## ST7588T

### 81 x 132 Dot Matrix LCD Controller/Driver

#### ■ INTRODUCTION

The ST7588T is a driver & controller LSI for graphic dot-matrix liquid crystal display systems. It contains 132 segment and 80 common+1ICON driver circuits. This chip is connected directly to a microprocessor, accepts 3-line serial peripheral interface (SPI), 4-line serial peripheral interface (SPI), I<sup>2</sup>C interface or 8-bit parallel interface, display data can stores in an on-chip display data RAM of 81 x 132 bits. It performs display data RAM read/write operation with no external operating clock to minimize power consumption. In addition, because it contains power supply circuits to drive liquid crystal, it is possible to make a display system with the fewest components.

#### ■ FEATURES

##### Single-chip LCD controller & driver

##### Driver Output Circuits

- 132 segment outputs / 81 common outputs

##### On-chip Display Data ram

- Capacity: 81X132=10,692 bits

##### Microprocessor Interface

- 8-bit parallel bi-directional interface with 6800-series or 8080-series
- 4-line A mode SPI (write only)
- 4-line B mode SPI (write only)
- 3-line 8 bit A mode SPI (write only)
- 3-line 8 bit B mode SPI (write only)
- 3 line 9 bit SPI (write only)
- I<sup>2</sup>C (Inter-Integrated Circuit) Interface (write only)

##### On-chip Low Power Analog Circuit

- Generation of LCD supply voltage (externally V<sub>OUT</sub> voltage supply is possible)
- Generation of intermediate LCD bias voltages
- Oscillator requires no external components (external clock also possible)
- Voltage converter (x2, x3, x4, x5, x6)
- Voltage regulator (temperature gradient -0.1%/°C)
- Voltage follower
- On-chip electronic contrast control (128 steps)

##### External RESB (reset) pin

##### Logic supply voltage range:

- V<sub>DD1</sub>: 1.8V to 3.3V
- V<sub>DD2</sub>: 2.4V to 3.3V

Temperature range: -30 to +85 °C

<b>ST7588T</b>	<b>6800, 8080, 4-Line, 3-Line interface (without I<sup>2</sup>C interface)</b>	
<b>ST7588Ti</b>	<b>I<sup>2</sup>C interface</b>	

# ST7588T

## ■ PAD ARRANGEMENT (COG)

Chip Size: 7,708  $\mu\text{m}$   $\times$  980  $\mu\text{m}$

### Bump Pitch:

PAD NO 1~185, 248~276: 45 $\mu\text{m}$  (COM/SEG)

PAD NO 186~187, 188~189, 191~192, 193~194, 195~196, 197~198, 199~200, 201~202, 213~214, 215~216: 119 $\mu\text{m}$

PAD NO 187~188, 189~190, 192~193, 194~195, 196~197, 198~199, 200~201, 209~211, 212~213, 214~215, 216~217,  
218~220: 73 $\mu\text{m}$

PAD NO 190~191: 134 $\mu\text{m}$ ; PAD NO 202~203: 77 $\mu\text{m}$ ; PAD NO 204~205, 206~207: 75 $\mu\text{m}$

PAD NO 203~204, 205~206: 175 $\mu\text{m}$ ; PAD NO 207~208: 150 $\mu\text{m}$ ; PAD NO 211~212, 217~218: 102 $\mu\text{m}$

PAD NO 220~221: 93 $\mu\text{m}$ ; PAD NO 208~209: 68 $\mu\text{m}$ ; PAD NO 221~243, 244~247: 70 $\mu\text{m}$  PAD NO 243~244: 145 $\mu\text{m}$

### Bump Size:

PAD NO 1~156, 174~185, 248~259: 30(x)  $\mu\text{m}$   $\times$  80(y)  $\mu\text{m}$

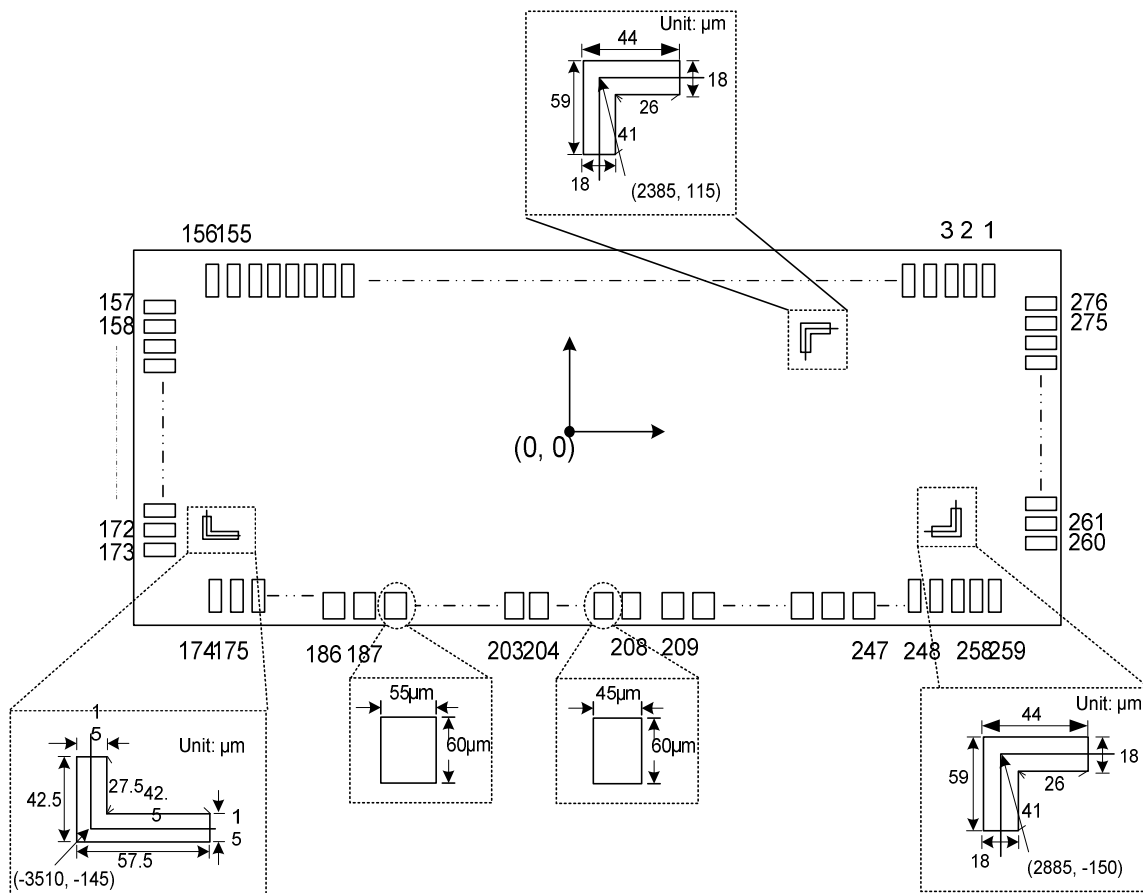

PAD NO 157~173, 260~276: 80(x)  $\mu\text{m}$   $\times$  30(y)  $\mu\text{m}$

PAD NO 186~202, 209~247: 55(x)  $\mu\text{m}$   $\times$  60(y)  $\mu\text{m}$

PAD NO 203~208: 45(x)  $\mu\text{m}$   $\times$  60(y)  $\mu\text{m}$

### Bump Height: 17 $\mu\text{m}$

### Chip Thickness: 480 $\mu\text{m}$

		L	8080-series	/WR	Write enable clock input pin The data on D0 to D7 are latched at the rising edge of the /WR signal	
When in the serial interface must fix to "H"						
/RD (E)	I	Read/Write execution control pin :				1
		PS2	MPU Type	/RD (E)	Description	
		H	6800-series	E	Read/Write control input pin R/W="H": When E is "H", D0 to D7 are in an output status. R/W="L": The data on D0 to D7 are latched at the falling edge of the E signal.	
		L	8080-series	/RD	Read enable clock input pin When /RD is "L", D0 to D7 are in an output status.	
When in the serial interface must fix to "H"						
D7 to D4 D1 to D3 (SDA) D0 (SCL)		<b>When the parallel interface selected: 8-bit interface</b> This is an 8-bit bi-directional data bus that connected to the standard 8-bit microprocessor data bus. When chip select is not active, D0 to D7 is high impedance.				
		<b>When the serial interface selected: 3 or 4-line</b> D0: serial input clock (SCL) D1 to D3: serial input data (SDA) D4, D5, D6, D7 : must fix to "H" When chip select is not active, D0 to D7 is high impedance.				
D7 to D6 (SA) D2 to D5 (SDA_OUT) D1 (SDA_IN) D0 (SCL)	I/O	<b>When the serial interface selected (PS2~0="H" ): I<sup>2</sup>C</b> D0: SCL, serial clock input. D1: SDA_IN, serial input data. D2 to D5: SDA_OUT, serial data acknowledge for the I <sup>2</sup> C interface. By connecting SDA_OUT to SDA_IN externally, the SDA line becomes fully I <sup>2</sup> C interface compatible. Having the acknowledge output separated from the serial data line is advantageous in chip on glass (COG) applications. In COG applications, a potential voltage divider on SDA track is formed by the I <sup>2</sup> C pull-up resistor and the ITO track resistance (due to the track resistance from the SDA_OUT pad to the system). It is possible that during the acknowledge cycle the IC will not be able to create a valid logic 0 level because of the ITO track resistance. By splitting the SDA_IN input from the SDA_OUT output, the device could be operated in the mode that ignores the acknowledge bit. In COG applications where the acknowledge cycle is required, it is necessary to minimize the track resistance from the SDA_OUT pad to the system SDA line to guarantee a valid low level. D6 and D7 are slave address bit 0 and 1 which can be set as 00 to 11.				8
		<b><u>D1 to D5 must be connected together (SDA)</u></b> Chip select input pin "CSB" is not used and must be fixed to "H"

## ITO Limitations

PIN Name	ITO Resistance
SYNC, /DOF, PS0~2, M0, M1, MS	No Limitation
T0~5	Floating
V <sub>DD1</sub> , V <sub>DD2</sub> , V <sub>SS</sub> , VRS, V <sub>OUT</sub>	<100Ω
D1~D5 (if operated as I <sup>2</sup> C mode)	<300Ω
CSB, CL, E, R/W, A0, D0~D7	<1KΩ
V0, V1, V2, V3, V4, CAP1P, CAP1N, CAP2P, CAP2N, CAP3P, CAP3N, CAP4P, CAP5P	<100Ω
RESB	<10KΩ

## FUNCTIONAL DESCRIPTION

### MICROPROCESSOR INTERFACE

#### Chip Select Input

There is CSB pin for chip selection. The ST7588T can interface with an MPU when CSB is "L". When these pins are set to any other combination, A0, /RD (E), and /WR(R/W) inputs are disabled and DB0 to DB7 are to be high impedance. And, in case of serial interface, the internal shift register and the counter are reset.

#### Selection Interface

ST7588T has eight types of interface with an MPU, which are six serial and two parallel interfaces. This parallel or serial interface is determined by PS0, PS1 and PS2 pin as shown in Table 1.

**Table 1 Parallel / Serial Interface Mode**

Type	PS2	PS1	PS0	Interface mode
Parallel	0	0	0	8bit 8080-series MPU mode
	1	0	0	8 bit 6800-series MPU mode
Serial	0	1	0	4-line serial interface A mode
	1	1	0	4-line serial interface B mode
	0	0	1	3-line (8 bit) serial interface A mode
	1	0	1	3-line (8-bit) serial interface B mode
	0	1	1	3-line (9-bit) serial interface
	1	1	1	I <sup>2</sup> C serial interface

#### Parallel Interface

The 8-bit bi-directional data bus is used in parallel interface and the type of MPU is selected by PS0 as shown in Table 2. The type of data transfer is determined by signals at A0, /RD (E) and /WR(R/W) as shown in Table 3.

**Table 2 Microprocessor Selection for Parallel Interface**

PS2	CSB	A0	E_RD	RW_WR	DB0 to DB7	MPU bus
H	CSB	A0	E	RW	DB0 to DB7	6800-series
L	CSB	A0	/RD	/WR	DB0 to DB7	8080-series

**Table 3 Parallel Data Transfer**

Common	6800-series		8080-series		Description
	E_RD (E)	RW_WR (RW)	E_RD (/RD)	RW_WR (/WR)	
A0	H	H	L	H	Display data read out
H	H	L	H	L	Display data write
L	H	H	L	H	Register status read
L	H	L	H	L	Writes to internal register (instruction)

NOTE: When E\_RD pin is always pulled high for 6800-series interface, it can be used CSB for enable signal. In this case, the interface data is latched at the rising edge of CSB and the type of data transfer is determined by signals at A0, RW\_WR as in case of 6800-series mode.

# ST7588T

## Serial Interface

### 4-Line SPI

When the ST7588T is active (CSB="L"), serial data (DB1~3) and serial clock (DB0) inputs are enabled. While not active, the internal 8-bit shift register and the 3-bit counter are reset. The display data/command indication may be controlled either by software or the Register Select (A0) Pin. When the A0 pin is used, data is display data when A0 is high and is command data when A0 is low. When A0 is not used, the LCD Driver will receive command from MCU by default. If messages on the data pin are data rather than command, MCU should send Data Direction command (11101000) to control the data direction and then one more command to define the number of data bytes will be write. After these two continuous commands are sent, the following messages will be data rather than command. Serial data can be read on the rising edge of serial clock going into DB6 and processed as 8-bit parallel data on the eighth serial clock. And the DDRAM column address pointer will be increased by one automatically. The next bytes after the display data string is handled as command data.

- (1) 4-Line SPI A Mode (PS0 = "L", PS1 = "H", PS2 = "L")

- (2) 4-Line SPI B Mode (PS0 = "L", PS1 = "H", PS2 = "H")

# ST7588T

## 3-Line SPI

### (1) 3-Line SPI (8 bit)

To write data to the DDRAM, set address and No. of Data Bytes before transferring data, then data will be latched at the rising edge of SCL. The DDRAM column address pointer will be increased by one automatically.

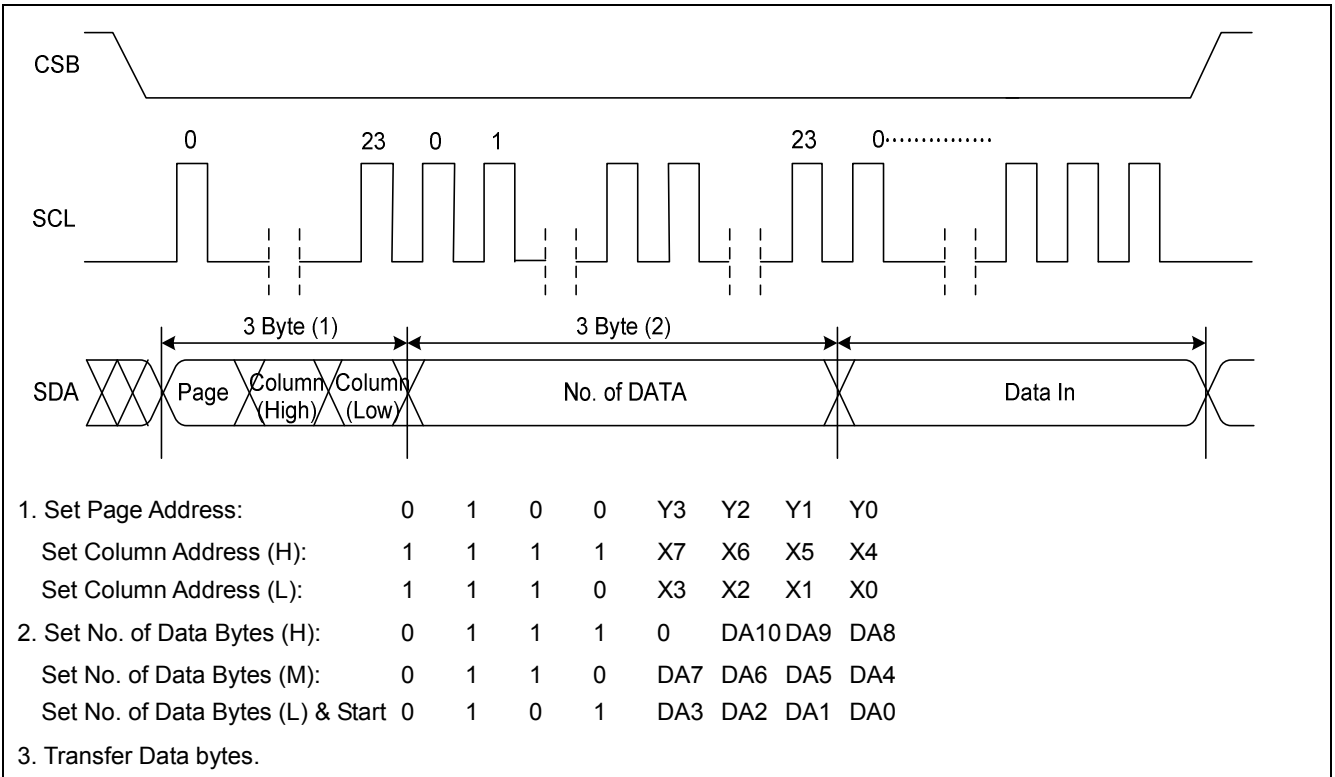

Figure 4 3-pin SPI (8 bit) A mode Timing (A0 is not used)

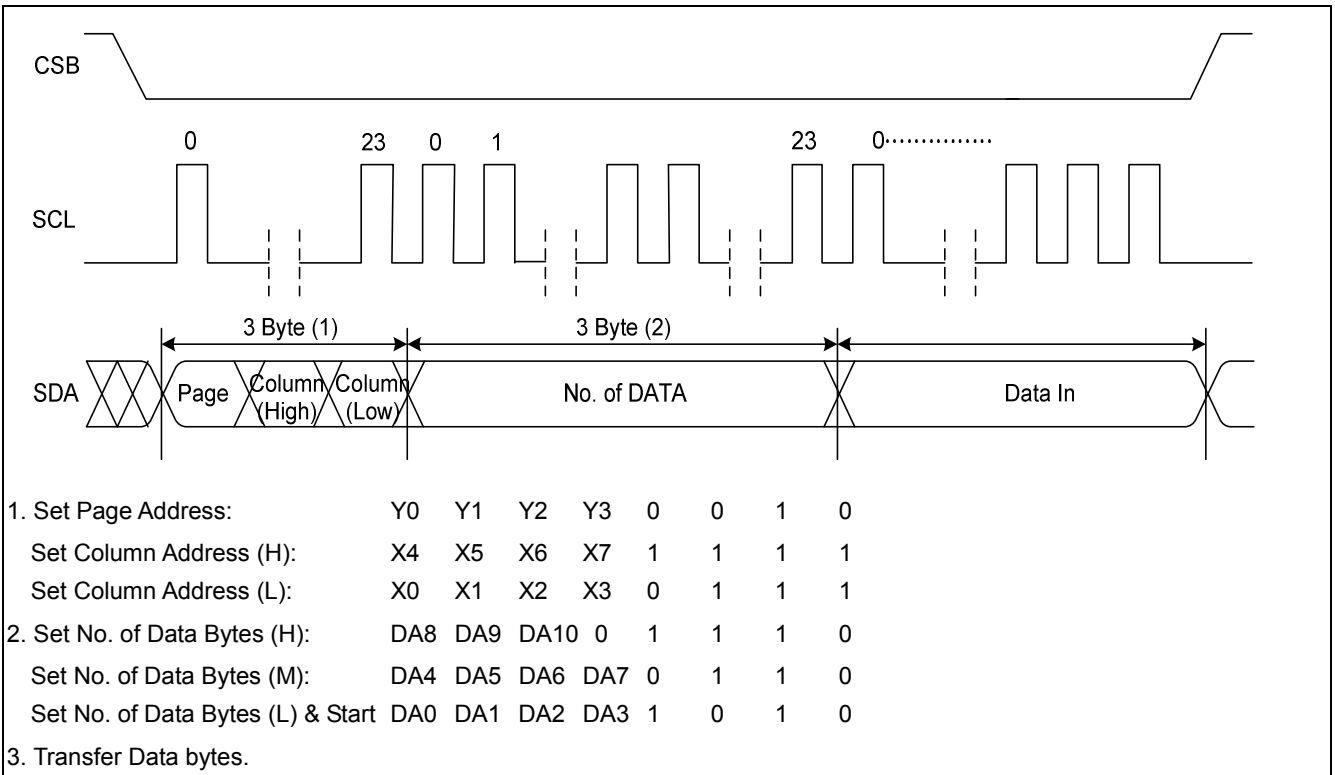

Figure 5 3-pin SPI (8 bit) B mode Timing (A0 is not used)

# ST7588T

This command is used in 3-Line SPI mode only. It will be 3 continuous commands; they contain the data length and inform the LCD driver the following bytes will be display data. After sending out these 3 commands, the following messages will be display data. If data is halted during transmitting, it is not valid data.

New data will be transferred serially with most significant bit first.

NOTE: In spite of transmission of data, if CSB is disabled, state stops abnormally. Next state is initialized.

(2) 3-Line SPI (9 bit)

In 3-Line mode, default message from MCU is command, the 2 bytes command of Set **Data Direction & Display Data Length** must be set before display data send from MCU, after the display data is sent over, the next message is turned to be command.

## I<sup>2</sup>C Interface

The I<sup>2</sup>C interface receives and executes the commands sent via the I<sup>2</sup>C Interface. It also receives RAM data and sends it to the RAM. The I<sup>2</sup>C Interface is for bi-directional, two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

(1) BIT TRANSFER

One data bit is transferred during each clock pulse. Data on the SDA line must remain stable during the HIGH period of the clock pulse, because data changes at this moment will be regarded as a control signal. Bit transfer is illustrated in Figure 8.

(2) START AND STOP CONDITIONS

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P). The START and STOP conditions are illustrated in Figure 9.

(3) SYSTEM CONFIGURATION

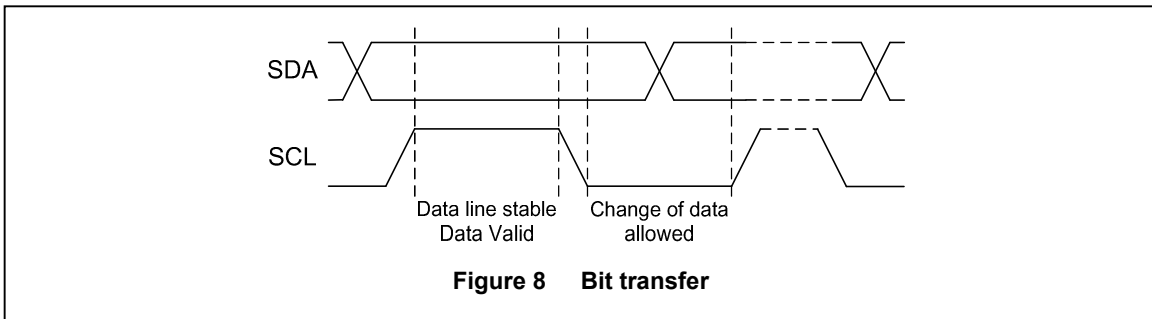

The system configuration is illustrated in Figure 10.

- Transmitter: the device that sends the data to the bus.
- Receiver: the device that receives the data from the bus.
- Master: the device that initiates transmission, generates clock signals, and terminates a transfer.
- Slave: the device addressed by a master.
- Multi-Master: more than one master can attempt to control the bus at the same time without corrupting the message.
- Arbitration: procedure to ensure that, if more than one master simultaneously tries to control the bus, only one is allowed to do so and the message is not corrupted.
- Synchronization: procedure to synchronize the clock signals of two or more devices.

(4) ACKNOWLEDGE

Each byte of eight bits is followed by an acknowledge bit. The acknowledge bit is a HIGH signal put on the bus by the transmitter during which time the master generates an extra acknowledge related clock pulse. A slave receiver which is

addressed must generate an acknowledgement after the reception of each byte. A master receiver must also generate an acknowledgement after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledgement related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal an end-of-data to the transmitter by not generating an acknowledgement on the last byte that has been clocked out of the slave. In this situation, the transmitter must leave the data line HIGH to enable the master to generate a STOP condition. Acknowledgement on the I<sup>2</sup>C Interface is illustrated in Figure 7.

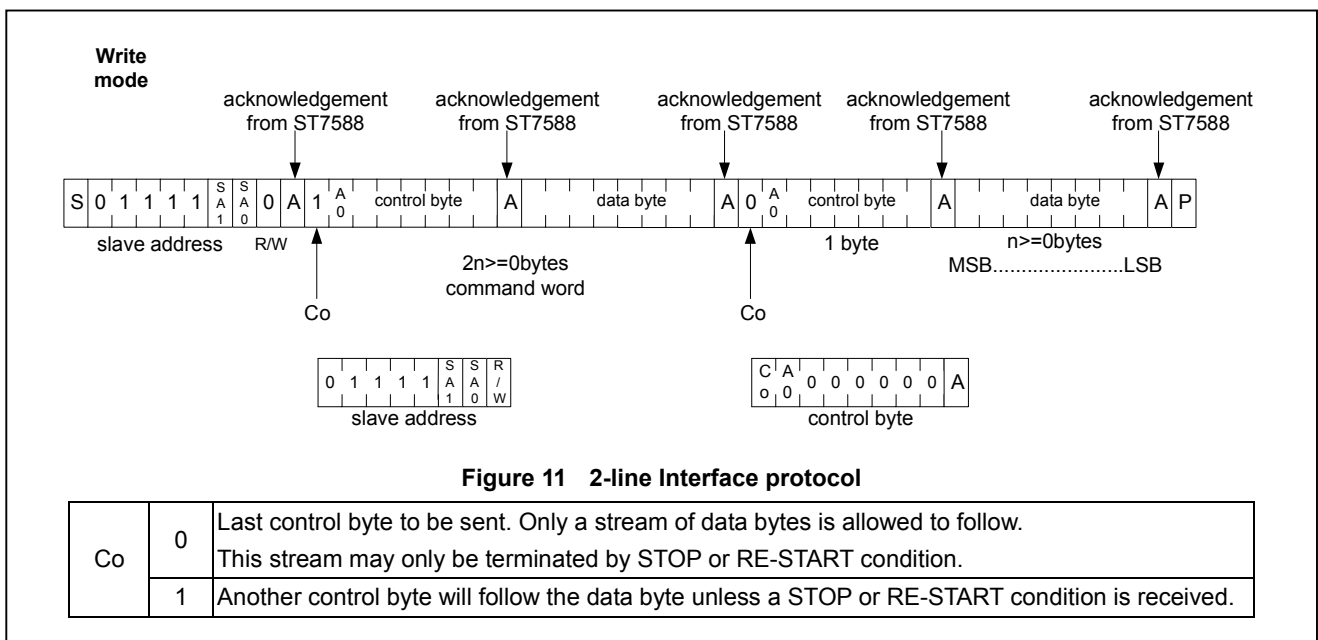

# ST7588T

## (5) I<sup>2</sup>C Interface protocol

The ST7588T supports command, data write addressed slaves on the bus. Before any data is transmitted on the I<sup>2</sup>C Interface, the device, which should respond, is addressed first. Four 7-bit slave addresses (0111100, 0111101, 0111110, and 0111111) are reserved for the ST7588T. The least significant bit of the slave address is set by connecting the input SA0 and SA1 to either logic 0 (V<sub>SS</sub>) or logic 1 (V<sub>DD1</sub>). The I<sup>2</sup>C Interface protocol is illustrated in Figure 11.

The sequence is initiated with a START condition (S) from the I<sup>2</sup>C Interface master, which is followed by the slave address. All slaves with the corresponding address acknowledge in parallel, all the others will ignore the I<sup>2</sup>C Interface transfer. After acknowledgement, one or more command words follow which define the status of the addressed slaves.

A command word consists of a control byte, which defines Co and A0, plus a data byte. The last control byte is tagged with a cleared most significant bit (i.e. the continuation bit Co). After a control byte with a cleared Co bit, only data bytes will follow. The state of the A0 bit defines whether the data byte is regarded as a command or as RAM data. All addressed slaves on the bus also acknowledge the control and data bytes. After the last control byte, depending on the A0 bit setting; either a series of display data bytes or command data bytes may follow. If the A0 bit is set to logic 1, these display bytes are stored in the display RAM at the address specified by the data pointer. The data pointer is automatically updated and the data is directed to the intended ST7588T device. If the A0 bit of the last control byte is set to logic 0, these command bytes will be decoded and the setting of the device will be changed according to the received commands. Only the addressed slave makes the acknowledgement after each byte. At the end of the transmission the I<sup>2</sup>C INTERFACE-bus master issues a STOP condition (P). If the R/W bit is set to logic 1 the chip will output data immediately after the slave address if the A0 bit, which was sent during the last write access, is set to logic 0. If the master generates no acknowledgement after a byte, the driver stops transferring data to the master.

## Data Transfer

The ST7588T uses bus holder and internal data bus for data transfer with the MPU. When writing data from the MPU to on-chip RAM, data is automatically transferred from the bus holder to the RAM as shown in Figure 12. Moreover, when reading data from on-chip RAM to the MPU, the data for the initial read cycle is stored in the bus holder (dummy read) and the MPU reads this stored data from bus holder for the next data read cycle as shown in Figure 13. This means that a dummy read cycle must be inserted between each pair of address sets when a sequence of address sets is executed. Therefore, the data of the specified address cannot be output with the read display data instruction right after the address sets, but can be output at the second read of data.

# ST7588T

## DISPLAY DATA RAM (DDRAM)

The ST7588T contains an 81X132 bit static RAM that stores the display data. The display data RAM store the dot data for the LCD. It has an 81(10 pageX8 bit +1 pageX1 bit) X 132. There is a direct correspondence between X-address and column output number. It is 81-row by 132-column addressable array. Each pixel can be selected when the page and column addresses are specified.

### Page Address Circuit

This circuit is for providing a Page Address to Display Data RAM. It incorporates 4-bit Page Address register changed by only the "Set Page" instruction. Page Address 11 is a special RAM area for the icons and display data D0 is only valid.

### Line Address Circuit

This circuit assigns DDRAM a Line Address corresponding to the first line (COM0) of the display. Therefore, by setting Line Address repeatedly, it is possible to realize the screen scrolling and page switching without changing the contents of on-chip RAM. It incorporates 7-bit Line Address register changed by only the initial display line instruction and 7-bit counter circuit. At the beginning of each LCD frame, the contents of register are copied to the line counter which is increased by CL signal and generates the line address for transferring the 132-bit RAM data to the display data latch circuit. When icon is selected by setting icon page address, display data of icons are not scrolled because the MPU cannot access Line Address of icons.

### Column Address Circuit

Column Address Circuit has an 8-bit preset counter that provides Column Address to the Display Data RAM as shown in Figure 14. The display data RAM column address is specified by the Column Address Set command. The specified column address is incremented (+1) with each display data read/write command. This allows the MPU display data to be accessed continuously.

Register MX and MY selection instruction makes it possible to invert the relationship between the Column Address and the segment outputs. It is necessary to rewrite the display data on built-in RAM after issuing MX select instruction. Refer to the following Figure 15.

#### SEG Output

MX	Segment Pads	
	SEG0	SEG131
"0"	Seg0	→ Segment Address → Seg131
"1"	Seg131	← Segment Address ← Seg0

#### COM Output

MY	Common Pads	
	COM0	COM79
"0"	Com0	→ Common Address → Com79
"1"	Com79	← Common Address ← Com0

Data is downloaded in bytes into the RAM matrix of ST7588T as indicated in Figs.14, 15, 16. The display RAM has a matrix of 81 by 132 bits. The address pointer addresses the columns. The address range is: X=0~131 (1000011); Y=0~10 (1010). Addresses out of this range are not allowed.

In horizontal addressing mode, the X address increments after each access (see Figure 16). After reaching the last X address (X = 131), X address wraps around to 0 and Y address increases to address the next row.

After the very last address (X = 131, Y = 10) the address pointers wrap around to address (X = 0, Y = 0)

## Data structure

Figure 14 RAM format and addressing, if DO=0

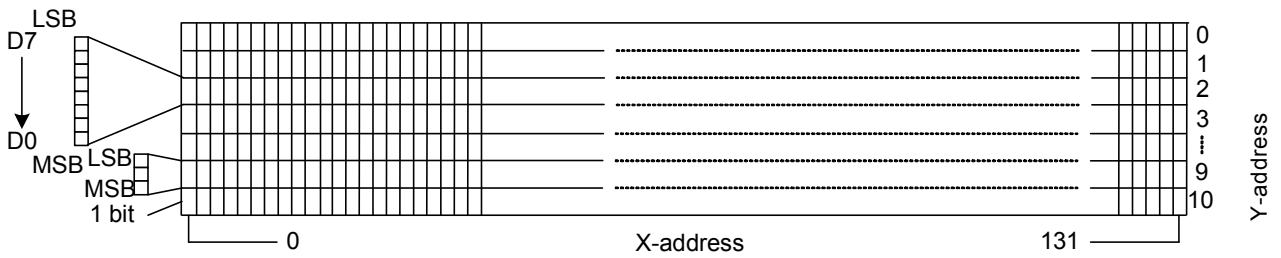

Figure 15 RAM format and addressing, if DO=1

Figure 16 Sequence of writing data bytes into RAM with horizontal addressing

## LCD DRIVER CIRCUIT

This driver circuit is configured by 81-channel common drivers and 132-channel segment drivers. This LCD panel driver voltage depends on the combination of display data and M (Frame Indicator) signal.

Figure 17 LCD Driver output waveform

## REFERENCE BOOSTER CIRCUIT EXAMPLE

**Figure 18 Booster Configuration**

**Notes:**

1. C1 = 1uF ~ 4.7uF. Please take care about the "Voltage Rating" of the capacitor.
2. V<sub>OUT</sub> should not exceed the Absolutely Maximum Rating.

## RESET CIRCUIT

Setting RESB to "L" or Reset instruction can initialize internal function.

When RESB becomes "L", the following procedure is entered.

Page address: 0

Column address: 0

Display control: Display blank

COM Scan Direction MY: 0

SEG Select Direction MX: 0

DO=0

Oscillator: OFF

N-line inversion register: 0 (disable)

Power down mode (PD = 1)

Normal instruction set (H[1:0] = 00)

Display blank (E = D = 0)

Address counter X [7:0] = 0, Y [3:0] = 0

Bias system (BS [2:0] = 010)

V0 is equal to 0; the HV generator is switched off ( $V_{OP}$  [6:0] = 0)

After power-on, RAM data are undefined

While RESB is "L" or reset instruction is executed, no instruction except read status can be accepted. Reset status appears at DB0. After DB0 becoming "L", any instruction can be accepted. RESB must be connected to the reset pin of the MPU, and initialize the MPU and this LSI at the same time. The initialization by RESB is essential before used.

## Partial Display on LCD

The ST7588T realizes the Partial Display function on LCD with low-duty driving for saving power consumption and showing the various display duty. To show the various display duty on LCD, LCD driving duty and bias are programmable via the instruction. Moreover, built-in power supply circuits are controlled by the instruction for adjusting the LCD driving voltages.

Figure 20 Reference Example for Partial Display

Figure 21 Partial Display (Partial Display Duty=16, initial COM0=0)

Figure 22 Moving Display (Partial Display Duty=16, Initial COM0=8)

## ■ INSTRUCTION DESCRIPTION

**H[1:0] is independent.**

### Write data

8-bit data of Display Data from the microprocessor can be written to the RAM location specified by the column address and page address. The column address is increased by 1 automatically so that the microprocessor can continuously write data to the addressed page. During auto-increment, the column address wraps to 0 after the last column is written.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	Write data							

### Read data

8-bit data of Display Data from the RAM location specified by the column address and page address can be read to the microprocessor.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
1	1	Read data							

### Read status byte

Indicates the internal status of the ST7588T

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	1	PD	0	V	D	E	MX	MY	DO

Flag	Description		
PD	PD=0:chip is active PD=1:chip is in power down mode		
V	When V = 0, the horizontal addressing is selected. When V = 1, the vertical addressing is selected.		
D,E	D	E	The bits D and E select the display mode.
	0	0	Display OFF
	0	1	All display segments on
	1	0	Normal mode
MX	SEG bi-direction selection		
	MY=0:normal direction (SEG0(SEG131) MY=1:reverse direction (SEG131(SEG0)		
MY	COM bi-direction selection		
	MY=0:normal direction (COM0(COM79) MY=1:reverse direction (COM79(COM0)		
DO	DO=0:MSB is on top		
	DO=1:LSB is on top		

### Function Set

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	MX	MY	PD	H1	H0

Flag	Description
MX	SEG bi-direction selection MY=0:normal direction (SEG0→SEG131); MY=1:reverse direction (SEG131→SEG0)
MY	COM bi-direction selection MY=0:normal direction (COM0→COM79); MY=1:reverse direction (COM79→COM0)
PD	PD=0:chip is active; PD=1:chip is in power down mode All LCD outputs at VSS (display off), bias generator and V <sub>OUT</sub> generator off, V <sub>0</sub> can be disconnected, oscillator off (external clock possible), RAM contents not cleared; RAM data can be written.
H0, H1	Selection of Extended Command Table

# ST7588T

## H[1:0]=[0:0]

### Set V0 (V<sub>OP</sub>) range

V0 (V<sub>OP</sub>) range L/H select

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	1	0	PRS

PRS=0: V0 (V<sub>OP</sub>) programming range LOW

PRS=1: V0 (V<sub>OP</sub>) programming range HIGH

### END

This command releases the read/modify/write mode, and returns the column and row address to the address it was at when the mode was entered.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	1	1	0

### Read/modify/write

This command is used coupled with the “END” command. Once this command has been input, the display data read command does not change the column and row address, but only the display data write command increments (+1) the address depend on V register setting. This mode is kept until the END command is input. When the END command is input, the address returns to the address it was at when the read/modify/write command was entered. This function makes it possible to reduce the load on the MPU when there are repeating data changes in a specified display region, such as when there is a blanking cursor.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	1	1	1

\* Even in read/modify/write mode, other commands aside from display data read/write commands can also be used.

# ST7588T

## Display Control

This bits D and E selects the display mode.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	1	D	0	E

Flag	Description		
D,E	D	E	The bits D and E select the display mode.
	0	0	Display OFF
	1	0	Normal display
	0	1	All display segments on
	1	1	Inverse video mode

## Set SI3-8 bit Data

### Display Data Length resister

This command is used in 8-bit 3-line SPI only. When A0 is not used, the Display Data Length instruction is used to indicate the specified number of display data byte to be transmitted. The next byte after the display data string is handled as data.

A0	WR (R/W)	D7	D6	D5	D4	D3	D2	D1	D0

1	0	0	0	0	0	0	0	128
1	0	0	0	0	0	0	1	129
1	0	0	0	0	0	1	0	130
1	0	0	0	0	0	1	1	131

## H[1:0]=[0:1]

### Display configuration

Top/bottom row mode set data order and the direction of Address.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	1	DO	0	V

Flag	Description
DO	DO=0:MSB is on top DO=1:LSB is on top
V	When V = 0, the horizontal addressing is selected. When V = 1, the vertical addressing is selected.

### System Bias

Select LCD bias ratio of the voltage required for driving the LCD.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	0	BS2	BS1	BS0

BS2	BS1	BS0	Bias	Recommend Duty
0	0	0	11	1/100
0	0	1	10	1/81
0	1	0	9	1/65, 1/68
0	1	1	8	1/49
1	0	0	7	1/40, 1/36
1	0	1	6	1/24
1	1	0	5	1/18, 1/16
1	1	1	4	1/10, 1/9, 1/8

### LCD bias voltage

Symbol	Bias voltage for 1/9 bias	Symbol	Bias voltage for 1/9 bias
V0	V0	V3	2/9 X V0
V1	8/9 X V0	V4	1/9 X V0
V2	7/9 X V0	V <sub>SS</sub>	V <sub>SS</sub>

# ST7588T

Set V0 (V<sub>OP</sub>) value:

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	1	V <sub>OP6</sub>	V <sub>OP5</sub>	V <sub>OP4</sub>	V <sub>OP3</sub>	V <sub>OP2</sub>	V <sub>OP1</sub>	V <sub>OP0</sub>

The operation voltage V0 (V<sub>OP</sub>) can be set by software.

$$V0 = V_{OP} = ( a + V_{OP} \times b ) \tag{1}$$

The parameters are described in table 4. The maximum voltage that can be generated is depending on the V<sub>DD1</sub> voltage and the display load current. Two overlapping V0 (V<sub>OP</sub>) ranges are selectable via the command “Booster control”. For the LOW (PRS=0) range a=a1 and for the HIGH (PRS=1) range a=a2 with steps equal to “b” in both ranges. **Note that the charge pump is turned off if V<sub>OP</sub> [6:0] and the bit PRS are all set to zero.**

SYMBOL	VALUE	UNIT
a1	3.528(PRS=0)	V
a2	8.862(PRS=1)	V
b	0.042	V

Table 4 Typical values for parameter for the HV-Generator programming

\* Recommended LCD V<sub>OP</sub> voltage is 9.5V~10.5V (1/10 Bias).

## H[1:0]=[1:0]

Partial screen mode

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	1	0	PS

Flag	Description
PS	Full display mode or partial screen mode selection. PS=0: Full display mode with MUX 1:80. PS=1: Partial screen mode with MUX 1:16 or MUX 1:32.

# ST7588T

## Partial screen size

This instruction controls partial screen size, partial screen 16 rows when WS is low and partial screen 32 rows when WS is high.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	1	0	0	WS

## Display part

This instruction can select partial screen display area.

**Note:** when 81 duty is selected, 4f (1001111) is MAX;  
 when 65 duty is selected, 3f (0111111) is MAX;  
 when 49 duty is selected, 2f (0101111) is MAX

# ST7588T

## H[1:0]=[1:1]

### Reset

This instruction resets initial display line, column address, page address, and common output status select to their initial status. This instruction cannot initialize the LCD power supply, which is initialized by the RESB pin.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	0	1	1

### High Power Mode

This command is to enter the high power mode. HP=1: high power mode, HP=0: normal mode.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	1	0	1	1	0	HP	0	0

### Frame frequency

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	1	FR2	FR1	FR0

This command is used to set the frame frequency.

FR2	FR1	FR0	Frame frequency
0	0	0	50 Hz
0	0	1	68 Hz
0	1	0	70 Hz
0	1	1	73 Hz
1	0	0	75 Hz
1	0	1	78 Hz
1	1	0	80 Hz
1	1	1	150 Hz

### Set N-line inversion

Sets the inverted line number within range of 3 to 33 to improve the display quality by controlling the phase of the internal LCD AC signal (M)

Note: The N-line inversion mode will be disabled when partial display mode enter. After the partial display mode end, the N-line inversion mode will return as it was.

■ COMMAND DESCRIPTION

Referential Instruction Setup Flow: Initializing with the built-in Power Supply Circuits

Figure 24 Initializing with the Built-in Power Supply Circuits

Referential Instruction Flow for Power Down:

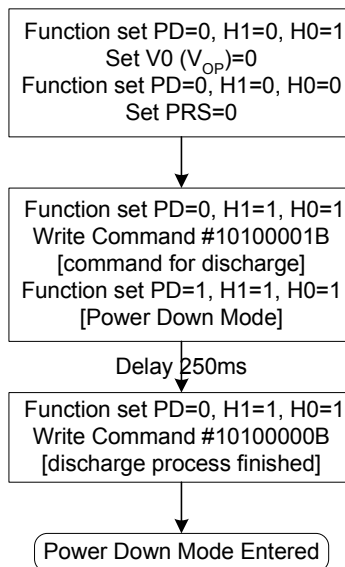

Figure 25 Instruction Flow for Power Down

## ■ ABSOLUTE MAXIMUM RATINGS

In accordance with the Absolute Maximum Rating System; see notes 1 and 2.

Parameter	Symbol	Conditions	Unit
Digital Power Supply Voltage	$V_{DD1}$	-0.3 ~ 3.6	V
Analog Power supply voltage	$V_{DD2}$	-0.3 ~ 3.6	V
LCD Operation Power supply voltage	$V_{OUT}, V_0$	-0.5 ~ +13.5	V
LCD Driving Power supply voltage	$V_1, V_2, V_3, V_4$	0.3 to $V_0$	V
Input voltage	$V_{IN}$	-0.5 to $V_{DD}+0.5$	V
Output voltage	$V_O$	-0.5 to $V_{DD}+0.5$	V
Operating temperature	$T_{OPR}$	-30 to +85	°C
Storage temperature	$T_{STR}$	-65 to +150	°C

### Notes

1. Stresses above those listed under Limiting Values may cause permanent damage to the device.
2. Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to  $V_{SS}$  unless otherwise noted.
3. Insure that the voltage levels of  $V_1, V_2, V_3,$  and  $V_4$  are always such that
 
$$V_{OUT} \geq V_0 \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_{SS}$$
4. Recommended LCD  $V_{OP}$  voltage is 9.5V~10.5V (1/10 Bias).

## DC CHARACTERISTICS

$V_{SS} = 0V$ ;  $T_{amb} = -30^{\circ}C$  to  $+85^{\circ}C$ ; unless otherwise specified.

Item	Symbol	Condition	Rating			Units	Applicable Pin	
			Min.	Typ.	Max.			
Operating Voltage (1)	$V_{DD1}$		1.8	--	3.3	V	$V_{DD1}$	
Operating Voltage (2)	$V_{DD2}$		2.4	--	3.3	V	$V_{DD2}$	
High-level Input Voltage	$V_{IHC}$		$0.7 \times V_{DD1}$	--	$V_{DD1}$	V		
Low-level Input Voltage	$V_{ILC}$		$V_{SS}$	--	$0.3 \times V_{DD1}$	V		
High-level Output Voltage	$V_{OHC}$	$I_{OH}=1mA$	$0.7 \times V_{DD1}$	--	$V_{DD1}$	V		
Low-level Output Voltage	$V_{OLC}$	$I_{OL}=1mA$	$V_{SS}$	--	$0.3 \times V_{DD1}$	V		
Input leakage current	$I_{LI}$	$V_{IN} = V_{DD1}$ or $V_{SS}$	-1.0	--	1.0	$\mu A$		
Liquid Crystal Driver ON Resistance	$R_{ON}$	$T_a = 25^{\circ}C$ (relative to $V_{SS}$ )	$V_0 = 11.0 V$	--	0.8	1.1	k $\Omega$	SEGn COMn
Oscillator Frequency	Internal Oscillator	$f_{OSC}$	1/81 duty	--	53	--	kHz	*1
	Frame Frequency	$f_{FRAME}$		--	80	--	Hz	

Item	Symbol	Condition	Rating			Units	Applicable Pin	
			Min.	Typ.	Max.			
Internal Power	Voltage Step-up Circuit output	$V_{OUT}$	(Relative To $V_{SS}$ )	--	--	13.5	V	$V_{SS}$ , *2

\* **Recommended LCD  $V_{OP}$  voltage is 9.5V~10.5V (1/10 Bias).**

Dynamic Consumption Current: During Display, with the Internal Power Supply OFF Current consumed by total ICs when an external power supply is used.

Test pattern	Symbol	Condition	Rating			Units	Notes
			Min.	Typ.	Max.		
Display Pattern SNOW	$I_{SS}$	$V_{DD} = 3.0 V$ , $V_0 - V_{SS} = 10.0 V$	--	120	--	$\mu A$	*3
Power Down	$I_{SS}$	$T_a = 25^{\circ}C$	--	0.05	2	$\mu A$	*4

### Notes to the DC characteristics:

1. Internal clock
2. The maximum possible  $V_{OUT}$  voltage that may be generated is dependent on voltage, temperature and (display) load.
3. If external  $V_0$  used, the display load current is not transmitted to  $I_{DD}$ .
4. Power-down mode. During power down, all static currents are switched off.

## TIMING CHARACTERISTICS

System Bus Read/Write Characteristics(For the 8080 Series MPU)

Figure 26

( $V_{DD} = 3.3V$ ,  $T_a = -30$  to  $85\text{ }^{\circ}\text{C}$ )

Item	Signal	Symbol	Condition	Rating		Units

# ST7588T

## THE MPU INTERFACE (REFERENCE EXAMPLES)

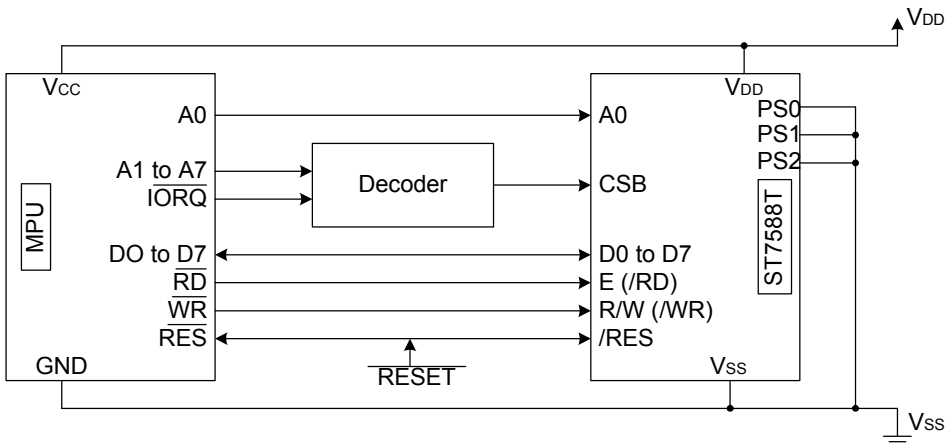

The ST7588T Series can be connected to either 80X86 Series MPU or to 6800 Series MPU. Moreover, using the serial interface it is possible to operate the ST7588T series chips with fewer signal lines.

The display area may be expanded by using multiple ST7588T Series chips. In this application, the chip select signal can be used to select the individual ICs to access.
