1 i.MX 8M Nano introduction

The i.MX 8M Nano application processor represents NXP’s latest graphics and audio experience combining state-of-the-art media-specific features with high-performance processing while optimized for lowest power consumption.

The i.MX 8M Nano family of processors features advanced implementation of a quad Arm® Cortex®-A53 core, which operates at speeds of up to 1.4 GHz. A general purpose Cortex®-M7 running up to 750 MHz core processor is for real-time and low-power processing.

The i.MX 8M Nano family of processors provides additional computing resources and peripherals:

- Advanced security modules for secure boot, cipher acceleration and DRM support
- A wide range of audio interfaces, including I2S, AC 97, TDM, and S/PDIF
- Large set of peripherals that are commonly used in consumer/industrial market, including USB and Ethernet

2 Modules list

The i.MX 8M Nano family of processors contains a variety of digital and analog modules. [Table 4](#) describes these modules in alphabetical order.

Table 4. i.MX 8M Nano modules list

Block mnemonic	Block name	Brief description
APBH-DMA	NAND Flash and BCH ECC DMA Controller	DMA controller used for GPMI2 operation.
Arm	Arm Platform	The Arm Core Platform includes a quad Cortex-A53 core and a Cortex-M7 core. The Cortex-A53 core includes associated sub-blocks, such as the Level 2 Cache Controller, Snoop Control Unit (SCU), General Interrupt Controller (GIC), private timers, watchdog, and CoreSight debug modules. The Cortex-M7 core is used as a customer microcontroller.
BCH	Binary-BCH ECC Processor	The BCH module provides up to 62-bit ECC encryption/decryption for NAND Flash controller (GPMI)
CAAM	Cryptographic accelerator and assurance module	CAAM is a cryptographic accelerator and assurance module. CAAM implements several encryption and hashing functions, a run-time integrity checker, entropy source generator, and a Pseudo Random Number Generator (PRNG). The PRNG is certifiable by the Cryptographic Algorithm Validation Program (CAVP) of the National Institute of Standards and Technology (NIST). CAAM also implements a Secure Memory mechanism. In i.MX 8M Nano processors, the secure memory provided is 32 KB.
CCM GPC SRC	Clock Control Module, General Power Controller, System Reset Controller	These modules are responsible for clock and reset distribution in the system, and also for the system power management.
CSU	Central Security Unit	The Central Security Unit (CSU) is responsible for setting comprehensive security policy within the i.MX 8M Nano platform.
CTI-0 CTI-1 CTI-2 CTI-3 CTI-4	Cross Trigger Interface	Cross Trigger Interface (CTI) allows cross-triggering based on inputs from masters attached to CTIs. The CTI module is internal to the Cortex-A53 core platform.
DAP	Debug Access Port	The DAP provides real-time access for the debugger without halting the core to access: <ul style="list-style-type: none"> • System memory and peripheral registers • All debug configuration registers The DAP also provides debugger access to JTAG scan chains.
DDRC	Double Data Rate Controller	The DDR Controller has the following features: <ul style="list-style-type: none"> • Supports 16-bit LPDDR4-3200, DDR4-2400, and DDR3L-1600 • Supports up to 8 Gbyte DDR memory space
eCSPI1 eCSPI2 eCSPI3	Configurable SPI	Full-duplex enhanced Synchronous Serial Interface, with data rate up to 52 Mbit/s. Configurable to support Master/Slave modes, four chip selects to support multiple peripherals.

Table 4. i.MX 8M Nano modules list (continued)

Block mnemonic	Block name	Brief description
ENET1	Ethernet Controller	The Ethernet Media Access Controller (MAC) is designed to support 10/100/1000 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The module has dedicated hardware to support the IEEE 1588 standard. See the ENET chapter of the <i>i.MX 8M Nano Applications Processor Reference Manual (IMX8MNRM)</i> for details.
FlexSPI	FlexSPI	The FlexSPI module acts as an interface to external serial flash devices. This module contains the following features: <ul style="list-style-type: none"> • Flexible sequence engine to support various flash vendor devices • Single pad/Dual pad/Quad pad mode of operation • Single Data Rate/Double Data Rate mode of operation • Parallel Flash mode • DMA support • Memory mapped read access to connected flash devices • Multi master access with priority and flexible and configurable buffer for each master
GIC	Generic Interrupt Controller	The GIC handles all interrupts from the various subsystems and is ready for virtualization.
GPC	General Power Control Module	The GPC independently control reset and gated clock to each switched power domain when powering on/off the domain.
GPIO1 GPIO2 GPIO3 GPIO4 GPIO5	General Purpose I/O Modules	Used for general purpose input/output to external ICs. Each GPIO module supports up to 32 bits of I/O.
GPMI	General Purpose Memory Interface	The GPMI module supports up to 8x NAND devices and 62-bit ECC encryption/decryption for NAND Flash Controller (GPMI2). GPMI supports separate DMA channels for each NAND device.
GPT1 GPT2 GPT3 GPT4 GPT5 GPT6	General Purpose Timer	Each GPT is a 32-bit “free-running” or “set-and-forget” mode timer with programmable prescaler and compare and capture register. A timer counter value can be captured using an external event and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in “set-and-forget” mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock.
GPU3D	Graphics Processing Unit-3D	The GPU3D provides hardware acceleration for 3D graphics algorithms with sufficient processor power to run desktop quality interactive graphics applications on displays.
I2C1 I2C2 I2C3 I2C4	I ² C Interface	I ² C provides serial interface for external devices. Data rates of up to 320 kbps are supported.

Table 4. i.MX 8M Nano modules list (continued)

Block mnemonic	Block name	Brief description
IOMUXC	IOMUX Control	This module enables flexible I/O multiplexing. Each IO pad has a default as well as several alternate functions. The alternate functions are software configurable.
LCDIF	LCD interface	The LCDIF is a general purpose display controller used to drive a wide range of display devices varying in size and capability, the key feature of the display controller includes: <ul style="list-style-type: none"> • Support 8-bit/16-bit/24-bit/32-bit pixel depth • Support DOTCLK mode for MIPI-DPI interface • Support resolution up to 1920 x1200p60
MIPI CSI (four-lane)	MIPI Camera Serial Interface	This module provides one four-lane MIPI camera serial interfaces, which operates up to a maximum bit rate of 1.5 Gbps.
MIPI DSI (four-lane)	MIPI Display Serial Interface	This module provides a four-lane MIPI display serial interface operating up to a maximum bit rate of 1.5 Gbps.
OCOTP_CTRL	OTP Controller	The On-Chip OTP controller (OCOTP_CTRL) provides an interface for reading, programming, and/or overriding identification and control information stored in on-chip fuse elements. The module supports electrically programmable poly fuses (eFUSEs). The OCOTP_CTRL also provides a set of volatile software-accessible signals that can be used for software control of hardware elements, not requiring non volatility. The OCOTP_CTRL provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, JTAG secure mode, boot characteristics, and various control signals requiring permanent non volatility.
OCRAM	On-Chip Memory controller	The On-Chip Memory controller (OCRAM) module is designed as an interface between the system's AXI bus and the internal (on-chip) SRAM memory module. In i.MX 8M Nano processors, the OCRAM is used for controlling the 512 KB multimedia RAM through a 64-bit AXI bus.
PDM	Pulse Density Modulation	The PDM supports up to 8-channels (4 lanes).
PWM1 PWM2 PWM3 PWM4	Pulse Width Modulation	The pulse-width modulator (PWM) has a 16-bit counter and is optimized to generate sound from stored sample audio images. It can also generate tones. It uses 16-bit resolution and a 4x16 data FIFO to generate sound.
SAI2 SAI3 SAI5 SAI6 SAI7	Synchronous Audio Interface	The SAI module provides a synchronous audio interface (SAI) that supports full duplex serial interfaces with frame synchronization, such as I2S, AC97, TDM, and codec/DSP interfaces.

Table 4. i.MX 8M Nano modules list (continued)

Block mnemonic	Block name	Brief description
SDMA	Smart Direct Memory Access	<p>The SDMA is a multichannel flexible DMA engine. It helps in maximizing system performance by offloading the various cores in dynamic data routing. It has the following features:</p> <ul style="list-style-type: none"> • Powered by a 16-bit Instruction-Set micro-RISC engine • Multi channel DMA supporting up to 32 time-division multiplexed DMA channels • 48 events with total flexibility to trigger any combination of channels • Memory accesses including linear, FIFO, and 2D addressing • Shared peripherals between Arm and SDMA • Very fast Context-Switching with 2-level priority based preemptive multi tasking • DMA units with auto-flush and prefetch capability • Flexible address management for DMA transfers (increment, decrement, and no address changes on source and destination address) • DMA ports can handle unidirectional and bidirectional flows (Copy mode) • Up to 8-word buffer for configurable burst transfers for EMIv2.5 • Support of byte-swapping and CRC calculations • Library of Scripts and API is available
SJC	Secure JTAG Controller	<p>The SJC provides JTAG interface (designed to be compatible with JTAG TAP standards) to internal logic. The i.MX 8M Nano family of processors uses JTAG port for system debugging. The JTAG port must be accessible during platform initial laboratory bring-up, for troubleshooting, as well as for software debugging by authorized entities. The i.MX 8M Nano SJC incorporates three security modes for protecting against unauthorized accesses. Modes are selected through eFUSE configuration.</p>
SNVS	Secure Non-Volatile Storage	Secure Non-Volatile Storage, including Secure Real Time Clock, Security State Machine, Master Key Control, and Violation/Tamper Detection and reporting.
SPDIF1	Sony Philips Digital Interconnect Format	A standard audio file transfer format, developed jointly by the Sony and Phillips corporations. It supports Transmitter and Receiver functionality.
TEMPSENSOR	Temperature Sensor	Temperature sensor
TZASC	Trust-Zone Address Space Controller	The TZASC (TZC-380 by Arm) provides security address region control functions required for intended application. It is used on the path to the DRAM controller.
UART1 UART2 UART3 UART4	UART Interface	<p>Each of the UARTv2 modules supports the following serial data transmit/receive protocols and configurations:</p> <ul style="list-style-type: none"> • 7- or 8-bit data words, 1 or 2 stop bits, programmable parity (even, odd, or none) • Programmable baud rates up to 4 Mbps. This is a higher max baud rate relative to the 1.875 MHz, which is stated by the TIA/EIA-232-F standard. • 32-byte FIFO on Tx and 32 half-word FIFO on Rx supporting auto-baud

Table 4. i.MX 8M Nano modules list (continued)

Block mnemonic	Block name	Brief description
uSDHC1 uSDHC2 uSDHC3	SD/MMC and SDXC Enhanced Multi-Media Card / Secure Digital Host Controller	i.MX 8M Nano SoC characteristics: All the MMC/SD/SDIO controller IPs are based on the uSDHC IP. They are designed to support: <ul style="list-style-type: none"> • SD/SDIO standard, up to version 3.0. • MMC standard, up to version 5.1. • 1.8 V and 3.3 V operation, but do not support 1.2 V operation. • 1-bit/4-bit SD and SDIO modes, 1-bit/4-bit/8-bit MMC mode. One uSDHC controller (SD1) can support up to an 8-bit interface, the other controller (SD2) can only support up to a 4-bit interface.
USB 2.0	1x USB 2.0 controller and PHY	One USB controller and PHY that support USB 2.0.
WDOG1 WDOG2 WDOG3	Watchdog	The watchdog (WDOG) timer supports two comparison points during each counting period. Each of the comparison points is configurable to evoke an interrupt to the Arm core, and a second point evokes an external event on the WDOG line.

2.1 Recommended connections for unused input/output

If a function of the i.MX 8M Nano is not in use, the I/Os and power rails of that function can be terminated to reduce overall board power.

¹ Applying the maximum voltage results in maximum power consumption and heat generation. A voltage set point = (V_{min} + the supply tolerance) is recommended. This results in an optimized power/speed ratio.

² For VDD_ARM at 1.0V typical, Power-on Hours will decreased if junction temperature is increased. Please refer to *i.MX 8M Nano Product Lifetime Usage (AN12983)* for details.

³ VDD_DRAM, VDD_SOC, and VDD_GPU are required to be tied together and keep same or ground.

⁴ Booting VDD_SOC at 0.800 V ±5% is acceptable (V_{min} = 0.760 V). Software is expected to program the VDD_SOC voltage to the typical value in this table prior to first DRAM memory access.

⁵ “EN” of TMU Enable Register (TMU_TER) is required to be always enabled for the part to operate correctly.

3.1.4 External clock sources

Each i.MX 8M Nano processor has two external input system clocks: a low frequency (RTC_XTALI) and a high frequency (XTALI).

The RTC_XTALI is used for low-frequency functions. It supplies the clock for wake-up circuit, power-down real time clock operation, and slow system and watch-dog counters. The clock input can only be connected to an external oscillator. RTC_XTALO should be directly connected to VDD_SNVS_0P8.

The system clock input XTALI is used to generate the main system clock. It supplies the PLLs and other peripherals. The system clock input can be connected to either an external oscillator or a crystal using internal oscillator amplifier.

Table 17 shows the interface frequency requirements.

Table 17. External input clock frequency

Parameter Description	Symbol	Min	Typ	Max	Unit
RTC_XTALI Oscillator ¹	f _{ckil}	—	32.768 ²	—	KHz
XTALI Oscillator ^{1,3}	f _{xtal}		24		MHz

Electrical characteristics

- ¹ The required frequency stability of this clock source is application dependent.
- ² Recommended nominal frequency 32.768 kHz.
- ³ External oscillator or a fundamental frequency crystal appropriately coupled to the internal oscillator amplifier.

The typical values shown in [Table 17](#) are required for use with NXP software to ensure precise time keeping and USB operation. For RTC_XTALI operation, an external oscillator is necessary. RTC_XTALO should be directly connected to VDD_SNV5_0P8 when using an external 32.768 kHz oscillator.

NOTE

There is no internal RC oscillator.

[Table 18](#) shows the external input clock for OSC32K.

3.1.5 Estimated power supply maximum currents

Power consumption is highly dependent on the application. Estimating the maximum supply currents required for power supply design is difficult because the use cases that requires maximum supply current is not a realistic use cases.

The table below represents the estimated maximum current on the power supply rails and should be used as a guideline for power supply selection. The data below is based on a combination of design simulation and characterization data based on typical datasheet voltages. Actual power consumption for typical use cases are lower than values presented on the table below.

3.1.6 Power modes

The i.MX 8M Nano supports the following power modes:

- **RUN Mode:** All external power rails are on, CPU is active and running; other internal modules can be on/off based on application.
- **IDLE Mode:** When there is no thread running and all high-speed devices are not active, the CPU can automatically enter this mode. The CPU can be in the power-gated state but with L2 data retained, DRAM and the bus clock are reduced. Most of the internal logic is clock gated but still remains powered. The M7 core can remain running. Compared with RUN mode, all the external power rails from the PMIC remain the same, and most of the modules still remain in their state.
- **SUSPEND Mode:** The most efficient power saving mode where all the clocks are off and all the unnecessary power supplies are off.

Electrical characteristics

- SNVS Mode: This mode is also called RTC mode. Only the power for the SNVS domain remains on to keep RTC and SNVS logic alive.
- OFF Mode: All power rails are off.

3.2 Power supplies requirements and restrictions

The system design must comply with power-up sequence, power-down sequence, and steady state guidelines as described in this section to guarantee the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the processor (worst-case scenario)

3.2.1 Power-up sequence

Figure 3 illustrates the power-up sequence for 14 x 14 mm package of i.MX 8M Nano applications processor.

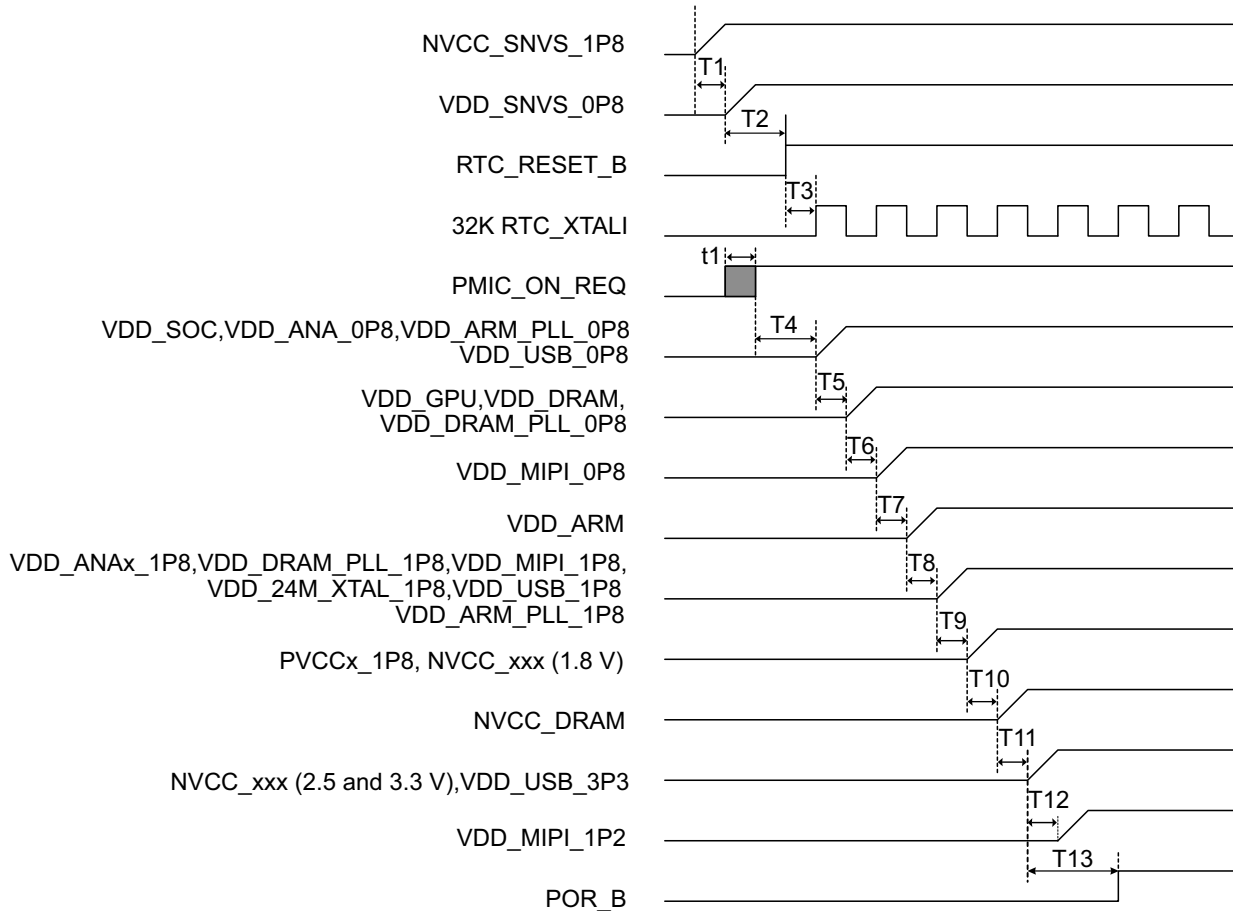

Figure 3. The power-up sequence for 14 x 14 mm package

NOTE

VDD_MIPI_1P2 should power up after VDD_MIPI_0P8 and VDD_MIPI_1P8, and it can power up before the POR_B release or after the POR_B release.

Table 26 represents the timing parameters of the power-up sequence for 14 x 14 mm package.

3.4 On-chip oscillators

3.4.1 OSC24M

A 24 MHz oscillator is used as the primary clock source for the PLLs to generate the clock for the CPU, BUS, and high-speed interfaces. For fractional PLLs, the 24 MHz clock from the oscillator can be used as the PLL reference clock directly.

Drive level	10.02	—	100	μ W
ESR	—	—	60	Ω

¹ Actual working drive level is depend on real design. Please contact crystal vendor for selecting drive level of crystal.

3.4.2 OSC32K

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements a low power oscillator.

Table 32. 32K crystal specifications

Parameter Description	Min	Typ	Max	Unit
Frequency	—	32.768	—	kHz

Drive level ²	17.74	—	1000	nW
ESR ³	—	—	70K	—
Rf (feedback resistor) ⁴	4.7	—	—	MΩ
Rs (series resistor) ⁵	0	—	1	MΩ

¹ CL is the load capacitance of the crystal that is recommended by the crystal vendors to obtain target clock frequency. CL is given by the following formula: $CL = \{CL1 \times CL2 / (CL1 + CL2)\} + PCB \text{ strays}$

² Actual working drive level is depend on real design. Please contact crystal vendor for selecting drive level of crystal.

³ ESR is the equivalent series resistance of the crystal.

⁴ Rf is the feedback resistor to bias the amplifier. A larger value of Rf is preferred at lower frequencies.

⁵ Rs is the series resistor to limit amplifier gain and reduce power dissipation in the crystal.

3.5.1 DDR I/O DC electrical characteristics

The DDR I/O pads support LPDDR 4, DDR4, and DDR3L operational modes. The DDR Memory Controller (DDRM) is designed to be compatible with JEDEC-compliant SDRAMs.

DDRM operation is contingent upon the board's DDR design adherence to the DDR design and layout requirements stated in the hardware development guide for the i.MX 8M Nano applications processor.

3.6 I/O AC parameters

This section includes the AC parameters of the following I/O types:

- General Purpose I/O (GPIO)

The GPIO load circuit and output transition time waveforms are shown in [Figure 8](#) and [Figure 9](#).

Figure 8. Load circuit for output

3.6.1 General purpose I/O AC parameters

This section presents the I/O AC parameters for GPIO in different modes. Note that the fast or slow I/O behavior is determined by the appropriate control bits in the IOMUXC control registers.

3.7 Output buffer impedance parameters

This section defines the I/O impedance parameters of the i.MX 8M Nano family of processors for the following I/O types:

NOTE

DDR I/O output driver impedance is measured with “long” transmission line of impedance Z_{tl} attached to I/O pad and incident wave launched into transmission line. R_{pu}/R_{pd} and Z_{tl} form a voltage divider that defines specific voltage of incident wave relative to OVDD. Output driver impedance is calculated from this voltage divider (see [Figure 10](#)).

Figure 10. Impedance matching load for measurement

3.7.1 DDR I/O output buffer impedance

Table 37 shows DDR I/O output buffer impedance of i.MX 8M Nano family of processors.

Table 37. DDR I/O output buffer impedance

Parameter	Symbol	Test Conditions DSE (Drive Strength)	Typical			Unit
			NVCC_DRAM = 1.35 V (DDR3L)	NVCC_DRAM = 1.2 V (DDR4)	NVCC_DRAM = 1.1 V (LPDDR4)	
Output Driver Impedance	Rdrv	000000	Hi-Z	Hi-Z	Hi-Z	Ω
		000010	240	240	240	
		001000	120	120	120

		011010	48	48	48	
		111000	40	40	40	
		111010	34	34	34	

Note:

1. Output driver impedance is controlled across PVTs using ZQ calibration procedure.
2. Calibration is done against 240 Ω external reference resistor.
3. Output driver impedance deviation (calibration accuracy) is ±5% (max/min impedance) across PVTs.

3.8 System modules timing

This section contains the timing and electrical parameters for the modules in each i.MX 8M Nano processor.

3.8.1 Reset timings parameters

Figure 11 shows the reset timing and Table 38 lists the timing parameters.

Figure 11. Reset timing diagram

NOTE

RTC_XTALI is approximately 32 kHz. RTC_XTALI cycle is one period or approximately 30 μ s.

NOTE

WDOGx_B output signals (for each one of the Watchdog modules) do not have dedicated pins, but are muxed out through the IOMUX. See the IOMUXC chapter of the *i.MX 8M Nano Applications Processor Reference Manual* (IMX8MNRM) for detailed information.

3.9 External peripheral interface parameters

The following subsections provide information on external peripheral interfaces.

3.9.1 ECSPI timing parameters

This section describes the timing parameters of the ECSPI blocks. The ECSPI have separate timing parameters for master and slave modes.

3.9.1.1 ECSPi Master mode timing

Figure 13 depicts the timing of ECSPi in master mode. Table 40 lists the ECSPi master mode timing characteristics.

¹ In Low-Speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

² In Normal (Full) -Speed mode for SD/SDIO card, clock frequency can be any value between 0 – 25 MHz. In High-speed mode, clock frequency can be any value between 0 – 50 MHz.

³ In Normal (Full) -Speed mode for MMC card, clock frequency can be any value between 0 – 20 MHz. In High-speed mode, clock frequency can be any value between 0 – 52 MHz.

⁴ To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

3.9.2.2 eMMC5.1/SD3.0 (dual data rate) AC timing

Figure 16 depicts the timing of eMMC5.1/SD3.0 (DDR). Table 43 lists the eMMC5.1/SD3.0 (DDR) timing characteristics. Be aware that only DATA is sampled on both edges of the clock (not applicable to CMD).

3.9.2.6 Bus operation condition for 3.3 V and 1.8 V signaling

Signaling level of SD/eMMC4.5/5.0/5.1 can be 1.8 V or 3.3 V depending on the working mode. The DC parameters for the NVCC_SD1, NVCC_SD2 and NVCC_SD3 supplies are identical to those shown in Table 33, "GPIO DC parameters," on page 36.

3.9.3 Ethernet controller (ENET) AC electrical specifications

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the physical interface.

3.9.3.2 RGMII signal switching specifications

The following timing specifications meet the requirements for RGMII interfaces for a range of transceiver devices.

Table 49. RGMII signal switching specifications¹

Symbol	Description	Min.	Max.	Unit
T_{cyc}^2	Clock cycle duration	7.2	8.8	ns
T_{skewT}^3	Data to clock output skew at transmitter	-500	500	ps
T_{skewR}^3	Data to clock input skew at receiver	1	2.6	ns
Duty_G ⁴	Duty cycle for Gigabit	45	55	%
Duty_T ⁴	Duty cycle for 10/100T	40	60	%
Tr/Tf	Rise/fall time (20–80%)	—	0.75	ns

¹ The timings assume the following configuration:

DDR_SEL = (11)b

DSE (drive-strength) = (111)b

² For 10 Mbps and 100 Mbps, T_{cyc} will scale to 400 ns ±40 ns and 40 ns ±4 ns respectively.

³ For all versions of RGMII prior to 2.0; this implies that PC board design will require clocks to be routed such that an additional trace delay of greater than 1.5 ns and less than 2.0 ns will be added to the associated clock signal. For 10/100, the Max value is unspecified.

⁴ Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three T_{cyc} of the lowest speed transitioned between.

3.9.4 General-purpose media interface (GPMI) timing

The i.MX 8M Nano GPMI controller is a flexible interface NAND Flash controller with 8-bit data width, up to 200 MB/s I/O speed and individual chip select.

It supports Asynchronous Timing mode, Source Synchronous Timing mode and Toggle Timing mode separately, as described in the following subsections.

3.9.4.1 Asynchronous mode AC timing (ONFI 1.0 compatible)

Asynchronous mode AC timings are provided as multiplications of the clock cycle and fixed delay. The maximum I/O speed of GPMI in Asynchronous mode is about 50 MB/s. Figure 24 through Figure 27 depicts the relative timing between GPMI signals at the module level for different operations under Asynchronous mode. Table 50 describes the timing parameters (NF1–NF17) that are shown in the figures.

¹ GPMI's Asynchronous mode output timing can be controlled by the module's internal registers HW_GPMI_TIMING0_ADDRESS_SETUP, HW_GPMI_TIMING0_DATA_SETUP, and HW_GPMI_TIMING0_DATA_HOLD. This AC timing depends on these registers settings. In the table, AS/DS/DH represents each of these settings.

² AS minimum value can be 0, while DS/DH minimum value is 1.

³ T = GPMI clock period -0.075 ns (half of maximum p-p jitter).

⁴ NF12 is guaranteed by the design.

⁵ Non-EDO mode.

⁶ EDO mode, GPMI clock \approx 100 MHz
(AS=DS=DH=1, GPMI_CTL1 [RDN_DELAY] = 8, GPMI_CTL1 [HALF_PERIOD] = 0).

In EDO mode (Figure 27), NF16/NF17 are different from the definition in non-EDO mode (Figure 26). They are called tREA/tRHOH (RE# access time/RE# HIGH to output hold). The typical values for them are 16 ns (max for tREA)/15 ns (min for tRHOH) at 50 MB/s EDO mode. In EDO mode, GPMI samples NAND_DATAxx at the rising edge of delayed NAND_RE_B provided by an internal DPLL. The delay value can be controlled by GPMI_CTRL1.RDN_DELAY (see the GPMI chapter of the *i.MX 8M Nano Applications Processor Reference Manual* [IMX8MNRM]). The typical value of this control register is 0x8 at 50 MT/s EDO mode. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

3.9.4.2 Source synchronous mode AC timing (ONFI 2.x compatible)

Figure 29 to Figure 31 show the write and read timing of Source Synchronous mode.

¹ GPMI's Source Synchronous mode output timing can be controlled by the module's internal registers GPMI_TIMING2_CE_DELAY, GPMI_TIMING2_PREAMBLE_DELAY, GPMI_TIMING2_POST_DELAY. This timing depends on these registers settings. In the table, CE_DELAY/PREAMBLE_DELAY/POST_DELAY represents each of these settings.

² T = tCK(GPMI clock period) - 0.075 ns (half of maximum p-p jitter).

For DDR Source Synchronous mode, Figure 32 shows the timing diagram of NAND_DQS/NAND_DATAxx read valid window. The typical value of tDQSQ is 0.85 ns (max) and 1 ns (max) for tQHS at 200 MB/s. GPMI will sample NAND_DATA[7:0] at both rising and falling edge of an delayed NAND_DQS signal, which can be provided by an internal DPLL. The delay value can be controlled by GPMI register GPMI_READ_DDR_DLL_CTRL.SLV_DLY_TARGET (see the GPMI chapter of the *i.MX 8M Nano Applications Processor Reference Manual [IMX8MNRM]*). Generally, the typical delay value of this register is equal to 0x7 which means 1/4 clock cycle delay expected. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

3.9.4.3 ONFI NV-DDR2 mode (ONFI 3.2 compatible)

3.9.4.3.1 Command and address timing

ONFI 3.2 mode command and address timing is the same as ONFI 1.0 compatible Async mode AC timing. See [Section 3.9.4.1, Asynchronous mode AC timing \(ONFI 1.0 compatible\)](#), for details.

3.9.4.3.2 Read and write timing

ONFI 3.2 mode read and write timing is the same as Toggle mode AC timing. See [Section 3.9.4.4, Toggle mode AC Timing](#), for details.

3.9.4.4 Toggle mode AC Timing

3.9.4.4.1 Command and address timing

NOTE

Toggle mode command and address timing is the same as ONFI 1.0 compatible Asynchronous mode AC timing. See [Section 3.9.4.1, Asynchronous mode AC timing \(ONFI 1.0 compatible\)](#), for details.

⁵ Shown in Figure 33.

⁶ Shown in Figure 34.

For DDR Toggle mode, Figure 32 shows the timing diagram of NAND_DQS/NAND_DATA_{xx} read valid window. The typical value of tDQSQ is 1.4 ns (max) and 1.4 ns (max) for tQHS at 133 MB/s. GPMI samples NAND_DATA[7:0] at both the rising and falling edges of a delayed NAND_DQS signal, which is provided by an internal DPLL. The delay value of this register can be controlled by the GPMI register GPMI_READ_DDR_DLL_CTRL.SLV_DLY_TARGET (see the GPMI chapter of the *i.MX 8M Nano Applications Processor Reference Manual* [IMX8MNRM]). Generally, the typical delay value is equal to 0x7, which means a 1/4 clock cycle delay is expected. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

3.9.5 I²C bus characteristics

The Inter-Integrated Circuit (I2C) provides functionality of a standard I2C master and slave. The I2C is designed to be compatible with the I2C Bus Specification, version 2.1, by Philips Semiconductor (now NXP Semiconductors).

3.9.6 MIPI D-PHY timing parameters

MIPI D-PHY electrical specifications are compliance.

3.9.7 PDM timing parameters

Figure 35 illustrates the input timing of the PDM.

Figure 35. PDM input timing

PDM clock operative range is from 500 kHz to 6 MHz. Within range, only need to configure ipg_clk_app rate and CLKDIV without I/O timing concerns.

3.9.8 Pulse width modulator (PWM) timing parameters

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before

being input to the counter. The output is available at the pulse-width modulator output (PWMO) external pin.

Figure 36 depicts the timing of the PWM, and Table 54 lists the PWM timing parameters.

3.9.9 FlexSPI timing parameters

Measurements are with a load of 15 pF and an input slew rate of 1 V/ns.

3.9.9.1 FlexSPI input/read timing

There are three sources for the internal sample clock for FlexSPI read data:

- Dummy read strobe generated by FlexSPI controller and looped back internally (FlexSPI_n_MCR0[RXCLKSRC] = 0x0)
- Dummy read strobe generated by FlexSPI controller and looped back through the DQS pad (FlexSPI_n_MCR0[RXCLKSRC] = 0x1)
- Read strobe provided by memory device and input from DQS pad (FlexSPI_n_MCR0[RXCLKSRC] = 0x3)

The following sections describe input signal timing for each of these four internal sample clock sources.

3.9.9.1.1 SDR mode with FlexSPI_n_MCR0[RXCLKSRC] = 0x0, 0x1, 0x2

Figure 37. FlexSPI input timing in SDR mode where FlexSPI_n_MCR0[RXCLKSRC] = 0x0, 0x1, 0x2

NOTE

Timing shown is based on the memory generating read data on the SCK falling edge, and FlexSPI controller sampling read data on the falling edge.

3.9.9.1.2 SDR mode with FlexSPI_n_MCR0[RXCLKSRC] = 0x3

There are two cases when the memory provides both read data and the read strobe in SDR mode:

- A1—Memory generates both read data and read strobe on SCK rising edge (or falling edge)
- A2—Memory generates read data on SCK falling edge and generates read strobe on SCK rising edge

3.9.10 SAI/I2S switching specifications

This section provides the AC timings for the SAI in Master (clocks driven) and Slave (clocks input) modes. All timings are given for non inverted serial clock polarity (SAI_TCR[TSCKP] = 0, SAI_RCR[RSCKP] = 0) and non inverted frame sync (SAI_TCR[TFSI] = 0, SAI_RCR[RFSI] = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timings remain valid by inverting the clock signal (SAI_BCLK) and/or the frame sync (SAI_FS) shown in the figures below.

Table 64. Master mode SAI timing (50 MHz)¹

Num	Characteristic	Min	Max	Unit
S1	SAI_MCLK cycle time	20	—	ns
S2	SAI_MCLK pulse width high/low	40%	60%	MCLK period
S3	SAI_BCLK cycle time	20	—	ns

Table 64. Master mode SAI timing (50 MHz)¹ (continued)

3.9.11 SPDIF timing parameters

The Sony/Philips Digital Interconnect Format (SPDIF) data is sent using the bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Table 68 and Figure 46 and Figure 47 show SPDIF timing parameters for the Sony/Philips Digital Interconnect Format (SPDIF), including the timing of the modulating Rx clock (SPDIF_SR_CLK) for SPDIF in Rx mode and the timing of the modulating Tx clock (SPDIF_ST_CLK) for SPDIF in Tx mode.

Table 68. SPDIF timing parameters

Parameter	Symbol	Timing Parameter Range		Unit
		Min	Max	
SPDIF_IN Skew: asynchronous inputs, no specs apply	—	—	0.7	ns
SPDIF_OUT output (Load = 50 pf)				
• Skew	—	—	1.5	ns
• Transition rising	—	—	24.2	
• Transition falling	—	—	31.3	
SPDIF_OUT output (Load = 30 pf)				
• Skew	—	—	13.6	ns
• Transition rising	—	—	18.0	
• Transition falling	—	—		
Modulating Rx clock (SPDIF_SR_CLK) period	srckp	40.0	—	ns
SPDIF_SR_CLK high period	srckph	16.0	—	ns

3.9.12 UART I/O configuration and timing parameters

3.9.12.1 UART RS-232 I/O configuration in different modes

The i.MX 8M Nano UART interfaces can serve both as DTE or DCE device. This can be configured by the DCEDTE control bit (default 0—DCE mode). Table 69 shows the UART I/O configuration based on the enabled mode.

Table 69. UART I/O configuration vs. mode

Port	DTE Mode		DCE Mode	
	Direction	Description	Direction	Description
UARTx_RTS_B	Output	UARTx_RTS_B from DTE to DCE	Input	UARTx_RTS_B from DTE to DCE
UARTx_CTS_B	Input	UARTx_CTS_B from DCE to DTE	Output	UARTx_CTS_B from DCE to DTE

3.9.12.2 UART RS-232 Serial mode timing

This section describes the electrical information of the UART module in the RS-232 mode.

3.9.12.2.1 UART transmitter

Figure 48 depicts the transmit timing of UART in the RS-232 Serial mode, with 8 data bit/1 stop bit format. Table 70 lists the UART RS-232 Serial mode transmit timing characteristics.

Figure 48. UART RS-232 Serial mode transmit timing diagram

Table 70. RS-232 Serial mode transmit timing parameters

ID	Parameter	Symbol	Min	Max	Unit
UA1	Transmit Bit Time	t_{Tbit}	$1/F_{baud_rate}^1 - T_{ref_clk}^2$	$1/F_{baud_rate} + T_{ref_clk}$	—

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

3.9.12.2.2 UART receiver

Figure 49 depicts the RS-232 Serial mode receive timing with 8 data bit/1 stop bit format. Table 71 lists Serial mode receive timing characteristics.

Figure 49. UART RS-232 Serial mode receive timing diagram

Table 71. RS-232 Serial mode receive timing parameters

ID	Parameter	Symbol	Min	Max	Unit
UA2	Receive Bit Time ¹	t_{Rbit}	$1/F_{baud_rate}^2 - 1/(16 \times F_{baud_rate})$	$1/F_{baud_rate} + 1/(16 \times F_{baud_rate})$	—

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

3.9.13 USB PHY parameters

This section describes the USB-OTG PHY parameters.

3.9.13.1 Pad/Package/Board connections

The USB1_VBUS pin cannot directly connect to the 5 V VBUS voltage on the USB2.0 link.

Each USB1_VBUS pin must be isolated by an external 30 K Ω 1% precision resistor.

The USB 2.0 PHY uses USB1_TXRTUNE and an external resistor to calibrate the USB1_DP/DN 45 Ω source impedance. The external resistor value is 200 Ω 1% precision on USB1_TXRTUNE pad to ground.

3.9.13.2 USB PHY worst power consumption

Table 72 shows the USB 2.0 PHY worst power dissipation.

Table 72. USB 2.0 PHY worst power dissipation

Mode	VDD_USB_0P8		VDD_USB_3P3		VDD_USB_1P8		Total Power	
HS TX	8.286	mA	4.63	mA	23.409	mA	70.448	mW
FS TX	6.767		12.52		5.968		63.22	
LS TX	7.001		13.58		6.224		67.779	
Suspend	0.752		0.164		0.106		1.465	
Sleep	0.761		0.163		0.106		1.472	

4 Boot mode configuration

This section provides information on Boot mode configuration pins allocation and boot devices interfaces allocation.

4.1 Boot mode configuration pins

Table 73 provides boot options, functionality, fuse values, and associated pins. Several input pins are also sampled at reset and can be used to override fuse values, depending on the value of BT_FUSE_SEL fuse. The boot option pins are in effect when BT_FUSE_SEL fuse is '0' (cleared, which is the case for an unblown fuse). For detailed Boot mode options configured by the Boot mode pins, see the “System Boot, Fusemap, and eFuse” chapter in the *i.MX 8M Nano Applications Processor Reference Manual* (IMX8MNRM).

Table 73. Fuses and associated pins used for boot

Interface	IP instance	Allocated pads during boot	Comment
BOOT_MODE0	Input	ccmsrcgpcmix.BOOT_MODE[0]	Boot mode selection

BOOT_MODE2	Input	ccmsrcgpcmix.BOOT_MODE[2]	
BOOT_MODE3	Input	ccmsrcgpcmix.BOOT_MODE[3]	

4.2 Boot device interface allocation

Table 74 lists the interfaces that can be used by the boot process in accordance with the specific Boot mode configuration. The table also describes the interface's specific modes and IOMUXC allocation, which are configured during boot when appropriate.

Table 74. Interface allocation during boot

1 i.MX 8M Nano introduction

According to PCN-[202108031F02](#), NXP is migrating the i.MX 8M Nano (14x14 package only) to a pin compatible replacement package with different package height and case outline to ensure the availability of product due to substrate supply constraints on the existing 14x14 package. This addendum lists old package parts' part number, thermal parameters and package outline. please refer to [AN13416](#) for more details.

The i.MX 8M Nano conforms to the specification described in the i.MX 8M Nano Applications Processors datasheet with the exceptions defined in this document.

As NXP documents are frequently updated, see the website listed on the back page of this document or contact your NXP representative for the latest revision.

3.1.3 14 x 14 mm FCBGA package thermal resistance

The following table displays the 14 x 14 mm FCBGA package thermal resistance data.

Table 2. 14 x 14 mm package thermal resistance data

Rating	Test Conditions	Symbol	Value	Unit	Notes
Junction to Ambient Natural Convection	Four Layer Board (2s2p)	$R_{\theta JA}$	22.9	°C/W	1, 2, 5
Junction-to-Top of Package Thermal Characterization Parameter	Four Layer Board (2s2p)	Ψ_{JT}	0.2	°C/W	1, 2, 3, 5
Junction to Case	Single Layer Board (1s)	$R_{\theta JC}$	4	°C/W	1, 4, 5

¹ Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components in the board, and board thermal resistance. Thermal resistance data in this report is solely for a thermal performance comparison of one package to another in a standardized specified environment. It is not meant to predict the performance of a package in an application-specific environment.

² Per SEMI G38-87 and JESD51-2a methodology on JESD51-9 horizontal board.

³ Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2a. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

⁴ Thermal resistance between the die and the case (top surface) using cold plate method (MIL SPEC-883 Method 1012.1).

⁵ Thermal resistance data in this report is solely for a thermal performance comparison of one package to another in a standard specified environment. It is not meant to predict the performance of a package in an application-specific environment.
