

MAXIM

MAX3724/MAX3725 Evaluation Kit

General Description

The MAX3724/MAX3725 evaluation kit (EV kit) allows complete evaluation of both versions of 3.2Gbps transimpedance amplifiers.

The EV kit includes a circuit that emulates the high speed, zero-to-peak current input signal that would be produced by a photodiode. The kit also includes a calibration circuit that allows accurate bandwidth measurement.

The MAX3724/MAX3725 EV kit is fully assembled and tested.

Features

- ◆ Fully Assembled and Tested
- ◆ Includes Photodiode Emulation Circuit
- ◆ Calibration Circuit for Accurate Bandwidth Measurement

Ordering Information

PART	TEMP RANGE	IC-PACKAGE
MAX3724EVKIT	-40°C to +85°C	Die
MAX3725EVKIT	-40°C to +85°C	Die

Electrical Evaluation Component List

DESIGNATION	QTY	DESCRIPTION
C3, C5, C6	3	0.01 μ F \pm 10% ceramic capacitors (0201)
C4, C7, C8, C10, C11	5	0.1 μ F \pm 10% ceramic capacitors (0402)
C2	1	10 μ F \pm 10% 10V min ceramic capacitor
C1	1	33 μ F \pm 5% 10V min tantalum capacitor
R3, R4, R11, R12	4	499 Ω \pm 1% resistor (0402)
R5, R8	2	4.99k Ω \pm 1% resistor (0402)
R6, R7	2	53.6 Ω \pm 1% resistor (0402)
R9, R10	2	49.9 Ω \pm 1% resistor (0402) MAX3724 EV board
		Not installed MAX3725 EV board
R13, R14	2	24.9 Ω \pm 1% resistor (0402) MAX3724 EV board
		0 Ω shunt resistor (0402) MAX3725 EV board
R15, R16	2	10k Ω \pm 1% resistor (0402)

Note: Please indicate that you are using the MAX3724/MAX3725 when contacting these component suppliers.

Quick Start

- 1) Connect a signal source to IN at J3. Set the signal amplitude to 100mVp-p (this may require some attenuation between the source and the MAX3724/MAX3725 EV kit.) The signal should have a data rate of 3.2Gbps.
- 1) Connect OUT+ and OUT- to the 50Ω inputs of a high-speed oscilloscope at J6 and J7.
- 3) Remove the shunt from jumper JU1.
- 4) Connect a +3.3V supply to the VCC terminal and ground to the GND terminal.
- 5) The differential signal at the oscilloscope should be greater than 280mVp-p (140mVp-p on MAX3724 EV Kit).

Detailed Description

The MAX3724/MAX3725 EV kit allows characterisation without a photodiode. The kit is designed to emulate a DC-coupled photodiode input. Diode currents may have 6uA_{pp} to 2mA_{pp} AC-current with a DC component from 10uA to 1mA. The high-speed current source of the photodiode is emulated on the EV kit using separate AC and DC paths. The AC signal is supplied from a standard 50Ω lab source that delivers power to an on board termination resistor. A current is then generated from the voltage signal by a resistor with low stray capacitance. The effect of the DC photodiode current may be emulated by a current source at TP1. An isolation resistor prevents the DC source from loading the AC path.

The values of the series resistive element, R3 and R4, have been carefully selected so that the bandwidth of

the transimpedance amplifier is not altered. Surface-mount resistors have parasitic capacitance that may reduce their impedance at frequencies above 1GHz.

Photodiode Emulation

The following procedure can be used to emulate the high-speed current signal generated by a photodiode:

- 1) Select the desired optical power (P_{AVE} , dBm) and extinction ratio (r_e).
- 2) Calculate the average current (I_{AVE} , A). Set the DC current at TP1 to I_{AVE} .

$$I_{AVE} = \frac{10^{(P_{AVE}/10)}}{1000} \cdot \rho$$

(ρ = photodiode responsivity in A/W)

- 3) Calculate the AC signal current and adjust the signal generator to obtain it.

$$I_{AC} = 2 \cdot I_{AVE} \cdot \frac{r_e - 1}{r_e + 1}$$

For example: To emulate a photodiode with an average power of -16dBm and an extinction ratio of 10;

- 1) -16dBm optical power will produce 25μA of average input current (assume photodiode responsivity of 1A/W). Set the DC current input to 25μA at TP1.
- 2) The signal amplitude is $2 I_{AVE} (r_e - 1)/(r_e + 1) = 41\mu A$. To generate this current through the 1000Ω input resistors, set the signal source to produce an output level of

$$41\mu A \cdot 1000 \Omega = 41mVp-p.$$

Noise Measurement

Remove R3 and R4 before attempting noise measurements to minimize input capacitance. With R3 and R4 removed the total capacitance at the IN pin is approximately 0.85pF.

RSSI (MAX3724)

The Average Power at the MAX3724 input is indicated by the common mode output measured at TP2 and TP3. Refer to the MAX3724 data sheet for details.

Adjustments and Control Descriptions

COMPONENT	NAME	FUNCTION
JU1	OFFSET CORRECTION	Instal JU1 to disable offset correction.
TP1	DC CURRENT INPUT	Apply DC current for photodiode simulation.
TP2, TP3	OUTPUT COMMON MODE	MAX3724 RSSI Signal
