for strobes	$V_{SEL}$	$V_{SSQ}$	$V_{DDQ}/2 - V_{IL(AC)}$	mV	6
Single-ended low level for CK, CK#		$V_{SS}$	$V_{DD}/2 - V_{IL(AC)}$	mV	6

- Notes:
1. Clock is referenced to  $V_{DD}$  and  $V_{SS}$ . Data strobe is referenced to  $V_{DDQ}$  and  $V_{SSQ}$ .
  2. Reference is  $V_{REFCA(DC)}$  for clock and for  $V_{REFDQ(DC)}$  for strobe.
  3. Differential input slew rate = 2 V/ns
  4. Defines slew rate reference points, relative to input crossing voltages.
  5. Maximum limit is relative to single-ended signals; overshoot specifications are applicable.
  6. Minimum limit is relative to single-ended signals; undershoot specifications are applicable.
  7. The typical value of  $V_{IX(AC)}$  is expected to be about  $0.5 \times V_{DD}$  of the transmitting device, and  $V_{IX(AC)}$  is expected to track variations in  $V_{DD}$ .  $V_{IX(AC)}$  indicates the voltage at which differential input signals must cross.
  8. The  $V_{IX}$  extended range ( $\pm 175mV$ ) is allowed only for the clock; this  $V_{IX}$  extended range is only allowed when the following conditions are met: The single-ended input signals are monotonic, have the single-ended swing  $V_{SEL}$ ,  $V_{SEH}$  of at least  $V_{DD}/2 \pm 250mV$ , and the differential slew rate of CK, CK# is greater than 3 V/ns.

**Figure 17:  $V_{IX}$  for Differential Signals**

**Figure 18: Single-Ended Requirements for Differential Signals**

**Figure 19: Definition of Differential AC-Swing and  $t_{DVAC}$**

**Table 27: Allowed Time Before Ringback ( $t_{DVAC}$ ) for CK - CK# and DQS - DQS#**

Slew Rate (V/ns)	$t_{DVAC}$ (ps) at $ V_{IH,diff(AC)} \text{ to } V_{IL,diff(AC)} $	
	350mV	300mV
>4.0	75	175
4.0	57	170
3.0	50	167
2.0	38	163
1.9	34	162
1.6	29	161

**Table 27: Allowed Time Before Ringback ( $t_{DVAC}$ ) for CK - CK# and DQS - DQS# (Continued)**

Slew Rate (V/ns)	$t_{DVAC}$ (ps) at $ V_{IH,diff(AC)} \text{ to } V_{IL,diff(AC)} $	
	350mV	300mV
1.4	22	159
1.2	13	155
1.0	0	150
<1.0	0	150

Note: 1. Below  $V_{IL(AC)}$

### Slew Rate Definitions for Single-Ended Input Signals

Setup ( $t_{IS}$  and  $t_{DS}$ ) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of  $V_{REF}$  and the first crossing of  $V_{IH(AC)min}$ . Setup ( $t_{IS}$  and  $t_{DS}$ ) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of  $V_{REF}$  and the first crossing of  $V_{IL(AC)max}$ .

Hold ( $t_{IH}$  and  $t_{DH}$ ) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of  $V_{IL(DC)max}$  and the first crossing of  $V_{REF}$ . Hold ( $t_{IH}$  and  $t_{DH}$ ) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of  $V_{IH(DC)min}$  and the first crossing of  $V_{REF}$  (see Figure 20 (page 52)).

**Table 28: Single-Ended Input Slew Rate Definition**

Input Slew Rates (Linear Signals)		Measured		Calculation
Input	Edge	From	To	
Setup	Rising	$V_{REF}$	$V_{IH(AC)min}$	$\frac{V_{IH(AC)min} - V_{REF}}{\Delta TRS}$
	Falling	$V_{REF}$	$V_{IL(AC)max}$	$\frac{V_{REF} - V_{IL(AC)max}}{\Delta TFS}$
Hold	Rising	$V_{IL(DC)max}$	$V_{REF}$	$\frac{V_{REF} - V_{IL(DC)max}}{\Delta TFH}$
	Falling	$V_{IH(DC)min}$	$V_{REF}$	$\frac{V_{IH(DC)min} - V_{REF}}{\Delta TRSH}$

**Figure 20: Nominal Slew Rate Definition for Single-Ended Input Signals**

### Slew Rate Definitions for Differential Input Signals

Input slew rate for differential signals (CK, CK# and DQS, DQS#) are defined and measured, as shown in Table 29 and Figure 21. The nominal slew rate for a rising signal is defined as the slew rate between  $V_{IL,diff,max}$  and  $V_{IH,diff,min}$ . The nominal slew rate for a falling signal is defined as the slew rate between  $V_{IH,diff,min}$  and  $V_{IL,diff,max}$ .

**Table 29: Differential Input Slew Rate Definition**

Differential Input Slew Rates (Linear Signals)		Measured		Calculation
Input	Edge	From	To	
CK and DQS reference	Rising	$V_{IL,diff,max}$	$V_{IH,diff,min}$	$\frac{V_{IH,diff,min} - V_{IL,diff,max}}{\Delta TR_{diff}}$
	Falling	$V_{IH,diff,min}$	$V_{IL,diff,max}$	$\frac{V_{IH,diff,min} - V_{IL,diff,max}}{\Delta TF_{diff}}$

**Figure 21: Nominal Differential Input Slew Rate Definition for DQS, DQS# and CK, CK#**

## ODT Characteristics

ODT effective resistance  $R_{TT}$  is defined by MR1 [9, 6, and 2]. ODT is applied to the DQ, DM, DQS, DQS#, and TDQS, TDQS# balls (x8 devices only). The ODT target values and a functional representation are listed in Table 30 and Table 31 (page 55). The individual pull-up and pull-down resistors ( $R_{TT(PU)}$  and  $R_{TT(PD)}$ ) are defined as follows:

- $R_{TT(PU)} = (V_{DDQ} - V_{OUT}) / |I_{OUT}|$ , under the condition that  $R_{TT(PD)}$  is turned off
- $R_{TT(PD)} = (V_{OUT}) / |I_{OUT}|$ , under the condition that  $R_{TT(PU)}$  is turned off

**Figure 22: ODT Levels and I-V Characteristics**

**Table 30: On-Die Termination DC Electrical Characteristics**

Parameter/Condition	Symbol	Min	Nom	Max	Units	Notes	
$R_{TT}$ effective impedance	$R_{TT(EFF)}$	See Table 31 (page 55)					1, 2
Deviation of VM with respect to $V_{DDQ}/2$	$\Delta VM$	-5		+5	%	1, 2, 3	

- Notes:
1. Tolerance limits are applicable after proper ZQ calibration has been performed at a stable temperature and voltage ( $V_{DDQ} = V_{DD}$ ,  $V_{SSQ} = V_{SS}$ ). Refer to ODT Sensitivity (page 56) if either the temperature or voltage changes after calibration.
  2. Measurement definition for  $R_{TT}$ : Apply  $V_{IH(AC)}$  to pin under test and measure current  $I[V_{IH(AC)}]$ , then apply  $V_{IL(AC)}$  to pin under test and measure current  $I[V_{IL(AC)}]$ :

$$R_{TT} = \frac{V_{IH(AC)} - V_{IL(AC)}}{|I(V_{IH(AC)}) - I(V_{IL(AC)})|}$$

3. Measure voltage (VM) at the tested pin with no load:

$$\Delta VM = \left( \frac{2 \times VM}{V_{DDQ}} - 1 \right) \times 100$$

4. For IT and AT (1Gb only) devices, the minimum values are derated by 6% when the device operates between  $-40^{\circ}C$  and  $0^{\circ}C$  ( $T_C$ ).

## ODT Resistors

Table 31 (page 55) provides an overview of the ODT DC electrical characteristics. The values provided are not specification requirements; however, they can be used as design guidelines to indicate what  $R_{TT}$  is targeted to provide:

- $R_{TT}$  120 $\Omega$  is made up of  $R_{TT120(PD240)}$  and  $R_{TT120(PU240)}$
- $R_{TT}$  60 $\Omega$  is made up of  $R_{TT60(PD120)}$  and  $R_{TT60(PU120)}$

- $R_{TT}$  40Ω is made up of  $R_{TT40}(PD80)$  and  $R_{TT40}(PU80)$
- $R_{TT}$  30Ω is made up of  $R_{TT30}(PD60)$  and  $R_{TT30}(PU60)$
- $R_{TT}$  20Ω is made up of  $R_{TT20}(PD40)$  and  $R_{TT20}(PU40)$

**Table 31:  $R_{TT}$  Effective Impedances**

MR1 [9, 6, 2]	$R_{TT}$	Resistor	$V_{OUT}$	Min	Nom	Max	Units
0, 1, 0	120Ω	$R_{TT120}(PD240)$	$0.2 \times V_{DDQ}$	0.6	1.0	1.1	RZQ/1
			$0.5 \times V_{DDQ}$	0.9	1.0	1.1	RZQ/1

Note: 1. Values assume an RZQ of 240Ω (±1%).

## ODT Sensitivity

If either the temperature or voltage changes after I/O calibration, then the tolerance limits listed in Table 30 (page 54) and Table 31 can be expected to widen according to Table 32 and Table 33 (page 56).

**Table 32: ODT Sensitivity Definition**

Symbol	Min	Max	Units
R <sub>TT</sub>	0.9 - dR <sub>TT</sub> dT ×  DT  - dR <sub>TT</sub> dV ×  DV	1.6 + dR <sub>TT</sub> dT ×  DT  + dR <sub>TT</sub> dV ×  DV	RZQ/(2, 4, 6, 8, 12)

Note: 1. ΔT = T - T(@ calibration), ΔV = V<sub>DDQ</sub> - V<sub>DDQ</sub>(@ calibration) and V<sub>DD</sub> = V<sub>DDQ</sub>.

**Table 33: ODT Temperature and Voltage Sensitivity**

Change	Min	Max	Units
dR <sub>TT</sub> dT	0	1.5	%/°C
dR <sub>TT</sub> dV	0	0.15	%/mV

Note: 1. ΔT = T - T(@ calibration), ΔV = V<sub>DDQ</sub> - V<sub>DDQ</sub>(@ calibration) and V<sub>DD</sub> = V<sub>DDQ</sub>.

## ODT Timing Definitions

ODT loading differs from that used in AC timing measurements. The reference load for ODT timings is shown in Figure 23. Two parameters define when ODT turns on or off synchronously, two define when ODT turns on or off asynchronously, and another defines when ODT turns on or off dynamically. Table 34 outlines and provides definition and measurement references settings for each parameter (see Table 35 (page 57)).

ODT turn-on time begins when the output leaves High-Z and ODT resistance begins to turn on. ODT turn-off time begins when the output leaves Low-Z and ODT resistance begins to turn off.

**Figure 23: ODT Timing Reference Load**

**Table 34: ODT Timing Definitions**

Symbol	Begin Point Definition	End Point Definition	Figure
$t_{AON}$	Rising edge of CK - CK# defined by the end point of ODTL on	Extrapolated point at $V_{SSQ}$	Figure 24 (page 58)
$t_{AOF}$	Rising edge of CK - CK# defined by the end point of ODTL off	Extrapolated point at $V_{RTT,nom}$	Figure 24 (page 58)
$t_{AONPD}$	Rising edge of CK - CK# with ODT first being registered HIGH	Extrapolated point at $V_{SSQ}$	Figure 25 (page 58)
$t_{AOFPD}$	Rising edge of CK - CK# with ODT first being registered LOW	Extrapolated point at $V_{RTT,nom}$	Figure 25 (page 58)
$t_{ADC}$	Rising edge of CK - CK# defined by the end point of ODTLcnw, ODTLcwn4, or ODTLcwn8	Extrapolated points at $V_{RTT(WR)}$ and $V_{RTT,nom}$	Figure 26 (page 59)

**Table 35: Reference Settings for ODT Timing Measurements**

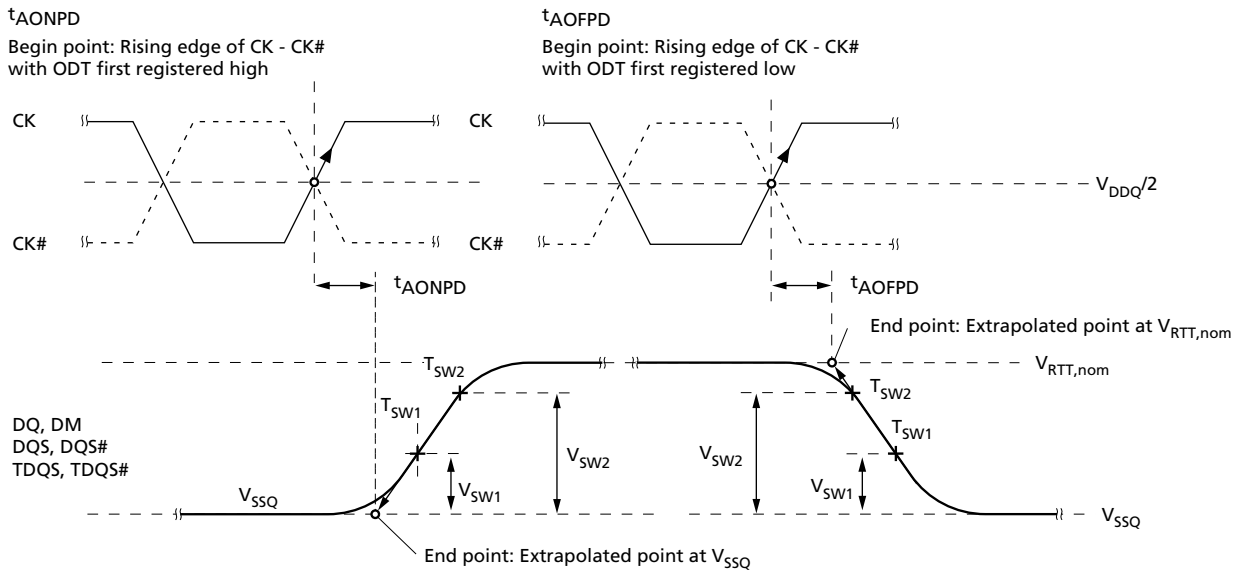

Measured Parameter	$R_{TT,nom}$ Setting	$R_{TT(WR)}$ Setting	$V_{SW1}$	$V_{SW2}$
$t_{AON}$	RZQ/4 (60Ω)	n/a	50mV	100mV
	RZQ/12 (20Ω)	n/a	100mV	200mV
$t_{AOF}$	RZQ/4 (60Ω)	n/a	50mV	100mV
	RZQ/12 (20Ω)	n/a	100mV	200mV
$t_{AONPD}$	RZQ/4 (60Ω)	n/a	50mV	100mV
	RZQ/12 (20Ω)	n/a	100mV	200mV
$t_{AOFPD}$	RZQ/4 (60Ω)	n/a	50mV	100mV
	RZQ/12 (20Ω)	n/a	100mV	200mV
$t_{ADC}$	RZQ/12 (20Ω)	RZQ/2 (120Ω)	200mV	300mV

Note: 1. Assume an RZQ of 240Ω (±1%) and that proper ZQ calibration has been performed at a stable temperature and voltage ( $V_{DDQ} = V_{DD}$ ,  $V_{SSQ} = V_{SS}$ ).

**Figure 24:  $t_{AON}$  and  $t_{AOF}$  Definitions**

**Figure 25:  $t_{AONPD}$  and  $t_{AOFPD}$  Definitions**

**Figure 26:  $t_{ADC}$  Definition**

## Output Driver Impedance

The output driver impedance is selected by MR1 [5,1] during initialization. The selected value is able to maintain the tight tolerances specified if proper ZQ calibration is performed. Output specifications refer to the default output driver unless specifically stated otherwise. A functional representation of the output buffer is shown below. The output driver impedance  $R_{ON}$  is defined by the value of the external reference resistor RZQ as follows:

- $R_{ON,x} = RZQ/y$  (with  $RZQ = 240\Omega \pm 1\%$ ;  $x = 34\Omega$  or  $40\Omega$  with  $y = 7$  or  $6$ , respectively)

The individual pull-up and pull-down resistors ( $R_{ON(PU)}$  and  $R_{ON(PD)}$ ) are defined as follows:

- $R_{ON(PU)} = (V_{DDQ} - V_{OUT})/|I_{OUT}|$ , when  $R_{ON(PD)}$  is turned off
- $R_{ON(PD)} = (V_{OUT})/|I_{OUT}|$ , when  $R_{ON(PU)}$  is turned off

**Figure 27: Output Driver**

### 34 Ohm Output Driver Impedance

The 34Ω driver (MR1[5, 1] = 01) is the default driver. Unless otherwise stated, all timings and specifications listed herein apply to the 34Ω driver only. Its impedance  $R_{ON}$  is defined by the value of the external reference resistor RZQ as follows:  $R_{ON34} = RZQ/7$  (with nominal RZQ = 240Ω ±1%) and is actually 34.3Ω ±1%.

**Table 36: 34 Ohm Driver Impedance Characteristics**

MR1[5,1]	$R_{ON}$	Resistor	$V_{OUT}$	Min	Nom	Max	Units	Notes
0,1	34.3Ω	$R_{ON34(PD)}$	0.2 $V_{DDQ}$	0.6	1.0	1.1	RZQ/7	
			0.5 $V_{DDQ}$	0.9	1.0	1.1	RZQ/7	
			0.8 $V_{DDQ}$	0.9	1.0	1.4	RZQ/7	
		$R_{ON34(PU)}$	0.2 $V_{DDQ}$	0.9	1.0	1.4	RZQ/7	
			0.5 $V_{DDQ}$	0.9	1.0	1.1	RZQ/7	
			0.8 $V_{DDQ}$	0.6	1.0	1.1	RZQ/7	
Pull-up/pull-down mismatch ( $MM_{PUPD}$ )			0.5 $V_{DDQ}$	-10%	n/a	10	%	2

- Notes:
1. Tolerance limits assume RZQ of 240Ω (±1%) and are applicable after proper ZQ calibration has been performed at a stable temperature and voltage ( $V_{DDQ} = V_{DD}$ ,  $V_{SSQ} = V_{SS}$ ). Refer to 34 Ohm Output Driver Sensitivity (page 63) if either the temperature or the voltage changes after calibration.
  2. Measurement definition for mismatch between pull-up and pull-down ( $MM_{PUPD}$ ). Measure both  $R_{ON(PU)}$  and  $R_{ON(PD)}$  at  $0.5 \times V_{DDQ}$ :
 
$$MM_{PUPD} = \frac{Ron_{PU} - Ron_{PD}}{Ron_{NOM}} \times 100$$
  3. For IT and AT (1Gb only) devices, the minimum values are derated by 6% when the device operates between -40°C and 0°C ( $T_C$ ).

### 34 Ohm Driver

The 34Ω driver's current range has been calculated and summarized in Table 38 (page 62)  $V_{DD} = 1.5V$ , Table 39 (page 62) for  $V_{DD} = 1.57V$ , and Table 40 (page 63) for  $V_{DD} = 1.42V$ . The individual pull-up and pull-down resistors ( $R_{ON34(PD)}$  and  $R_{ON34(PU)}$ ) are defined as follows:

- $R_{ON34(PD)} = (V_{OUT})/|I_{OUT}|$ ;  $R_{ON34(PU)}$  is turned off
- $R_{ON34(PU)} = (V_{DDQ} - V_{OUT})/|I_{OUT}|$ ;  $R_{ON34(PD)}$  is turned off

**Table 37: 34 Ohm Driver Pull-Up and Pull-Down Impedance Calculations**

$R_{ON}$				Min	Nom	Max	Units
RZQ = 240Ω ±1%				237.6	240	242.4	Ω

			$I_{OH} @ 0.8 \times V_{DDQ}$	14.0	8.3	7.5	mA

### 34 Ohm Output Driver Sensitivity

If either the temperature or the voltage changes after ZQ calibration, then the tolerance limits listed in Table 36 (page 61) can be expected to widen according to Table 41 and Table 42 (page 63).

**Table 41: 34 Ohm Output Driver Sensitivity Definition**

Symbol	Min	Max	Units
$R_{ON} @ 0.8 \times V_{DDQ}$	$0.9 - dR_{ONdTH} \times  \Delta T  - dR_{ONdVH} \times  \Delta V $	$1.1 + dR_{ONdTH} \times  \Delta T  + dR_{ONdVH} \times  \Delta V $	RZQ/7
$R_{ON} @ 0.5 \times V_{DDQ}$	$0.9 - dR_{ONdTM} \times  \Delta T  - dR_{ONdVM} \times  \Delta V $	$1.1 + dR_{ONdTM} \times  \Delta T  + dR_{ONdVM} \times  \Delta V $	RZQ/7
$R_{ON} @ 0.2 \times V_{DDQ}$	$0.9 - dR_{ONdTL} \times  \Delta T  - dR_{ONdVL} \times  \Delta V $	$1.1 + dR_{ONdTL} \times  \Delta T  + dR_{ONdVL} \times  \Delta V $	RZQ/7

Note: 1.  $\Delta T = T - T(@ \text{calibration})$ ,  $\Delta V = V_{DDQ} - V_{DDQ}(@ \text{calibration})$ , and  $V_{DD} = V_{DDQ}$ .

**Table 42: 34 Ohm Output Driver Voltage and Temperature Sensitivity**

Change	Min	Max	Units
$dR_{ONdTM}$	0	1.5	%/°C
$dR_{ONdVM}$	0	0.13	%/mV
$dR_{ONdTL}$	0	1.5	%/°C
$dR_{ONdVL}$	0	0.13	%/mV
$dR_{ONdTH}$	0	1.5	%/°C
$dR_{ONdVH}$	0	0.13	%/mV

## Alternative 40 Ohm Driver

**Table 43: 40 Ohm Driver Impedance Characteristics**

MR1[5,1]	R <sub>ON</sub>	Resistor	V <sub>OUT</sub>	Min	Nom	Max	Units
0,0	40Ω	R <sub>ON40(PD)</sub>	0.2 × V <sub>DDQ</sub>	0.6	1.0	1.1	RZQ/6
			0.5 × V <sub>DDQ</sub>	0.9	1.0	1.1	RZQ/6
			0.8 × V <sub>DDQ</sub>	0.9	1.0	1.4	RZQ/6
		R <sub>ON40(PU)</sub>	0.2 × V <sub>DDQ</sub>	0.9	1.0	1.4	RZQ/6
			0.5 × V <sub>DDQ</sub>	0.9	1.0	1.1	RZQ/6
			0.8 × V <sub>DDQ</sub>	0.6	1.0	1.1	RZQ/6
Pull-up/pull-down mismatch (MM <sub>PUPD</sub> )			0.5 × V <sub>DDQ</sub>	-10%	n/a	10	%

- Notes:
1. Tolerance limits assume RZQ of 240Ω (±1%) and are applicable after proper ZQ calibration has been performed at a stable temperature and voltage (V<sub>DDQ</sub> = V<sub>DD</sub>, V<sub>SSQ</sub> = V<sub>SS</sub>). Refer to 40 Ohm Output Driver Sensitivity (page 64) if either the temperature or the voltage changes after calibration.
  2. Measurement definition for mismatch between pull-up and pull-down (MM<sub>PUPD</sub>). Measure both R<sub>ON(PU)</sub> and R<sub>ON(PD)</sub> at 0.5 × V<sub>DDQ</sub>:
 
$$MM_{PUPD} = \frac{Ron_{PU} - Ron_{PD}}{Ron_{NOM}} \times 100$$
  3. For IT and AT (1Gb only) devices, the minimum values are derated by 6% when the device operates between -40°C and 0°C (T<sub>C</sub>).

## 40 Ohm Output Driver Sensitivity

If either the temperature or the voltage changes after I/O calibration, then the tolerance limits listed in Table 43 can be expected to widen according to Table 44 and Table 45 (page 65).

**Table 44: 40 Ohm Output Driver Sensitivity Definition**

Symbol	Min	Max	Units
R <sub>ON</sub> @ 0.8 × V <sub>DDQ</sub>	0.9 - dR <sub>ON</sub> dTH ×  ΔT  - dR <sub>ON</sub> dVH ×  ΔV	1.1 + dR <sub>ON</sub> dTH ×  ΔT  + dR <sub>ON</sub> dVH ×  ΔV	RZQ/6
R <sub>ON</sub> @ 0.5 × V <sub>DDQ</sub>	0.9 - dR <sub>ON</sub> dTM ×  ΔT  - dR <sub>ON</sub> dVM ×  ΔV	1.1 + dR <sub>ON</sub> dTM ×  ΔT  + dR <sub>ON</sub> dVM ×  ΔV	RZQ/6
R <sub>ON</sub> @ 0.2 × V <sub>DDQ</sub>	0.9 - dR <sub>ON</sub> dTL ×  ΔT  - dR <sub>ON</sub> dVL ×  ΔV	1.1 + dR <sub>ON</sub> dTL ×  ΔT  + dR <sub>ON</sub> dVL ×  ΔV	RZQ/6

Note: 1. ΔT = T - T(@ calibration), ΔV = V<sub>DDQ</sub> - V<sub>DDQ</sub>(@ calibration), and V<sub>DD</sub> = V<sub>DDQ</sub>.

**Table 45: 40 Ohm Output Driver Voltage and Temperature Sensitivity**

<b>Change</b>	<b>Min</b>	<b>Max</b>	<b>Unit</b>
dR <sub>ONd</sub> TM	0	1.5	%/°C
dR <sub>ONd</sub> VM	0	0.15	%/mV
dR <sub>ONd</sub> TL	0	1.5	%/°C
dR <sub>ONd</sub> VL	0	0.15	%/mV
dR <sub>ONd</sub> TH	0	1.5	%/°C
dR <sub>ONd</sub> VH	0	0.15	%/mV

## Output Characteristics and Operating Conditions

The DRAM uses both single-ended and differential output drivers. The single-ended output driver is summarized below, while the differential output driver is summarized in Table 46 while the differential output driver is summarized in Table 47 (page 67).

**Table 46: Single-Ended Output Driver Characteristics**

All voltages are referenced to  $V_{SS}$

Parameter/Condition	Symbol	Min	Max	Units	Notes
Output leakage current: DQ are disabled; $0V \leq V_{OUT} \leq V_{DDQ}$ ; ODT is disabled; ODT is HIGH	$I_{OZ}$	-5	+5	$\mu A$	1
Output slew rate: Single-ended; For rising and falling edges, measure between $V_{OL(AC)} = V_{REF} - 0.1 \times V_{DDQ}$ and $V_{OH(AC)} = V_{REF} + 0.1 \times V_{DDQ}$	SRQse	2.5	6	V/ns	1, 2, 3, 4
Single-ended DC high-level output voltage	$V_{OH(DC)}$	$0.8 \times V_{DDQ}$		V	1, 2, 5
Single-ended DC mid-point level output voltage	$V_{OM(DC)}$	$0.5 \times V_{DDQ}$		V	1, 2, 5
Single-ended DC low-level output voltage	$V_{OL(DC)}$	$0.2 \times V_{DDQ}$		V	1, 2, 5
Single-ended AC high-level output voltage	$V_{OH(AC)}$	$V_{TT} + 0.1 \times V_{DDQ}$		V	1, 2, 3, 6
Single-ended AC low-level output voltage	$V_{OL(AC)}$	$V_{TT} - 0.1 \times V_{DDQ}$		V	1, 2, 3, 6
Delta Ron between pull-up and pull-down for DQ/DQS	MM <sub>PUPD</sub>	-10	+10	%	1, 7
Test load for AC timing and output slew rates	Output to $V_{TT}$ ( $V_{DDQ}/2$ ) via 25 $\Omega$ resistor				3

- Notes:
1. RZQ of 240 $\Omega$  ( $\pm 1\%$ ) with RZQ/7 enabled (default 34 $\Omega$  driver) and is applicable after proper ZQ calibration has been performed at a stable temperature and voltage ( $V_{DDQ} = V_{DD}$ ,  $V_{SSQ} = V_{SS}$ ).
  2.  $V_{TT} = V_{DDQ}/2$ .
  3. See Figure 30 (page 68) for the test load configuration.
  4. The 6 V/ns maximum is applicable for a single DQ signal when it is switching either from HIGH to LOW or LOW to HIGH while the remaining DQ signals in the same byte lane are either all static or all switching the opposite direction. For all other DQ signal switching combinations, the maximum limit of 6 V/ns is reduced to 5 V/ns.
  5. See Table 36 (page 61) for IV curve linearity. Do not use AC test load.
  6. See Table 48 (page 69) for output slew rate.
  7. See Table 36 (page 61) for additional information.
  8. See Figure 28 (page 67) for an example of a single-ended output signal.

**Table 47: Differential Output Driver Characteristics**

All voltages are referenced to  $V_{SS}$

Parameter/Condition	Symbol	Min	Max	Units	Notes
Output leakage current: DQ are disabled; $0V \leq V_{OUT} \leq V_{DDQ}$ ; ODT is disabled; ODT is HIGH	$I_{OZ}$	-5	+5	$\mu A$	1
Output slew rate: Differential; For rising and falling edges, measure between $V_{OL,diff(AC)} = -0.2 \times V_{DDQ}$ and $V_{OH,diff(AC)} = +0.2 \times V_{DDQ}$	SRQdiff	5	12	V/ns	1
Output differential cross-point voltage	$V_{OX(AC)}$	$V_{REF} - 150$	$V_{REF} + 150$	mV	1, 2, 3
Differential high-level output voltage	$V_{OH,diff(AC)}$	$+0.2 \times V_{DDQ}$		V	1, 4
Differential low-level output voltage	$V_{OL,diff(AC)}$	$-0.2 \times V_{DDQ}$		V	1, 4
Delta Ron between pull-up and pull-down for DQ/DQS	$MM_{PUPD}$	-10	+10	%	1, 5
Test load for AC timing and output slew rates	Output to $V_{TT}$ ( $V_{DDQ}/2$ ) via 25 $\Omega$ resistor				3

- Notes:
1. RZQ of 240 $\Omega$  ( $\pm 1\%$ ) with RZQ/7 enabled (default 34 $\Omega$  driver) and is applicable after proper ZQ calibration has been performed at a stable temperature and voltage ( $V_{DDQ} = V_{DD}$ ,  $V_{SSQ} = V_{SS}$ ).
  2.  $V_{REF} = V_{DDQ}/2$ .
  3. See Figure 30 (page 68) for the test load configuration.
  4. See Table 49 (page 70) for the output slew rate.
  5. See Table 36 (page 61) for additional information.
  6. See Figure 29 (page 68) for an example of a differential output signal.

**Figure 28: DQ Output Signal**

**Figure 29: Differential Output Signal**

### Reference Output Load

Figure 30 represents the effective reference load of  $25\Omega$  used in defining the relevant device AC timing parameters (except ODT reference timing) as well as the output slew rate measurements. It is not intended to be a precise representation of a particular system environment or a depiction of the actual load presented by a production tester. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment.

**Figure 30: Reference Output Load for AC Timing and Output Slew Rate**

**Slew Rate Definitions for Single-Ended Output Signals**

The single-ended output driver is summarized in Table 46 (page 66). With the reference load for timing measurements, the output slew rate for falling and rising edges is defined and measured between  $V_{OL(AC)}$  and  $V_{OH(AC)}$  for single-ended signals.

**Table 48: Single-Ended Output Slew Rate Definition**

Single-Ended Output Slew Rates (Linear Signals)		Measured		Calculation
Output	Edge	From	To	
DQ	Rising	$V_{OL(AC)}$	$V_{OH(AC)}$	$\frac{V_{OH(AC)} - V_{OL(AC)}}{\Delta TR_{SE}}$
	Falling	$V_{OH(AC)}$	$V_{OL(AC)}$	$\frac{V_{OH(AC)} - V_{OL(AC)}}{\Delta TF_{SE}}$

**Figure 31: Nominal Slew Rate Definition for Single-Ended Output Signals**

**Slew Rate Definitions for Differential Output Signals**

The differential output driver is summarized in Table 47 (page 67). With the reference load for timing measurements, the output slew rate for falling and rising edges is defined and measured between  $V_{OL(diff)}$  and  $V_{OH(diff)}$  for differential signals.

**Table 49: Differential Output Slew Rate Definition**

Differential Output Slew Rates (Linear Signals)		Measured		Calculation
Output	Edge	From	To	
DQS, DQS#	Rising	$V_{OL,diff(AC)}$	$V_{OH,diff(AC)}$	$\frac{V_{OH,diff(AC)} - V_{OL,diff(AC)}}{\Delta TR_{diff}}$
	Falling	$V_{OH,diff(AC)}$	$V_{OL,diff(AC)}$	$\frac{V_{OH,diff(AC)} - V_{OL,diff(AC)}}{\Delta TF_{diff}}$

**Figure 32: Nominal Differential Output Slew Rate Definition for DQS, DQS#**

- Notes:
1. Parameters are applicable with  $0^{\circ}\text{C} \leq T_C \leq +95^{\circ}\text{C}$  and  $V_{DD}/V_{DDQ} = +1.5\text{V} \pm 0.075\text{V}$ .
  2. All voltages are referenced to  $V_{SS}$ .
  3. Output timings are only valid for  $R_{ON34}$  output buffer selection.
  4. The unit  ${}^t\text{CK (AVG)}$  represents the actual  ${}^t\text{CK (AVG)}$  of the input clock under operation. The unit CK represents one clock cycle of the input clock, counting the actual clock edges.
  5. AC timing and  $I_{DD}$  tests may use a  $V_{IL}$ -to- $V_{IH}$  swing of up to 900mV in the test environment, but input timing is still referenced to  $V_{REF}$  (except  ${}^t\text{IS}$ ,  ${}^t\text{IH}$ ,  ${}^t\text{DS}$ , and  ${}^t\text{DH}$  use the AC/DC trip points and CK, CK# and DQS, DQS# use their crossing points). The minimum slew rate for the input signals used to test the device is 1 V/ns for single-ended inputs and 2 V/ns for differential inputs in the range between  $V_{IL(AC)}$  and  $V_{IH(AC)}$ .
  6. All timings that use time-based values (ns,  $\mu\text{s}$ , ms) should use  ${}^t\text{CK (AVG)}$  to determine the correct number of clocks (Table 54 (page 75) uses CK or  ${}^t\text{CK [AVG]}$  interchangeably). In the case of noninteger results, all minimum limits are to be rounded up to the nearest whole integer, and all maximum limits are to be rounded down to the nearest whole integer.
  7. Strobe or DQSDiff refers to the DQS and DQS# differential crossing point when DQS is the rising edge. Clock or CK refers to the CK and CK# differential crossing point when CK is the rising edge.
  8. This output load is used for all AC timing (except ODT reference timing) and slew rates. The actual test load may be different. The output signal voltage reference point is  $V_{DDQ}/2$  for single-ended signals and the crossing point for differential signals (see Figure 30 (page 68)).
  9. When operating in DLL disable mode, Micron does not warrant compliance with normal mode timings or functionality.
  10. The clock's  ${}^t\text{CK (AVG)}$  is the average clock over any 200 consecutive clocks and  ${}^t\text{CK(AVG) MIN}$  is the smallest clock rate allowed, with the exception of a deviation due to clock jitter. Input clock jitter is allowed provided it does not exceed values specified and must be of a random Gaussian distribution in nature.
  11. Spread spectrum is not included in the jitter specification values. However, the input clock can accommodate spread-spectrum at a sweep rate in the range of 20–60 kHz with an additional 1% of  ${}^t\text{CK(AVG)}$  as a long-term jitter component; however, the spread spectrum may not use a clock rate below  ${}^t\text{CK (AVG) MIN}$ .
  12. The clock's  ${}^t\text{CH (AVG)}$  and  ${}^t\text{CL (AVG)}$  are the average half clock period over any 200 consecutive clocks and is the smallest clock half period allowed, with the exception of a deviation due to clock jitter. Input clock jitter is allowed provided it does not exceed values specified and must be of a random Gaussian distribution in nature.
  13. The period jitter ( ${}^t\text{JITper}$ ) is the maximum deviation in the clock period from the average or nominal clock. It is allowed in either the positive or negative direction.
  14.  ${}^t\text{CH(ABS)}$  is the absolute instantaneous clock high pulse width as measured from one rising edge to the following falling edge.
  15.  ${}^t\text{CL(ABS)}$  is the absolute instantaneous clock low pulse width as measured from one falling edge to the following rising edge.
  16. The cycle-to-cycle jitter ( ${}^t\text{JITcc}$ ) is the amount the clock period can deviate from one cycle to the next. It is important to keep cycle-to-cycle jitter at a minimum during the DLL locking time.
  17. The cumulative jitter error ( ${}^t\text{ERRnper}$ ), where  $n$  is the number of clocks between 2 and 50, is the amount of clock time allowed to accumulate consecutively away from the average clock over  $n$  number of clock cycles.
  18.  ${}^t\text{DS (base)}$  and  ${}^t\text{DH (base)}$  values are for a single-ended 1 V/ns DQ slew rate and 2 V/ns differential DQS, DQS# slew rate.
  19. These parameters are measured from a data signal (DM, DQ0, DQ1, and so forth) transition edge to its respective data strobe signal (DQS, DQS#) crossing.

20. The setup and hold times are listed converting the base specification values (to which derating tables apply) to  $V_{REF}$  when the slew rate is 1 V/ns. These values, with a slew rate of 1 V/ns, are for reference only.
21. When the device is operated with input clock jitter, this parameter needs to be derated by the actual  $t_{JITper}$  (larger of  $t_{JITper}$  (MIN) or  $t_{JITper}$  (MAX) of the input clock (output deratings are relative to the SDRAM input clock).
22. Single-ended signal parameter.
23. The DRAM output timing is aligned to the nominal or average clock. Most output parameters must be derated by the actual jitter error when input clock jitter is present, even when within specification. This results in each parameter becoming larger. The following parameters are required to be derated by subtracting  $t_{ERR_{10PER}}$  (MAX):  $t_{DQSK}$  (MIN),  $t_{LZ}$  (DQS) MIN,  $t_{LZ}$  (DQ) MIN, and  $t_{AON}$  (MIN). The following parameters are required to be derated by subtracting  $t_{ERR_{10PER}}$  (MIN):  $t_{DQSK}$  (MAX),  $t_{HZ}$  (MAX),  $t_{LZ}$  (DQS) MAX,  $t_{LZ}$  (DQ) MAX, and  $t_{AON}$  (MAX). The parameter  $t_{RPRE}$  (MIN) is derated by subtracting  $t_{JITper}$  (MAX), while  $t_{RPRE}$  (MAX) is derated by subtracting  $t_{JITper}$  (MIN).
24. The maximum preamble is bound by  $t_{LZDQS}$  (MAX).
25. These parameters are measured from a data strobe signal (DQS, DQS#) crossing to its respective clock signal (CK, CK#) crossing. The specification values are not affected by the amount of clock jitter applied, as these are relative to the clock signal crossing. These parameters should be met whether clock jitter is present.
26. The  $t_{DQSKdll\_dis}$  parameter begins CL + AL - 1 cycles after the READ command.
27. The maximum postamble is bound by  $t_{HZDQS}$  (MAX).
28. Commands requiring a locked DLL are: READ (and RDAP) and synchronous ODT commands. In addition, after any change of latency  $t_{XPDLL}$ , timing must be met.
29.  $t_{IS}$  (base) and  $t_{IH}$  (base) values are for a single-ended 1 V/ns control/command/address slew rate and 2 V/ns CK, CK# differential slew rate.
30. These parameters are measured from a command/address signal transition edge to its respective clock (CK, CK#) signal crossing. The specification values are not affected by the amount of clock jitter applied as the setup and hold times are relative to the clock signal crossing that latches the command/address. These parameters should be met whether clock jitter is present.
31. For these parameters, the DDR3 SDRAM device supports  $t_{nPARAM}$  ( $nCK$ ) =  $RU(t_{PARAM} [ns]/t_{CK}[AVG] [ns])$ , assuming all input clock jitter specifications are satisfied. For example, the device will support  $t_{nRP}$  ( $nCK$ ) =  $RU(t_{RP}/t_{CK}[AVG])$  if all input clock jitter specifications are met. This means that for DDR3-800 6-6-6, of which  $t_{RP} = 5ns$ , the device will support  $t_{nRP} = RU(t_{RP}/t_{CK}[AVG]) = 6$  as long as the input clock jitter specifications are met. That is, the PRECHARGE command at  $T_0$  and the ACTIVATE command at  $T_0 + 6$  are valid even if six clocks are less than 15ns due to input clock jitter.
32. During READs and WRITEs with auto precharge, the DDR3 SDRAM will hold off the internal PRECHARGE command until  $t_{RAS}$  (MIN) has been satisfied.
33. When operating in DLL disable mode, the greater of 4CK or 15ns is satisfied for  $t_{WR}$ .
34. The start of the write recovery time is defined as follows:
  - For BL8 (fixed by MRS and OTF): Rising clock edge four clock cycles after WL
  - For BC4 (OTF): Rising clock edge four clock cycles after WL
  - For BC4 (fixed by MRS): Rising clock edge two clock cycles after WL
35. RESET# should be LOW as soon as power starts to ramp to ensure the outputs are in High-Z. Until RESET# is LOW, the outputs are at risk of driving and could result in excessive current, depending on bus activity.
36. The refresh period is 64ms when  $T_C$  is less than or equal to 85°C. This equates to an average refresh rate of 7.8125 $\mu$ s. However, nine REFRESH commands should be asserted at least once every 70.3 $\mu$ s. When  $T_C$  is greater than +85°C, the refresh period is 32ms. Although JEDEC specifies  $t_{REFI}$  as a MAX, Micron allows REFRESH commands to be burst provided that the maximum refresh period is not violated.

37. Although CKE is allowed to be registered LOW after a REFRESH command when  $t_{RE-FPDEN}$  (MIN) is satisfied, there are cases where additional time such as  $t_{XPDLL}$  (MIN) is required.
38. ODT turn-on time MIN is when the device leaves High-Z and ODT resistance begins to turn on. ODT turn-on time maximum is when the ODT resistance is fully on. The ODT reference load is shown in Figure 22 (page 54).
39. Half-clock output parameters must be derated by the actual  $t_{ERR_{10}PER}$  and  $t_{JITdy}$  when input clock jitter is present. This results in each parameter becoming larger. The parameters  $t_{ADC}$  (MIN) and  $t_{AOF}$  (MIN) are each required to be derated by subtracting both  $t_{ERR_{10}PER}$  (MAX) and  $t_{JITdy}$  (MAX). The parameters  $t_{ADC}$  (MAX) and  $t_{AOF}$  (MAX) are required to be derated by subtracting both  $t_{ERR_{10}PER}$  (MAX) and  $t_{JITdy}$  (MAX).
40. ODT turn-off time minimum is when the device starts to turn off ODT resistance. ODT turn-off time maximum is when the DRAM buffer is in High-Z. The ODT reference load is shown in Figure 23 (page 57). This output load is used for ODT timings (see Figure 30 (page 68)).
41. Pulse width of a input signal is defined as the width between the first crossing of  $V_{REF(DC)}$  and the consecutive crossing of  $V_{REF(DC)}$ .
42. Should the clock rate be larger than  $t_{RFC}$  (MIN), an AUTO REFRESH command should have at least one NOP command between it and another AUTO REFRESH command. Additionally, if the clock rate is slower than 40ns (25 MHz), all REFRESH commands should be followed by a PRECHARGE ALL command.

## Command and Address Setup, Hold, and Derating

The total  $t_{IS}$  (setup time) and  $t_{IH}$  (hold time) required is calculated by adding the data sheet  $t_{IS}$  (base) and  $t_{IH}$  (base) values (see Table 55; values come from Table 54 (page 75)) to the  $\Delta t_{IS}$  and  $\Delta t_{IH}$  derating values (see Table 56 (page 85) and Table 57 (page 85)), respectively. Example:  $t_{IS}$  (total setup time) =  $t_{IS}$  (base) +  $\Delta t_{IS}$ . For a valid transition, the input signal has to remain above/below  $V_{IH(AC)}/V_{IL(AC)}$  for some time  $t_{VAC}$  (see Table 57 (page 85)).

Although the total setup time for slow slew rates might be negative (for example, a valid input signal will not have reached  $V_{IH(AC)}/V_{IL(AC)}$  at the time of the rising clock transition), a valid input signal is still required to complete the transition and to reach  $V_{IH(AC)}/V_{IL(AC)}$  (see Figure 14 (page 47) for input signal requirements). For slew rates which fall between the values listed in Table 57 (page 85) and Table 58 (page 86), the derating values may be obtained by linear interpolation.

Setup ( $t_{IS}$ ) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of  $V_{REF(DC)}$  and the first crossing of  $V_{IH(AC)min}$ . Setup ( $t_{IS}$ ) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of  $V_{REF(DC)}$  and the first crossing of  $V_{IL(AC)max}$ . If the actual signal is always earlier than the nominal slew rate line between the shaded “ $V_{REF(DC)}$ -to-AC region,” use the nominal slew rate for derating value (see Figure 33 (page 87)). If the actual signal is later than the nominal slew rate line anywhere between the shaded “ $V_{REF(DC)}$ -to-AC region,” the slew rate of a tangent line to the actual signal from the AC level to the DC level is used for derating value (see Figure 35 (page 89)).

Hold ( $t_{IH}$ ) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of  $V_{IL(DC)max}$  and the first crossing of  $V_{REF(DC)}$ . Hold ( $t_{IH}$ ) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of  $V_{IH(DC)min}$  and the first crossing of  $V_{REF(DC)}$ . If the actual signal is always later than the nominal slew rate line between the shaded “DC-to- $V_{REF(DC)}$  region,” use the nominal slew rate for derating value (see Figure 34 (page 88)). If the actual signal is earlier than the nominal slew rate line anywhere between the shaded “DC-to- $V_{REF(DC)}$  region,” the slew rate of a tangent line to the actual signal from the DC level to the  $V_{REF(DC)}$  level is used for derating value (see Figure 36 (page 90)).

## Data Setup, Hold, and Derating

The total  $t_{DS}$  (setup time) and  $t_{DH}$  (hold time) required is calculated by adding the data sheet  $t_{DS}$  (base) and  $t_{DH}$  (base) values (see Table 59 (page 91); values come from Table 54 (page 75)) to the  $\Delta t_{DS}$  and  $\Delta t_{DH}$  derating values (see Table 60 (page 92)), respectively. Example:  $t_{DS}$  (total setup time) =  $t_{DS}$  (base) +  $\Delta t_{DS}$ . For a valid transition, the input signal has to remain above/below  $V_{IH(AC)}/V_{IL(AC)}$  for some time  $t_{VAC}$  (see Table 62 (page 93)).

Although the total setup time for slow slew rates might be negative (for example, a valid input signal will not have reached  $V_{IH(AC)}/V_{IL(AC)}$  at the time of the rising clock transition), a valid input signal is still required to complete the transition and to reach  $V_{IH}/V_{IL(AC)}$ . For slew rates which fall between the values listed in Table 61 (page 92), the derating values may be obtained by linear interpolation.

Setup ( $t_{DS}$ ) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of  $V_{REF(DC)}$  and the first crossing of  $V_{IH(AC)min}$ . Setup ( $t_{DS}$ ) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of  $V_{REF(DC)}$  and the first crossing of  $V_{IL(AC)max}$ . If the actual signal is always earlier than the nominal slew rate line between the shaded “ $V_{REF(DC)}$ -to-AC region,” use the nominal slew rate for derating value (see Figure 37 (page 94)). If the actual signal is later than the nominal slew rate line anywhere between the shaded “ $V_{REF(DC)}$ -to-AC region,” the slew rate of a tangent line to the actual signal from the AC level to the DC level is used for derating value (see Figure 39 (page 96)).

Hold ( $t_{DH}$ ) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of  $V_{IL(DC)max}$  and the first crossing of  $V_{REF(DC)}$ . Hold ( $t_{DH}$ ) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of  $V_{IH(DC)min}$  and the first crossing of  $V_{REF(DC)}$ . If the actual signal is always later than the nominal slew rate line between the shaded “DC-to- $V_{REF(DC)}$  region,” use the nominal slew rate for derating value (see Figure 38 (page 95)). If the actual signal is earlier than the nominal slew rate line anywhere between the shaded “DC-to- $V_{REF(DC)}$  region,” the slew rate of a tangent line to the actual signal from the “DC-to- $V_{REF(DC)}$  region” is used for derating value (see Figure 40 (page 97)).

ZQ CALIBRATION SHORT	ZQCS	H	H	L	H	H	L	X	X	X	L	X		

Notes: 1. Commands are defined by states of CS#, RAS#, CAS#, WE#, and CKE at the rising edge of the clock. The MSB of BA, RA, and CA are device-, density-, and configuration-dependent.

2. RESET# is LOW enabled and used only for asynchronous reset. Thus, RESET# must be held HIGH during any normal operation.
3. The state of ODT does not affect the states described in this table.
4. Operations apply to the bank defined by the bank address. For MRS, BA selects one of four mode registers.
5. "V" means "H" or "L" (a defined logic level), and "X" means "Don't Care."
6. See Table 64 (page 100) for additional information on CKE transition.
7. Self refresh exit is asynchronous.
8. Burst READs or WRITEs cannot be terminated or interrupted. MRS (fixed) and OTF BL/BC are defined in MRO.
9. The purpose of the NOP command is to prevent the DRAM from registering any unwanted commands. A NOP will not terminate an operation that is executing.
10. The DES and NOP commands perform similarly.
11. The power-down mode does not perform any REFRESH operations.
12. ZQ CALIBRATION LONG is used for either ZQinit (first ZQCL command during initialization) or ZQoper (ZQCL command after initialization).

**Table 64: Truth Table – CKE**

Notes 1–2 apply to the entire table; see Table 63 (page 98) for additional command details

Current State <sup>3</sup>	CKE		Command <sup>5</sup> (RAS#, CAS#, WE#, CS#)	Action <sup>5</sup>	Notes
	Previous Cycle <sup>4</sup> ( <i>n</i> - 1)	Present Cycle <sup>4</sup> ( <i>n</i> )			
Power-down	L	L	“Don’t Care”	Maintain power-down	
	L	H	DES or NOP	Power-down exit	
Self refresh	L	L	“Don’t Care”	Maintain self refresh	
	L	H	DES or NOP	Self refresh exit	
Bank(s) active	H	L	DES or NOP	Active power-down entry	
Reading	H	L	DES or NOP	Power-down entry	
Writing	H	L	DES or NOP	Power-down entry	
Precharging	H	L	DES or NOP	Power-down entry	
Refreshing	H	L	DES or NOP	Precharge power-down entry	
All banks idle	H	L	DES or NOP	Precharge power-down entry	6
	H	L	REFRESH	Self refresh	

- Notes:
1. All states and sequences not shown are illegal or reserved unless explicitly described elsewhere in this document.
  2. <sup>t</sup>CKE (MIN) means CKE must be registered at multiple consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the required number of registration clocks. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of <sup>t</sup>IS + <sup>t</sup>CKE (MIN) + <sup>t</sup>IH.
  3. Current state = The state of the DRAM immediately prior to clock edge *n*.
  4. CKE (*n*) is the logic state of CKE at clock edge *n*; CKE (*n* - 1) was the state of CKE at the previous clock edge.
  5. COMMAND is the command registered at the clock edge (must be a legal command as defined in Table 63 (page 98)). Action is a result of COMMAND. ODT does not affect the states described in this table and is not listed.
  6. Idle state = All banks are closed, no data bursts are in progress, CKE is HIGH, and all timings from previous operations are satisfied. All self refresh exit and power-down exit parameters are also satisfied.

## Commands

### DESELECT

The Deselect (DES) command (CS# HIGH) prevents new commands from being executed by the DRAM. Operations already in progress are not affected.

### NO OPERATION

The NO OPERATION (NOP) command (CS# LOW) prevents unwanted commands from being registered during idle or wait states. Operations already in progress are not affected.

### ZQ CALIBRATION LONG

The ZQ CALIBRATION LONG (ZQCL) command is used to perform the initial calibration during a power-up initialization and reset sequence (see Figure 49 (page 117)). This command may be issued at any time by the controller depending on the system environment. The ZQCL command triggers the calibration engine inside the DRAM. After calibration is achieved, the calibrated values are transferred from the calibration engine to the DRAM I/O, which are reflected as updated  $R_{ON}$  and ODT values.

The DRAM is allowed a timing window defined by either  $t_{ZQinit}$  or  $t_{ZQoper}$  to perform the full calibration and transfer of values. When ZQCL is issued during the initialization sequence, the timing parameter  $t_{ZQinit}$  must be satisfied. When initialization is complete, subsequent ZQCL commands require the timing parameter  $t_{ZQoper}$  to be satisfied.

### ZQ CALIBRATION SHORT

The ZQ CALIBRATION SHORT (ZQCS) command is used to perform periodic calibrations to account for small voltage and temperature variations. The shorter timing window is provided to perform the reduced calibration and transfer of values as defined by timing parameter  $t_{ZQCS}$ . A ZQCS command can effectively correct a minimum of 0.5%  $R_{ON}$  and  $R_{TT}$  impedance error within 64 clock cycles, assuming the maximum sensitivities specified in Table 41 (page 63) and Table 42 (page 63).

### ACTIVATE

The ACTIVATE command is used to open (or activate) a row in a particular bank for a subsequent access. The value on the BA[2:0] inputs selects the bank, and the address provided on inputs A[n:0] selects the row. This row remains open (or active) for accesses until a PRECHARGE command is issued to that bank.

A PRECHARGE command must be issued before opening a different row in the same bank.

### READ

The READ command is used to initiate a burst read access to an active row. The address provided on inputs A[2:0] selects the starting column address depending on the burst length and burst type selected (see Burst Order table for additional information). The value on input A10 determines whether or not auto precharge is used. If auto precharge is selected, the row being accessed will be precharged at the end of the READ burst. If auto precharge is not selected, the row will remain open for subsequent accesses. The value on input A12 (if enabled in the mode register) when the READ command is issued

determines whether BC4 (chop) or BL8 is used. After a READ command is issued, the READ burst may not be interrupted.

**Table 65: READ Command Summary**

Function		Symbol	CKE		CS#	RAS#	CAS#	WE#	BA [3:0]	An	A12	A10	A[11, 9:0]
			Prev. Cycle	Next Cycle									
READ	BL8MRS, BC4MRS	RD	H		L	H	L	H	BA	RFU	V	L	CA
	BC4OTF	RDS4	H		L	H	L	H	BA	RFU	L	L	CA
	BL8OTF	RDS8	H		L	H	L	H	BA	RFU	H	L	CA
READ with auto precharge	BL8MRS, BC4MRS	RDAP	H		L	H	L	H	BA	RFU	V	H	CA
	BC4OTF	RDAPS4	H		L	H	L	H	BA	RFU	L	H	CA
	BL8OTF	RDAPS8	H		L	H	L	H	BA	RFU	H	H	CA

## WRITE

The WRITE command is used to initiate a burst write access to an active row. The value on the BA[2:0] inputs selects the bank. The value on input A10 determines whether or not auto precharge is used. The value on input A12 (if enabled in the MR) when the WRITE command is issued determines whether BC4 (chop) or BL8 is used.

Input data appearing on the DQ is written to the memory array subject to the DM input logic level appearing coincident with the data. If a given DM signal is registered LOW, the corresponding data will be written to memory. If the DM signal is registered HIGH, the corresponding data inputs will be ignored and a WRITE will not be executed to that byte/column location.

**Table 66: WRITE Command Summary**

Function		Symbol	CKE		CS#	RAS#	CAS#	WE#	BA [3:0]	An	A12	A10	A[11, 9:0]
			Prev. Cycle	Next Cycle									
WRITE	BL8MRS, BC4MRS	WR	H		L	H	L	L	BA	RFU	V	L	CA
	BC4OTF	WRS4	H		L	H	L	L	BA	RFU	L	L	CA
	BL8OTF	WRS8	H		L	H	L	L	BA	RFU	H	L	CA
WRITE with auto precharge	BL8MRS, BC4MRS	WRAP	H		L	H	L	L	BA	RFU	V	H	CA
	BC4OTF	WRAPS4	H		L	H	L	L	BA	RFU	L	H	CA
	BL8OTF	WRAPS8	H		L	H	L	L	BA	RFU	H	H	CA

## PRECHARGE

The PRECHARGE command is used to deactivate the open row in a particular bank or in all banks. The bank(s) are available for a subsequent row access a specified time (<sup>t</sup>RP) after the PRECHARGE command is issued, except in the case of concurrent auto pre-

charge. A READ or WRITE command to a different bank is allowed during concurrent auto precharge as long as it does not interrupt the data transfer in the current bank and does not violate any other timing parameters. Input A10 determines whether one or all banks are precharged. In the case where only one bank is precharged, inputs BA[2:0] select the bank; otherwise, BA[2:0] are treated as “Don’t Care.”

After a bank is precharged, it is in the idle state and must be activated prior to any READ or WRITE commands being issued to that bank. A PRECHARGE command is treated as a NOP if there is no open row in that bank (idle state) or if the previously open row is already in the process of precharging. However, the precharge period is determined by the last PRECHARGE command issued to the bank.

## REFRESH

REFRESH is used during normal operation of the DRAM and is analogous to CAS#-before-RAS# (CBR) refresh or auto refresh. This command is nonpersistent, so it must be issued each time a refresh is required. The addressing is generated by the internal refresh controller. This makes the address bits a “Don’t Care” during a REFRESH command. The DRAM requires REFRESH cycles at an average interval of 7.8 $\mu$ s (maximum when  $T_C \leq +85^\circ\text{C}$  or 3.9 $\mu$ s; maximum when  $T_C \leq +95^\circ\text{C}$ ). The REFRESH period begins when the REFRESH command is registered and ends  $t_{RFC}(\text{MIN})$  later.

To allow for improved efficiency in scheduling and switching between tasks, some flexibility in the absolute refresh interval is provided. A maximum of eight REFRESH commands can be posted to any given DRAM, meaning that the maximum absolute interval between any REFRESH command and the next REFRESH command is nine times the maximum average interval refresh rate. Self refresh may be entered with up to eight REFRESH commands being posted. After exiting self refresh (when entered with posted REFRESH commands) additional posting of REFRESH commands is allowed to the extent the maximum number of cumulative posted REFRESH commands (both pre and post self refresh) does not exceed eight REFRESH commands.

The posting limit of eight REFRESH commands is a JEDEC specification; however, as long as all the required number of REFRESH commands are issued within the refresh period (64ms), exceeding the eight posted REFRESH commands is allowed.

**Figure 41: Refresh Mode**

- Notes:
1. NOP commands are shown for ease of illustration; other valid commands may be possible at these times. CKE must be active during the PRECHARGE, ACTIVATE, and REFRESH commands, but may be inactive at other times (see Power-Down Mode (page 165)).
  2. The second REFRESH is not required but depicts two back-to-back REFRESH commands.
  3. "Don't Care" if A10 is HIGH at this point; however, A10 must be HIGH if more than one bank is active (must precharge all active banks).
  4. For operations shown, DM, DQ, and DQS signals are all "Don't Care"/High-Z.
  5. Only NOP and DES commands are allowed after a REFRESH command and until t<sub>RFC</sub>(MIN) is satisfied.

## SELF REFRESH

SELF REFRESH command is used to retain data in the DRAM, even if the rest of the system is powered down. When in self refresh mode, the DRAM retains data without external clocking. Self refresh mode is also a convenient method used to enable/disable the DLL as well as to change the clock frequency within the allowed synchronous operating range (see Input Clock Frequency Change (page 109)). All power supply inputs (including V<sub>REFCA</sub> and V<sub>REFDQ</sub>) must be maintained at valid levels upon entry/exit and during self refresh mode operation. All power supply inputs (including V<sub>REFCA</sub> and V<sub>REFDQ</sub>) must be maintained at valid levels upon entry/exit and during self refresh mode operation. V<sub>REFDQ</sub> may float or not drive V<sub>DDQ</sub>/2 while in self refresh mode under certain conditions:

- V<sub>SS</sub> < V<sub>REFDQ</sub> < V<sub>DD</sub> is maintained
- V<sub>REFDQ</sub> is valid and stable prior to CKE going back HIGH
- The first WRITE operation may not occur earlier than 512 clocks after V<sub>REFDQ</sub> is valid
- All other self refresh mode exit timing requirements are met

## DLL Disable Mode

If the DLL is disabled by the mode register (MR1[0] can be switched during initialization or later), the DRAM is targeted, but not guaranteed, to operate similarly to the normal mode with a few notable exceptions:

- The DRAM supports only one value of CAS latency (CL = 6) and one value of CAS WRITE latency (CWL = 6).
- DLL disable mode affects the read data clock-to-data strobe relationship ( $t_{DQSCK}$ ), but not the read data-to-data strobe relationship ( $t_{DQSQ}$ ,  $t_{QH}$ ). Special attention is needed to line the read data up with the controller time domain when the DLL is disabled.
- In normal operation (DLL on),  $t_{DQSCK}$  starts from the rising clock edge AL + CL cycles after the READ command. In DLL disable mode,  $t_{DQSCK}$  starts AL + CL - 1 cycles after the READ command. Additionally, with the DLL disabled, the value of  $t_{DQSCK}$  could be larger than  $t_{CK}$ .

The ODT feature is not supported during DLL disable mode (including dynamic ODT). The ODT resistors must be disabled by continuously registering the ODT ball LOW by programming  $R_{TT,nom}$  MR1[9, 6, 2] and  $R_{TT(WR)}$  MR2[10, 9] to 0 while in the DLL disable mode.

Specific steps must be followed to switch between the DLL enable and DLL disable modes due to a gap in the allowed clock rates between the two modes ( $t_{CK [AVG] MAX}$  and  $t_{CK [DLL disable] MIN}$ , respectively). The only time the clock is allowed to cross this clock rate gap is during self refresh mode. Thus, the required procedure for switching from the DLL enable mode to the DLL disable mode is to change frequency during self refresh:

1. Starting from the idle state (all banks are precharged, all timings are fulfilled, ODT is turned off, and  $R_{TT,nom}$  and  $R_{TT(WR)}$  are High-Z), set MR1[0] to 1 to disable the DLL.
2. Enter self refresh mode after  $t_{MOD}$  has been satisfied.
3. After  $t_{CKSRE}$  is satisfied, change the frequency to the desired clock rate.
4. Self refresh may be exited when the clock is stable with the new frequency for  $t_{CKSRX}$ . After  $t_{XS}$  is satisfied, update the mode registers with appropriate values.
5. The DRAM will be ready for its next command in the DLL disable mode after the greater of  $t_{MRD}$  or  $t_{MOD}$  has been satisfied. A ZQCL command should be issued with appropriate timings met.

**Figure 42: DLL Enable Mode to DLL Disable Mode**

- Notes:
1. Any valid command.
  2. Disable DLL by setting MR1[0] to 1.
  3. Enter SELF REFRESH.
  4. Exit SELF REFRESH.
  5. Update the mode registers with the DLL disable parameters setting.
  6. Starting with the idle state,  $R_{TT}$  is in the High-Z state.
  7. Change frequency.
  8. Clock must be stable  $t_{CKSRX}$ .
  9. Static LOW in the case that  $R_{TT,nom}$  or  $R_{TT(WR)}$  is enabled; otherwise, static LOW or HIGH.

A similar procedure is required for switching from the DLL disable mode back to the DLL enable mode. This also requires changing the frequency during self refresh mode (see Figure 43 (page 107)).

1. Starting from the idle state (all banks are precharged, all timings are fulfilled, ODT is turned off, and  $R_{TT,nom}$  and  $R_{TT(WR)}$  are High-Z), enter self refresh mode.
2. After  $t_{CKSRE}$  is satisfied, change the frequency to the new clock rate.
3. Self refresh may be exited when the clock is stable with the new frequency for  $t_{CKSRX}$ . After  $t_{XS}$  is satisfied, update the mode registers with the appropriate values. At a minimum, set MR1[0] to 0 to enable the DLL. Wait  $t_{MRD}$ , then set MR0[8] to 1 to enable DLL RESET.
4. After another  $t_{MRD}$  delay is satisfied, then update the remaining mode registers with the appropriate values.
5. The DRAM will be ready for its next command in the DLL enable mode after the greater of  $t_{MRD}$  or  $t_{MOD}$  has been satisfied. However, before applying any command or function requiring a locked DLL, a delay of  $t_{DLLK}$  after DLL RESET must be satisfied. A ZQCL command should be issued with the appropriate timings met.

**Figure 43: DLL Disable Mode to DLL Enable Mode**

- Notes:
1. Enter SELF REFRESH.
  2. Exit SELF REFRESH.
  3. Wait  $t_{XS}$ , then set MR1[0] to 0 to enable DLL.
  4. Wait  $t_{MRD}$ , then set MR0[8] to 1 to begin DLL RESET.
  5. Wait  $t_{MRD}$ , update registers (CL, CWL, and write recovery may be necessary).
  6. Wait  $t_{MOD}$ , any valid command.
  7. Starting with the idle state.
  8. Change frequency.
  9. Clock must be stable at least  $t_{CKSRX}$ .
  10. Static LOW in the case that  $R_{TT,nom}$  or  $R_{TT(WR)}$  is enabled; otherwise, static LOW or HIGH.

The clock frequency range for the DLL disable mode is specified by the parameter  $t_{CKdll\_dis}$ . Due to latency counter and timing restrictions, only CL = 6 and CWL = 6 are supported.

DLL disable mode will affect the read data clock to data strobe relationship ( $t_{DQSCK}$ ) but not the data strobe to data relationship ( $t_{DQSQ}$ ,  $t_{QH}$ ). Special attention is needed to line up read data to the controller time domain.

Compared to the DLL on mode where  $t_{DQSCK}$  starts from the rising clock edge AL + CL cycles after the READ command, the DLL disable mode  $t_{DQSCK}$  starts AL + CL - 1 cycles after the READ command.

WRITE operations function similarly between the DLL enable and DLL disable modes; however, ODT functionality is not allowed with DLL disable mode.

## Input Clock Frequency Change

When the DDR3 SDRAM is initialized, it requires the clock to be stable during most normal states of operation. This means that after the clock frequency has been set to the stable state, the clock period is not allowed to deviate except what is allowed for by the clock jitter and spread spectrum clocking (SSC) specifications.

The input clock frequency can be changed from one stable clock rate to another under two conditions: self refresh mode and precharge power-down mode. Outside of these two modes, it is illegal to change the clock frequency. For the self refresh mode condition, when the DDR3 SDRAM has been successfully placed into self refresh mode and  $t_{CKSRE}$  has been satisfied, the state of the clock becomes a “Don’t Care.” When the clock becomes a “Don’t Care,” changing the clock frequency is permissible, provided the new clock frequency is stable prior to  $t_{CKSRX}$ . When entering and exiting self refresh mode for the sole purpose of changing the clock frequency, the self refresh entry and exit specifications must still be met.

The precharge power-down mode condition is when the DDR3 SDRAM is in precharge power-down mode (either fast exit mode or slow exit mode). Either ODT must be at a logic LOW or  $R_{TT,nom}$  and  $R_{TT(WR)}$  must be disabled via MR1 and MR2. This ensures  $R_{TT,nom}$  and  $R_{TT(WR)}$  are in an off state prior to entering precharge power-down mode, and CKE must be at a logic LOW. A minimum of  $t_{CKSRE}$  must occur after CKE goes LOW before the clock frequency can change. The DDR3 SDRAM input clock frequency is allowed to change only within the minimum and maximum operating frequency specified for the particular speed grade ( $t_{CK [AVG] MIN}$  to  $t_{CK [AVG] MAX}$ ). During the input clock frequency change, CKE must be held at a stable LOW level. When the input clock frequency is changed, a stable clock must be provided to the DRAM  $t_{CKSRX}$  before precharge power-down may be exited. After precharge power-down is exited and  $t_{XP}$  has been satisfied, the DLL must be reset via the MRS. Depending on the new clock frequency, additional MRS commands may need to be issued. During the DLL lock time,  $R_{TT,nom}$  and  $R_{TT(WR)}$  must remain in an off state. After the DLL lock time, the DRAM is ready to operate with a new clock frequency.

## Write Leveling

For better signal integrity, DDR3 SDRAM memory modules adopted fly-by topology for the commands, addresses, control signals, and clocks. Write leveling is a scheme for the memory controller to adjust or deskew the DQS strobe (DQS, DQS#) to CK relationship at the DRAM with a simple feedback feature provided by the DRAM. Write leveling is generally used as part of the initialization process, if required. For normal DRAM operation, this feature must be disabled. This is the only DRAM operation where the DQS functions as an input (to capture the incoming clock) and the DQ function as outputs (to report the state of the clock). Note that nonstandard ODT schemes are required.

The memory controller using the write leveling procedure must have adjustable delay settings on its DQS strobe to align the rising edge of DQS to the clock at the DRAM pins. This is accomplished when the DRAM asynchronously feeds back the CK status via the DQ bus and samples with the rising edge of DQS. The controller repeatedly delays the DQS strobe until a CK transition from 0 to 1 is detected. The DQS delay established through this procedure helps ensure  $t_{DQSS}$ ,  $t_{DSS}$ , and  $t_{DSH}$  specifications in systems that use fly-by topology by deskewing the trace length mismatch. A conceptual timing of this procedure is shown.

**Figure 46: Write Leveling Concept**

When write leveling is enabled, the rising edge of DQS samples CK, and the prime DQ outputs the sampled CK's status. The prime DQ for a x4 or x8 configuration is DQ0 with all other DQ (DQ[7:1]) driving LOW. The prime DQ for a x16 configuration is DQ0 for the lower byte and DQ8 for the upper byte. It outputs the status of CK sampled by LDQS and UDQS. All other DQ (DQ[7:1], DQ[15:9]) continue to drive LOW. Two prime DQ on a x16 enable each byte lane to be leveled independently.

The write leveling mode register interacts with other mode registers to correctly configure the write leveling functionality. Besides using MR1[7] to disable/enable write leveling, MR1[12] must be used to enable/disable the output buffers. The ODT value, burst length, and so forth need to be selected as well. This interaction is shown in Table 68. It should also be noted that when the outputs are enabled during write leveling mode, the DQS buffers are set as inputs, and the DQ are set as outputs. Additionally, during write leveling mode, only the DQS strobe terminations are activated and deactivated via the ODT ball. The DQ remain disabled and are not affected by the ODT ball.

**Table 68: Write Leveling Matrix**

Note 1 applies to the entire table

MR1[7] Write Leveling	MR1[12] Output Buffers	MR1[3, 6, 9] R <sub>TT,nom</sub> Value	DRAM ODT Ball	DRAM R <sub>TT,nom</sub>		DRAM State	Case	Notes
				DQS	DQ			
Disabled	See normal operations					Write leveling not enabled	0	
Enabled (1)	Disabled (1)	n/a	Low	Off	Off	DQS not receiving: not terminated Prime DQ High-Z: not terminated Other DQ High-Z: not terminated	1	2
		20Ω, 30Ω, 40Ω, 60Ω, or 120Ω	High	On		DQS not receiving: terminated by R <sub>TT</sub> Prime DQ High-Z: not terminated Other DQ High-Z: not terminated	2	
	Enabled (0)	n/a	Low	Off		DQS receiving: not terminated Prime DQ driving CK state: not terminated Other DQ driving LOW: not terminated	3	3
		40Ω, 60Ω, or 120Ω	High	On		DQS receiving: terminated by R <sub>TT</sub> Prime DQ driving CK state: not terminated Other DQ driving LOW: not terminated	4	

- Notes:
1. Expected usage if used during write leveling: Case 1 may be used when DRAM are on a dual-rank module and on the rank not being leveled or on any rank of a module not being leveled on a multislotted system. Case 2 may be used when DRAM are on any rank of a module not being leveled on a multislotted system. Case 3 is generally not used. Case 4 is generally used when DRAM are on the rank that is being leveled.
  2. Since the DRAM DQS is not being driven (MR1[12] = 1), DQS ignores the input strobe, and all R<sub>TT,nom</sub> values are allowed. This simulates a normal standby state to DQS.
  3. Since the DRAM DQS is being driven (MR1[12] = 0), DQS captures the input strobe, and only some R<sub>TT,nom</sub> values are allowed. This simulates a normal write state to DQS.

## Write Leveling Procedure

A memory controller initiates the DRAM write leveling mode by setting MR1[7] to a 1, assuming the other programmable features (MR0, MR1, MR2, and MR3) are first set and the DLL is fully reset and locked. The DQ balls enter the write leveling mode going from a High-Z state to an undefined driving state, so the DQ bus should not be driven. During write leveling mode, only the NOP or DES commands are allowed. The memory controller should attempt to level only one rank at a time; thus, the outputs of other ranks should be disabled by setting MR1[12] to a 1 in the other ranks. The memory controller may assert ODT after a  $t_{MOD}$  delay as the DRAM will be ready to process the ODT transition. ODT should be turned on prior to DQS being driven LOW by at least  $ODTL_{on\ delay} (WL - 2 t_{CK})$ , provided it does not violate the aforementioned  $t_{MOD}$  delay requirement.

The memory controller may drive DQS LOW and DQS# HIGH after  $t_{WLDQSEN}$  has been satisfied. The controller may begin to toggle DQS after  $t_{WLMRD}$  (one DQS toggle is DQS transitioning from a LOW state to a HIGH state with DQS# transitioning from a HIGH state to a LOW state, then both transition back to their original states). At a minimum,  $ODTL_{on}$  and  $t_{AON}$  must be satisfied at least one clock prior to DQS toggling.

After  $t_{WLMRD}$  and a DQS LOW preamble ( $t_{WPRE}$ ) have been satisfied, the memory controller may provide either a single DQS toggle or multiple DQS toggles to sample CK for a given DQS-to-CK skew. Each DQS toggle must not violate  $t_{DQSL} (MIN)$  and  $t_{DQSH} (MIN)$  specifications.  $t_{DQSL} (MAX)$  and  $t_{DQSH} (MAX)$  specifications are not applicable during write leveling mode. The DQS must be able to distinguish the CK's rising edge within  $t_{WLS}$  and  $t_{WLH}$ . The prime DQ will output the CK's status asynchronously from the associated DQS rising edge CK capture within  $t_{WLO}$ . The remaining DQ that always drive LOW when DQS is toggling must be LOW within  $t_{WLOE}$  after the first  $t_{WLO}$  is satisfied (the prime DQ going LOW). As previously noted, DQS is an input and not an output during this process. Figure 47 (page 114) depicts the basic timing parameters for the overall write leveling procedure.

The memory controller will likely sample each applicable prime DQ state and determine whether to increment or decrement its DQS delay setting. After the memory controller performs enough DQS toggles to detect the CK's 0-to-1 transition, the memory controller should lock the DQS delay setting for that DRAM. After locking the DQS setting, leveling for the rank will have been achieved, and the write leveling mode for the rank should be disabled or reprogrammed (if write leveling of another rank follows).

**Figure 47: Write Leveling Sequence**

- Notes:
1. MRS: Load MR1 to enter write leveling mode.
  2. NOP: NOP or DES.
  3. DQS, DQS# needs to fulfill minimum pulse width requirements  $t_{DQSH}$  (MIN) and  $t_{DQSL}$  (MIN) as defined for regular writes. The maximum pulse width is system-dependent.
  4. Differential DQS is the differential data strobe (DQS, DQS#). Timing reference points are the zero crossings. The solid line represents DQS; the dotted line represents DQS#.
  5. DRAM drives leveling feedback on a prime DQ (DQ0 for x4 and x8). The remaining DQ are driven LOW and remain in this state throughout the leveling procedure.

### Write Leveling Mode Exit Procedure

After the DRAM are leveled, they must exit from write leveling mode before the normal mode can be used. Figure 48 (page 115) depicts a general procedure in exiting write leveling mode. After the last rising DQS (capturing a 1 at T0), the memory controller should stop driving the DQS signals after  $t_{WLO}$  (MAX) delay plus enough delay to enable the memory controller to capture the applicable prime DQ state (at  $\sim T_{b0}$ ). The DQ balls become undefined when DQS no longer remains LOW, and they remain undefined until  $t_{MOD}$  after the MRS command (at Te1).

The ODT input should be deasserted LOW such that ODTL off (MIN) expires after the DQS is no longer driving LOW. When ODT LOW satisfies  $t_{IS}$ , ODT must be kept LOW (at  $\sim T_{b0}$ ) until the DRAM is ready for either another rank to be leveled or until the normal mode can be used. After DQS termination is switched off, write level mode should be disabled via the MRS command (at Tc2). After  $t_{MOD}$  is satisfied (at Te1), any valid command may be registered by the DRAM. Some MRS commands may be issued after  $t_{MRD}$  (at Td1).

**Figure 48: Exit Write Leveling**

Note: 1. The DQ result, = 1, between Ta0 and Tc0, is a result of the DQS, DQS# signals capturing CK HIGH just after the T0 state.

## Initialization

The following sequence is required for power up and initialization, as shown in Figure 49 (page 117):

1. Apply power. RESET# is recommended to be below  $0.2 \times V_{DDQ}$  during power ramp to ensure the outputs remain disabled (High-Z) and ODT off ( $R_{TT}$  is also High-Z). All other inputs, including ODT, may be undefined.

During power-up, either of the following conditions may exist and must be met:

- Condition A:
    - $V_{DD}$  and  $V_{DDQ}$  are driven from a single-power converter output and are ramped with a maximum delta voltage between them of  $\Delta V \leq 300\text{mV}$ . Slope reversal of any power supply signal is allowed. The voltage levels on all balls other than  $V_{DD}$ ,  $V_{DDQ}$ ,  $V_{SS}$ ,  $V_{SSQ}$  must be less than or equal to  $V_{DDQ}$  and  $V_{DD}$  on one side, and must be greater than or equal to  $V_{SSQ}$  and  $V_{SS}$  on the other side.
    - Both  $V_{DD}$  and  $V_{DDQ}$  power supplies ramp to  $V_{DD,\text{min}}$  and  $V_{DDQ,\text{min}}$  within  $t_{V_{DDPR}} = 200\text{ms}$ .
    - $V_{REFDQ}$  tracks  $V_{DD} \times 0.5$ ,  $V_{REFCA}$  tracks  $V_{DD} \times 0.5$ .
    - $V_{TT}$  is limited to  $0.95\text{V}$  when the power ramp is complete and is not applied directly to the device; however,  $t_{VTD}$  should be greater than or equal to zero to avoid device latchup.
  - Condition B:
    - $V_{DD}$  may be applied before or at the same time as  $V_{DDQ}$ .
    - $V_{DDQ}$  may be applied before or at the same time as  $V_{TT}$ ,  $V_{REFDQ}$ , and  $V_{REFCA}$ .
    - No slope reversals are allowed in the power supply ramp for this condition.
2. Until stable power, maintain RESET# LOW to ensure the outputs remain disabled (High-Z). After the power is stable, RESET# must be LOW for at least  $200\mu\text{s}$  to begin the initialization process. ODT will remain in the High-Z state while RESET# is LOW and until CKE is registered HIGH.
  3. CKE must be LOW  $10\text{ns}$  prior to RESET# transitioning HIGH.
  4. After RESET# transitions HIGH, wait  $500\mu\text{s}$  (minus one clock) with CKE LOW.
  5. After this CKE LOW time, CKE may be brought HIGH (synchronously) and only NOP or DES commands may be issued. The clock must be present and valid for at least  $10\text{ns}$  (and a minimum of five clocks) and ODT must be driven LOW at least  $t_{IS}$  prior to CKE being registered HIGH. When CKE is registered HIGH, it must be continuously registered HIGH until the full initialization process is complete.
  6. After CKE is registered HIGH and after  $t_{XPR}$  has been satisfied, MRS commands may be issued. Issue an MRS (LOAD MODE) command to MR2 with the applicable settings (provide LOW to BA2 and BA0 and HIGH to BA1).
  7. Issue an MRS command to MR3 with the applicable settings.
  8. Issue an MRS command to MR1 with the applicable settings, including enabling the DLL and configuring ODT.
  9. Issue an MRS command to MR0 with the applicable settings, including a DLL RESET command.  $t_{DLLK}$  (512) cycles of clock input are required to lock the DLL.
  10. Issue a ZQCL command to calibrate  $R_{TT}$  and  $R_{ON}$  values for the process voltage temperature (PVT). Prior to normal operation,  $t_{ZQinit}$  must be satisfied.
  11. When  $t_{DLLK}$  and  $t_{ZQinit}$  have been satisfied, the DDR3 SDRAM will be ready for normal operation.

**Figure 49: Initialization Sequence**

## Mode Registers

Mode registers (MR0–MR3) are used to define various modes of programmable operations of the DDR3 SDRAM. A mode register is programmed via the mode register set (MRS) command during initialization, and it retains the stored information (except for MR0[8] which is self-clearing) until it is either reprogrammed, RESET# goes LOW, or until the device loses power.

Contents of a mode register can be altered by reexecuting the MRS command. If the user chooses to modify only a subset of the mode register’s variables, all variables must be programmed when the MRS command is issued. Reprogramming the mode register will not alter the contents of the memory array, provided it is performed correctly.

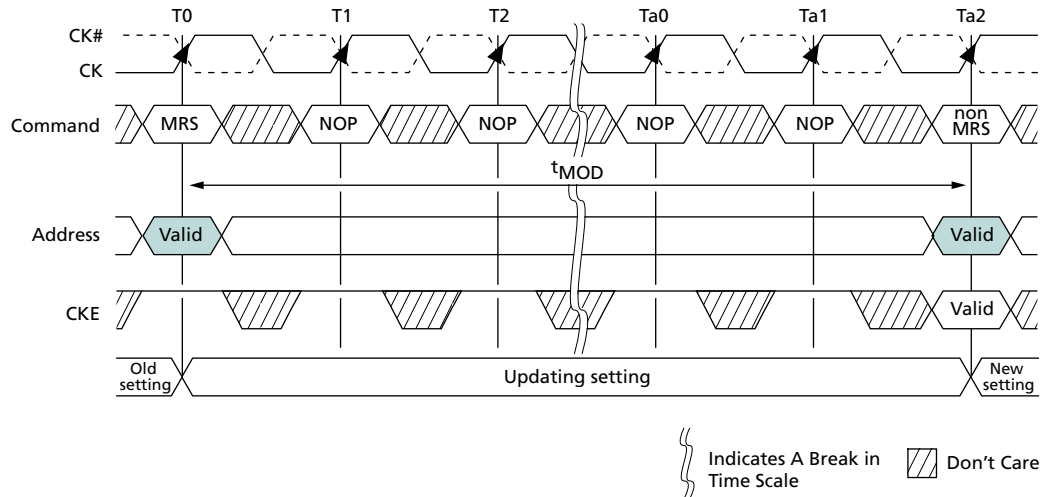

The MRS command can only be issued (or reissued) when all banks are idle and in the precharged state ( $t_{RP}$  is satisfied and no data bursts are in progress). After an MRS command has been issued, two parameters must be satisfied:  $t_{MRD}$  and  $t_{MOD}$ . The controller must wait  $t_{MRD}$  before initiating any subsequent MRS commands.

**Figure 50: MRS to MRS Command Timing ( $t_{MRD}$ )**

- Notes:
1. Prior to issuing the MRS command, all banks must be idle and precharged,  $t_{RP}$  (MIN) must be satisfied, and no data bursts can be in progress.
  2.  $t_{MRD}$  specifies the MRS to MRS command minimum cycle time.
  3. CKE must be registered HIGH from the MRS command until  $t_{MRSPDEN}$  (MIN) (see Power-Down Mode (page 165)).
  4. For a CAS latency change,  $t_{XPDLL}$  timing must be met before any nonMRS command.

The controller must also wait  $t_{MOD}$  before initiating any nonMRS commands (excluding NOP and DES). The DRAM requires  $t_{MOD}$  in order to update the requested features, with the exception of DLL RESET, which requires additional time. Until  $t_{MOD}$  has been satisfied, the updated features are to be assumed unavailable.

**Figure 51: MRS to nonMRS Command Timing ( $t_{MOD}$ )**

- Notes:
1. Prior to issuing the MRS command, all banks must be idle (they must be precharged,  $t_{RP}$  must be satisfied, and no data bursts can be in progress).
  2. Prior to  $Ta_2$  when  $t_{MOD}$  (MIN) is being satisfied, no commands (except NOP/DES) may be issued.
  3. If  $R_{TT}$  was previously enabled, ODT must be registered LOW at  $T_0$  so that ODTL is satisfied prior to  $Ta_1$ . ODT must also be registered LOW at each rising CK edge from  $T_0$  until  $t_{MOD}$  (MIN) is satisfied at  $Ta_2$ .
  4. CKE must be registered HIGH from the MRS command until  $t_{MRSPDEN}$  (MIN), at which time power-down may occur (see Power-Down Mode (page 165)).

## Mode Register 0 (MR0)

The base register, MR0, is used to define various DDR3 SDRAM modes of operation. These definitions include the selection of a burst length, burst type, CAS latency, operating mode, DLL RESET, write recovery, and precharge power-down mode, as shown in Figure 52 (page 120).

### Burst Length

Burst length is defined by  $MR0[1:0]$ . Read and write accesses to the DDR3 SDRAM are burst-oriented, with the burst length being programmable to 4 (chop mode), 8 (fixed), or selectable using  $A_{12}$  during a READ/WRITE command (on-the-fly). The burst length determines the maximum number of column locations that can be accessed for a given READ or WRITE command. When  $MR0[1:0]$  is set to 01 during a READ/WRITE command, if  $A_{12} = 0$ , then BC4 (chop) mode is selected. If  $A_{12} = 1$ , then BL8 mode is selected. Specific timing diagrams, and turnaround between READ/WRITE, are shown in the READ/WRITE sections of this document.

When a READ or WRITE command is issued, a block of columns equal to the burst length is effectively selected. All accesses for that burst take place within this block, meaning that the burst will wrap within the block if a boundary is reached. The block is uniquely selected by  $A[i:2]$  when the burst length is set to 4 and by  $A[i:3]$  when the burst length is set to 8 (where  $A_i$  is the most significant column address bit for a given configuration). The remaining (least significant) address bit(s) is (are) used to select the

starting location within the block. The programmed burst length applies to both READ and WRITE bursts.

**Figure 52: Mode Register 0 (MR0) Definitions**

Note: 1. MR0[16, 13, 7, 2] are reserved for future use and must be programmed to 0.

## Burst Type

Accesses within a given burst may be programmed to either a sequential or an interleaved order. The burst type is selected via MR0[3] (see Figure 52 (page 120)). The ordering of accesses within a burst is determined by the burst length, the burst type, and the starting column address. DDR3 only supports 4-bit burst chop and 8-bit burst access modes. Full interleave address ordering is supported for READs, while WRITEs are restricted to nibble (BC4) or word (BL8) boundaries.

**Table 69: Burst Order**

Burst Length	READ/ WRITE	Starting Column Address (A[2, 1, 0])	Burst Type = Sequential (Decimal)	Burst Type = Interleaved (Decimal)	Notes
4 chop	READ	0 0 0	0, 1, 2, 3, Z, Z, Z, Z	0, 1, 2, 3, Z, Z, Z, Z	1, 2
		0 0 1	1, 2, 3, 0, Z, Z, Z, Z	1, 0, 3, 2, Z, Z, Z, Z	1, 2
		0 1 0	2, 3, 0, 1, Z, Z, Z, Z	2, 3, 0, 1, Z, Z, Z, Z	1, 2
		0 1 1	3, 0, 1, 2, Z, Z, Z, Z	3, 2, 1, 0, Z, Z, Z, Z	1, 2
		1 0 0	4, 5, 6, 7, Z, Z, Z, Z	4, 5, 6, 7, Z, Z, Z, Z	1, 2
		1 0 1	5, 6, 7, 4, Z, Z, Z, Z	5, 4, 7, 6, Z, Z, Z, Z	1, 2
		1 1 0	6, 7, 4, 5, Z, Z, Z, Z	6, 7, 4, 5, Z, Z, Z, Z	1, 2
		1 1 1	7, 4, 5, 6, Z, Z, Z, Z	7, 6, 5, 4, Z, Z, Z, Z	1, 2
	WRITE	0 V V	0, 1, 2, 3, X, X, X, X	0, 1, 2, 3, X, X, X, X	1, 3, 4
1 V V		4, 5, 6, 7, X, X, X, X	4, 5, 6, 7, X, X, X, X	1, 3, 4	
8	READ	0 0 0	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7	1
		0 0 1	1, 2, 3, 0, 5, 6, 7, 4	1, 0, 3, 2, 5, 4, 7, 6	1
		0 1 0	2, 3, 0, 1, 6, 7, 4, 5	2, 3, 0, 1, 6, 7, 4, 5	1
		0 1 1	3, 0, 1, 2, 7, 4, 5, 6	3, 2, 1, 0, 7, 6, 5, 4	1
		1 0 0	4, 5, 6, 7, 0, 1, 2, 3	4, 5, 6, 7, 0, 1, 2, 3	1
		1 0 1	5, 6, 7, 4, 1, 2, 3, 0	5, 4, 7, 6, 1, 0, 3, 2	1
		1 1 0	6, 7, 4, 5, 2, 3, 0, 1	6, 7, 4, 5, 2, 3, 0, 1	1
		1 1 1	7, 4, 5, 6, 3, 0, 1, 2	7, 6, 5, 4, 3, 2, 1, 0	1
	WRITE	V V V	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7	1, 3

- Notes:
1. Internal READ and WRITE operations start at the same point in time for BC4 as they do for BL8.
  2. Z = Data and strobe output drivers are in tri-state.
  3. V = A valid logic level (0 or 1), but the respective input buffer ignores level-on input pins.
  4. X = "Don't Care."

## DLL RESET

DLL RESET is defined by MR0[8] (see Figure 52 (page 120)). Programming MR0[8] to 1 activates the DLL RESET function. MR0[8] is self-clearing, meaning it returns to a value of 0 after the DLL RESET function has been initiated.

Anytime the DLL RESET function is initiated, CKE must be HIGH and the clock held stable for 512 (<sup>4</sup>DLLK) clock cycles before a READ command can be issued. This is to allow time for the internal clock to be synchronized with the external clock. Failing to wait for synchronization to occur may result in invalid output timing specifications, such as <sup>4</sup>DQSCK timings.

## Write Recovery

WRITE recovery time is defined by MR0[11:9] (see Figure 52 (page 120)). Write recovery values of 5, 6, 7, 8, 10, or 12 may be used by programming MR0[11:9]. The user is required to program the correct value of write recovery and is calculated by dividing <sup>4</sup>WR

(ns) by  $t_{CK}$  (ns) and rounding up a noninteger value to the next integer:  $WR$  (cycles) =  $\text{roundup}(t_{WR} [\text{ns}] / t_{CK} [\text{ns}])$ .

### Precharge Power-Down (Precharge PD)

The precharge PD bit applies only when precharge power-down mode is being used. When MR0[12] is set to 0, the DLL is off during precharge power-down providing a lower standby current mode; however,  $t_{XPDLL}$  must be satisfied when exiting. When MR0[12] is set to 1, the DLL continues to run during precharge power-down mode to enable a faster exit of precharge power-down mode; however,  $t_{XP}$  must be satisfied when exiting (see Power-Down Mode (page 165)).

### CAS Latency (CL)

The CL is defined by MR0[6:4], as shown in Figure 52 (page 120). CAS latency is the delay, in clock cycles, between the internal READ command and the availability of the first bit of output data. The CL can be set to 5, 6, 7, 8, 9, or 10. DDR3 SDRAM do not support half-clock latencies.

Examples of CL = 6 and CL = 8 are shown below. If an internal READ command is registered at clock edge  $n$ , and the CAS latency is  $m$  clocks, the data will be available nominally coincident with clock edge  $n + m$ . Table 50 (page 71) through Table 52 (page 73) indicate the CLs supported at various operating frequencies.

**Figure 53: READ Latency**

- Notes: 1. For illustration purposes, only CL = 6 and CL = 8 are shown. Other CL values are possible.  
2. Shown with nominal  $t_{DQSCK}$  and nominal  $t_{DSDQ}$ .

## Mode Register 1 (MR1)

The mode register 1 (MR1) controls additional functions and features not available in the other mode registers: Q OFF (OUTPUT DISABLE), TDQS (for the x8 configuration only), DLL ENABLE/DLL DISABLE,  $R_{TT,nom}$  value (ODT), WRITE LEVELING, POSTED CAS ADDITIVE latency, and OUTPUT DRIVE STRENGTH. These functions are controlled via the bits shown in Figure 54 (page 123). The MR1 register is programmed via the MRS command and retains the stored information until it is reprogrammed, until RESET# goes LOW, or until the device loses power. Reprogramming the MR1 register will not alter the contents of the memory array, provided it is performed correctly.

The MR1 register must be loaded when all banks are idle and no bursts are in progress. The controller must satisfy the specified timing parameters  $t_{MRD}$  and  $t_{MOD}$  before initiating a subsequent operation.

**Figure 54: Mode Register 1 (MR1) Definition**

- Notes:
- MR1[16, 13, 10, 8] are reserved for future use and must be programmed to 0.
  - During write leveling, if MR1[7] and MR1[12] are 1, then all  $R_{TT,nom}$  values are available for use.
  - During write leveling, if MR1[7] is a 1, but MR1[12] is a 0, then only  $R_{TT,nom}$  write values are available for use.

### DLL Enable/DLL Disable

The DLL may be enabled or disabled by programming MR1[0] during the LOAD MODE command, as shown in Figure 54 (page 123). The DLL must be enabled for normal operation. DLL enable is required during power-up initialization and upon returning to normal operation after having disabled the DLL for the purpose of debugging or evaluation. Enabling the DLL should always be followed by resetting the DLL using the appropriate LOAD MODE command.

If the DLL is enabled prior to entering self refresh mode, the DLL is automatically disabled when entering SELF REFRESH operation and is automatically reenabled and reset upon exit of SELF REFRESH operation. If the DLL is disabled prior to entering self refresh mode, the DLL remains disabled even upon exit of SELF REFRESH operation until it is reenabled and reset.

The DRAM is not tested to check—nor does Micron warrant compliance with—normal mode timings or functionality when the DLL is disabled. An attempt has been made to have the DRAM operate in the normal mode where reasonably possible when the DLL has been disabled; however, by industry standard, a few known exceptions are defined:

- ODT is not allowed to be used
- The output data is no longer edge-aligned to the clock
- CL and CWL can only be six clocks

When the DLL is disabled, timing and functionality can vary from the normal operation specifications when the DLL is enabled (see DLL Disable Mode (page 105)). Disabling the DLL also implies the need to change the clock frequency (see Input Clock Frequency Change (page 109)).

## Output Drive Strength

The DDR3 SDRAM uses a programmable impedance output buffer. The drive strength mode register setting is defined by MR1[5, 1]. RZQ/7 (34Ω [NOM]) is the primary output driver impedance setting for DDR3 SDRAM devices. To calibrate the output driver impedance, an external precision resistor (RZQ) is connected between the ZQ ball and V<sub>SSQ</sub>. The value of the resistor must be 240Ω ±1%.

The output impedance is set during initialization. Additional impedance calibration updates do not affect device operation, and all data sheet timings and current specifications are met during an update.

To meet the 34Ω specification, the output drive strength must be set to 34Ω during initialization. To obtain a calibrated output driver impedance after power-up, the DDR3 SDRAM needs a calibration command that is part of the initialization and reset procedure.

## OUTPUT ENABLE/DISABLE

The OUTPUT ENABLE function is defined by MR1[12], as shown in Figure 54 (page 123). When enabled (MR1[12] = 0), all outputs (DQ, DQS, DQS#) function when in the normal mode of operation. When disabled (MR1[12] = 1), all DDR3 SDRAM outputs (DQ and DQS, DQS#) are tri-stated. The output disable feature is intended to be used during I<sub>DD</sub> characterization of the READ current and during <sup>t</sup>DQSS margining (write leveling) only.

## TDQS Enable

Termination data strobe (TDQS) is a feature of the x8 DDR3 SDRAM configuration that provides termination resistance (R<sub>TT</sub>) and may be useful in some system configurations. TDQS is not supported in x4 or x16 configurations. When enabled via the mode register (MR1[11]), the R<sub>TT</sub> that is applied to DQS and DQS# is also applied to TDQS and TDQS#. In contrast to the RDQS function of DDR2 SDRAM, DDR3's TDQS provides the termination resistance R<sub>TT</sub> only. The OUTPUT DATA STROBE function of RDQS is not provided by TDQS; thus, R<sub>ON</sub> does not apply to TDQS and TDQS#. The TDQS and DM

functions share the same ball. When the TDQS function is enabled via the mode register, the DM function is not supported. When the TDQS function is disabled, the DM function is provided, and the TDQS# ball is not used. The TDQS function is available in the x8 DDR3 SDRAM configuration only and must be disabled via the mode register for the x4 and x16 configurations.

## On-Die Termination

ODT resistance  $R_{TT,nom}$  is defined by MR1[9, 6, 2] (see Figure 54 (page 123)). The  $R_{TT}$  termination value applies to the DQ, DM, DQS, DQS#, and TDQS, TDQS# balls. DDR3 supports multiple  $R_{TT}$  termination values based on  $RZQ/n$  where  $n$  can be 2, 4, 6, 8, or 12 and  $RZQ$  is  $240\Omega$ .

Unlike DDR2, DDR3 ODT must be turned off prior to reading data out and must remain off during a READ burst.  $R_{TT,nom}$  termination is allowed any time after the DRAM is initialized, calibrated, and not performing read access, or when it is not in self refresh mode. Additionally, write accesses with dynamic ODT enabled ( $R_{TT(WR)}$ ) temporarily replaces  $R_{TT,nom}$  with  $R_{TT(WR)}$ .

The actual effective termination,  $R_{TT(EFF)}$ , may be different from the  $R_{TT}$  targeted due to nonlinearity of the termination. For  $R_{TT(EFF)}$  values and calculations (see On-Die Termination (ODT) (page 175)).

The ODT feature is designed to improve signal integrity of the memory channel by enabling the DDR3 SDRAM controller to independently turn on/off ODT for any or all devices. The ODT input control pin is used to determine when  $R_{TT}$  is turned on (ODTL on) and off (ODTL off), assuming ODT has been enabled via MR1[9, 6, 2].

Timings for ODT are detailed in On-Die Termination (ODT) (page 175).

## WRITE LEVELING

The WRITE LEVELING function is enabled by MR1[7], as shown in Figure 54 (page 123). Write leveling is used (during initialization) to deskew the DQS strobe to clock offset as a result of fly-by topology designs. For better signal integrity, DDR3 SDRAM memory modules adopted fly-by topology for the commands, addresses, control signals, and clocks.

The fly-by topology benefits from a reduced number of stubs and their lengths. However, fly-by topology induces flight time skews between the clock and DQS strobe (and DQ) at each DRAM on the DIMM. Controllers will have a difficult time maintaining  $t_{DQSS}$ ,  $t_{DSS}$ , and  $t_{DSH}$  specifications without supporting write leveling in systems which use fly-by topology-based modules. Write leveling timing and detailed operation information is provided in Write Leveling (page 111).

## POSTED CAS ADDITIVE Latency

POSTED CAS ADDITIVE latency (AL) is supported to make the command and data bus efficient for sustainable bandwidths in DDR3 SDRAM. MR1[4, 3] define the value of AL, as shown in Figure 55 (page 126). MR1[4, 3] enable the user to program the DDR3 SDRAM with  $AL = 0$ ,  $CL - 1$ , or  $CL - 2$ .

With this feature, the DDR3 SDRAM enables a READ or WRITE command to be issued after the ACTIVATE command for that bank prior to  $t_{RCD}(\text{MIN})$ . The only restriction is  $ACTIVATE$  to  $READ$  or  $WRITE + AL \geq t_{RCD}(\text{MIN})$  must be satisfied. Assuming  $t_{RCD}$

(MIN) = CL, a typical application using this feature sets  $AL = CL - 1 \cdot CK = t_{RCD} (MIN) - 1 \cdot CK$ . The READ or WRITE command is held for the time of the AL before it is released internally to the DDR3 SDRAM device. READ latency (RL) is controlled by the sum of the AL and CAS latency (CL),  $RL = AL + CL$ . WRITE latency (WL) is the sum of CAS WRITE latency and AL,  $WL = AL + CWL$  (see Mode Register 2 (MR2) (page 126)). Examples of READ and WRITE latencies are shown in Figure 55 (page 126) and Figure 57 (page 127).

**Figure 55: READ Latency (AL = 5, CL = 6)**

## Mode Register 2 (MR2)

The mode register 2 (MR2) controls additional functions and features not available in the other mode registers. These additional functions are CAS WRITE latency (CWL), AUTO SELF REFRESH (ASR), SELF REFRESH TEMPERATURE (SRT), and DYNAMIC ODT ( $R_{TT(WR)}$ ). These functions are controlled via the bits shown in Figure 56. The MR2 is programmed via the MRS command and will retain the stored information until it is programmed again or until the device loses power. Reprogramming the MR2 register will not alter the contents of the memory array, provided it is performed correctly. The MR2 register must be loaded when all banks are idle and no data bursts are in progress, and the controller must wait the specified time  $t_{MRD}$  and  $t_{MOD}$  before initiating a subsequent operation.

**Figure 56: Mode Register 2 (MR2) Definition**

Note: 1. MR2[16, 13:11, 8, and 2:0] are reserved for future use and must all be programmed to 0.

### CAS Write Latency (CWL)

CWL is defined by MR2[5:3] and is the delay, in clock cycles, from the releasing of the internal write to the latching of the first data in. CWL must be correctly set to the corresponding operating clock frequency (see Figure 56 (page 127)). The overall WRITE latency (WL) is equal to CWL + AL (Figure 54 (page 123)).

**Figure 57: CAS Write Latency**

### AUTO SELF REFRESH (ASR)

Mode register MR2[6] is used to disable/enable the ASR function. When ASR is disabled, the self refresh mode's refresh rate is assumed to be at the normal 85°C limit (some-

times referred to as 1X refresh rate). In the disabled mode, ASR requires the user to ensure the DRAM never exceeds a  $T_C$  of +85°C while in self refresh unless the user enables the SRT feature listed below when the  $T_C$  is between +85°C and +95°C.

Enabling ASR assumes the DRAM self refresh rate is changed automatically from 1X to 2X when the case temperature exceeds +85°C. This enables the user to operate the DRAM beyond the standard 85°C limit up to the optional extended temperature range of +95°C while in self refresh mode.

The standard self refresh current test specifies test conditions to normal case temperature (+85°C) only, meaning if ASR is enabled, the standard self refresh current specifications do not apply (see Extended Temperature Usage (page 164)).

## SELF REFRESH TEMPERATURE (SRT)

Mode register MR2[7] is used to disable/enable the SRT function. When SRT is disabled, the self refresh mode's refresh rate is assumed to be at the normal +85°C limit (sometimes referred to as 1X refresh rate). In the disabled mode, SRT requires the user to ensure the DRAM never exceeds a  $T_C$  of +85°C while in self refresh mode unless the user enables ASR.

When SRT is enabled, the DRAM self refresh is changed internally from 1X to 2X, regardless of the case temperature. This enables the user to operate the DRAM beyond the standard +85°C limit up to the optional extended temperature range of +95°C while in self refresh mode. The standard self refresh current test specifies test conditions to normal case temperature (+85°C) only, meaning if SRT is enabled, the standard self refresh current specifications do not apply (see Extended Temperature Usage (page 164)).

## SRT vs. ASR

If the normal case temperature limit of 85°C is not exceeded, then neither SRT nor ASR is required, and both can be disabled throughout operation. However, if the extended temperature option of +95°C is needed, the user is required to provide a 2X refresh rate during (manual) refresh and to enable either the SRT or the ASR to ensure self refresh is performed at the 2X rate.

SRT forces the DRAM to switch the internal self refresh rate from 1X to 2X. Self refresh is performed at the 2X refresh rate regardless of the case temperature.

ASR automatically switches the DRAM's internal self refresh rate from 1X to 2X. However, while in self refresh mode, ASR enables the refresh rate to automatically adjust between 1X to 2X over the supported temperature range. One other disadvantage with ASR is the DRAM cannot always switch from a 1X to a 2X refresh rate at an exact case temperature of +85°C. Although the DRAM will support data integrity when it switches from a 1X to a 2X refresh rate, it may switch at a lower temperature than +85°C.

Since only one mode is necessary, SRT and ASR cannot be enabled at the same time.

## DYNAMIC ODT

The dynamic ODT ( $R_{TT(WR)}$ ) feature is defined by MR2[10, 9]. Dynamic ODT is enabled when a value is selected. This new DDR3 SDRAM feature enables the ODT termination value to change without issuing an MRS command, essentially changing the ODT termination on-the-fly.

With dynamic ODT ( $R_{TT(WR)}$ ) enabled, the DRAM switches from normal ODT ( $R_{TT,nom}$ ) to dynamic ODT ( $R_{TT(WR)}$ ) when beginning a WRITE burst and subsequently switches back to ODT ( $R_{TT,nom}$ ) at the completion of the WRITE burst. If  $R_{TT,nom}$  is disabled, the  $R_{TT,nom}$  value will be High-Z. Special timing parameters must be adhered to when dynamic ODT ( $R_{TT(WR)}$ ) is enabled: ODTLcnw, ODTLcnw4, ODTLcnw8, ODTH4, ODTH8, and  $t_{ADC}$ .

Dynamic ODT is only applicable during WRITE cycles. If ODT ( $R_{TT,nom}$ ) is disabled, dynamic ODT ( $R_{TT(WR)}$ ) is still permitted.  $R_{TT,nom}$  and  $R_{TT(WR)}$  can be used independent of one other. Dynamic ODT is not available during write leveling mode, regardless of the state of ODT ( $R_{TT,nom}$ ). For details on dynamic ODT operation, refer to On-Die Termination (ODT) (page 175).

### Mode Register 3 (MR3)

The mode register 3 (MR3) controls additional functions and features not available in the other mode registers. Currently defined is the MULTIPURPOSE REGISTER (MPR). This function is controlled via the bits shown in Figure 58 (page 129). The MR3 is programmed via the LOAD MODE command and retains the stored information until it is programmed again or until the device loses power. Reprogramming the MR3 register will not alter the contents of the memory array, provided it is performed correctly. The MR3 register must be loaded when all banks are idle and no data bursts are in progress, and the controller must wait the specified time  $t_{MRD}$  and  $t_{MOD}$  before initiating a subsequent operation.

**Figure 58: Mode Register 3 (MR3) Definition**

- Notes:
- MR3[16 and 13:3] are reserved for future use and must all be programmed to 0.
  - When MPR control is set for normal DRAM operation, MR3[1, 0] will be ignored.
  - Intended to be used for READ synchronization.

### MULTIPURPOSE REGISTER (MPR)

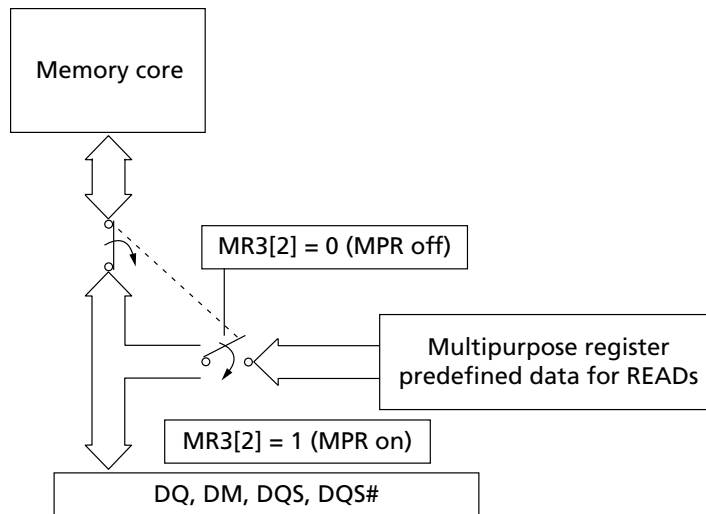

The MULTIPURPOSE REGISTER function is used to output a predefined system timing calibration bit sequence. Bit 2 is the master bit that enables or disables access to the MPR register, and bits 1 and 0 determine which mode the MPR is placed in. The basic concept of the multipurpose register is shown in Figure 59 (page 130).

If MR3[2] is a 0, then the MPR access is disabled, and the DRAM operates in normal mode. However, if MR3[2] is a 1, then the DRAM no longer outputs normal read data

but outputs MPR data as defined by MR3[0, 1]. If MR3[0, 1] is equal to 00, then a predefined read pattern for system calibration is selected.

To enable the MPR, the MRS command is issued to MR3, and MR3[2] = 1. Prior to issuing the MRS command, all banks must be in the idle state (all banks are precharged, and tRP is met). When the MPR is enabled, any subsequent READ or RDAP commands are redirected to the multipurpose register. The resulting operation when either a READ or a RDAP command is issued, is defined by MR3[1:0] when the MPR is enabled (see Table 71 (page 131)). When the MPR is enabled, only READ or RDAP commands are allowed until a subsequent MRS command is issued with the MPR disabled (MR3[2] = 0). Power-down mode, self refresh, and any other nonREAD/RDAP commands are not allowed during MPR enable mode. The RESET function is supported during MPR enable mode.

**Figure 59: Multipurpose Register (MPR) Block Diagram**

- Notes:
1. A predefined data pattern can be read out of the MPR with an external READ command.
  2. MR3[2] defines whether the data flow comes from the memory core or the MPR. When the data flow is defined, the MPR contents can be read out continuously with a regular READ or RDAP command.

**Table 70: MPR Functional Description of MR3 Bits**

MR3[2]	MR3[1:0]	Function
MPR	MPR READ Function	
0	"Don't Care"	Normal operation, no MPR transaction All subsequent READs come from the DRAM memory array All subsequent WRITES go to the DRAM memory array
1	A[1:0] (see Table 71 (page 131))	Enable MPR mode, subsequent READ/RDAP commands defined by bits 1 and 2

### MPR Functional Description

The MPR JEDEC definition enables either a prime DQ (DQ0 on a x4 and a x8; on a x16, DQ0 = lower byte and DQ8 = upper byte) to output the MPR data with the remaining

DQs driven LOW, or for all DQs to output the MPR data. The MPR readout supports fixed READ burst and READ burst chop (MRS and OTF via A12/BC#) with regular READ latencies and AC timings applicable, provided the DLL is locked as required.

MPR addressing for a valid MPR read is as follows:

- A[1:0] must be set to 00 as the burst order is fixed per nibble
- A2 selects the burst order:
  - BL8, A2 is set to 0, and the burst order is fixed to 0, 1, 2, 3, 4, 5, 6, 7
- For burst chop 4 cases, the burst order is switched on the nibble base along with the following:
  - A2 = 0; burst order = 0, 1, 2, 3
  - A2 = 1; burst order = 4, 5, 6, 7
- Burst order bit 0 (the first bit) is assigned to LSB, and burst order bit 7 (the last bit) is assigned to MSB
- A[9:3] are a “Don’t Care”
- A10 is a “Don’t Care”
- A11 is a “Don’t Care”
- A12: Selects burst chop mode on-the-fly, if enabled within MR0
- A13 is a “Don’t Care”
- BA[2:0] are a “Don’t Care”

## MPR Register Address Definitions and Bursting Order

The MPR currently supports a single data format. This data format is a predefined read pattern for system calibration. The predefined pattern is always a repeating 0–1 bit pattern.

Examples of the different types of predefined READ pattern bursts are shown in the following figures.

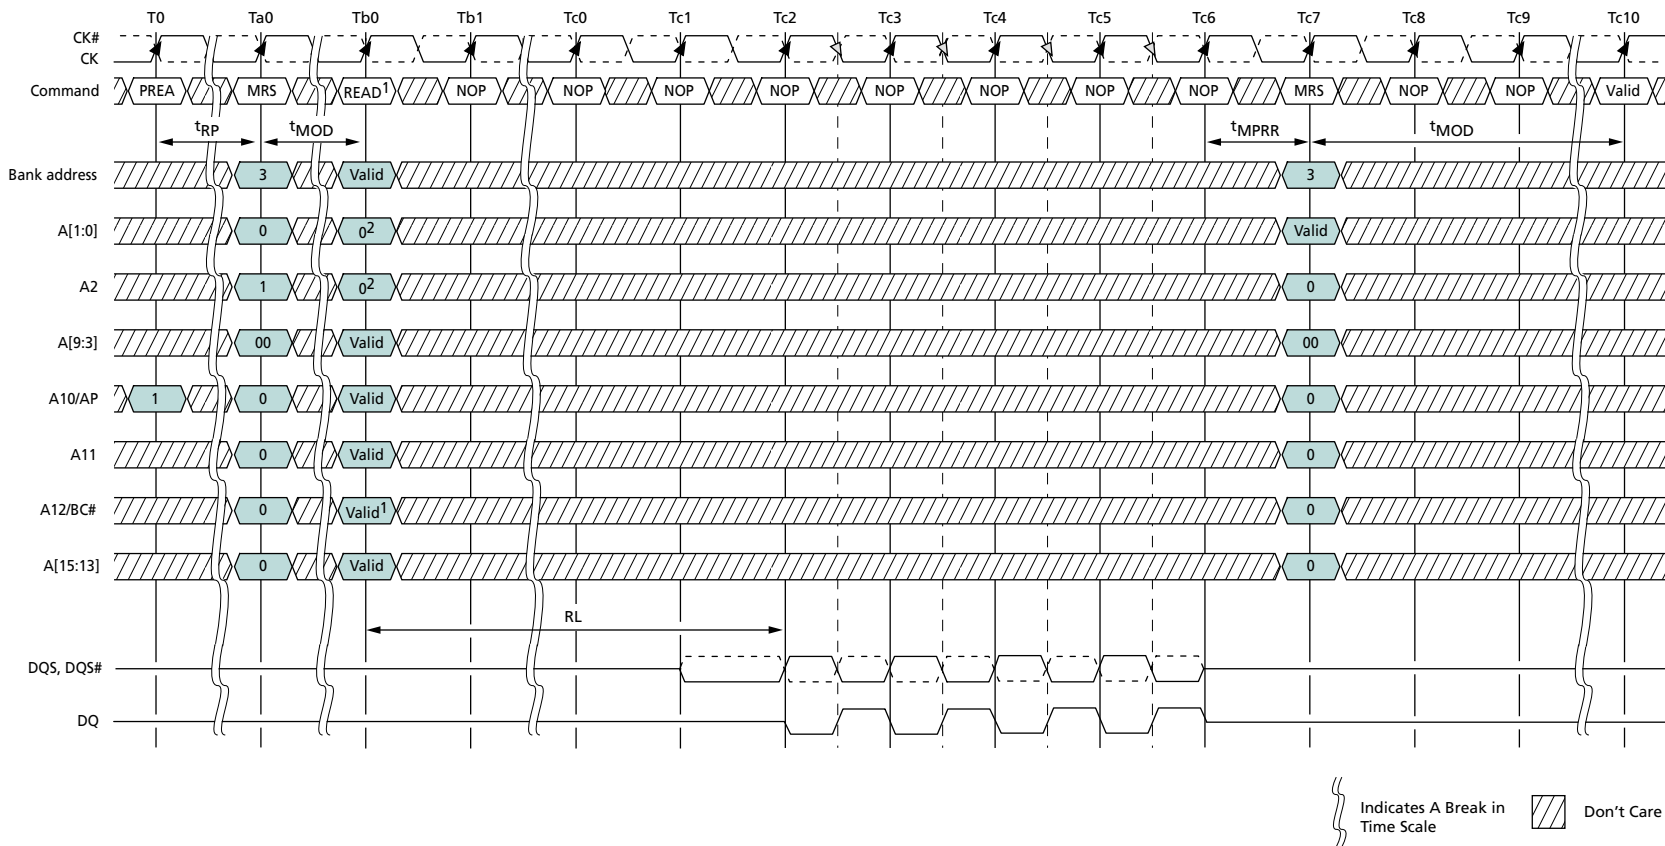

**Table 71: MPR Readouts and Burst Order Bit Mapping**

MR3[2]	MR3[1:0]	Function	Burst Length	Read A[2:0]	Burst Order and Data Pattern
1	00	READ predefined pattern for system calibration	BL8	000	Burst order: 0, 1, 2, 3, 4, 5, 6, 7 Predefined pattern: 0, 1, 0, 1, 0, 1, 0, 1
			BC4	000	Burst order: 0, 1, 2, 3 Predefined pattern: 0, 1, 0, 1
			BC4	100	Burst order: 4, 5, 6, 7 Predefined pattern: 0, 1, 0, 1
1	01	RFU	n/a	n/a	n/a
			n/a	n/a	n/a
			n/a	n/a	n/a
1	10	RFU	n/a	n/a	n/a
			n/a	n/a	n/a
			n/a	n/a	n/a

**Table 71: MPR Readouts and Burst Order Bit Mapping (Continued)**

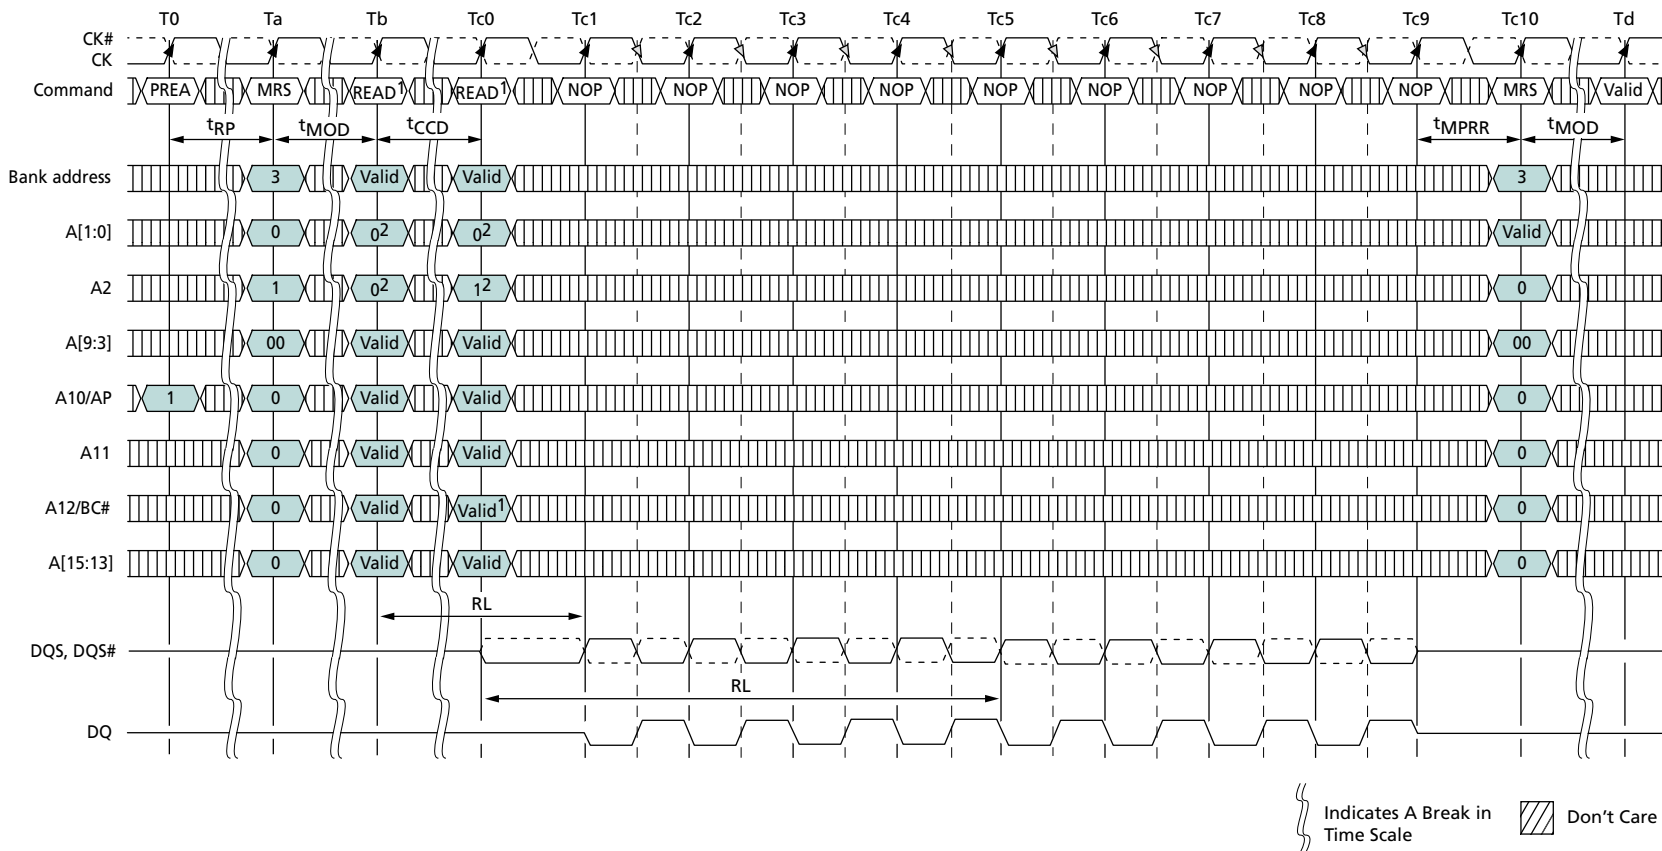

MR3[2]	MR3[1:0]	Function	Burst Length	Read A[2:0]	Burst Order and Data Pattern
1	11	RFU	n/a	n/a	n/a
			n/a	n/a	n/a
			n/a	n/a	n/a

Note: 1. Burst order bit 0 is assigned to LSB, and burst order bit 7 is assigned to MSB of the selected MPR agent.

**Figure 60: MPR System Read Calibration with BL8: Fixed Burst Order Single Readout**

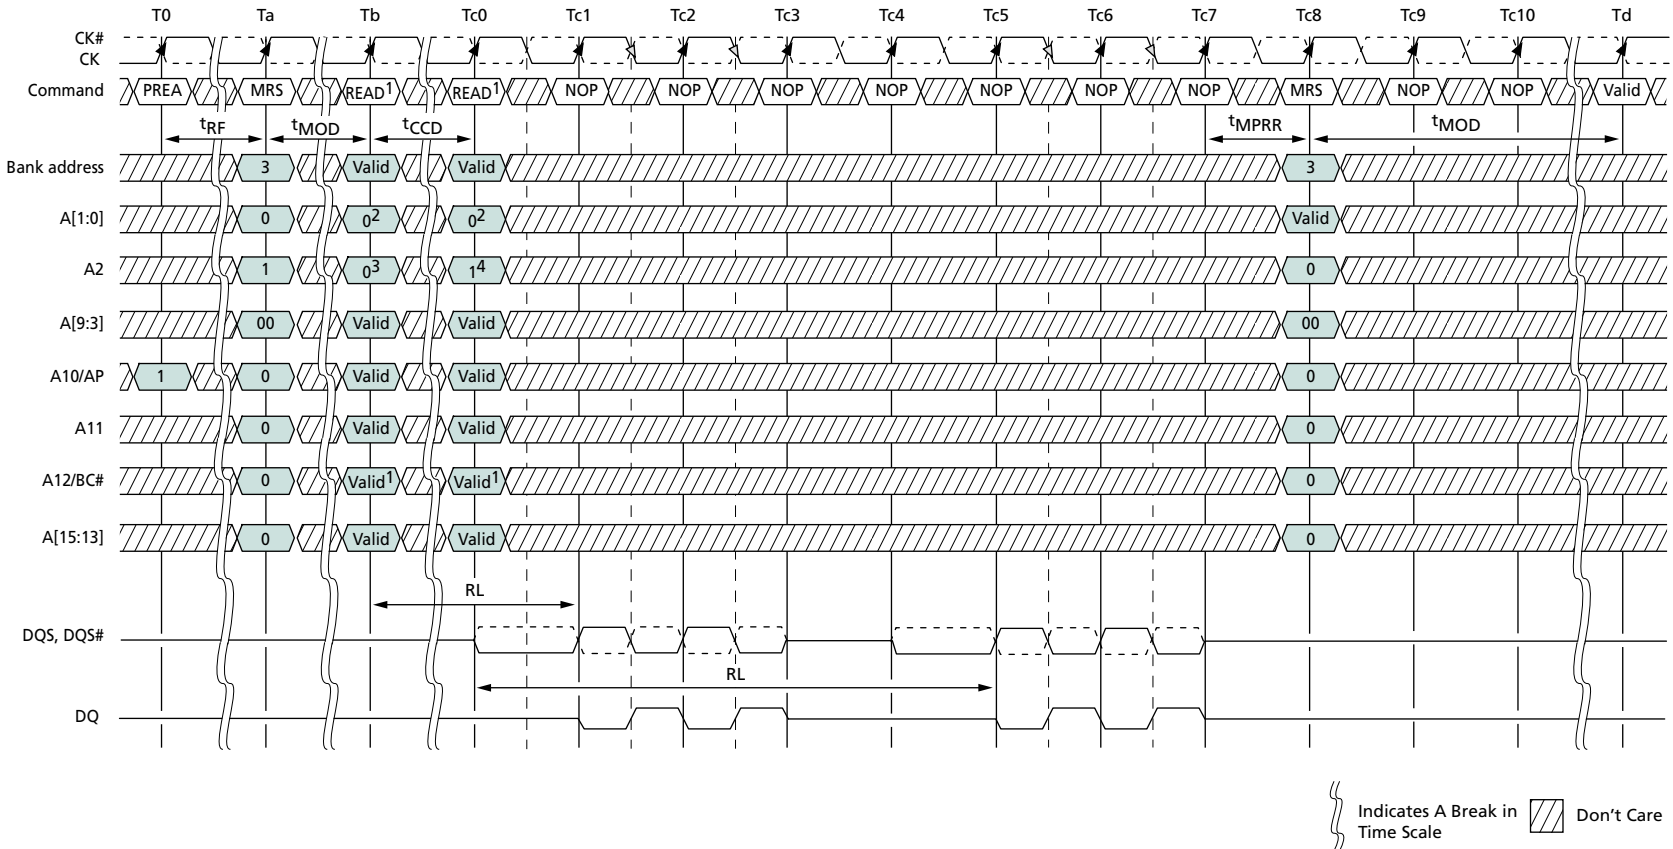

- Notes:
1. READ with BL8 either by MRS or OTF.
  2. Memory controller must drive 0 on A[2:0].

Indicates A Break in Time Scale  
 Don't Care

- Notes:
1. READ with BL8 either by MRS or OTF.
  2. Memory controller must drive 0 on A[2:0].

**Figure 62: MPR System Read Calibration with BC4: Lower Nibble, Then Upper Nibble**

- Notes:
1. READ with BC4 either by MRS or OTF.
  2. Memory controller must drive 0 on A[1:0].
  3. A2 = 0 selects lower 4 nibble bits 0 . . . 3.
  4. A2 = 1 selects upper 4 nibble bits 4 . . . 7.

**Figure 63: MPR System Read Calibration with BC4: Upper Nibble, Then Lower Nibble**

- Notes:
1. READ with BC4 either by MRS or OTF.
  2. Memory controller must drive 0 on A[1:0].
  3. A2 = 1 selects upper 4 nibble bits 4 . . . 7.
  4. A2 = 0 selects lower 4 nibble bits 0 . . . 3.

## MPR Read Predefined Pattern

The predetermined read calibration pattern is a fixed pattern of 0, 1, 0, 1, 0, 1, 0, 1. The following is an example of using the read out predetermined read calibration pattern. The example is to perform multiple reads from the multipurpose register to do system level read timing calibration based on the predetermined and standardized pattern.

The following protocol outlines the steps used to perform the read calibration:

1. Precharge all banks
2. After  $t_{RP}$  is satisfied, set MRS, MR3[2] = 1 and MR3[1:0] = 00. This redirects all subsequent reads and loads the predefined pattern into the MPR. As soon as  $t_{MRD}$  and  $t_{MOD}$  are satisfied, the MPR is available
3. Data WRITE operations are not allowed until the MPR returns to the normal DRAM state
4. Issue a read with burst order information (all other address pins are “Don’t Care”):
  - A[1:0] = 00 (data burst order is fixed starting at nibble)
  - A2 = 0 (for BL8, burst order is fixed as 0, 1, 2, 3, 4, 5, 6, 7)
  - A12 = 1 (use BL8)
5. After  $RL = AL + CL$ , the DRAM bursts out the predefined read calibration pattern (0, 1, 0, 1, 0, 1, 0, 1)
6. The memory controller repeats the calibration reads until read data capture at memory controller is optimized
7. After the last MPR READ burst and after  $t_{MPRR}$  has been satisfied, issue MRS, MR3[2] = 0, and MR3[1:0] = “Don’t Care” to the normal DRAM state. All subsequent read and write accesses will be regular reads and writes from/to the DRAM array
8. When  $t_{MRD}$  and  $t_{MOD}$  are satisfied from the last MRS, the regular DRAM commands (such as activate a memory bank for regular read or write access) are permitted

## MODE REGISTER SET (MRS) Command

The mode registers are loaded via inputs BA[2:0], A[13:0]. BA[2:0] determine which mode register is programmed:

- BA2 = 0, BA1 = 0, BA0 = 0 for MR0
- BA2 = 0, BA1 = 0, BA0 = 1 for MR1
- BA2 = 0, BA1 = 1, BA0 = 0 for MR2
- BA2 = 0, BA1 = 1, BA0 = 1 for MR3

The MRS command can only be issued (or reissued) when all banks are idle and in the precharged state ( $t_{RP}$  is satisfied and no data bursts are in progress). The controller must wait the specified time  $t_{MRD}$  before initiating a subsequent operation such as an ACTIVATE command (see Figure 50 (page 118)). There is also a restriction after issuing an MRS command with regard to when the updated functions become available. This parameter is specified by  $t_{MOD}$ . Both  $t_{MRD}$  and  $t_{MOD}$  parameters are shown in Figure 50 (page 118) and Figure 51 (page 119). Violating either of these requirements will result in unspecified operation.

## ZQ CALIBRATION Operation

The ZQ CALIBRATION command is used to calibrate the DRAM output drivers ( $R_{ON}$ ) and ODT values ( $R_{TT}$ ) over process, voltage, and temperature, provided a dedicated  $240\Omega$  ( $\pm 1\%$ ) external resistor is connected from the DRAM's ZQ ball to  $V_{SSQ}$ .

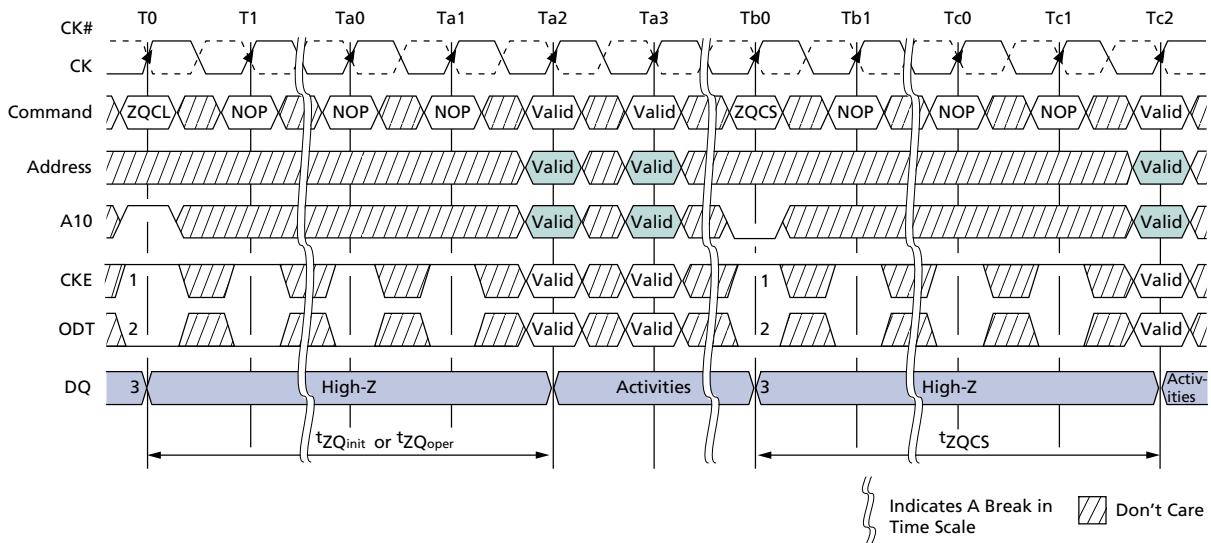

DDR3 SDRAM need a longer time to calibrate  $R_{ON}$  and ODT at power-up initialization and self refresh exit and a relatively shorter time to perform periodic calibrations. DDR3 SDRAM defines two ZQ CALIBRATION commands: ZQCL and ZQCS. An example of ZQ calibration timing is shown below.

All banks must be precharged and  $t_{RP}$  must be met before ZQCL or ZQCS commands can be issued to the DRAM. No other activities (other than another ZQCL or ZQCS command may be issued to another DRAM) can be performed on the DRAM channel by the controller for the duration of  $t_{ZQinit}$  or  $t_{ZQoper}$ . The quiet time on the DRAM channel helps accurately calibrate  $R_{ON}$  and ODT. After DRAM calibration is achieved, the DRAM should disable the ZQ ball's current consumption path to reduce power.

ZQ CALIBRATION commands can be issued in parallel to DLL RESET and locking time. Upon self refresh exit, an explicit ZQCL is required if ZQ calibration is desired.

In dual-rank systems that share the ZQ resistor between devices, the controller must not allow overlap of  $t_{ZQinit}$ ,  $t_{ZQoper}$ , or  $t_{ZQcs}$  between ranks.

**Figure 64: ZQ Calibration Timing (ZQCL and ZQCS)**

- Notes:
1. CKE must be continuously registered HIGH during the calibration procedure.
  2. ODT must be disabled via the ODT signal or the MRS during the calibration procedure.
  3. All devices connected to the DQ bus should be High-Z during calibration.

## ACTIVATE Operation

Before any READ or WRITE commands can be issued to a bank within the DRAM, a row in that bank must be opened (activated). This is accomplished via the ACTIVATE command, which selects both the bank and the row to be activated.

After a row is opened with an ACTIVATE command, a READ or WRITE command may be issued to that row, subject to the  $t_{RCD}$  specification. However, if the additive latency is programmed correctly, a READ or WRITE command may be issued prior to  $t_{RCD}$  (MIN). In this operation, the DRAM enables a READ or WRITE command to be issued after the ACTIVATE command for that bank, but prior to  $t_{RCD}$  (MIN) with the requirement that  $(\text{ACTIVATE-to-READ/WRITE}) + AL \geq t_{RCD}$  (MIN) (see POSTED CAS ADDITIVE Latency).  $t_{RCD}$  (MIN) should be divided by the clock period and rounded up to the next whole number to determine the earliest clock edge after the ACTIVATE command on which a READ or WRITE command can be entered. The same procedure is used to convert other specification limits from time units to clock cycles.

When at least one bank is open, any READ-to-READ command delay or WRITE-to-WRITE command delay is restricted to  $t_{CCD}$  (MIN).

A subsequent ACTIVATE command to a different row in the same bank can only be issued after the previous active row has been closed (precharged). The minimum time interval between successive ACTIVATE commands to the same bank is defined by  $t_{RC}$ .

A subsequent ACTIVATE command to another bank can be issued while the first bank is being accessed, which results in a reduction of total row-access overhead. The minimum time interval between successive ACTIVATE commands to different banks is defined by  $t_{RRD}$ . No more than four bank ACTIVATE commands may be issued in a given  $t_{FAW}$  (MIN) period, and the  $t_{RRD}$  (MIN) restriction still applies. The  $t_{FAW}$  (MIN) parameter applies, regardless of the number of banks already opened or closed.

**Figure 65: Example: Meeting  $t_{RRD}$  (MIN) and  $t_{RCD}$  (MIN)**

**Figure 66: Example:  $t_{FAW}$**

## READ Operation

READ bursts are initiated with a READ command. The starting column and bank addresses are provided with the READ command and auto precharge is either enabled or disabled for that burst access. If auto precharge is enabled, the row being accessed is automatically precharged at the completion of the burst. If auto precharge is disabled, the row will be left open after the completion of the burst.

During READ bursts, the valid data-out element from the starting column address is available READ latency (RL) clocks later. RL is defined as the sum of POSTED CAS ADDITIVE latency (AL) and CAS latency (CL) ( $RL = AL + CL$ ). The value of AL and CL is programmable in the mode register via the MRS command. Each subsequent data-out element will be valid nominally at the next positive or negative clock edge (that is, at the next crossing of CK and CK#). Figure 67 shows an example of RL based on a CL setting of 8 and an AL setting of 0.

**Figure 67: READ Latency**

- Notes:
1. DO  $n$  = data-out from column  $n$ .
  2. Subsequent elements of data-out appear in the programmed order following DO  $n$ .

DQS, DQS# is driven by the DRAM along with the output data. The initial low state on DQS and HIGH state on DQS# is known as the READ preamble ( $t_{RPRE}$ ). The low state on DQS and the HIGH state on DQS#, coincident with the last data-out element, is known as the READ postamble ( $t_{RPST}$ ). Upon completion of a burst, assuming no other commands have been initiated, the DQ will go High-Z. A detailed explanation of  $t_{DQSQ}$  (valid data-out skew),  $t_{QH}$  (data-out window hold), and the valid data window are depicted in Figure 78 (page 149). A detailed explanation of  $t_{DQSCK}$  (DQS transition skew to CK) is also depicted in Figure 78 (page 149).

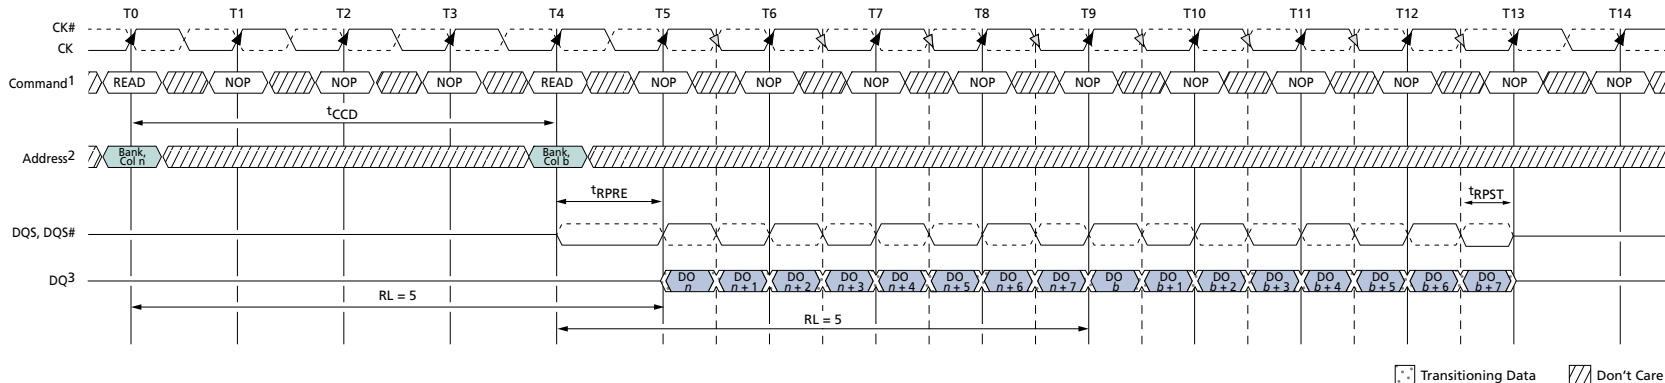

Data from any READ burst may be concatenated with data from a subsequent READ command to provide a continuous flow of data. The first data element from the new burst follows the last element of a completed burst. The new READ command should be issued  $t_{CCD}$  cycles after the first READ command. This is shown for BL8 in Figure 68 (page 143). If BC4 is enabled,  $t_{CCD}$  must still be met which will cause a gap in the data output, as shown in Figure 69 (page 143). Nonconsecutive read data is reflected in Fig-

ure 70 (page 144). DDR3 SDRAM does not allow interrupting or truncating any READ burst.

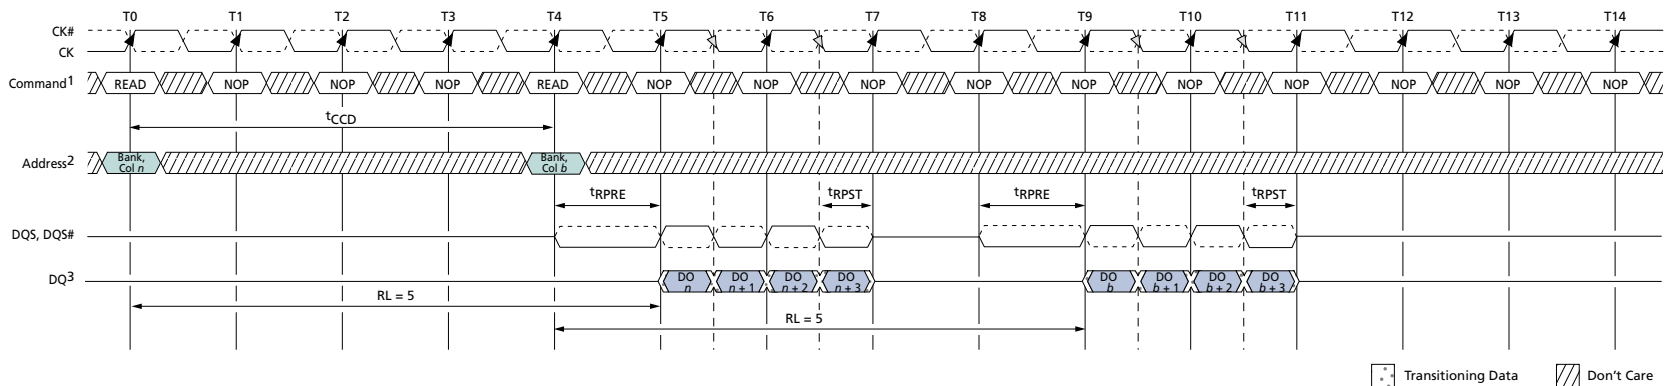

Data from any READ burst must be completed before a subsequent WRITE burst is allowed. An example of a READ burst followed by a WRITE burst for BL8 is shown in Figure 71 (page 144) (BC4 is shown in Figure 72 (page 145)). To ensure the read data is completed before the write data is on the bus, the minimum READ-to-WRITE timing is  $RL + t_{CCD} - WL + 2t_{CK}$ .

A READ burst may be followed by a PRECHARGE command to the same bank provided auto precharge is not activated. The minimum READ-to-PRECHARGE command spacing to the same bank is four clocks and must also satisfy a minimum analog time from the READ command. This time is called  $t_{RTP}$  (READ-to-PRECHARGE).  $t_{RTP}$  starts AL cycles later than the READ command. Examples for BL8 are shown in Figure 73 (page 145) and BC4 in Figure 74 (page 146). Following the PRECHARGE command, a subsequent command to the same bank cannot be issued until  $t_{RP}$  is met. The PRECHARGE command followed by another PRECHARGE command to the same bank is allowed. However, the precharge period will be determined by the last PRECHARGE command issued to the bank.

If A10 is HIGH when a READ command is issued, the READ with auto precharge function is engaged. The DRAM starts an auto precharge operation on the rising edge, which is  $AL + t_{RTP}$  cycles after the READ command. DRAM support a  $t_{RAS}$  lockout feature (see Figure 76 (page 146)). If  $t_{RAS} (MIN)$  is not satisfied at the edge, the starting point of the auto precharge operation will be delayed until  $t_{RAS} (MIN)$  is satisfied. If  $t_{RTP} (MIN)$  is not satisfied at the edge, the starting point of the auto precharge operation will be delayed until  $t_{RTP} (MIN)$  is satisfied. In case the internal precharge is pushed out by  $t_{RTP}$ ,  $t_{RP}$  starts at the point at which the internal precharge happens (not at the next rising clock edge after this event). The time from READ with auto precharge to the next ACTIVATE command to the same bank is  $AL + (t_{RTP} + t_{RP})^*$ , where \* means rounded up to the next integer. In any event, internal precharge does not start earlier than four clocks after the last  $8n$ -bit prefetch.

**Figure 68: Consecutive READ Bursts (BL8)**

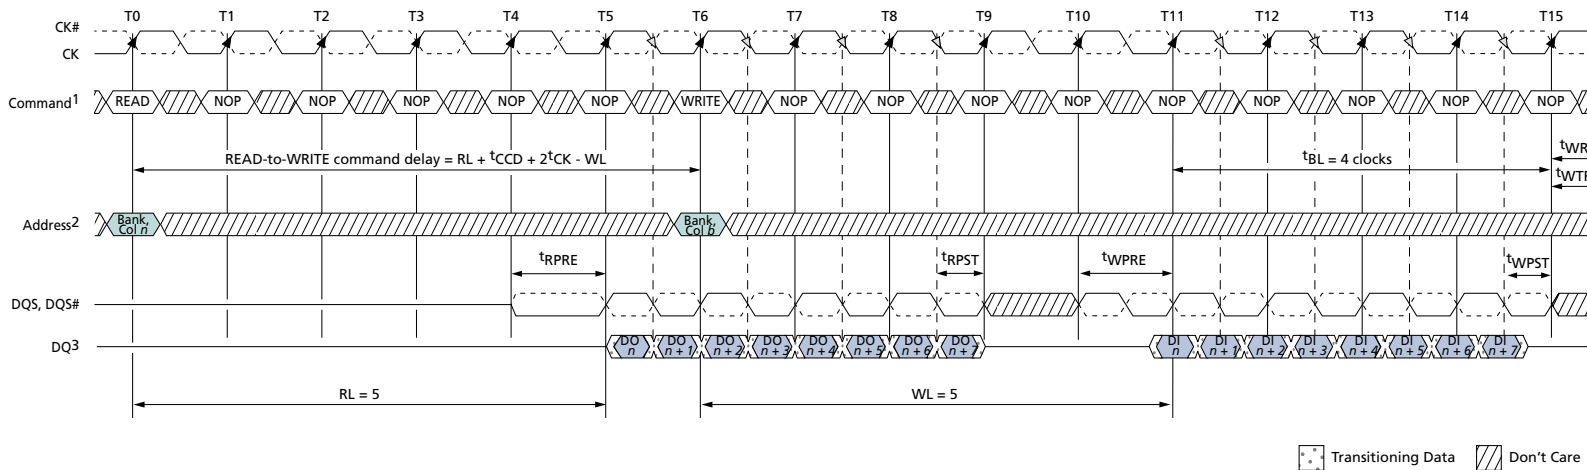

- Notes:
1. NOP commands are shown for ease of illustration; other commands may be valid at these times.
  2. The BL8 setting is activated by either MR0[1:0] = 00 or MR0[1:0] = 01 and A12 = 1 during READ command at T0 and T4.
  3. DO *n* (or *b*) = data-out from column *n* (or column *b*).
  4. BL8, RL = 5 (CL = 5, AL = 0).

**Figure 69: Consecutive READ Bursts (BC4)**

- Notes:
1. NOP commands are shown for ease of illustration; other commands may be valid at these times.
  2. The BC4 setting is activated by either MR0[1:0] = 10 or MR0[1:0] = 01 and A12 = 0 during READ command at T0 and T4.
  3. DO *n* (or *b*) = data-out from column *n* (or column *b*).
  4. BC4, RL = 5 (CL = 5, AL = 0).

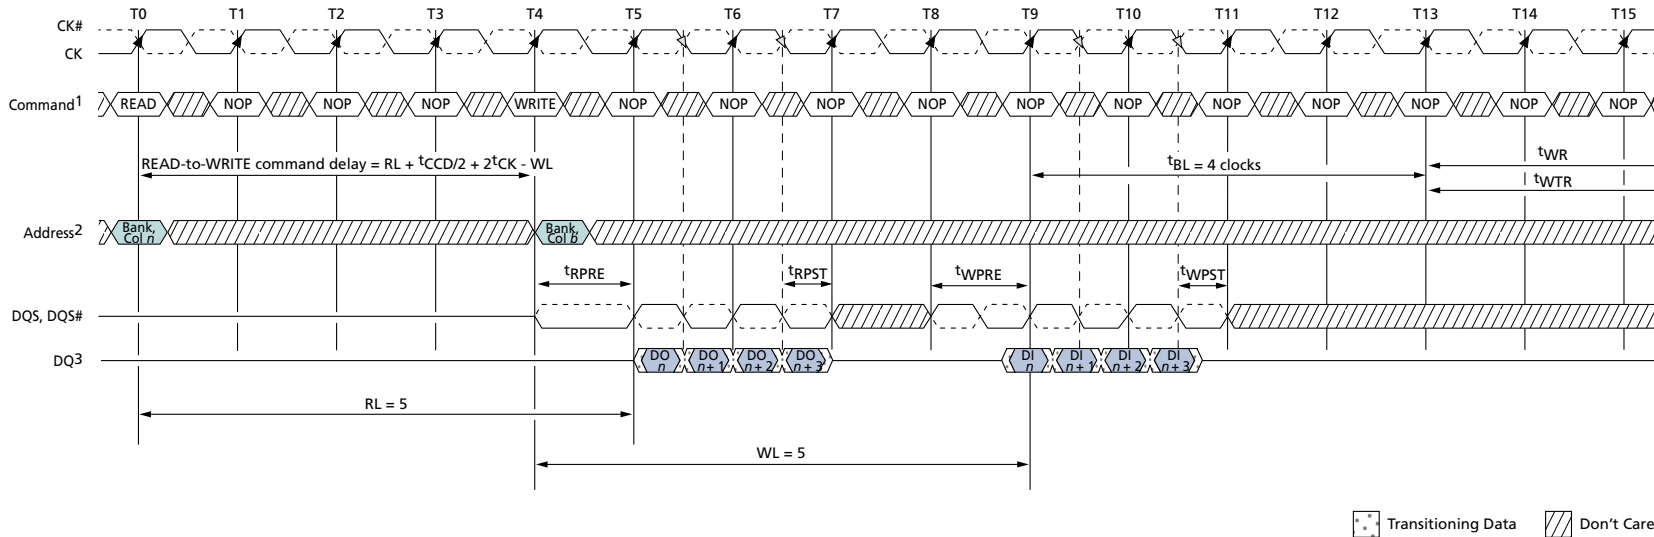

**Figure 70: Nonconsecutive READ Bursts**

- Notes:
1. AL = 0, RL = 8.
  2. DO *n* (or *b*) = data-out from column *n* (or column *b*).
  3. Seven subsequent elements of data-out appear in the programmed order following DO *n*.
  4. Seven subsequent elements of data-out appear in the programmed order following DO *b*.

**Figure 71: READ (BL8) to WRITE (BL8)**

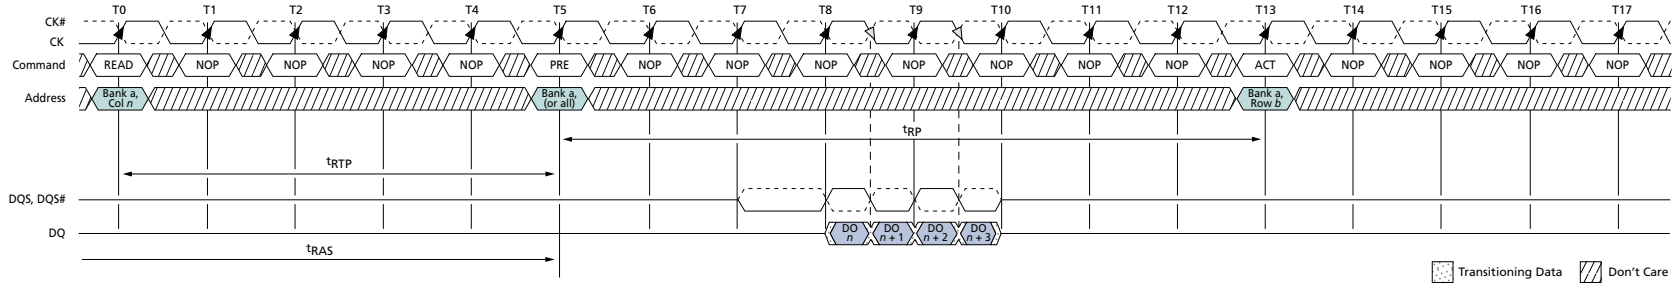

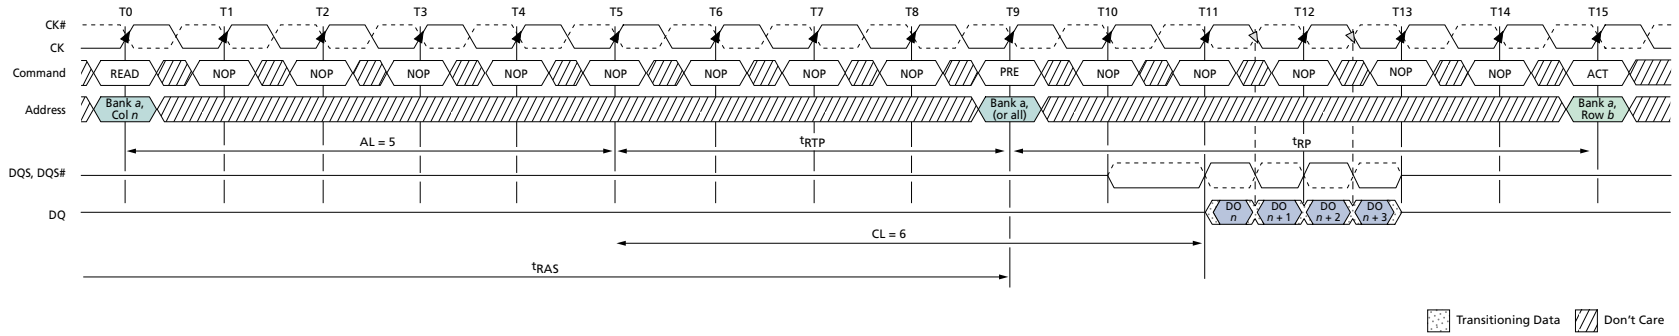

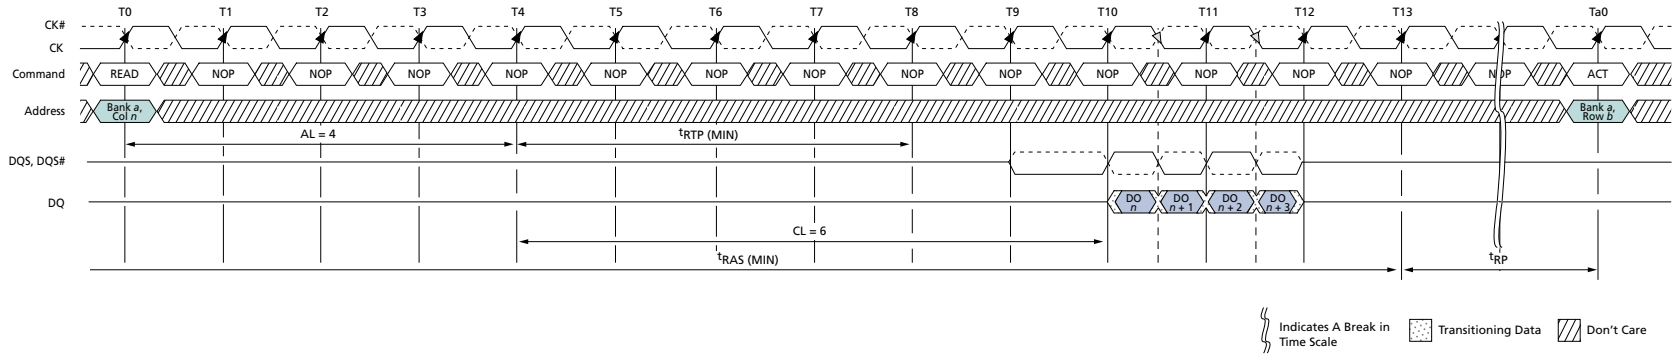

- Notes:
1. NOP commands are shown for ease of illustration; other commands may be valid at these times.
  2. The BL8 setting is activated by either MR0[1:0] = 00 or MR0[1:0] = 01 and A12 = 1 during the READ command at T0, and the WRITE command at T6.
  3. DO *n* = data-out from column, DI *b* = data-in for column *b*.
  4. BL8, RL = 5 (AL = 0, CL = 5), WL = 5 (AL = 0, CWL = 5).

**Figure 72: READ (BC4) to WRITE (BC4) OTF**

- Notes:
1. NOP commands are shown for ease of illustration; other commands may be valid at these times.
  2. The BC4 OTF setting is activated by M0[1:0] and A12 = 0 during READ command at T0 and WRITE command at T4.
  3. DO *n* = data-out from column *n*; DI *n* = data-in from column *b*.
  4. BC4, RL = 5 (AL = 0, CL = 5), WL = 5 (AL = 0, CWL = 5).

**Figure 73: READ to PRECHARGE (BL8)**

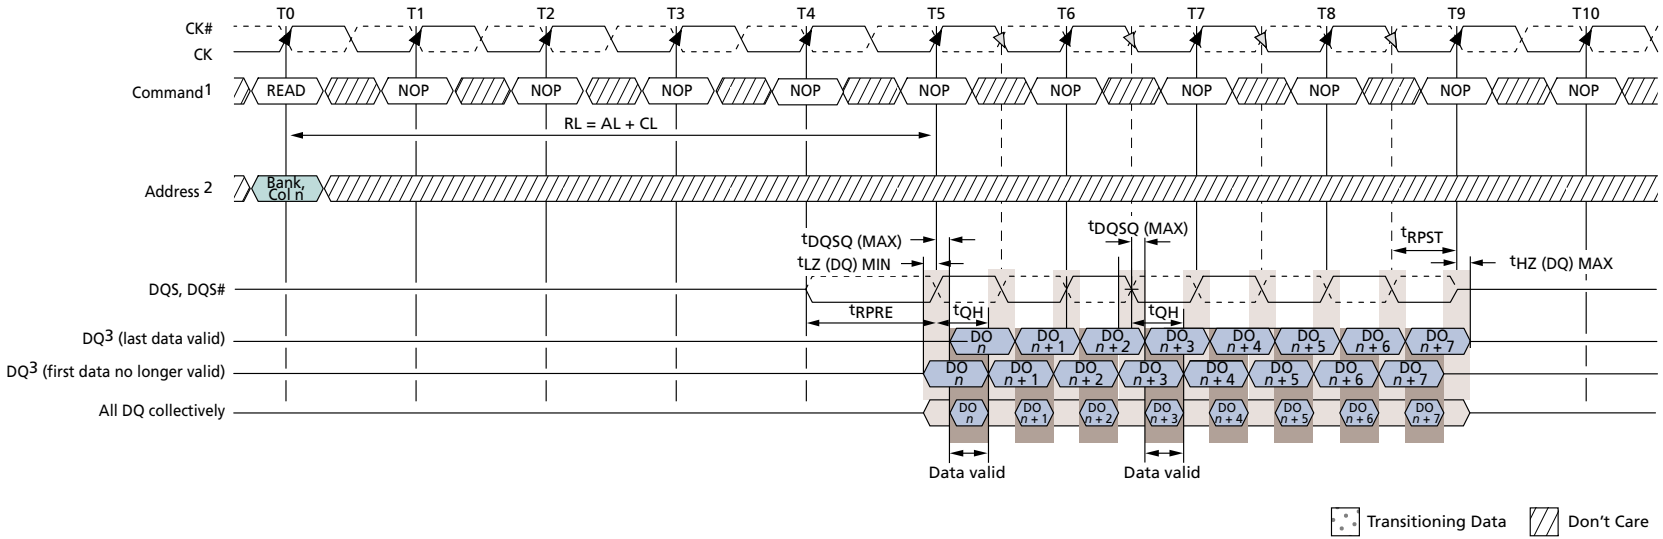

**Figure 74: READ to PRECHARGE (BC4)**

**Figure 75: READ to PRECHARGE (AL = 5, CL = 6)**

**Figure 76: READ with Auto Precharge (AL = 4, CL = 6)**

DQS to DQ output timing is shown in Figure 77 (page 148). The DQ transitions between valid data outputs must be within  $t_{DQSQ}$  of the crossing point of DQS, DQS#. DQS must also maintain a minimum HIGH and LOW time of  $t_{QSH}$  and  $t_{QSL}$ . Prior to the READ preamble, the DQ balls either will be floating or terminated depending on the status of the ODT signal.

Figure 78 (page 149) shows the strobe-to-clock timing during a READ. The crossing point DQS, DQS# must transition within  $\pm t_{DQSCK}$  of the clock crossing point. The data out has no timing relationship to clock, only to DQS, as shown in Figure 78 (page 149).

Figure 78 (page 149) also shows the READ preamble and postamble. Typically, both DQS and DQS# are High-Z to save power ( $V_{DDQ}$ ). Prior to data output from the DRAM, DQS is driven LOW and DQS# is HIGH for  $t_{RPRE}$ . This is known as the READ preamble.

The READ postamble,  $t_{RPST}$ , is one half clock from the last DQS, DQS# transition. During the READ postamble, DQS is driven LOW and DQS# is HIGH. When complete, the DQ will either be disabled or will continue terminating depending on the state of the ODT signal. Figure 83 (page 153) demonstrates how to measure  $t_{RPST}$ .

**Figure 77: Data Output Timing –  $t^{\text{DQSQ}}$  and Data Valid Window**

- Notes:
1. NOP commands are shown for ease of illustration; other commands may be valid at these times.
  2. The BL8 setting is activated by either MR0[1, 0] = 0, 0 or MR0[0, 1] = 0, 1 and A12 = 1 during READ command at T0.
  3. DO  $n$  = data-out from column  $n$ .
  4. BL8, RL = 5 (AL = 0, CL = 5).
  5. Output timings are referenced to  $V_{\text{DDQ}}/2$  and DLL on and locked.
  6.  $t^{\text{DQSQ}}$  defines the skew between DQS, DQS# to data and does not define DQS, DQS# to clock.
  7. Early data transitions may not always happen at the same DQ. Data transitions of a DQ can vary (either early or late) within a burst.

$t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time as valid data transitions. These parameters are referenced to a specific voltage level which specifies when the device output is no longer driving  $t_{HZ}$  (DQS) and  $t_{HZ}$  (DQ) or begins driving  $t_{LZ}$  (DQS),  $t_{LZ}$  (DQ). Figure 79 (page 150) shows a method to calculate the point when the device is no longer driving  $t_{HZ}$  (DQS) and  $t_{HZ}$  (DQ) or begins driving  $t_{LZ}$  (DQS),  $t_{LZ}$  (DQ) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the calculation is consistent. The parameters  $t_{LZ}$  (DQS),  $t_{LZ}$  (DQ),  $t_{HZ}$  (DQS), and  $t_{HZ}$  (DQ) are defined as single-ended.

**Figure 78: Data Strobe Timing – READs**

Figure 79: Method for Calculating  $t_{LZ}$  and  $t_{HZ}$

- Notes:
1. Within a burst, the rising strobe edge is not necessarily fixed at  $t_{DQSK} (MIN)$  or  $t_{DQSK} (MAX)$ . Instead, the rising strobe edge can vary between  $t_{DQSK} (MIN)$  and  $t_{DQSK} (MAX)$ .
  2. The DQS high pulse width is defined by  $t_{QSH}$ , and the DQS low pulse width is defined by  $t_{QSL}$ . Likewise,  $t_{LZ} (DQS) MIN$  and  $t_{HZ} (DQS) MIN$  are not tied to  $t_{DQSK} (MIN)$  (early strobe case) and  $t_{LZ} (DQS) MAX$  and  $t_{HZ} (DQS) MAX$  are not tied to  $t_{DQSK} (MAX)$  (late strobe case); however, they tend to track one another.
  3. The minimum pulse width of the READ preamble is defined by  $t_{RPRE} (MIN)$ . The minimum pulse width of the READ postamble is defined by  $t_{RPST} (MIN)$ .

Figure 80:  $t_{RPRE}$  Timing

Figure 81:  $t_{RPST}$  Timing

## WRITE Operation

WRITE bursts are initiated with a WRITE command. The starting column and bank addresses are provided with the WRITE command, and auto precharge is either enabled or disabled for that access. If auto precharge is selected, the row being accessed will be precharged at the end of the WRITE burst. If auto precharge is not selected, the row will remain open for subsequent accesses. After a WRITE command has been issued, the WRITE burst may not be interrupted. For the generic WRITE commands used in Figure 84 (page 154) through Figure 92 (page 159), auto precharge is disabled.

During WRITE bursts, the first valid data-in element is registered on a rising edge of DQS following the WRITE latency (WL) clocks later and subsequent data elements will be registered on successive edges of DQS. WRITE latency (WL) is defined as the sum of POSTED CAS ADDITIVE latency (AL) and CAS WRITE latency (CWL):  $WL = AL + CWL$ . The values of AL and CWL are programmed in the MR0 and MR2 registers, respectively. Prior to the first valid DQS edge, a full cycle is needed (including a dummy crossover of DQS, DQS#) and specified as the WRITE preamble shown in Figure 84 (page 154). The half cycle on DQS following the last data-in element is known as the WRITE postamble.

The time between the WRITE command and the first valid edge of DQS is WL clocks  $\pm$  <sup>t</sup>DQSS. Figure 85 (page 155) through Figure 92 (page 159) show the nominal case where <sup>t</sup>DQSS = 0ns; however, Figure 84 (page 154) includes <sup>t</sup>DQSS (MIN) and <sup>t</sup>DQSS (MAX) cases.

Data may be masked from completing a WRITE using data mask. The mask occurs on the DM ball aligned to the write data. If DM is LOW, the write completes normally. If DM is HIGH, that bit of data is masked.

Upon completion of a burst, assuming no other commands have been initiated, the DQ will remain High-Z, and any additional input data will be ignored.

Data for any WRITE burst may be concatenated with a subsequent WRITE command to provide a continuous flow of input data. The new WRITE command can be <sup>t</sup>CCD clocks following the previous WRITE command. The first data element from the new burst is applied after the last element of a completed burst. Figure 85 (page 155) and Figure 86 (page 155) on Figure 86 (page 155) show concatenated bursts. An example of nonconsecutive WRITES is shown in Figure 87 (page 156).

Data for any WRITE burst may be followed by a subsequent READ command after <sup>t</sup>WTR has been met (see Figure 88 (page 156) and Figure 89 (page 157) on Figure 89 (page 157) and Figure 90 (page 158)).

Data for any WRITE burst may be followed by a subsequent PRECHARGE command providing <sup>t</sup>WR has been met, as shown in Figure 91 (page 159) and Figure 92 (page 159).

Both <sup>t</sup>WTR and <sup>t</sup>WR starting time may vary depending on the mode register settings (fixed BC4, BL8 versus OTF).

**Figure 82:  $t_{WPRE}$  Timing**

- Notes:
1. NOP commands are shown for ease of illustration; other commands may be valid at these times.
  2.  $t_{WTR}^2$  controls the WRITE-to-READ delay to the same device and starts after  $t_{BL}$ .
  3. The BC4 OTF setting is activated by  $MRO[1:0] = 01$  and  $A12 = 0$  during the WRITE command at  $T_0$  and the READ command at  $T_n$ .
  4.  $DI_n$  = data-in for column  $n$ .
  5. BC4,  $RL = 5$  ( $AL = 0, CL = 5$ ),  $WL = 5$  ( $AL = 0, CWL = 5$ ).

**Figure 91: WRITE (BL8) to PRECHARGE**

- Notes:
1. DI  $n$  = data-in from column  $n$ .
  2. Seven subsequent elements of data-in are applied in the programmed order following DO  $n$ .
  3. Shown for WL = 7 (AL = 0, CWL = 7).

**Figure 92: WRITE (BC4 Mode Register Setting) to PRECHARGE**

- Notes:
1. NOP commands are shown for ease of illustration; other commands may be valid at these times.
  2. The write recovery time ( $t_{WR}$ ) is referenced from the first rising clock edge after the last write data is shown at T7.  $t_{WR}$  specifies the last burst WRITE cycle until the PRECHARGE command can be issued to the same bank.
  3. The fixed BC4 setting is activated by MR0[1:0] = 10 during the WRITE command at T0.
  4. DI  $n$  = data-in for column  $n$ .
  5. BC4 (fixed), WL = 5, RL = 5.

**Figure 93: WRITE (BC4 OTF) to PRECHARGE**

- Notes:
1. NOP commands are shown for ease of illustration; other commands may be valid at these times.
  2. The write recovery time ( $t_{WR}$ ) is referenced from the rising clock edge at T9.  $t_{WR}$  specifies the last burst WRITE cycle until the PRECHARGE command can be issued to the same bank.
  3. The BC4 setting is activated by MR0[1:0] = 01 and A12 = 0 during the WRITE command at T0.
  4. DI  $n$  = data-in for column  $n$ .
  5. BC4 (OTF), WL = 5, RL = 5.

## DQ Input Timing

Figure 84 (page 154) shows the strobe to clock timing during a WRITE. DQS, DQS# must transition within  $0.25t_{CK}$  of the clock transitions as limited by  $t_{DQSS}$ . All data and data mask setup and hold timings are measured relative to the DQS, DQS# crossing, not the clock crossing.

The WRITE preamble and postamble are also shown here. One clock prior to data input to the DRAM, DQS must be HIGH and DQS# must be LOW. Then for a half clock, DQS is driven LOW (DQS# is driven HIGH) during the WRITE preamble,  $t_{WPRE}$ . Likewise, DQS must be kept LOW by the controller after the last data is written to the DRAM during the WRITE postamble,  $t_{WPST}$ .

Data setup and hold times are shown. All setup and hold times are measured from the crossing points of DQS and DQS#. These setup and hold values pertain to data input and data mask input.

Additionally, the half period of the data input strobe is specified by  $t_{DQSH}$  and  $t_{DQSL}$ .

**Figure 94: Data Input Timing**

## PRECHARGE Operation

Input A10 determines whether one bank or all banks are to be precharged, and in the case where only one bank is to be precharged, inputs BA[2:0] select the bank.

When all banks are to be precharged, inputs BA[2:0] are treated as “Don’t Care.” After a bank is precharged, it is in the idle state and must be activated prior to any READ or WRITE commands being issued.

## SELF REFRESH Operation

The SELF REFRESH operation is initiated like a REFRESH command except CKE is LOW. The DLL is automatically disabled upon entering SELF REFRESH and is automatically enabled and reset upon exiting SELF REFRESH.

All power supply inputs (including  $V_{\text{REFCA}}$  and  $V_{\text{REFDQ}}$ ) must be maintained at valid levels upon entry/exit and during self refresh mode operation.  $V_{\text{REFDQ}}$  may float or not drive  $V_{\text{DDQ}}/2$  while in the self refresh mode under certain conditions:

- $V_{\text{SS}} < V_{\text{REFDQ}} < V_{\text{DD}}$  is maintained
- $V_{\text{REFDQ}}$  is valid and stable prior to CKE going back HIGH
- The first WRITE operation may not occur earlier than 512 clocks after  $V_{\text{REFDQ}}$  is valid
- All other self refresh mode exit timing requirements are met

The DRAM must be idle with all banks in the precharge state ( $t_{\text{RP}}$  is satisfied and no bursts are in progress) before a self refresh entry command can be issued. ODT must also be turned off before self refresh entry by registering the ODT ball LOW prior to the self refresh entry command (see On-Die Termination (ODT) (page 175) for timing requirements). If  $R_{\text{TT,nom}}$  and  $R_{\text{TT(WR)}}$  are disabled in the mode registers, ODT can be a “Don’t Care.” After the self refresh entry command is registered, CKE must be held LOW to keep the DRAM in self refresh mode.

After the DRAM has entered self refresh mode, all external control signals, except CKE and RESET#, become “Don’t Care.” The DRAM initiates a minimum of one REFRESH command internally within the  $t_{\text{CKE}}$  period when it enters self refresh mode.

The requirements for entering and exiting self refresh mode depend on the state of the clock during self refresh mode. First and foremost, the clock must be stable (meeting  $t_{\text{CK}}$  specifications) when self refresh mode is entered. If the clock remains stable and the frequency is not altered while in self refresh mode, then the DRAM is allowed to exit self refresh mode after  $t_{\text{CKESR}}$  is satisfied (CKE is allowed to transition HIGH  $t_{\text{CKESR}}$  later than when CKE was registered LOW). Since the clock remains stable in self refresh mode (no frequency change),  $t_{\text{CKSRE}}$  and  $t_{\text{CKSRX}}$  are not required. However, if the clock is altered during self refresh mode (turned-off or frequency change), then  $t_{\text{CKSRE}}$  and  $t_{\text{CKSRX}}$  must be satisfied. When entering self refresh mode,  $t_{\text{CKSRE}}$  must be satisfied prior to altering the clock's frequency. Prior to exiting self refresh mode,  $t_{\text{CKSRX}}$  must be satisfied prior to registering CKE HIGH.

When CKE is HIGH during self refresh exit, NOP or DES must be issued for  $t_{\text{XS}}$  time.  $t_{\text{XS}}$  is required for the completion of any internal refresh that is already in progress and must be satisfied before a valid command not requiring a locked DLL can be issued to the device.  $t_{\text{XS}}$  is also the earliest time self refresh reentry may occur. Before a command requiring a locked DLL can be applied, a ZQCL command must be issued,  $t_{\text{ZQoper}}$  timing must be met, and  $t_{\text{XSDLL}}$  must be satisfied. ODT must be off during  $t_{\text{XSDLL}}$ .

**Figure 95: Self Refresh Entry/Exit Timing**

- Notes:
1. The clock must be valid and stable meeting  $t_{CK}$  specifications at least  $t_{CKSRE}^1$  after entering self refresh mode, and at least  $t_{CKSRX}^1$  prior to exiting self refresh mode, if the clock is stopped or altered between states Ta0 and Tb0. If the clock remains valid and unchanged from entry and during self refresh mode, then  $t_{CKSRE}^1$  and  $t_{CKSRX}^1$  do not apply; however,  $t_{CKESR}^1$  must be satisfied prior to exiting at SRX.
  2. ODT must be disabled and  $R_{TT}$  off prior to entering self refresh at state T1. If both  $R_{TT,nom}$  and  $R_{TT(WR)}$  are disabled in the mode registers, ODT can be a "Don't Care."
  3. Self refresh entry (SRE) is synchronous via a REFRESH command with CKE LOW.
  4. A NOP or DES command is required at T2 after the SRE command is issued prior to the inputs becoming "Don't Care."
  5. NOP or DES commands are required prior to exiting self refresh mode until state Te0.
  6.  $t_{XS}$  is required before any commands not requiring a locked DLL.
  7.  $t_{XSDLL}$  is required before any commands requiring a locked DLL.
  8. The device must be in the all banks idle state prior to entering self refresh mode. For example, all banks must be precharged,  $t_{RP}$  must be met, and no data bursts can be in progress.
  9. Self refresh exit is asynchronous; however,  $t_{XS}$  and  $t_{XSDLL}$  timings start at the first rising clock edge where CKE HIGH satisfies  $t_{ISXR}$  at Tc1.  $t_{CKSRX}^1$  timing is also measured so that  $t_{ISXR}$  is satisfied at Tc1.

## Extended Temperature Usage

Micron's DDR3 SDRAM supports the optional extended temperature range of 0°C to +95°C,  $T_C$ . Thus, the SRT and ASR options must be used at a minimum.

The extended temperature range DRAM must be refreshed externally at 2X (double refresh) anytime the case temperature is above +85°C (and does not exceed +95°C). The external refreshing requirement is accomplished by reducing the refresh period from 64ms to 32ms. However, self refresh mode requires either ASR or SRT to support the extended temperature. Thus either ASR or SRT must be enabled when  $T_C$  is above +85°C or self refresh cannot be used until the case temperature is at or below +85°C.

Table 72 summarizes the two extended temperature options and Table 73 summarizes how the two extended temperature options relate to one another.

**Table 72: Self Refresh Temperature and Auto Self Refresh Description**

Field	MR2 Bits	Description
<b>Self Refresh Temperature (SRT)</b>		
SRT	7	If ASR is disabled (MR2[6] = 0), SRT must be programmed to indicate $T_{OPER}$ during self refresh: *MR2[7] = 0: Normal operating temperature range (0°C to +85°C) *MR2[7] = 1: Extended operating temperature range (0°C to +95°C) If ASR is enabled (MR2[7] = 1), SRT must be set to 0, even if the extended temperature range is supported *MR2[7] = 0: SRT is disabled
<b>Auto Self Refresh (ASR)</b>		
ASR	6	When ASR is enabled, the DRAM automatically provides SELF REFRESH power management functions, (refresh rate for all supported operating temperature values) * MR2[6] = 1: ASR is enabled (M7 must = 0) When ASR is not enabled, the SRT bit must be programmed to indicate $T_{OPER}$ during SELF REFRESH operation * MR2[6] = 0: ASR is disabled, must use manual self refresh temperature (SRT)

**Table 73: Self Refresh Mode Summary**

MR2[6] (ASR)	MR2[7] (SRT)	SELF REFRESH Operation	Permitted Operating Temperature Range for Self Refresh Mode
0	0	Self refresh mode is supported in the normal temperature range	Normal (0°C to +85°C)
0	1	Self refresh mode is supported in normal and extended temperature ranges; When SRT is enabled, it increases self refresh power consumption	Normal and extended (0°C to +95°C)
1	0	Self refresh mode is supported in normal and extended temperature ranges; Self refresh power consumption may be temperature-dependent	Normal and extended (0°C to +95°C)
1	1	Illegal	

## Power-Down Mode

Power-down is synchronously entered when CKE is registered LOW coincident with a NOP or DES command. CKE is not allowed to go LOW while either an MRS, MPR, ZQCAL, READ, or WRITE operation is in progress. CKE is allowed to go LOW while any of the other legal operations (such as ROW ACTIVATION, PRECHARGE, auto precharge, or REFRESH) are in progress. However, the power-down  $I_{DD}$  specifications are not applicable until such operations have been completed. Depending on the previous DRAM state and the command issued prior to CKE going LOW, certain timing constraints must be satisfied (as noted in Table 74). Timing diagrams detailing the different power-down mode entry and exits are shown in Figure 96 (page 167) through Figure 105 (page 172).

**Table 74: Command to Power-Down Entry Parameters**

DRAM Status	Last Command Prior to CKE LOW <sup>1</sup>	Parameter (Min)	Parameter Value	Figure
Idle or active	ACTIVATE	$t_{ACTPDEN}$	$1^tCK$	Figure 103 (page 171)
Idle or active	PRECHARGE	$t_{PRPDEN}$	$1^tCK$	Figure 104 (page 171)
Active	READ or READAP	$t_{RDPDEN}$	$RL + 4^tCK + 1^tCK$	Figure 99 (page 169)
Active	WRITE: BL8OTF, BL8MRS, BC4OTF	$t_{WRPDEN}$	$WL + 4^tCK + t_{WR}^tCK$	Figure 100 (page 169)
Active	WRITE: BC4MRS		$WL + 2^tCK + t_{WR}^tCK$	Figure 100 (page 169)
Active	WRITEAP: BL8OTF, BL8MRS, BC4OTF	$t_{WRAPDEN}$	$WL + 4^tCK + WR + 1^tCK$	Figure 101 (page 170)
Active	WRITEAP: BC4MRS		$WL + 2^tCK + WR + 1^tCK$	Figure 101 (page 170)
Idle	REFRESH	$t_{REFPDEN}$	$1^tCK$	Figure 102 (page 170)
Power-down	REFRESH	$t_{XPDLL}$	Greater of $10^tCK$ or 24ns	Figure 106 (page 172)
Idle	MODE REGISTER SET	$t_{MRSPDEN}$	$t_{MOD}$	Figure 105 (page 172)

Note: 1. If slow-exit mode precharge power-down is enabled and entered, ODT becomes asynchronous  $t_{ANPD}$  prior to CKE going LOW and remains asynchronous until  $t_{ANPD} + t_{XPDLL}$  after CKE goes HIGH.

Entering power-down disables the input and output buffers, excluding CK, CK#, ODT, CKE, and RESET#. NOP or DES commands are required until  $t_{CPDED}$  has been satisfied, at which time all specified input/output buffers will be disabled. The DLL should be in a locked state when power-down is entered for the fastest power-down exit timing. If the DLL is not locked during power-down entry, the DLL must be reset after exiting power-down mode for proper READ operation as well as synchronous ODT operation.

During power-down entry, if any bank remains open after all in-progress commands are complete, the DRAM will be in active power-down mode. If all banks are closed after all in-progress commands are complete, the DRAM will be in precharge power-down mode. Precharge power-down mode must be programmed to exit with either a slow exit mode or a fast exit mode. When entering precharge power-down mode, the DLL is turned off in slow exit mode or kept on in fast exit mode.

The DLL remains on when entering active power-down as well. ODT has special timing constraints when slow exit mode precharge power-down is enabled and entered. Refer to Asynchronous ODT Mode (page 187) for detailed ODT usage requirements in slow

exit mode precharge power-down. A summary of the two power-down modes is listed in Table 75 (page 166).

While in either power-down state, CKE is held LOW, RESET# is held HIGH, and a stable clock signal must be maintained. ODT must be in a valid state but all other input signals are a “Don’t Care.” If RESET# goes LOW during power-down, the DRAM will switch out of power-down mode and go into the reset state. After CKE is registered LOW, CKE must remain LOW until  $t_{PD}$  (MIN) has been satisfied. The maximum time allowed for power-down duration is  $t_{PD}$  (MAX) ( $9 \times t_{REFI}$ ).

The power-down states are synchronously exited when CKE is registered HIGH (with a required NOP or DES command). CKE must be maintained HIGH until  $t_{CKE}$  has been satisfied. A valid, executable command may be applied after power-down exit latency,  $t_{XP}$   $t_{XPDLL}$ , have been satisfied. A summary of the power-down modes is listed below.

For specific CKE-intensive operations, for example, repeating a power-down exit to refresh to power-down entry sequence, the number of clock cycles between power-down exit and power-down entry may not be sufficient enough to keep the DLL properly updated. In addition to meeting  $t_{PD}$  when the REFRESH command is used in between power-down exit and power-down entry, two other conditions must be met. First,  $t_{XP}$  must be satisfied before issuing the REFRESH command. Second,  $t_{XPDLL}$  must be satisfied before the next power-down may be entered. An example is shown in Figure 106 (page 172).

**Table 75: Power-Down Modes**

DRAM State	MR1[12]	DLL State	Power-Down Exit	Relevant Parameters
Active (any bank open)	“Don’t Care”	On	Fast	$t_{XP}$ to any other valid command
Precharged (all banks precharged)	1	On	Fast	$t_{XP}$ to any other valid command
	0	Off	Slow	$t_{XPDLL}$ to commands that require the DLL to be locked (READ, RDAP, or ODT on) $t_{XP}$ to any other valid command

**Figure 96: Active Power-Down Entry and Exit**

**Figure 97: Precharge Power-Down (Fast-Exit Mode) Entry and Exit**

**Figure 98: Precharge Power-Down (Slow-Exit Mode) Entry and Exit**

- Notes: 1. Any valid command not requiring a locked DLL.  
2. Any valid command requiring a locked DLL.

**Figure 99: Power-Down Entry After READ or READ with Auto Precharge (RDAP)**

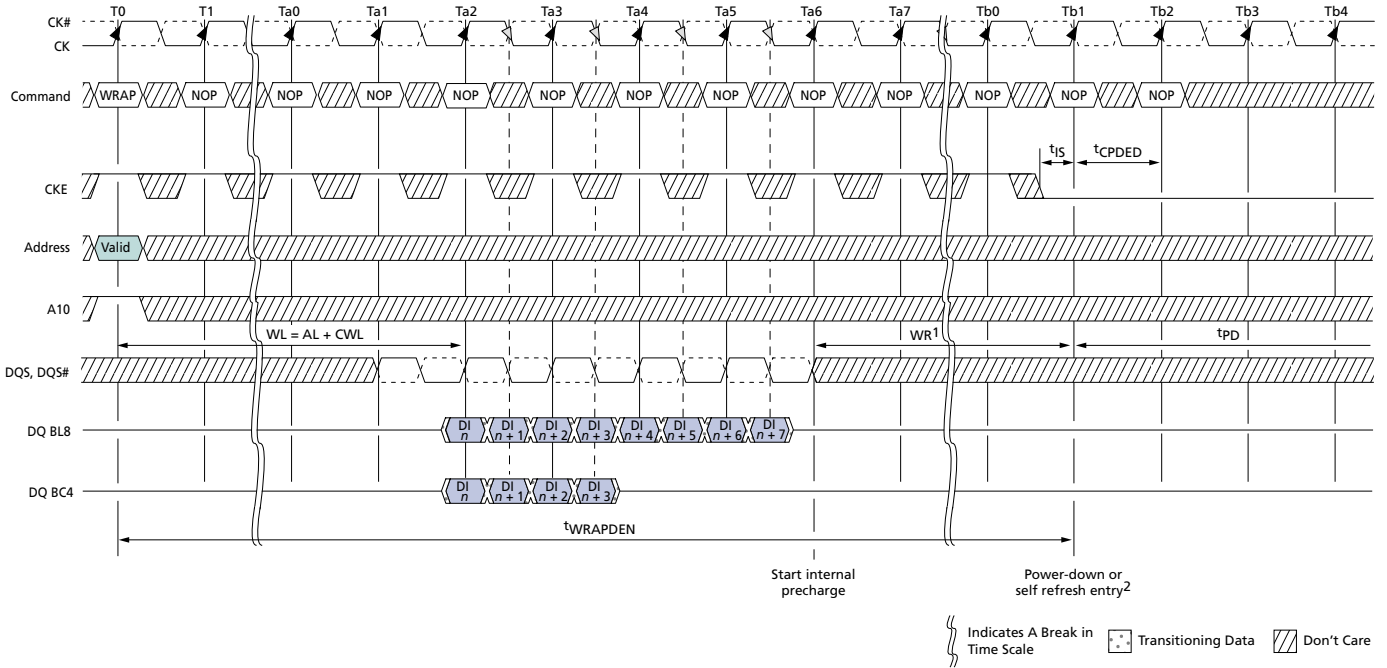

**Figure 100: Power-Down Entry After WRITE**

Note: 1. CKE can go LOW  $2^{t_{CK}}$  earlier if BC4MRS.

**Figure 101: Power-Down Entry After WRITE with Auto Precharge (WRAP)**

- Notes: 1.  $t_{WR}$  is programmed through MR0[11:9] and represents  $t_{WR}$  (MIN)ns/ $t_{CK}$  rounded up to the next integer  $t_{CK}$ .  
 2. CKE can go LOW  $2t_{CK}$  earlier if BC4MRS.

**Figure 102: REFRESH to Power-Down Entry**

- Note: 1. After CKE goes HIGH during  $t_{RFC}$ , CKE must remain HIGH until  $t_{RFC}$  is satisfied.

**Figure 103: ACTIVATE to Power-Down Entry**

**Figure 104: PRECHARGE to Power-Down Entry**

**Figure 105: MRS Command to Power-Down Entry**

**Figure 106: Power-Down Exit to Refresh to Power-Down Entry**

- Notes:
1.  $t_{XP}$  must be satisfied before issuing the command.
  2.  $t_{XPDLL}^2$  must be satisfied (referenced to the registration of power-down exit) before the next power-down can be entered.

## RESET Operation

The RESET signal (RESET#) is an asynchronous signal that triggers any time it drops LOW, and there are no restrictions about when it can go LOW. After RESET# goes LOW, it must remain LOW for 100ns. During this time, the outputs are disabled, ODT ( $R_{TT}$ ) turns off (High-Z), and the DRAM resets itself. CKE should be brought LOW prior to RESET# being driven HIGH. After RESET# goes HIGH, the DRAM must be reinitialized as though a normal power-up was executed. All refresh counters on the DRAM are reset, and data stored in the DRAM is assumed unknown after RESET# has gone LOW.

**Figure 107: RESET Sequence**

Note: 1. The minimum time required is the larger of 10ns or 5 clocks.

## On-Die Termination (ODT)

ODT is a feature that enables the DRAM to enable/disable and turn on/off termination resistance for each DQ, DQS, DQS#, and DM for the x4 and x8 configurations (and TDQS, TDQS# for the x8 configuration, when enabled). ODT is applied to each DQ, UDQS, UDQS#, LDQS, LDQS#, UDM, and LDM signal for the x16 configuration.

The ODT feature is designed to improve signal integrity of the memory channel by enabling the DRAM controller to independently turn on/off the DRAM's internal termination resistance for any grouping of DRAM devices. The ODT feature is not supported during DLL disable mode (simple functional representation shown below). The switch is enabled by the internal ODT control logic, which uses the external ODT ball and other control information.

**Figure 108: On-Die Termination**

## Functional Representation of ODT

The value of  $R_{TT}$  (ODT termination value) is determined by the settings of several mode register bits (see Table 79 (page 178)). The ODT ball is ignored while in self refresh mode (must be turned off prior to self refresh entry) or if mode registers MR1 and MR2 are programmed to disable ODT. ODT is comprised of nominal ODT and dynamic ODT modes and either of these can function in synchronous or asynchronous mode (when the DLL is off during precharge power-down or when the DLL is synchronizing). Nominal ODT is the base termination and is used in any allowable ODT state. Dynamic ODT is applied only during writes and provides OTF switching from no  $R_{TT}$  or  $R_{TT,nom}$  to  $R_{TT(WR)}$ .

The actual effective termination,  $R_{TT(EFF)}$ , may be different from the  $R_{TT}$  targeted due to nonlinearity of the termination. For  $R_{TT(EFF)}$  values and calculations, see ODT Characteristics (page 54).

## Nominal ODT

ODT (NOM) is the base termination resistance for each applicable ball, it is enabled or disabled via MR1[9, 6, 2] (see Mode Register 1 (MR1) Definition), and it is turned on or off via the ODT ball.

**Table 76: Truth Table – ODT (Nominal)**

Note 1 applies to the entire table

MR1[9, 6, 2]	ODT Pin	DRAM Termination State	DRAM State	Notes
000	0	$R_{TT,nom}$ disabled, ODT off	Any valid	2
000	1	$R_{TT,nom}$ disabled, ODT on	Any valid except self refresh, read	3
000–101	0	$R_{TT,nom}$ enabled, ODT off	Any valid	2
000–101	1	$R_{TT,nom}$ enabled, ODT on	Any valid except self refresh, read	3
110 and 111	X	$R_{TT,nom}$ reserved, ODT on or off	Illegal	

- Notes:
1. Assumes dynamic ODT is disabled (see Dynamic ODT (page 177) when enabled).
  2. ODT is enabled and active during most writes for proper termination, but it is not illegal to have it off during writes.
  3. ODT must be disabled during reads. The  $R_{TT,nom}$  value is restricted during writes. Dynamic ODT is applicable if enabled.

Nominal ODT resistance  $R_{TT,nom}$  is defined by MR1[9, 6, 2], as shown in Mode Register 1 (MR1) Definition. The  $R_{TT,nom}$  termination value applies to the output pins previously mentioned. DDR3 SDRAM supports multiple  $R_{TT,nom}$  values based on  $RZQ/n$  where  $n$  can be 2, 4, 6, 8, or 12 and  $RZQ$  is  $240\Omega$ .  $R_{TT,nom}$  termination is allowed any time after the DRAM is initialized, calibrated, and not performing read access or when it is not in self refresh mode.

Write accesses use  $R_{TT,nom}$  if dynamic ODT ( $R_{TT(WR)}$ ) is disabled. If  $R_{TT,nom}$  is used during writes, only  $RZQ/2$ ,  $RZQ/4$ , and  $RZQ/6$  are allowed (see Table 79 (page 178)). ODT timings are summarized in Table 77 (page 176), as well as listed in Table 54 (page 75).

Examples of nominal ODT timing are shown in conjunction with the synchronous mode of operation in Synchronous ODT Mode (page 182).

**Table 77: ODT Parameter**

Symbol	Description	Begins at	Defined to	Definition for All DDR3 Speed Bins	Units
ODTL on	ODT synchronous turn on delay	ODT registered HIGH	$R_{TT,on} \pm t_{AON}$	$CWL + AL - 2$	$t_{CK}$
ODTL off	ODT synchronous turn off delay	ODT registered HIGH	$R_{TT,off} \pm t_{AOF}$	$CWL + AL - 2$	$t_{CK}$
$t_{AONPD}$	ODT asynchronous turn on delay	ODT registered HIGH	$R_{TT,on}$	1–9	ns
$t_{AOFPD}$	ODT asynchronous turn off delay	ODT registered HIGH	$R_{TT,off}$	1–9	ns
ODTH4	ODT minimum HIGH time after ODT assertion or write (BC4)	ODT registered HIGH or write registration with ODT HIGH	ODT registered LOW	$4t_{CK}$	$t_{CK}$
ODTH8	ODT minimum HIGH time after write (BL8)	Write registration with ODT HIGH	ODT registered LOW	$6t_{CK}$	$t_{CK}$
$t_{AON}$	ODT turn-on relative to ODTL on completion	Completion of ODTL on	$R_{TT,on}$	See Table 54 (page 75)	ps
$t_{AOF}$	ODT turn-off relative to ODTL off completion	Completion of ODTL off	$R_{TT,off}$	$0.5t_{CK} \pm 0.2t_{CK}$	$t_{CK}$

## Dynamic ODT

In certain application cases, and to further enhance signal integrity on the data bus, it is desirable that the termination strength of the DDR3 SDRAM can be changed without issuing an MRS command, essentially changing the ODT termination on the fly. With dynamic ODT ( $R_{TT(WR)}$ ) enabled, the DRAM switches from nominal ODT ( $R_{TT,nom}$ ) to dynamic ODT ( $R_{TT(WR)}$ ) when beginning a WRITE burst and subsequently switches back to nominal ODT ( $R_{TT,nom}$ ) at the completion of the WRITE burst. This requirement is supported by the dynamic ODT feature, as described below.

### Functional Description

The dynamic ODT mode is enabled if either MR2[9] or MR2[10] is set to 1. Dynamic ODT is not supported during DLL disable mode so  $R_{TT(WR)}$  must be disabled. The dynamic ODT function is described below:

- Two  $R_{TT}$  values are available— $R_{TT,nom}$  and  $R_{TT(WR)}$ 
  - The value for  $R_{TT,nom}$  is preselected via MR1[9, 6, 2]
  - The value for  $R_{TT(WR)}$  is preselected via MR2[10, 9]
- During DRAM operation without READ or WRITE commands, the termination is controlled
  - Nominal termination strength  $R_{TT,nom}$  is used
  - Termination on/off timing is controlled via the ODT ball and latencies ODTL on and ODTL off
- When a WRITE command (WR, WRAP, WRS4, WRS8, WRAPS4, WRAPS8) is registered, and if dynamic ODT is enabled, the ODT termination is controlled
  - A latency of ODTLcnw after the WRITE command: termination strength  $R_{TT,nom}$  switches to  $R_{TT(WR)}$
  - A latency of ODTLcwn8 (for BL8, fixed or OTF) or ODTLcwn4 (for BC4, fixed or OTF) after the WRITE command: termination strength  $R_{TT(WR)}$  switches back to  $R_{TT,nom}$
  - On/off termination timing is controlled via the ODT ball and determined by ODTL on, ODTL off, ODTH4, and ODTH8
  - During the  $t_{ADC}$  transition window, the value of  $R_{TT}$  is undefined

ODT is constrained during writes and when dynamic ODT is enabled (see Table 78 (page 177)). ODT timings listed in Table 77 (page 176) also apply to dynamic ODT mode.

**Table 78: Dynamic ODT Specific Parameters**

Symbol	Description	Begins at	Defined to	Definition for All DDR3 Speed Bins	Units
ODTLcnw	Change from $R_{TT,nom}$ to $R_{TT(WR)}$	Write registration	$R_{TT}$ switched from $R_{TT,nom}$ to $R_{TT(WR)}$	WL - 2	$t_{CK}$
ODTLcwn4	Change from $R_{TT(WR)}$ to $R_{TT,nom}$ (BC4)	Write registration	$R_{TT}$ switched from $R_{TT(WR)}$ to $R_{TT,nom}$	$4t_{CK} + \text{ODTL off}$	$t_{CK}$
ODTLcwn8	Change from $R_{TT(WR)}$ to $R_{TT,nom}$ (BL8)	Write registration	$R_{TT}$ switched from $R_{TT(WR)}$ to $R_{TT,nom}$	$6t_{CK} + \text{ODTL off}$	$t_{CK}$
$t_{ADC}$	$R_{TT}$ change skew	ODTLcnw completed	$R_{TT}$ transition complete	$0.5t_{CK} \pm 0.2t_{CK}$	$t_{CK}$

**Table 79: Mode Registers for  $R_{TT,nom}$** 

MR1 ( $R_{TT,nom}$ )			$R_{TT,nom}$ (RZQ)	$R_{TT,nom}$ (Ohms)	$R_{TT,nom}$ Mode Restriction
M9	M6	M2			
0	0	0	Off	Off	n/a
0	0	1	RZQ/4	60	Self refresh
0	1	0	RZQ/2	120	
0	1	1	RZQ/6	40	
1	0	0	RZQ/12	20	Self refresh, write
1	0	1	RZQ/8	30	
1	1	0	Reserved	Reserved	n/a
1	1	1	Reserved	Reserved	n/a

Note: 1. RZQ = 240Ω. If  $R_{TT,nom}$  is used during WRITES, only RZQ/2, RZQ/4, RZQ/6 are allowed.

**Table 80: Mode Registers for  $R_{TT(WR)}$** 

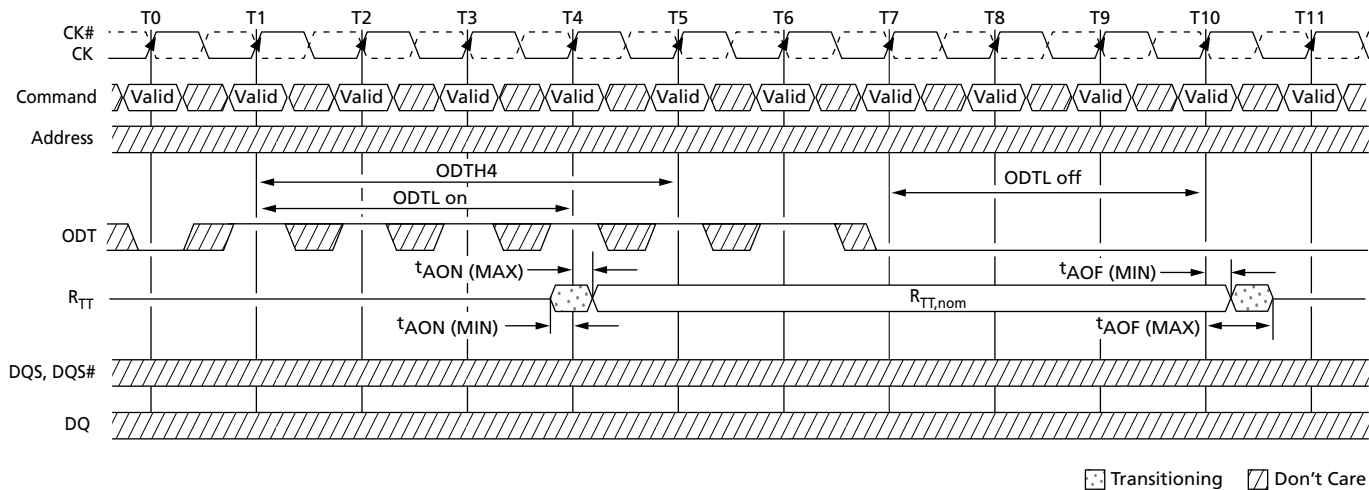

MR2 ( $R_{TT(WR)}$ )		$R_{TT(WR)}$ (RZQ)	$R_{TT(WR)}$ (Ohms)
M10	M9		
0	0	Dynamic ODT off: WRITE does not affect $R_{TT,nom}$	
0	1	RZQ/4	60
1	0	RZQ/2	120
1	1	Reserved	Reserved

**Table 81: Timing Diagrams for Dynamic ODT**

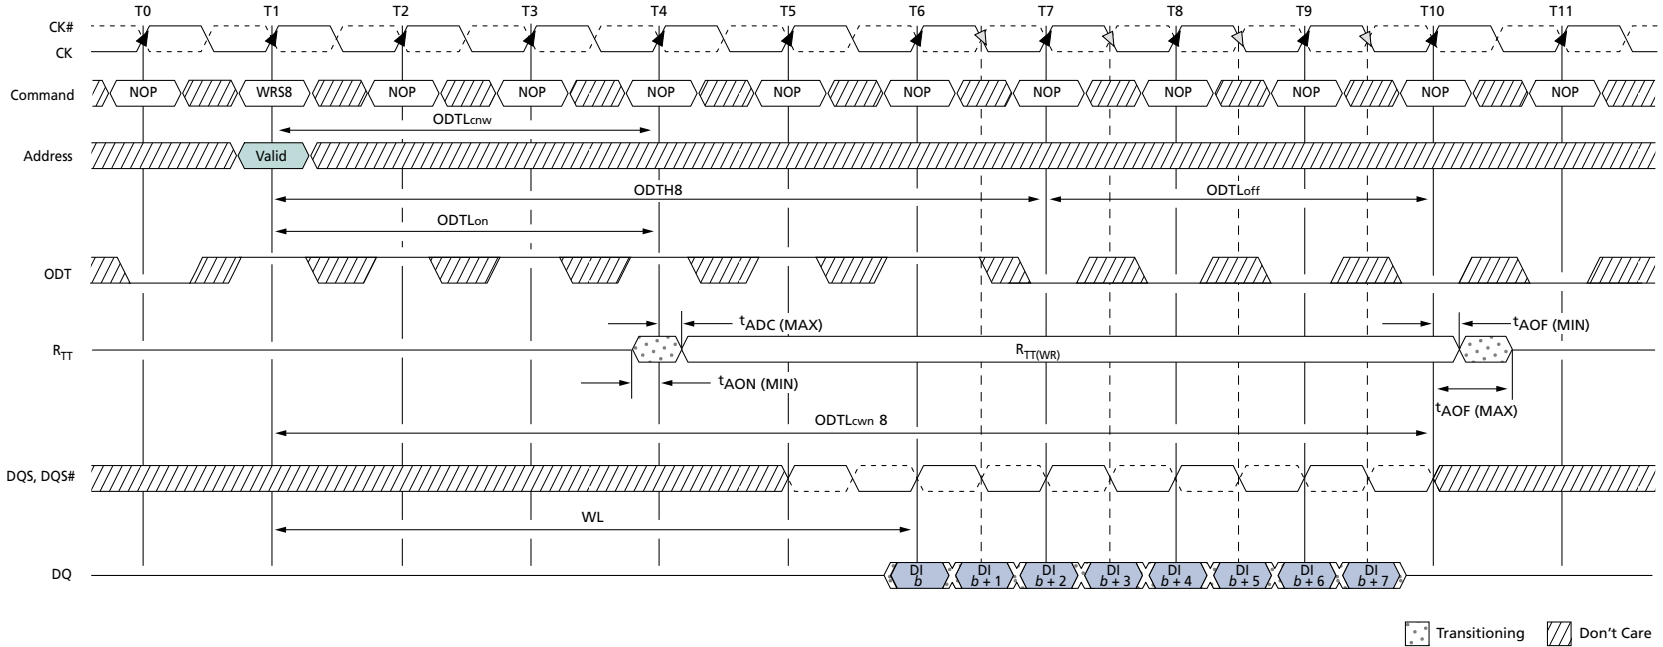

Figure and Page	Title
Figure 109 (page 179)	Dynamic ODT: ODT Asserted Before and After the WRITE, BC4
Figure 110 (page 179)	Dynamic ODT: Without WRITE Command
Figure 111 (page 180)	Dynamic ODT: ODT Pin Asserted Together with WRITE Command for 6 Clock Cycles, BL8
Figure 112 (page 181)	Dynamic ODT: ODT Pin Asserted with WRITE Command for 6 Clock Cycles, BC4
Figure 113 (page 181)	Dynamic ODT: ODT Pin Asserted with WRITE Command for 4 Clock Cycles, BC4

**Figure 109: Dynamic ODT: ODT Asserted Before and After the WRITE, BC4**

- Notes:
1. Via MRS or OTF. AL = 0, CWL = 5.  $R_{TT,nom}$  and  $R_{TT(WR)}$  are enabled.
  2. ODT<sub>H4</sub> applies to first registering ODT HIGH and then to the registration of the WRITE command. In this example, ODT<sub>H4</sub> is satisfied if ODT goes LOW at T8 (four clocks after the WRITE command).

**Figure 110: Dynamic ODT: Without WRITE Command**

- Notes:
1. AL = 0, CWL = 5.  $R_{TT,nom}$  is enabled and  $R_{TT(WR)}$  is either enabled or disabled.
  2. ODT<sub>H4</sub> is defined from ODT registered HIGH to ODT registered LOW; in this example, ODT<sub>H4</sub> is satisfied. ODT registered LOW at T5 is also legal.

**Figure 111: Dynamic ODT: ODT Pin Asserted Together with WRITE Command for 6 Clock Cycles, BL8**

- Notes:
1. Via MRS or OTF; AL = 0, CWL = 5. If R<sub>TT,nom</sub> can be either enabled or disabled, ODT can be HIGH. R<sub>TT</sub>(WR) is enabled.
  2. In this example, ODLH8 = 6 is satisfied exactly.

**Figure 112: Dynamic ODT: ODT Pin Asserted with WRITE Command for 6 Clock Cycles, BC4**

- Notes:
1. Via MRS or OTF. AL = 0, CWL = 5.  $R_{TT,nom}$  and  $R_{TT(WR)}$  are enabled.
  2. ODT<sub>H4</sub> is defined from ODT registered HIGH to ODT registered LOW, so in this example, ODT<sub>H4</sub> is satisfied. ODT registered LOW at T5 is also legal.

**Figure 113: Dynamic ODT: ODT Pin Asserted with WRITE Command for 4 Clock Cycles, BC4**

- Notes:
1. Via MRS or OTF. AL = 0, CWL = 5.  $R_{TT,nom}$  can be either enabled or disabled. If disabled, ODT can remain HIGH.  $R_{TT(WR)}$  is enabled.
  2. In this example ODT<sub>H4</sub> = 4 is satisfied exactly.

## Synchronous ODT Mode

Synchronous ODT mode is selected whenever the DLL is turned on and locked and when either  $R_{TT,nom}$  or  $R_{TT(WR)}$  is enabled. Based on the power-down definition, these modes are:

- Any bank active with CKE HIGH
- Refresh mode with CKE HIGH
- Idle mode with CKE HIGH
- Active power-down mode (regardless of MR0[12])
- Precharge power-down mode if DLL is enabled during precharge power-down by MR0[12]

## ODT Latency and Posted ODT

In synchronous ODT mode,  $R_{TT}$  turns on ODTL on clock cycles after ODT is sampled HIGH by a rising clock edge and turns off ODTL off clock cycles after ODT is registered LOW by a rising clock edge. The actual on/off times varies by  $t_{AON}$  and  $t_{AOF}$  around each clock edge (see Table 82 (page 183)). The ODT latency is tied to the WRITE latency (WL) by  $ODTL\ on = WL - 2$  and  $ODTL\ off = WL - 2$ .

Since write latency is made up of CAS WRITE latency (CWL) and ADDITIVE latency (AL), the AL programmed into the mode register (MR1[4, 3]) also applies to the ODT signal. The device's internal ODT signal is delayed a number of clock cycles defined by the AL relative to the external ODT signal. Thus  $ODTL\ on = CWL + AL - 2$  and  $ODTL\ off = CWL + AL - 2$ .

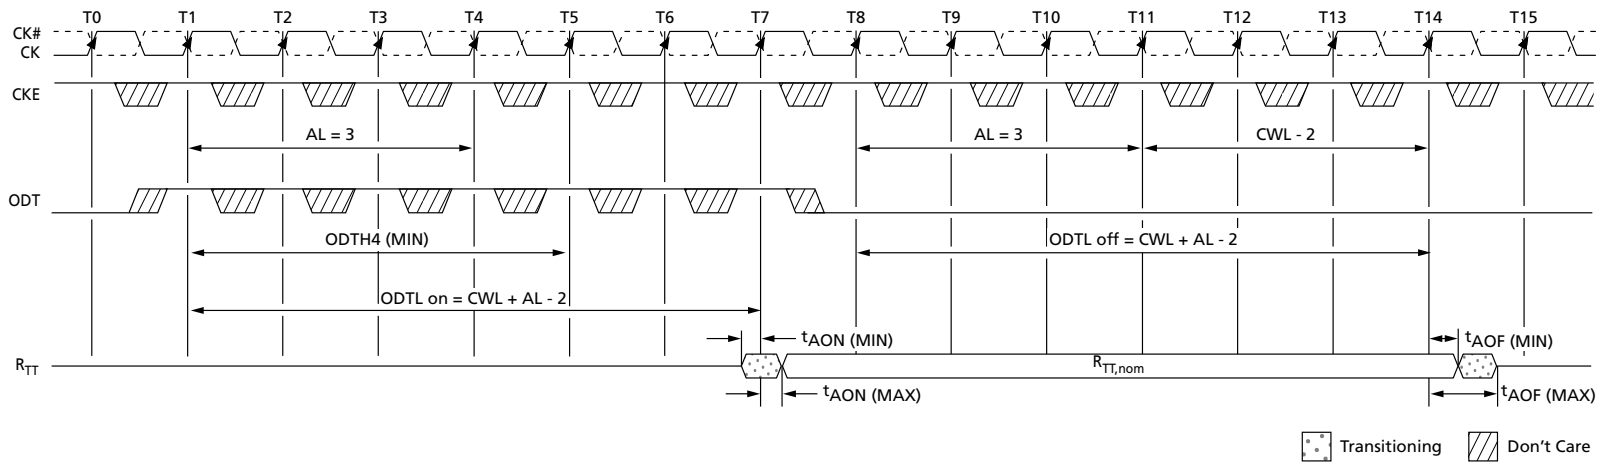

## Timing Parameters

Synchronous ODT mode uses the following timing parameters: ODTL on, ODTL off, ODTH4, ODTH8,  $t_{AON}$ , and  $t_{AOF}$ . The minimum  $R_{TT}$  turn-on time ( $t_{AON}$  [MIN]) is the point at which the device leaves High-Z and ODT resistance begins to turn on. Maximum  $R_{TT}$  turn-on time ( $t_{AON}$  [MAX]) is the point at which ODT resistance is fully on. Both are measured relative to ODTL on. The minimum  $R_{TT}$  turn-off time ( $t_{AOF}$  [MIN]) is the point at which the device starts to turn off ODT resistance. Maximum  $R_{TT}$  turn off time ( $t_{AOF}$  [MAX]) is the point at which ODT has reached High-Z. Both are measured from ODTL off.

When ODT is asserted, it must remain HIGH until ODTH4 is satisfied. If a WRITE command is registered by the DRAM with ODT HIGH, then ODT must remain HIGH until ODTH4 (BC4) or ODTH8 (BL8) after the WRITE command (see Figure 115 (page 184)). ODTH4 and ODTH8 are measured from ODT registered HIGH to ODT registered LOW or from the registration of a WRITE command until ODT is registered LOW.

**Table 82: Synchronous ODT Parameters**

Symbol	Description	Begins at	Defined to	Definition for All DDR3 Speed Bins	Units
ODTL on	ODT synchronous turn-on delay	ODT registered HIGH	$R_{TT,on} \pm t_{AON}$	$CWL + AL - 2$	$t_{CK}$
ODTL off	ODT synchronous turn-off delay	ODT registered HIGH	$R_{TT,off} \pm t_{AOF}$	$CWL + AL - 2$	$t_{CK}$
ODTH4	ODT minimum HIGH time after ODT assertion or WRITE (BC4)	ODT registered HIGH or write registration with ODT HIGH	ODT registered LOW	$4t_{CK}$	$t_{CK}$
ODTH8	ODT minimum HIGH time after WRITE (BL8)	Write registration with ODT HIGH	ODT registered LOW	$6t_{CK}$	$t_{CK}$
$t_{AON}$	ODT turn-on relative to ODTL on completion	Completion of ODTL on	$R_{TT,on}$	See Table 54 (page 75)	ps
$t_{AOF}$	ODT turn-off relative to ODTL off completion	Completion of ODTL off	$R_{TT,off}$	$0.5t_{CK} \pm 0.2t_{CK}$	$t_{CK}$

**Figure 114: Synchronous ODT**

Note: 1. AL = 3; CWL = 5; ODTL on = WL = 6.0; ODTL off = WL - 2 = 6. R<sub>TT,nom</sub> is enabled.

**Figure 115: Synchronous ODT (BC4)**

- Notes:
1.  $WL = 7$ .  $R_{TT,nom}$  is enabled.  $R_{TT(WR)}$  is disabled.
  2. ODT must be held HIGH for at least ODTH4 after assertion (T1).
  3. ODT must be kept HIGH ODTH4 (BC4) or ODTH8 (BL8) after the WRITE command (T7).
  4. ODTH is measured from ODT first registered HIGH to ODT first registered LOW or from the registration of the WRITE command with ODT HIGH to ODT registered LOW.
  5. Although ODTH4 is satisfied from ODT registered HIGH at T6, ODT must not go LOW before T11 as ODTH4 must also be satisfied from the registration of the WRITE command at T7.

## ODT Off During READs

Because the device cannot terminate and drive at the same time,  $R_{TT}$  must be disabled at least one-half clock cycle before the READ preamble by driving the ODT ball LOW (if either  $R_{TT,nom}$  or  $R_{TT(WR)}$  is enabled).  $R_{TT}$  may not be enabled until the end of the postamble, as shown in the following example.

**Note:** ODT may be disabled earlier and enabled later than shown Figure 116 (page 186).

**Figure 116: ODT During READs**

Note: 1. ODT must be disabled externally during READs by driving ODT LOW. For example, CL = 6; AL = CL - 1 = 5; RL = AL + CL = 11; CWL = 5; ODTL on = CWL + AL - 2 = 8; ODTL off = CWL + AL - 2 = 8.  $R_{TT,nom}$  is enabled.  $R_{TT(WR)}$  is a "Don't Care."

## Asynchronous ODT Mode

Asynchronous ODT mode is available when the DRAM runs in DLL on mode and when either  $R_{TT,nom}$  or  $R_{TT(WR)}$  is enabled; however, the DLL is temporarily turned off in pre-charged power-down standby (via MR0[12]). Additionally, ODT operates asynchronously when the DLL is synchronizing after being reset. See Power-Down Mode (page 165) for definition and guidance over power-down details.

In asynchronous ODT timing mode, the internal ODT command is not delayed by AL relative to the external ODT command. In asynchronous ODT mode, ODT controls  $R_{TT}$  by analog time. The timing parameters  $t_{AONPD}$  and  $t_{AOFPD}$  replace ODTL on/ $t_{AON}$  and ODTL off/ $t_{AOF}$ , respectively, when ODT operates asynchronously.

The minimum  $R_{TT}$  turn-on time ( $t_{AONPD}$  [MIN]) is the point at which the device termination circuit leaves High-Z and ODT resistance begins to turn on. Maximum  $R_{TT}$  turn-on time ( $t_{AONPD}$  [MAX]) is the point at which ODT resistance is fully on.  $t_{AONPD}$  (MIN) and  $t_{AONPD}$  (MAX) are measured from ODT being sampled HIGH.

The minimum  $R_{TT}$  turn-off time ( $t_{AOFPD}$  [MIN]) is the point at which the device termination circuit starts to turn off ODT resistance. Maximum  $R_{TT}$  turn-off time ( $t_{AOFPD}$  [MAX]) is the point at which ODT has reached High-Z.  $t_{AOFPD}$  (MIN) and  $t_{AOFPD}$  (MAX) are measured from ODT being sampled LOW.

**Figure 117: Asynchronous ODT Timing with Fast ODT Transition**

Note: 1. AL is ignored.

**Table 83: Asynchronous ODT Timing Parameters for All Speed Bins**

Symbol	Description	Min	Max	Units
$t_{AONPD}$	Asynchronous $R_{TT}$ turn-on delay (power-down with DLL off)	2	8.5	ns
$t_{AOFPD}$	Asynchronous $R_{TT}$ turn-off delay (power-down with DLL off)	2	8.5	ns

## Synchronous to Asynchronous ODT Mode Transition (Power-Down Entry)

There is a transition period around power-down entry (PDE) where the DRAM's ODT may exhibit either synchronous or asynchronous behavior. This transition period occurs if the DLL is selected to be off when in precharge power-down mode by the setting  $MR0[12] = 0$ . Power-down entry begins  $t_{ANPD}$  prior to CKE first being registered LOW, and it ends when CKE is first registered LOW.  $t_{ANPD}$  is equal to the greater of  $ODTL_{off} + t_{CK}$  or  $ODTL_{on} + t_{CK}$ . If a REFRESH command has been issued, and it is in progress when CKE goes LOW, power-down entry will end  $t_{RFC}$  after the REFRESH command rather than when CKE is first registered LOW. Power-down entry will then become the greater of  $t_{ANPD}$  and  $t_{RFC}$  - REFRESH command to CKE registered LOW.

ODT assertion during power-down entry results in an  $R_{TT}$  change as early as the lesser of  $t_{AONPD} (MIN)$  and  $ODTL_{on} \times t_{CK} + t_{AON} (MIN)$  or as late as the greater of  $t_{AONPD} (MAX)$  and  $ODTL_{on} \times t_{CK} + t_{AON} (MAX)$ . ODT deassertion during power-down entry may result in an  $R_{TT}$  change as early as the lesser of  $t_{AOFPD} (MIN)$  and  $ODTL_{off} \times t_{CK} + t_{AOF} (MIN)$  or as late as the greater of  $t_{AOFPD} (MAX)$  and  $ODTL_{off} \times t_{CK} + t_{AOF} (MAX)$ . Table 84 (page 190) summarizes these parameters.

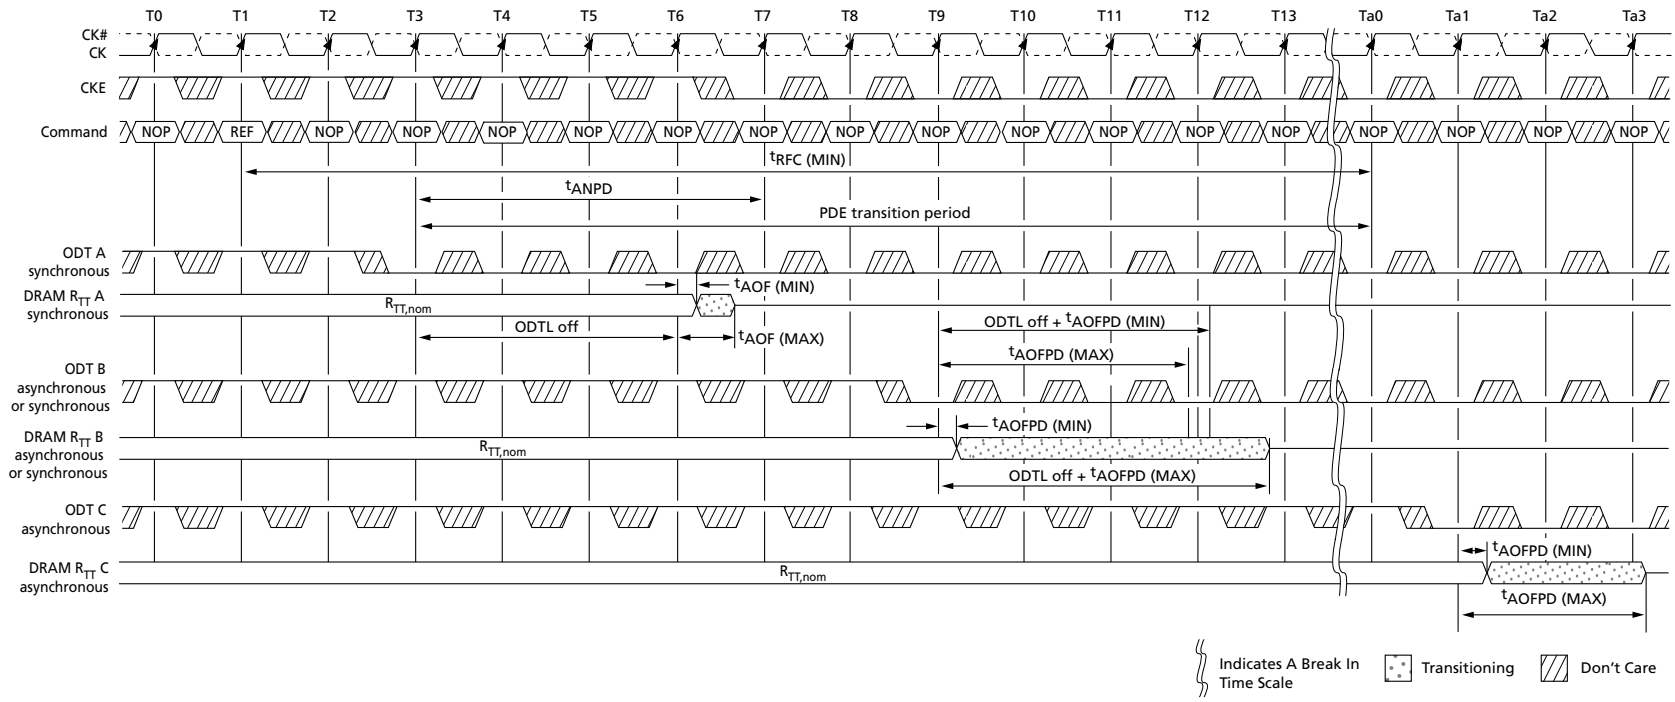

If the AL has a large value, the uncertainty of the state of  $R_{TT}$  becomes quite large. This is because  $ODTL_{on}$  and  $ODTL_{off}$  are derived from the WL and WL is equal to  $CWL + AL$ . Figure 118 (page 190) shows three different cases:

- ODT\_A: Synchronous behavior before  $t_{ANPD}$
- ODT\_B: ODT state changes during the transition period with  $t_{AONPD} (MIN)$  less than  $ODTL_{on} \times t_{CK} + t_{AON} (MIN)$  and  $t_{AONPD} (MAX)$  greater than  $ODTL_{on} \times t_{CK} + t_{AON} (MAX)$
- ODT\_C: ODT state changes after the transition period with asynchronous behavior

**Table 84: ODT Parameters for Power-Down (DLL Off) Entry and Exit Transition Period**

Description	Min	Max
Power-down entry transition period (power-down entry)	Greater of: $t_{ANPD}$ or $t_{RFC}$ - refresh to CKE LOW	
Power-down exit transition period (power-down exit)	$t_{ANPD} + t_{XPDLL}$	
ODT to $R_{TT}$ turn-on delay (ODTL on = WL - 2)	Lesser of: $t_{AONPD}$ (MIN) (1ns) or $ODTL\ on \times t_{CK} + t_{AON}$ (MIN)	Greater of: $t_{AONPD}$ (MAX) (9ns) or $ODTL\ on \times t_{CK} + t_{AON}$ (MAX)
ODT to $R_{TT}$ turn-off delay (ODTL off = WL - 2)	Lesser of: $t_{AOFPD}$ (MIN) (1ns) or $ODTL\ off \times t_{CK} + t_{AOF}$ (MIN)	Greater of: $t_{AOFPD}$ (MAX) (9ns) or $ODTL\ off \times t_{CK} + t_{AOF}$ (MAX)
$t_{ANPD}$	WL - 1 (greater of ODTL off + 1 or ODTL on + 1)	

**Figure 118: Synchronous to Asynchronous Transition During Precharge Power-Down (DLL Off) Entry**

Note: 1. AL = 0; CWL = 5; ODTL off = WL - 2 = 3.

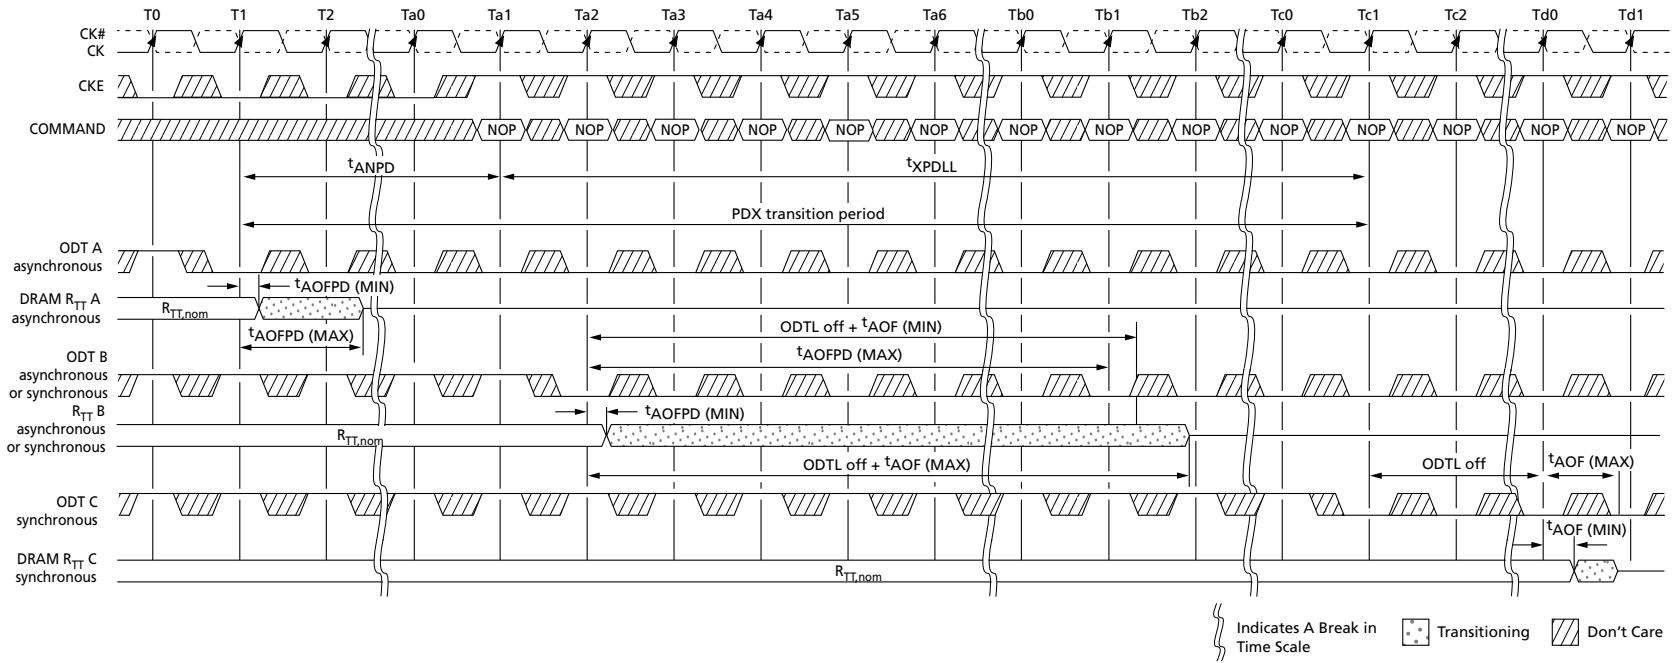

## Asynchronous to Synchronous ODT Mode Transition (Power-Down Exit)

The DRAM's ODT may exhibit either asynchronous or synchronous behavior during power-down exit (PDX). This transition period occurs if the DLL is selected to be off when in precharge power-down mode by setting MR0[12] to 0. Power-down exit begins  $t_{ANPD}$  prior to CKE first being registered HIGH, and it ends  $t_{XPDLL}$  after CKE is first registered HIGH.  $t_{ANPD}$  is equal to the greater of  $ODTL_{off} + 1t_{CK}$  or  $ODTL_{on} + 1t_{CK}$ . The transition period is  $t_{ANPD}$  plus  $t_{XPDLL}$ .

ODT assertion during power-down exit results in an  $R_{TT}$  change as early as the lesser of  $t_{AONPD} (MIN)$  and  $ODTL_{on} \times t_{CK} + t_{AON} (MIN)$  or as late as the greater of  $t_{AONPD} (MAX)$  and  $ODTL_{on} \times t_{CK} + t_{AON} (MAX)$ . ODT deassertion during power-down exit may result in an  $R_{TT}$  change as early as the lesser of  $t_{AOFPD} (MIN)$  and  $ODTL_{off} \times t_{CK} + t_{AOF} (MIN)$  or as late as the greater of  $t_{AOFPD} (MAX)$  and  $ODTL_{off} \times t_{CK} + t_{AOF} (MAX)$ . Table 84 (page 190) summarizes these parameters.

If the AL has a large value, the uncertainty of the  $R_{TT}$  state becomes quite large. This is because  $ODTL_{on}$  and  $ODTL_{off}$  are derived from the WL, and WL is equal to  $CWL + AL$ . Figure 119 (page 192) shows three different cases:

- ODT C: asynchronous behavior before  $t_{ANPD}$
- ODT B: ODT state changes during the transition period, with  $t_{AOFPD} (MIN)$  less than  $ODTL_{off} \times t_{CK} + t_{AOF} (MIN)$  and  $ODTL_{off} \times t_{CK} + t_{AOF} (MAX)$  greater than  $t_{AOFPD} (MAX)$
- ODT A: ODT state changes after the transition period with synchronous response

**Figure 119: Asynchronous to Synchronous Transition During Precharge Power-Down (DLL Off) Exit**

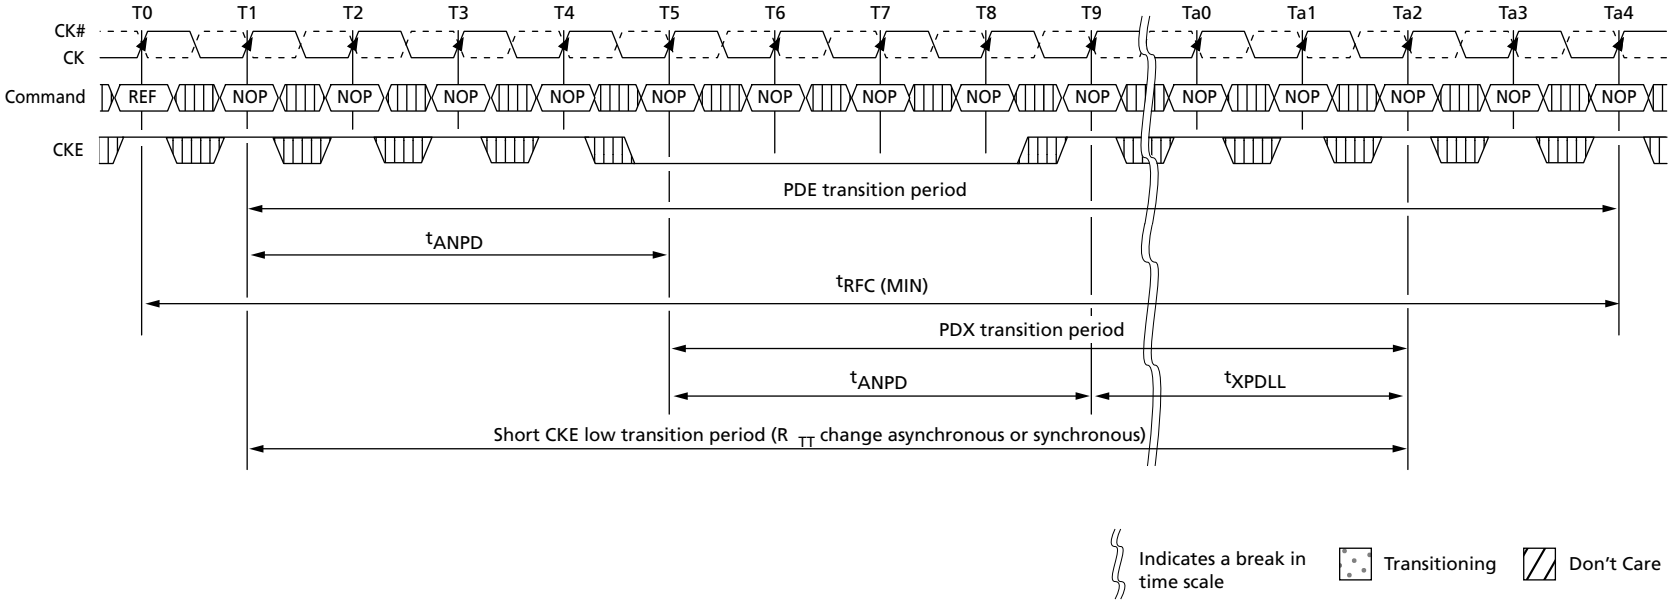

Note: 1. CL = 6; AL = CL - 1; CWL = 5; ODTL off = WL - 2 = 8.

**Asynchronous to Synchronous ODT Mode Transition (Short CKE Pulse)**

If the time in the precharge power down or idle states is very short (short CKE LOW pulse), the power-down entry and power-down exit transition periods will overlap. When overlap occurs, the response of the DRAM's  $R_{TT}$  to a change in the ODT state may be synchronous or asynchronous from the start of the power-down entry transition period to the end of the power-down exit transition period even if the entry period ends later than the exit period.

If the time in the idle state is very short (short CKE HIGH pulse), the power-down exit and power-down entry transition periods overlap. When this overlap occurs, the response of the DRAM's  $R_{TT}$  to a change in the ODT state may be synchronous or asynchronous from the start of power-down exit transition period to the end of the power-down entry transition period.

**Figure 120: Transition Period for Short CKE LOW Cycles with Entry and Exit Period Overlapping**

Note: 1. AL = 0, WL = 5,  $t_{ANPD} = 4$ .

**Figure 121: Transition Period for Short CKE HIGH Cycles with Entry and Exit Period Overlapping**

Note: 1. AL = 0, WL = 5,  $t_{ANPD} = 4$ .
