3.19.1 CONTROLSS_SDFM0_SDIFLGCLR Register (Offset = 4h) [reset = h]

Short Description: SD Module Interrupt Flag Clear Bits: Writing a "1" will clear the respective flag bit in the SDIFLG register. Writes of "0" are ignored. Note: If user writes a "1" to clear a bit on the same cycle that the hardware is trying to set the bit to "1", then hardware has priority and the bit will not be cleared.

Access Types Legend

Table 4-115. STCGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	INTCOUNT_B16	RW	1h	Number of intervals of the self test run (RWP - Read, Priviledge Mode Write only)Count of intervals that need to be covered for a specific selftest run.The selftest controller sends out ?complete? indication once it runs all of the intervals programmed in this field.INTCOUNT_B16=0 is an invalid configuration for a selftest.
15 - 11	NU0	RO	0h	Reserved bits
10 - 8	CAP_IDLE_CYCLE	RW	1h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only)Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7 - 5	SCANEN_HIGH_CAP_IDLE_CYCLE	RW	1h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only). *NOT BYTE ACCESSIBLEIdle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock (scan_en going high to func_clk_en generation) and misr_log_clk (scan_en going high to misr_log_en generation) generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
4 - 2	NU1	RO	0h	Reserved bits
1 - 0	RS_CNT_B1	RW	0h	Restart/Continue or preload (RWP - Read, Priviledge Mode Write only)This bit specifies the selftest controller whether to continue the run from next interval onwards, restart from ROM address 0 or preload from a prescribed interval. This bit gets reset after the completion of selftest run.00 = Continue NSTC run from previous interval01 = Restart NSTC run from ROM address 01X = Start from segment number specified in STC_SEGPLR register

Table 4-119. STCTPR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	TO_PRELOAD	RW	8C3DEFB1 EDB984FE2 AC71C71C7 h	Self test time out preload (RWP - Read, Priviledge Mode Write only)This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run. This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective.This register value (preload count value) gets loaded into the self test timeout down counter whenever a self test run is initiated (ST_ENA is enabled). and gets disabled on completion of a self test run.

Access Types Legend

Table 4-257. STCGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	INTCOUNT_B16	RW	1h	Number of intervals of the self test run (RWP - Read, Priviledge Mode Write only)Count of intervals that need to be covered for a specific selftest run.The selftest controller sends out ?complete? indication once it runs all of the intervals programmed in this field.INTCOUNT_B16=0 is an invalid configuration for a selftest.
15 - 11	NU0	RO	0h	Reserved bits
10 - 8	CAP_IDLE_CYCLE	RW	1h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only)Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7 - 5	SCANEN_HIGH_CAP_IDLE_CYCLE	RW	1h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only). *NOT BYTE ACCESSIBLEIdle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock (scan_en going high to func_clk_en generation) and misr_log_clk (scan_en going high to misr_log_en generation) generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
4 - 2	NU1	RO	0h	Reserved bits
1 - 0	RS_CNT_B1	RW	0h	Restart/Continue or preload (RWP - Read, Priviledge Mode Write only)This bit specifies the selftest controller whether to continue the run from next interval onwards, restart from ROM address 0 or preload from a prescribed interval. This bit gets reset after the completion of selftest run.00 = Continue NSTC run from previous interval01 = Restart NSTC run from ROM address 01X = Start from segment number specified in STC_SEGPLR register

4.5.110 R5SS1_STC_STCGCR1 Register (Offset = 4h) [reset = h]

Table 4-287. CORE1_CURMISR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	C1MISR0	RO	0h	MISR Signature for CORE1This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

2064h	32	TPCC0_IESRH_RN	Int Enable Set Register (High Part): CPU write of '1' to the IESRH.In bit causes the IESRH.In bit to be set. CPU write of '0' has no effect..	52A0 2064h
2068h	32	TPCC0_IPR_RN	Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.	52A0 2068h
206Ch	32	TPCC0_IPRH_RN	Interrupt Pending Register (High Part): IPRH.In bit is set when a interrupt completion code with TCC of N is detected. IPRH.In bit is cleared via software by writing a '1' to ICRH.In bit.	52A0 206Ch
2070h	32	TPCC0_ICR_RN	Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.	52A0 2070h
2074h	32	TPCC0_ICRH_RN	Interrupt Clear Register (High Part): CPU write of '1' to the ICRH.In bit causes the IPRH.In bit to be cleared. CPU write of '0' has no effect. All IPRH.In bits must be cleared before additional interrupts will be asserted by CC.	52A0 2074h
2078h	32	TPCC0_IEVAL_RN	Interrupt Eval Register	52A0 2078h
2080h	32	TPCC0_QER_RN	QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.	52A0 2080h

Table 4-402. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	TPCC0 Physical Address
2084h	32	TPCC0_QEER_RN	QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/ latched in QER.En.	52A0 2084h
2088h	32	TPCC0_QEECR_RN	QDMA Event Enable Clear Register: CPU write of '1' to the QEECR.En bit causes the QEER.En bit to be cleared. CPU write of '0' has no effect..	52A0 2088h
208Ch	32	TPCC0_QEESR_RN	QDMA Event Enable Set Register: CPU write of '1' to the QEESR.En bit causes the QEESR.En bit to be set. CPU write of '0' has no effect..	52A0 208Ch
2090h	32	TPCC0_QSER_RN	QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.	52A0 2090h
2094h	32	TPCC0_QSECR_RN	QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..	52A0 2094h

Offset	Length	Acronym	Register Name
1000h	32	TPCC0_ER	Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.
1004h	32	TPCC0_ERH	Event Register (High Part): If ERH.En bit is set and the EERH.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ERH.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EERH.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ERH.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EERH register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECRH pseudo-register.
1008h	32	TPCC0_ECR	Event Clear Register: CPU write of '1' to the ECR.En bit causes the ER.En bit to be cleared. CPU write of '0' has no effect.
100Ch	32	TPCC0_ECRH	Event Clear Register (High Part): CPU write of '1' to the ECRH.En bit causes the ERH.En bit to be cleared. CPU write of '0' has no effect.
1010h	32	TPCC0_ESR	Event Set Register: CPU write of '1' to the ESR.En bit causes the ER.En bit to be set. CPU write of '0' has no effect.
1014h	32	TPCC0_ESRH	Event Set Register (High Part) CPU write of '1' to the ESRH.En bit causes the ERH.En bit to be set. CPU write of '0' has no effect.

Table 4-403. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
1018h	32	TPCC0_CER	Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.
101Ch	32	TPCC0_CERH	Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.
1020h	32	TPCC0_EER	Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

2010h	32	TPCC0_ESR_RN	Event Set Register: CPU write of '1' to the ESR.En bit causes the ER.En bit to be set. CPU write of '0' has no effect.
2014h	32	TPCC0_ESRH_RN	Event Set Register (High Part) CPU write of '1' to the ESRH.En bit causes the ERH.En bit to be set. CPU write of '0' has no effect.
2018h	32	TPCC0_CER_RN	Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

Table 4-403. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
201Ch	32	TPCC0_CERH_RN	Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.
2020h	32	TPCC0_EER_RN	Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

Table 4-403. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
2024h	32	TPCC0_EERH_RN	Event Enable Register (High Part): Enables DMA transfers for ERH.En pending events. ERH.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CERH) or Event Set Register (ESRH). Note that if a bit is set in ERH.En while EERH.En is disabled no action is taken. If EERH.En is enabled at a later point (and ERH.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EERH.En is not directly writeable. Events can be enabled via writes to EESRH and can be disabled via writes to EECRH register. EERH.En = 0: ER.En is not enabled to trigger DMA transfers. EERH.En = 1: ER.En is enabled to trigger DMA transfers.
2028h	32	TPCC0_EECR_RN	Event Enable Clear Register: CPU write of '1' to the EECR.En bit causes the EER.En bit to be cleared. CPU write of '0' has no effect..
202Ch	32	TPCC0_EECRH_RN	Event Enable Clear Register (High Part): CPU write of '1' to the EECRH.En bit causes the EERH.En bit to be cleared. CPU write of '0' has no effect..
2030h	32	TPCC0_EESR_RN	Event Enable Set Register: CPU write of '1' to the EESR.En bit causes the EER.En bit to be set. CPU write of '0' has no effect..
2034h	32	TPCC0_EESRH_RN	Event Enable Set Register (High Part): CPU write of '1' to the EESRH.En bit causes the EERH.En bit to be set. CPU write of '0' has no effect..
2038h	32	TPCC0_SER_RN	Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.
203Ch	32	TPCC0_SERH_RN	Secondary Event Register (High Part): The secondary event register is used along with the Event Register (ERH) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Table 4-403. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
2040h	32	TPCC0_SECR_RN	Secondary Event Clear Register: The secondary event clear register is used to clear the status of the SER registers. CPU write of '1' to the SECR.En bit clears the SER register. CPU write of '0' has no effect.
2044h	32	TPCC0_SECRH_RN	Secondary Event Clear Register (High Part): The secondary event clear register is used to clear the status of the SERH registers. CPU write of '1' to the SECRH.En bit clears the SERH register. CPU write of '0' has no effect.
2050h	32	TPCC0_IER_RN	Int Enable Register: IER.In is not directly writeable. Interrupts can be enabled via writes to IESR and can be disabled via writes to IECR register. IER.In = 0: IPR.In is NOT enabled for interrupts. IER.In = 1: IPR.In IS enabled for interrupts.
2054h	32	TPCC0_IERH_RN	Int Enable Register (High Part): IERH.In is not directly writeable. Interrupts can be enabled via writes to IESRH and can be disabled via writes to IECRH register. IERH.In = 0: IPRH.In is NOT enabled for interrupts. IERH.In = 1: IPRH.In IS enabled for interrupts.
2058h	32	TPCC0_IECR_RN	Int Enable Clear Register: CPU write of '1' to the IECR.In bit causes the IER.In bit to be cleared. CPU write of '0' has no effect..
205Ch	32	TPCC0_IECRH_RN	Int Enable Clear Register (High Part): CPU write of '1' to the IECRH.In bit causes the IERH.In bit to be cleared. CPU write of '0' has no effect..
2060h	32	TPCC0_IESR_RN	Int Enable Set Register: CPU write of '1' to the IESR.In bit causes the IESR.In bit to be set. CPU write of '0' has no effect..
2064h	32	TPCC0_IESRH_RN	Int Enable Set Register (High Part): CPU write of '1' to the IESRH.In bit causes the IESRH.In bit to be set. CPU write of '0' has no effect..
2068h	32	TPCC0_IPR_RN	Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.
206Ch	32	TPCC0_IPRH_RN	Interrupt Pending Register (High Part): IPRH.In bit is set when a interrupt completion code with TCC of N is detected. IPRH.In bit is cleared via software by writing a '1' to ICRH.In bit.

Table 4-403. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
2070h	32	TPCC0_ICR_RN	Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.
2074h	32	TPCC0_ICRH_RN	Interrupt Clear Register (High Part): CPU write of '1' to the ICRH.In bit causes the IPRH.In bit to be cleared. CPU write of '0' has no effect. All IPRH.In bits must be cleared before additional interrupts will be asserted by CC.
2078h	32	TPCC0_IEVAL_RN	Interrupt Eval Register
2080h	32	TPCC0_QER_RN	QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.
2084h	32	TPCC0_QEER_RN	QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/ latched in QER.En.
2088h	32	TPCC0_QEECR_RN	QDMA Event Enable Clear Register: CPU write of '1' to the QEECR.En bit causes the QEER.En bit to be cleared. CPU write of '0' has no effect..
208Ch	32	TPCC0_QEESR_RN	QDMA Event Enable Set Register: CPU write of '1' to the QEESR.En bit causes the QEESR.En bit to be set. CPU write of '0' has no effect..

Table 4-403. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
2090h	32	TPCC0_QSER_RN	QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.
2094h	32	TPCC0_QSECR_RN	QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

Offset	Length	Acronym	Register Name
1060h	32	TPCC0_IESR	Int Enable Set Register: CPU write of '1' to the IESR.In bit causes the IESR.In bit to be set. CPU write of '0' has no effect..
1064h	32	TPCC0_IESRH	Int Enable Set Register (High Part): CPU write of '1' to the IESRH.In bit causes the IESRH.In bit to be set. CPU write of '0' has no effect..
1068h	32	TPCC0_IPR	Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.
106Ch	32	TPCC0_IPRH	Interrupt Pending Register (High Part): IPRH.In bit is set when a interrupt completion code with TCC of N is detected. IPRH.In bit is cleared via software by writing a '1' to ICRH.In bit.
1070h	32	TPCC0_ICR	Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.
1074h	32	TPCC0_ICRH	Interrupt Clear Register (High Part): CPU write of '1' to the ICRH.In bit causes the IPRH.In bit to be cleared. CPU write of '0' has no effect. All IPRH.In bits must be cleared before additional interrupts will be asserted by CC.
1078h	32	TPCC0_IEVAL	Interrupt Eval Register
1080h	32	TPCC0_QER	QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Table 4-404. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
1084h	32	TPCC0_QEER	QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/ latched in QER.En.
1088h	32	TPCC0_QEECR	QDMA Event Enable Clear Register: CPU write of '1' to the QEECR.En bit causes the QEER.En bit to be cleared. CPU write of '0' has no effect..
108Ch	32	TPCC0_QEESR	QDMA Event Enable Set Register: CPU write of '1' to the QEESR.En bit causes the QEESR.En bit to be set. CPU write of '0' has no effect..
1090h	32	TPCC0_QSER	QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.
1094h	32	TPCC0_QSECR	QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

Table 4-404. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
2000h	32	TPCC0_ER_RN	Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.
2004h	32	TPCC0_ERH_RN	Event Register (High Part): If ERH.En bit is set and the EERH.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ERH.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EERH.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ERH.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EERH register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECRH pseudo-register.
2008h	32	TPCC0_ECR_RN	Event Clear Register: CPU write of '1' to the ECR.En bit causes the ER.En bit to be cleared. CPU write of '0' has no effect.
200Ch	32	TPCC0_ECRH_RN	Event Clear Register (High Part): CPU write of '1' to the ECRH.En bit causes the ERH.En bit to be cleared. CPU write of '0' has no effect.
2010h	32	TPCC0_ESR_RN	Event Set Register: CPU write of '1' to the ESR.En bit causes the ER.En bit to be set. CPU write of '0' has no effect.
2014h	32	TPCC0_ESRH_RN	Event Set Register (High Part) CPU write of '1' to the ESRH.En bit causes the ERH.En bit to be set. CPU write of '0' has no effect.

Table 4-404. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
2018h	32	TPCC0_CER_RN	Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.
201Ch	32	TPCC0_CERH_RN	Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.
2020h	32	TPCC0_EER_RN	Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

Table 4-404. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
2024h	32	TPCC0_EERH_RN	Event Enable Register (High Part): Enables DMA transfers for ERH.En pending events. ERH.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CERH) or Event Set Register (ESRH). Note that if a bit is set in ERH.En while EERH.En is disabled no action is taken. If EERH.En is enabled at a later point (and ERH.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EERH.En is not directly writeable. Events can be enabled via writes to EESRH and can be disabled via writes to EECRH register. EERH.En = 0: ER.En is not enabled to trigger DMA transfers. EERH.En = 1: ER.En is enabled to trigger DMA transfers.
2028h	32	TPCC0_EECR_RN	Event Enable Clear Register: CPU write of '1' to the EECR.En bit causes the EER.En bit to be cleared. CPU write of '0' has no effect..
202Ch	32	TPCC0_EECRH_RN	Event Enable Clear Register (High Part): CPU write of '1' to the EECRH.En bit causes the EERH.En bit to be cleared. CPU write of '0' has no effect..
2030h	32	TPCC0_EESR_RN	Event Enable Set Register: CPU write of '1' to the EESR.En bit causes the EER.En bit to be set. CPU write of '0' has no effect..
2034h	32	TPCC0_EESRH_RN	Event Enable Set Register (High Part): CPU write of '1' to the EESRH.En bit causes the EERH.En bit to be set. CPU write of '0' has no effect..
2038h	32	TPCC0_SER_RN	Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.
203Ch	32	TPCC0_SERH_RN	Secondary Event Register (High Part): The secondary event register is used along with the Event Register (ERH) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Table 4-404. TPCC0, TPCC0_TPCC Registers, Base Address=52A0 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name
2040h	32	TPCC0_SECR_RN	Secondary Event Clear Register: The secondary event clear register is used to clear the status of the SER registers. CPU write of '1' to the SECR.En bit clears the SER register. CPU write of '0' has no effect.
2044h	32	TPCC0_SECRH_RN	Secondary Event Clear Register (High Part): The secondary event clear register is used to clear the status of the SERH registers. CPU write of '1' to the SECRH.En bit clears the SERH register. CPU write of '0' has no effect.
2050h	32	TPCC0_IER_RN	Int Enable Register: IER.In is not directly writeable. Interrupts can be enabled via writes to IESR and can be disabled via writes to IECR register. IER.In = 0: IPR.In is NOT enabled for interrupts. IER.In = 1: IPR.In IS enabled for interrupts.
2054h	32	TPCC0_IERH_RN	Int Enable Register (High Part): IERH.In is not directly writeable. Interrupts can be enabled via writes to IESRH and can be disabled via writes to IECRH register. IERH.In = 0: IPRH.In is NOT enabled for interrupts. IERH.In = 1: IPRH.In IS enabled for interrupts.
2058h	32	TPCC0_IECR_RN	Int Enable Clear Register: CPU write of '1' to the IECR.In bit causes the IER.In bit to be cleared. CPU write of '0' has no effect..
205Ch	32	TPCC0_IECRH_RN	Int Enable Clear Register (High Part): CPU write of '1' to the IECRH.In bit causes the IERH.In bit to be cleared. CPU write of '0' has no effect..
2060h	32	TPCC0_IESR_RN	Int Enable Set Register: CPU write of '1' to the IESR.In bit causes the IESR.In bit to be set. CPU write of '0' has no effect..
2064h	32	TPCC0_IESRH_RN	Int Enable Set Register (High Part): CPU write of '1' to the IESRH.In bit causes the IESRH.In bit to be set. CPU write of '0' has no effect..
2068h	32	TPCC0_IPR_RN	Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.
206Ch	32	TPCC0_IPRH_RN	Interrupt Pending Register (High Part): IPRH.In bit is set when a interrupt completion code with TCC of N is detected. IPRH.In bit is cleared via software by writing a '1' to ICRH.In bit.

Table 4-468. CCERR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 17	RES33	RO	0h	RESERVE FIELD
16	TCERR	RO	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors were previously clear) then an error will be signaled with TPCC error interrupt.
15 - 8	RES34	RO	0h	RESERVE FIELD
7	QTHRXCD7	RO	0h	Queue Threshold Error for Q7: QTHRXCD7 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD7 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD7 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
6	QTHRXCD6	RO	0h	Queue Threshold Error for Q6: QTHRXCD6 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD6 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD6 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
5	QTHRXCD5	RO	0h	Queue Threshold Error for Q5: QTHRXCD5 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD5 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD5 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

Table 4-468. CCERR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	QTHRXCD4	RO	0h	Queue Threshold Error for Q4: QTHRXCD4 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD4 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD4 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
3	QTHRXCD3	RO	0h	Queue Threshold Error for Q3: QTHRXCD3 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD3 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD3 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
2	QTHRXCD2	RO	0h	Queue Threshold Error for Q2: QTHRXCD2 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD2 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD2 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
1	QTHRXCD1	RO	0h	Queue Threshold Error for Q1: QTHRXCD1 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD1 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD1 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
0	QTHRXCD0	RO	0h	Queue Threshold Error for Q0: QTHRXCD0 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD0 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD0 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

16	QUEACTV0	RO	0h	Queue 0 Active QUEACTV0 = 0 : No Evts are queued in Q0. QUEACTV0 = 1 : At least one TR is queued in Q0.
15 - 14	RES62	RO	0h	RESERVE FIELD
13 - 8	COMPACTV	RO	0h	Completion Request Active: Counter that tracks the total number of completion requests submitted to the TC. The counter increments when a TR is submitted with TCINTEN or TCCHEN set to '1'. The counter decrements for every valid completion code received from any of the external TCs. The CC will not service new TRs if COMPACTV count is already at the limit. COMPACTV = 0 : No completion requests outstanding. COMPACTV = 1: Total of '1' completion request outstanding. ... COMPACTV = 63 : Total of 63 completion requests are outstanding. No additional TRs will be submitted until count is less than 63.
7 - 5	RES63	RO	0h	RESERVE FIELD

Table 4-516. CCSTAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	ACTV	RO	0h	Channel Controller Active: Channel Controller Active is a logical-OR of each of the ACTV signals. The ACTV bit must remain high through the life of a TR. ACTV = 0 : Channel is idle. ACTV = 1 : Channel is busy.
3	RES64	RO	0h	RESERVE FIELD
2	TRACTV	RO	0h	Transfer Request Active: TRACTV = 0 : Transfer Request processing/submission logic is inactive. TRACTV = 1 : Transfer Request processing/submission logic is active.
1	QEVTACTV	RO	0h	QDMA Event Active: QEVTACTV = 0 : No enabled QDMA Events are active within the CC. QEVTACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.
0	EVTACTV	RO	0h	DMA Event Active: EVTACTV = 0 : No enabled DMA Events are active within the CC. EVTACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.

31 - 1	RES68	RO	0h	RESERVE FIELD
0	CLR	WO	0h	AET Clear command: CPU write of '1' to the CLR bit causes the tpcc_aet output signal and AETSTAT.STAT register to be cleared. CPU write of '0' has no effect..

4.6.51 TPCC0_ER Register (Offset = 1000h) [reset = h]

Short Description: Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.6.57 TPCC0_CER Register (Offset = 1018h) [reset = h]

Short Description: Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.6.59 TPCC0_EER Register (Offset = 1020h) [reset = h]

Short Description: Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

Bit	Field	Type	Reset	Description
31 - 2	RES69	RO	0h	RESERVE FIELD
1	SET	WO	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	WO	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

4.6.80 TPCC0_QER Register (Offset = 1080h) [reset = h]

Short Description: QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Long Description:

4.6.81 TPCC0_QEER Register (Offset = 1084h) [reset = h]

Short Description: QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

4.6.86 TPCC0_ER_RN Register (Offset = 2000h) [reset = h]

Short Description: Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.6.92 TPCC0_CER_RN Register (Offset = 2018h) [reset = h]

Short Description: Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.6.94 TPCC0_EER_RN Register (Offset = 2020h) [reset = h]

Short Description: Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

Long Description:

4.6.101 TPCC0_SERH_RN Register (Offset = 203Ch) [reset = h]

Short Description: Secondary Event Register (High Part): The secondary event register is used along with the Event Register (ERH) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Long Description:

Bit	Field	Type	Reset	Description
31 - 2	RES76	RO	0h	RESERVE FIELD
1	SET	WO	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	WO	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

4.6.115 TPCC0_QER_RN Register (Offset = 2080h) [reset = h]

Short Description: QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Table 4-664. OPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PRIV	RO	0h	Privilege level: privilege level (supervisor vs. user) for the host/cpu/dma that programmed this PaRAM Entry. Value is set with the vbus priv value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus. PRIV = 0 : User level privilege PRIV = 1 : Supervisor level privilege
30 - 28	RES83	RO	0h	RESERVE FIELD
27 - 24	PRIVID	RO	0h	Privilege ID: Privilege ID for the external host/cpu/dma that programmed this PaRAM Entry. This value is set with the vbus privid value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus.
23	ITCCHEN	RW	0h	Intermediate transfer completion chaining enable: 0: Intermediate transfer complete chaining is disabled. 1: Intermediate transfer complete chaining is enabled.
22	TCCHEN	RW	0h	Transfer complete chaining enable: 0: Transfer complete chaining is disabled. 1: Transfer complete chaining is enabled.
21	ITCINTEN	RW	0h	Intermediate transfer completion interrupt enable: 0: Intermediate transfer complete interrupt is disabled. 1: Intermediate transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
20	TCINTEN	RW	0h	Transfer complete interrupt enable: 0: Transfer complete interrupt is disabled. 1: Transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
19	WIMODE	RW	0h	Backward compatibility mode: 0: Normal operation 1 : WI Backwards Compatibility mode forces BCNT to be adjusted by '1' upon TR submission (0 means 1 1 means 2 ...) and forces ACNT to be treated as a word-count (left shifted by 2 by hardware to create byte cnt for TR submission)
18	RES84	RO	0h	RESERVE FIELD
17 - 12	TCC	RW	0h	Transfer Complete Code: The 6-bit code is used to set the relevant bit in CER (bit CER[TCC]) for chaining or in IER (bit IER[TCC]) for interrupts.

Table 4-664. OPT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	TCCMODE	RW	0h	Transfer complete code mode: Indicates the point at which a transfer is considered completed. Applies to both chaining and interrupt. 0: Normal Completion A transfer is considered completed after the transfer parameters are returned to the CC from the TC (which was returned from the peripheral). 1: Early Completion A transfer is considered completed after the CC submits a TR to the TC. CC generates completion code internally .
10 - 8	FWID	RW	0h	FIFO width: Applies if either SAM or DAM is set to FIFO mode. Pass-thru to TC.
7 - 4	RES85	RO	0h	RESERVE FIELD
3	STATIC	RW	0h	Static Entry: 0: Entry is updated as normal 1: Entry is static Count and Address updates are not updated after TRP is submitted. Linking is not performed.
2	SYNCDIM	RW	0h	Transfer Synchronization Dimension: 0: A-Sync Each event triggers the transfer of ACNT elements. 1: AB-Sync Each event triggers the transfer of BCNT arrays of ACNT elements
1	DAM	RW	0h	Destination Address Mode: Destination Address Mode within an array. Pass-thru to TC. 0: INCR Dst addressing within an array increments. Dst is not a FIFO. 1: FIFO Dst addressing within an array wraps around upon reaching FIFO width.
0	SAM	RW	0h	Source Address Mode: Source Address Mode within an array. Pass-thru to TC. 0: INCR Src addressing within an array increments. Source is not a FIFO. 1: FIFO Src addressing within an array wraps around upon reaching FIFO width.

Access Types Legend

Table 4-668. ABCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	BCNT	RW	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 (64K-1 arrays). BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ...
15 - 0	ACNT	RW	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes (64K-1 bytes). ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation (to translate between a word count and a byte count) will dropthe 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT.

LINK															
RW															
0															

Access Types Legend

Table 4-674. LNK Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	BCNTRLD	RW	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT (conceptually) reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field.
15 - 0	LINK	RW	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination (i.e. after count fields are decremented to '0') with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case (5-lsbs) behavior is undefined forthe user (i.e. don't have to test it). In the former case (2 msbs) user should be able to take advantage of this feature (i.e. do have to test it). If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.

31 - 16	DCIDX	RW	0h	Destination Frame Index: DCIDX is a 16-bit signed value (2's complement) used for destination address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when DCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a ABsync transfer is the first array in the frame.
15 - 0	SCIDX	RW	0h	Source Frame Index: SCIDX is a 16-bit signed value (2's complement) used for source address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when SCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a AB-sync transfer is the first array in the frame.

Table 4-678. CCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	RES86	RO	0h	RESERVE FIELD
15 - 0	CCNT	RW	0h	CCNT : Count for 3rd Dimension: CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT can be anywhere between 1 and 65535. Therefore the maximum number of frames in a block is 65535 (64K-1 frames). CCNT of '1' means '1' frame in the block and CCNT of '0' means '0' frames in the block. A CCNT value of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. WIMODE has no affect on CCNT operation.

Table 4-790. ERRDET Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
17	TCCHEN	RO	0h	Contains the OPT.TCCHEN value programmed by the user for the Read or Write transaction that resulted in an error.
16	TCINTEN	RO	0h	Contains the OPT.TCINTEN value programmed by the user for the Read or Write transaction that resulted in an error.
	RESERVED	NONE		Reserved
13 - 8	TCC	RO	0h	Transfer Complete Code: Contains the OPT.TCC value programmed by the user for the Read or Write transaction that resulted in an error.
	RESERVED	NONE		Reserved
3 - 0	STAT	RO	0h	Transaction Status:Stores the non-zero status/error code that was detected on the read status or write status bus.MS-bit effectively serves as the read vs. write error code.If read status and write status are returned on the same cycle then the TC chooses non-zero version. If both are non-zero then write status is treated as higher priority.Encoding of errors matches the CBA spec.

4.6.185 TPTC01_ERRCMD Register (Offset = 130h) [reset = h]

Access Types Legend

Table 4-1315. ICSTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 15	NU2	RW	0h	Reserved
14	SDIR	RW	0h	Slave Direction. This bit is clear to '0' indicating the I2C is a master transmitter/receiver or a slave receiver. This bit is also clear by STOP condition or START condition. It is set to '1' when the I2C slave is a transmitter. In DLB mode (which the configuration should be master-transmitter slave-receiver) this bit is clear to '0'. Writing a"1" to this bit to clear it.
13	NACKSNT	RW	0h	A No Acknowledge is sent due to NACKMOD is set to a"1". NACKSNT =0: A No Acknowledge is not sent. NACKSNT =1: A No Acknowledge is sent. Writing a"1" to this bit to clear it.
12	BB	RW	0h	Bus Busy. This bit indicates the state of the serial bus. BB=0: The bus is free. BB=1: The bus is occupied. On reception of a"start" condition the device sets BB to 1. This bit is also set if the I2C detects SCL low state. BB is clear to 0 after reception of a"stop" condition. BB is kept to"0" regardless SCL state when the I2C is in reset (IRS_=0). If the IRS_ is set to"1" during transaction between other I2C devices the BB bit is set at the first falling edge of SCL or START condition. - (RW)
11	RSFULL	RW	0h	Receive shift full. This bit indicates whether the receiver has experienced overrun. Overrun occurs when the receive shift register (ICRSR) is full and ICDRR has not been read since the ICRSR-to-ICDRR transfer. The FSM is holding for ICDRR read access. RSFULL is clear when reading the ICDRR. RSFULL is set to"1" when the I2C has recognized an overrun. The contents of ICDRR are NOT lost in this case. In repeat mode since double buffer (ICRSR and ICDRR) behaves like a single buffer RSFULL is set to"1" every time the data is received. RSFULL is clear as a result of reading the ICDRR. - (RW)

Table 4-1315. ICSTR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	XSMT	RW	0h	Transmit shift empty not. This bit indicates whether the transmitter has experienced underflow. Underflow occurs when the transmit shift register (ICXSR) is empty and ICDXR has not been loaded. The FSM is holding for ICDXR write access. XSMT_ is cleared when underflow has occurred. XSMT_ is set to"1" as a result of writing to ICDXR. In repeat mode if the I2C in master transmitter mode is holding transfer with XSMT_=0 (i.e. waiting for further action) and the STT or STP bit is set XSMT_ is set to"1" by hardware.
9	AAS	RW	0h	Address As Slave. This bit is set to 1 by the device when it has recognized its own slave address or an address of all (8) zeros. The AAS bit is reset by stop condition or detection of any address byte that does not match ICOAR. - (RW)
8	AD0	RW	0h	Address Zero Status: This bit is set to 1 by device if it detects the address of all (8) zeros (i.e. general call). The AD0 bit is reset to 0 (default value) when a"start" or"stop" condition is detected. - (RW)
7 - 6	NU1	RW	0h	Reserved
5	SCD	RW	0h	Stop Condition Detection bit SCD is set when the I2C sends or receives STOP condition. This bit is cleared by reading ICIVR (as 110) or writing '1' to itself.
4	ICXRDY	RW	0h	Transmit Data Ready interrupt flag bit. ICXRDY is set to"1" is generated when the transmitted data has been copied from ICDXR to the transmit-shift register (ICXSR). ICRXDY is clear to"0" when the ICDXR is written. This bit can also be polled by the CPU to write a new transmitted data into the ICDXR. Write '1' to this bit will set it and DXR Write will clear it.
3	ICRRDY	RW	0h	Receive Data Ready interrupt flag bit. ICRRDY is set to"1" when the received data has been copied from ICRSR into the ICDRR. ICRRDY is cleared to"0" when the ICDRR is read. This bit can also be polled by the CPU to read the received data in the ICDRR. Write '1' or DRR Read will clear it.
2	ARDY	RW	0h	Register-access-ready interrupt flag bit. ARDY is generated by the hardware if the I2C is in the master mode when the previously programmed data and command has been performed and status bit has been updated. This flag is used by the CPU to let it knows that the I2C registers are ready to be accessed again. When RM=0 ARDY is set when the internal data count is passed 0 if STP register bit has not been set. When RM=1 ARDY is set at each byte end. If the I2C is in FDF mode(FDF=1) ARDY is set just after Start condition. This bit is automatically cleared by hardware when writing data to ICDXR in transmit mode reading data from ICDRR in receive mode or setting STT or STP bit. Write '1' will clear it.
1	NACK	RW	0h	No-Acknowledgement interrupt flag bit. The No Acknowledge flag bit is set when the hardware in "master" mode detects no acknowledge has been received. This bit is NOT set by no-acknowledgement after Start byte Write '1' or Read the ICIVR (as 010) will clear it.
0	AL	RW	0h	Arbitration-Lost interrupt flag bit. The Arbitration Lost flag bit is set to 1 when the device in the "master" mode senses it has lost an arbitration when two or more transmitters start a transmission almost simultaneously or when the I2C attempts to start a transfer while BB (bus busy) is 1. When this is set to 1 due to arbitration lost the MST/STT/STP bits are clear the I2C becomes a slave. Write '1' or Read the ICIVR (as 001) will clear it.

4.12.4 I2C0_ICCLKL Register (Offset = Ch) [reset = h]

Short Description: I2C Clock Divider Low register

Long Description:

Return to Summary Table

Table 4-1329. ICMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	NU2	RW	0h	Reserved
15	NACKMOD	RW	0h	No Acknowledge (NACK) mode. This bit is used to send an Acknowledge (ACK) or a No Acknowledge (NACK) to the transmitter. This bit is only applicable when the I2C is in receiver mode. In master receiver mode when the internal data count counter decrements to zero the I2C sends a NACK. The master receiver I2C finishes a transfer when it sends a NACK. The I2C ignores ICCNT when NACKMOD is '1'. The NACKMOD bit should be set before the rising edge of the last data bit (bit 8) if a NACK must be sent and this bit is cleared once a NACK has been sent. NACKMOD=0 the I2C sends an ACK to the transmitter during the acknowledge cycle. NACKMOD=1 the I2C sends a NACK to the transmitter during the acknowledge cycle.
14	FREE	RW	0h	Free Running. This bit is used to determine the state of the I2C when a breakpoint is encountered in the HLL debugger. FREE=0: (default) Stops immediately if SCL is low and keep driving SCL low whether I2C is master transmitter/receiver. If SCL is high I2C waits until SCL becomes low and then stops. If the I2C is a slave it will stop when the transmission/receiving completes. FREE=1: The I2C runs free.

Table 4-1329. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	STT	RW	0h	Start Condition (Master only mode). This bit can be set to a"1" by the CPU to generate a Start condition. In master mode when setting Start to"1" generates a Start condition. It is reset to "0" by the hardware after the Start condition has been generated. The Start/ Stop bits can be configured to generate different transfer formats. Note that the STT and STP can be used to terminate the repeat mode. ST T___STP____Conditions_____Bus Activities _1_____0_____Start_____S-A-D _0_____1_____Stop_____P _1_____1_____Start-Stop (ICCNT= n)_____S-A-D..(n)..D-P _1_____0_____Start (ICCNT= n)_____S-A-D..(n)..D
12	NU1	RW	0h	Reserved for IDLEEN (IDLE Enable on 5509). - (RW)
11	STP	RW	0h	Stop Condition (Master mode only). This bit can be set to a"1" by the CPU to generate a Stop condition. It is reset to "0" by the hardware after the Stop condition has been generated. The Stop condition is generated when ICCNT passes 0 when the I2C is in non-repeat mode(RM=0).
10	MST	RW	0h	Master. MST=0: The I 2 C peripheral is in the"slave" mode and clock is received from the"master" device. MST=1: The I 2 C peripheral is in the"master" mode and it generates the clock. This bit is clear when the transfer completed.
9	TRX	RW	0h	Transmitter. TRX=0: The I 2 C is in the"receiver" mode and data on data line SDA is shifted into the data register ICDRR. TRX=1: The I 2 C is in the"transmitter" mode and the data in ICDXR is shifted out on data line SDA. The operating modes (not in FDF mode) are defined as follows. In FDF mode TRX must be configured even if the I2C is in slave mode because there is no address/direction byte in FDF mode. MST___TRX___Operating Modes _0_____x_____"slave receiver" _0_____x_____"slave transmitter" _1_____0_____"master receiver" _1_____1_____"master transmitter"
8	XA	RW	0h	Expanded Address. XA=0: (default) 7-bit address mode (normal address mode). XA=1: 10-bit address mode (expanded address mode) Please note that XA needs to be configured even if the I2C is in slave mode.
7	RM	RW	0h	Repeat Mode. This bit is set to a"1" by the CPU to put the I2C in the repeat mode. In this mode data is continuously transmitted out of the ICDXR until the STP bit is set to"1" regardless of ICCNT value. This bit is don"t care if the I2C is configured in slave mode. __RM___STT___STP___Conditions_____Bus Activities_____Mode _0_____0_____0_____Idle_____None_____NA _0_____0_____1_____Stop_____P_____NA _0_____1_____0_____(Re)Start_____S-A-D..(n)..D____Repeat n _0_____1_____1_____(Re)Start-Stop___S-A-D..(n)..D-P__Repeat n _1_____0_____0_____Idle_____none_____NA _1_____0_____1_____Stop_____P _____NA _1_____1_____0_____(Re)Start_____S-A-D-D-D..____Continuous _1_____1_____1_____Reserved_____None_____NA
6	DLB	RW	0h	Digital Loop Back (in master transmit mode only). This bit is set to a"1" by the CPU to put the I2C in the loop back mode. In this mode data transmitted out of the ICDXR will be received in the ICDRR after ((CPU freq/I2C freq)8) CPU cycles via an internal path. The address of the ICOAR is output on SDA.

Table 4-1329. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	IRS	RW	0h	I2C Reset Not. This can be set to a"0" by the CPU to put the I2C in reset or to a"1" to take the I2C out of reset. When this bit is reset to 0 all status bits in ICSTR and ICIVR are set to default values. Note that if this bit is reset during a transfer it can cause the I2C bus hang (SDA and SCL are tri-stated).
4	STB	RW	0h	Start Byte (Master only mode). The Start Byte mode bit is set to 1 by the CPU to configure the I2C in Start byte mode the I2C sends "00000001"? regardless ICSAR value. Refer to the Philip I2C spec for more details.
3	FDF	RW	0h	Free Data Format. This bit can be set to"1" by the CPU to configure the I2C in Free Data Format mode. FDF___MST___TRX_____Operating mode _0_____0_____ x____Slave in non FDF mode _0_____1_____0____Master receive in non FDF mode _0_____1_____1____Master transmit in non FDF mode _1_____0_____0____Slave receiver in FDF mode _1_____0_____1____Slave transmitter in FDF mode _1_____1_____0____Master receiver in FDF mode _1_____1_____1____Master transmitter in FDF mode
2 - 0	BC2_BC1_BC0	RW	0h	Bit Count : Bit Count 2, Bit Count 1 and Bit Count 0 define the number of bits starting from the lsb (excluding the acknowledge bit) of the next byte which are yet to be received or transmitted. Bit	Field	Type	Reset	Description
31 - 12	NU2	RW	0h	Reserved.
11 - 8	TESTMD	RW	0h	Reserved for internal testing.
7 - 3	NU1	RW	0h	Reserved.
2 - 0	INTCODE	RW	0h	Interrupt code. The binary-coded-interrupt vector indicates which interrupt has occurred. Reading the ICIVR clears the interrupt code except ARDY(011) RRDY(100) and XRDY(101). Interrupt code for ARDY RRDY and XRDY is cleared when ARDY ICRRDY and ICXRDY bits in the ICSTR is cleared to default value respectively. If other interrupts are pending a new interrupt is generated. If there are more than one interrupt flag reading the ICIVR clears the highest priority interrupt code. Reading the ICIVR also clears corresponding status bit in the ICSTR except ARDY ICRRDY ICXRDY and AAS. Note that users must read (clear) the ICIVR before doing another start otherwise the ICIVR could contain incorrect (old interrupt flags) value. Interrupt Code Interrupt Occurred 000_(default) None _001_(highest priority) Arbitration Lost interrupt _010 No Acknowledgement interrupt _011 Register Access Ready interrupt _100 Receive Data Ready interrupt _101 Transmit Data Ready interrupt _110 Stop Condition Detection _111_(lowest priority) Address As Slave - (RW)

Table 4-1372. SCIGCR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 26	RESERVED_3	RO	0h	Reserved
25	TXENA	RW	0h	Transmit enable.[[br]]This bit is effective in LIN and SCI modes. Data is transferred from SCITD or the TDy (with y=0, 1,...7) buffers in LIN mode to the SCITXSHF shift out register only when the TXENA bit is set.[[br]] [[br]]Note: Data written to SCITD or the transmit multi-buffer before TXENA is set is not[[br]]transmitted. If TXENA is cleared while transmission is ongoing, the data previously[[br]]written to SCITD is sent (including the checksum byte in LIN mode). 0 | TXENA_DISABLEDisable transfers from SCITD or TDy to SCITXSHF 1 | TXENA_ENABLEEnable transfers of data from SCITD or TDy to SCITXSHF

Table 4-1372. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	RXENA	RW	0h	Receive enable.[[br]]This bit is effective in LIN or SCI-compatible mode. RXENA allows or prevents the transfer of data from SCIRXSHF to SCIRD or the receive multibuffers.[[br]] [[br]]Note: Clearing RXENA stops received characters from being transferred into the receive buffer or multi-buffers, prevents the RX status flags (see Table 7) from being updated by receive data, and inhibits both receive and error interrupts. However, the shift register continues to assemble data regardless of the state of RXENA.[[br]] [[br]]Note: If RXENA is cleared before the time the reception of a frame is complete, the data from the frame is not transferred into the receive buffer.[[br]] [[br]]Note: If RXENA is set before the time the reception of a frame is complete, the data from the frame is transferred into the receive buffer. If RXENA is set while SCIRXSHF is in the process of assembling a frame, the status flags are not guaranteed to be accurate for that frame. To ensure that the status flagscorrectly reflect what was detected on the bus during a particular frame, RXENA should be set before the detection of that frame 0 | RXENA_SUSPENDPrevents the receiver from transferring data from the shift buffer to the receive buffer or multi-buffers 1 | RXENA_RUNAllows the receiver to transfer data from the shift buffer to the receive buffer or multi-buffers
23 - 18	RESERVED_2	RO	0h	Reserved
17	CONT	RW	0h	Continue on suspend.[[br]]This bit has an effect only when a program is being debugged with an emulator, and it determines how the SCI/LIN operates when the program is suspended. This bit affects the LIN counters. When this bit is set, the counters are not stopped during debug. When this bit is cleared, the counters are stopped during debug. 0 | CONT_SUSPENDWhen debug mode is entered, the SCI/LIN state machine is frozen. Transmissions and LIN counters are halted and resume when debug mode is exited. 1 | CONT_RUNWhen debug mode is entered, the SCI/LIN continues to operate until the current transmit and receive functions are complete.
16	LOOPBACK	RW	0h	Loopback bit.[[br]]This bit is effective in LIN or SCI-compatible mode. The self-checking option for the SCI/LIN can be selected with this bit. If the LINTX and LINRX pins are configured with SCI/LIN functionality, then the LINTX pin is internally connected to the LINRX pin. Externally, during loop back operation, the LINTX pin outputs a high value and the LINRX pin is in a high-impedance state. If this bit value is changed while the SCI/LIN is transmitting or receiving data, errors may result. 0 | LOOPBACK_DISABLELoopback mode is disabled. 1 | LOOPBACK_ENABLELoopback mode is enabled.
15 - 14	RESERVED_1	RO	0h	Reserved
13	STOPEXTFRAME	RW	0h	Stop extended frame communication.[[br]]This bit is effective in LIN mode only. This bit can be written only during extended frame communication. When the extended frame communication is stopped, this bit is cleared automatically. 0 | STOPEXTFRAME_NO_EFFECTNo effect 1 | STOPEXTFRAME_EFFECTExtended frame communication will be stopped, once current frame transmission/reception is completed.
12	HGENCTRL	RW	0h	HGEN control bit.[[br]]This bit is effective in LIN mode only. This bit controls the type of mask filtering comparison. 0 | HGENCTRL_IDBYTEID filtering using ID-Byte. [[br]]RECEIVEDID and IDBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in NO match. 1 | HGENCTRL_IDSLAVEID filtering using ID-SlaveTask byte (Recommended). [[br]]RECEIVEDID and IDSLAVETASKBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in ALWAYS match

Table 4-1372. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	CTYPE	RW	0h	Checksum type.[[br]]This bit is effective in LIN mode only. This bit controls the type of checksum to be used: classic or enhanced. 0 | CTYPE_CLASSICClassic checksum is used. [[br]]This checksum is compatible with LIN 1.3 slave nodes. The classic checksum contains the modulo-256 sum with carry over all data bytes. Frames sent with Identifier 60 (0x3C) to 63 (0x3F) must allways use the classic checksum. 1 | CTYPE_ENHANCEDEnhanced checksum is used. [[br]]The enhanced checksum is compatible with LIN 2.0 and newer slave nodes. The enhanced checksum contains the modulo-256 sum with carry over all data bytes AND the protected Identifier.
10	MBUFMODE	RW	0h	Multibuffer mode.[[br]]This bit is effective in LIN or SCI-compatible mode. This bit controls receive/transmit buffer usage, that is, whether the RX/TX multibuffers are used or a single register, RD0/TD0, is used. 0 | MBUFMODE_DISABLEDThe multi-buffer mode is disabled. 1 | MBUFMODE_ENABLEDThe multi-buffer mode is enabled.
9	ADAPT	RW	0h	Adapt mode enable.[[br]]This mode is effective in LIN mode only. This bit has an effect during the detection of the Sync Field. There are two LIN protocol bit rate modes that could be enabled with this bit according to the Node capability file definition: automatic or select. Software and network configuration will decide which of the previous two modes. When this bit is cleared, the LIN 2.0 protocol fixed bit rate should be used. If the ADAPT bit is set, a LIN slave node detecting the baudrate will compare it to the prescalers in BRSR register and update it if they are different. The BRSR register will be updated with the new value. If this bit is not set there will be no adjustment to the BRSR register.[[br]] [[br]]This field is writable in LIN mode only. 0 | ADAPT_DISABLEAutomatic baudrate adjustment is disabled. 1 | ADAPT_ENABLEAutomatic baudrate adjustment is enabled.
8	SLEEP	RW	0h	SCI sleep.[[br]]SCI compatibility mode only. In a multiprocessor configuration, this bit controls the receive sleep function. Clearing this bit brings the SCI out of sleep mode.[[br]] [[br]]The receiver still operates when the SLEEP bit is set; however, RXRDY is updated and SCIRD is loaded with new data only when an address frame is detected. The remaining receiver status flags are updated and an error interrupt is requested if the corresponding interrupt enable bit is set, regardless of the value of the SLEEP bit. In this way, if an error is detected on the receive data line while the SCI is asleep, software can promptly deal with the error condition. The SLEEP bit is not automatically cleared when an address byte is detected.[[br]] [[br]]This field is writable in SCI mode only. 0 | SLEEP_DISABLESleep mode is disabled. 1 | SLEEP_ENABLESleep mode is enabled.
7	SWNRST	RW	0h	Software reset (active low).[[br]]This bit is effective in LIN or SCI-compatible mode. The SCI/LIN should only be configured while SWnRST = 0.[[br]] [[br]]Only the following configuration bits can be changed in runtime (i.e.,[[br]]while SWnRESET = 1):[[br]]- STOP EXT Frame (SCIGCR1[13])[[br]]- CC bit (SCIGCR2[17])[[br]]- SC bit (SCIGCR2[16]) 0 | SWNRST_RESETThe SCI/LIN is in its reset state; no data will be transmitted or received. Writing a 0 to this bit intializes the SCI/LIN state machines and operating flags. All affected logic is held in the reset state until a 1 is written to this bit. 1 | SWNRST_READYThe SCI/LIN is in its ready state; transmission and reception can occur. After this bit is set to 1, the configuration of the module should not change.
6	LINMODE	RW	0h	LIN mode[[br]]This bit controls the mode of operation of the module. 0 | LINMODE_DISABLELIN mode is disabled; SCI compatibility mode is enabled. 1 | LINMODE_ENABLELIN mode is enabled; SCI compatibility mode is disabled.

ADVANCE INFORMATION

Table 4-1372. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	CLK_MASTER	RW	0h	SCI internal clock enable or LIN Master/Slave configuration.[[br]]In the SCI mode, this bit enables the clock to the SCI module. In LIN mode, this bit determines whether a LIN node is a slave or master. 0 | CLK_MASTER_OFFSCI-compatible mode: Reserved.[[br]]LIN mode: The module is in slave mode. 1 | CLK_MASTER_ONSCI-compatible mode: Enable clock to the SCI module.[[br]]LIN mode: The node is in master mode.
4	STOP	RW	0h	SCI number of stop bits.[[br]]This bit is effective in SCI-compatible mode only.[[br]] [[br]]Note: The receiver checks for only one stop bit. However in idle-line mode, the receiver waits until the end of the second stop bit (if STOP = 1) to begin checking for an idle period. [[br]] [[br]]This field is writable in SCI mode only. 0 | STOP_ONEOne stop bit is used. 1 | STOP_TWOTwo stop bits are used.
3	PARITY	RW	0h	SCI parity odd/even selection.[[br]]This bit is effective in SCI-compatible mode only. If the PARITY ENA bit (SCIGCR1.2) is set, PARITY designates odd or even parity. The parity bit is calculated based on the data bits in each frame and the address bit (in address-bit mode). The start and stop fields in the frame are not included in the parity calculation.[[br]] [[br]]This field is writable in SCI mode only. 0 | PARITY_ODDOdd parity is used. The SCI transmits and expects to receive a value in the parity bit that makes odd the total number of bits in the frame with the value of 1. 1 | PARITY_EVENEven parity is used. The SCI transmits and expects to receive a value in the parity bit that makes even the total number of bits in the frame with the value of 1.
2	PARITYENA	RW	0h	Parity enable.[[br]]Enables or disables the parity function. 0 | PARITYENA_DISABLESCI-compatible mode: Parity disabled; no parity bit is generated during transmission or is expected during reception.[[br]]LIN mode: ID-parity verification is disabled. 1 | PARITYENA_ENABLESCI compatible mode: Parity enabled. A parity bit is generated during transmission and is expected during reception.[[br]]LIN mode: ID-parity verification is enabled.
1	TIMINGMODE	RW	0h	SCI timing mode bit.[[br]]This bit is effective in SCI-compatible mode only. It must be set to 1 when the SCI mode is used. This bit configures the SCI for asynchronous operation. 0 | TIMINGMODE_RSVDReserved. 1 | TIMINGMODE_SETMust be set to 1 when module is configured for SCI operation
0	COMMMODE	RW	0h	SCI/LIN communication mode bit.[[br]]In compatibility mode, it selects the SCI communication mode. In LIN mode it selects length control option for ID-field bits ID4 and ID5. 0 | COMMMODE_UNUSESCI-compatible mode: Idle-line mode is used. [[br]]LIN mode: ID4 and ID5 are not used for length control. 1 | COMMMODE_USESCI-compatible mode: Address-bit mode is used. [[br]]LIN mode: ID4 and ID5 are used for length control.

4.14.3 LIN0_SCIGCR2 Register (Offset = 8h) [reset = h]

Short Description: The SCIGCR2 register is used to send or compare a checksum byte during extended frames, to generate a wakeup and for low-power mode control of the LIN module.

Long Description:

Table 4-1374. SCIGCR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 18	RESERVED_3	RO	0h	Reserved
17	CC	RW	0h	Compare Checksum.[[br]]This mode is effective in LIN mode only. This bit is used by the receiver for extended frames to trigger a checksum compare. The user will initiate this transaction by writing a one to this bit.[[br]]In non multibuffer mode, once the CC bit is set, the checksum will be compared on the byte that is currently being received, expected to be the checkbyte.[[br]]During Multi-buffer mode, following are the scenarios associated with the CC bit :[[br]]- If CC bit is set during the reception of the data, then the byte that is received after the reception of the programmed no. of data bytes indicated by SCIFORMAT[18:16], is treated as a checksum byte.[[br]]- If CC bit is set during the IDLE period (i.e. during inter-frame space), then the next immediate byte will be treated as a checksum byte.[[br]] [[br]]A CE will immediatly be flagged if there is a checksum error. This bit is automatically cleared once the checksum is successfully compared. 0 | CC_NO_EFFECTNo effect 1 | CC_EFFECTCompare checksum on expected checkbyte
16	SC	RW	0h	Send Checksum[[br]]This mode is effective in LIN mode only. This bit is used by the transmitter with extended frames to send a checkbyte. In non multibuffer mode the checkbyte will be sent after the current byte transmission. In multibuffer mode the checkbyte will be sent after the last byte count, indicated by the SCIFORMAT[18:16]). [[br]] [[br]]This field is writable in LIN mode only. 0 | SC_NO_CHECKNo checkbyte will be sent. 1 | SC_CHECKA checkbyte will be sent. This bit will automatically get cleared after the checkbyte is transmitted. The checksum will not be sent if this bit is set before transmitting the very first byte, that is, during interframe space.
15 - 9	RESERVED_2	RO	0h	Reserved

ADVANCE INFORMATION

Table 4-1374. SCIGCR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	GENWU	RW	0h	Generate wakeup signal.[[br]]This bit controls the generation of a wakeup signal, by transmitting the TDO buffer value. This bit is cleared on reception of a valid sync break. 0 | GENWU_NO_EFFECTNo effect 1 | GENWU_EFFECTTransmit TDO for wakeup. This bit will be cleared on a SWnRST (SCIGCR1.7)
7 - 1	RESERVED_1	RO	0h	Reserved
0	POWERDOWN	RW	0h	Power down.[[br]]This bit is effective in LIN or SCI-compatible mode. When the powerdown bit is set, the SCI/LIN module attempts to enter local low-power mode. If the POWERDOWN bit is set while the receiver is actively receiving data and the wakeup interrupt is disabled, then the SCI/LIN will delay low-power mode from being entered until completion of reception. In LIN mode the user may set the POWERDOWN bit on Sleep Command reception or on idle bus detection (more than 4 seconds, i.e. 80,000 cycles at 20kHz) 0 | POWERDOWN_RUNNormal operation 1 | POWERDOWN_LOWRequest local low-power mode

4.14.4 LIN0_SCISETINT Register (Offset = Ch) [reset = h]

Short Description: The SCISETINT register is used to enable the various interrupts available in the LIN module.

Long Description:

Table 4-1376. SCISETINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SETBEINT	RW	0h	Set bit error interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is a bit error.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETBEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETBEINT_ENABLEInterrupt is enabled.
30	SETPBEINT	RW	0h	Set physical bus error interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when a physical bus error occurs.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETPBEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETPBEINT_ENABLEInterrupt is enabled.
29	SETCEINT	RW	0h	Set checksum-error Interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is a checksum error.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETCEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETCEINT_DEABLEInterrupt is enabled.
28	SETISFEINT	RW	0h	Set inconsistent-sync-field-error interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is an inconsistent sync field error.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETISFEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETISFEINT_ENABLEInterrupt is enabled.

Table 4-1376. SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	SETNREINT	RW	0h	Set no-response-error interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when a no-response error occurs.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETNREINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETNREINT_ENABLEInterrupt is enabled.
26	SETFEINT	RW	0h	Set framing-error interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a framing error occurs. 0 | SETFEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETFEINT_ENABLEInterrupt is enabled.
25	SETOEINT	RW	0h	Set overrun-error interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when an overrun error occurs. 0 | SETOEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETOEINT_ENABLEInterrupt is enabled.
24	SETPEINT	RW	0h	Set parity interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a parity error occurs. 0 | SETPEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETPEINT_ENABLEInterrupt is enabled.
23 - 19	RESERVED_5	RO	0h	Reserved
18	SET_RX_DMA_ALL	RW	0h	Set receiver DMA for Address & Data frames.[[br]]This bit is effective in LIN or SCI-compatible mode. To enable RX DMA request for address and data frames this bit must be set. If it is cleared, RX interrupt request is generated for address frames and DMA requests are generated for data frames. 0 | SERXDMAALL_DISABLEReceiver DMA request is disabled for address frames (RX interrupt request is enabled for address frames). Writing a 0 to this bit has no effect. 1 | SERXDMAALL_ENABLEReceiver DMA request is enabled for address and data frames
17	SET_RX_DMA	RW	0h	Set receiver DMA.[[br]]This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the receiver this bit must be set. If it is cleared, interrupt requests are generated depending on SETRXINT. 0 | SERXDMA_DISABLEReceiver DMA request is disabled. Writing a 0 to this bit has no effect. 1 | SERXDMA_ENABLEReceiver DMA request is enabled.
16	SET_TX_DMA	RW	0h	Set transmit DMA.[[br]]This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the transmitter, this bit must be set. If it is cleared, interrupt requests are generated depending on SETTXINT. 0 | SETXDMA_DISABLETransmit DMA request is disabled. Writing a 0 to this bit has no effect. 1 | SETXDMA_ENABLETransmit DMA request is enabled
15 - 14	RESERVED_4	RO	0h	Reserved
13	SETIDINT	RW	0h	Set Identification interrupt.[[br]]This bit is effective in LIN mode only. This bit is set to enable interrupt once a valid matching identifier is received. 0 | SETIDINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETIDINT_ENABLEInterrupt is enabled.
12 - 10	RESERVED_3	RO	0h	Reserved
9	SETRXINT	RW	0h	Set Receiver interrupt.[[br]]Setting this bit enables the SCI/LIN to generate a receive interrupt after a frame has been completely received and the data is being transferred from SCIRXSHF to SCIRD. 0 | SETRXINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETRXINT_ENABLEInterrupt is enabled.
8	SETTXINT	RW	0h	Set Transmitter interrupt.[[br]]Setting this bit enables the SCI/LIN to generate a transmit interrupt as data is being transferred from SCITD to SCITXSHF and the TXRDY bit is being set. 0 | SETTXINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETTXINT_ENABLEInterrupt is enabled.

Table 4-1376. SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	SETTOA3WUSINT	RW	0h	Set Timeout After 3 Wakeup Signals interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after 3 wakeup signals have been sent.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETTOA3WUSINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETTOA3WUSINT_ENABLEInterrupt is enabled.
6	SETTOAWUSINT	RW	0h	Set Timeout After Wakeup Signal interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after one wakeup signal has been sent.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETTOAWUSINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETTOAWUSINT_ENABLEInterrupt is enabled.
5	RESERVED_2	RO	0h	Reserved
4	SETTIMEOUTINT	RW	0h	Set timeout interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when no LIN bus activity (bus idle) occurs for at least 4 seconds.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETTIMEOUTINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETTIMEOUTINT_ENABLEInterrupt is enabled.
3 - 2	RESERVED_1	RO	0h	Reserved
1	SETWAKEUPINT	RW	0h	Set wake-up interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN to generate a wake-up interrupt and thereby exit low-power mode. The wake-up interrupt is asserted on falling edge of the wake-up pulse. If enabled, the wake-up interrupt is asserted when local low-power mode is requested while the receiver is busy or if a low level is detected on the SCIRX pin during low-power mode. Wake-up interrupt is not asserted upon a wakeup pulse if the module is not in power down mode. 0 | SETWAKEUPINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETWAKEUPINT_ENABLEInterrupt is enabled.
0	SETBRKDTINT	RW	0h	Set break-detect interrupt.[[br]]This bit is effective in SCI-compatible mode only. Setting this bit enables the SCI/LIN to generate an interrupt if a break condition is detected on the LINRX pin.[[br]] [[br]]This field is writable in SCI mode only. 0 | SETBRKDTINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETBRKDTINT_ENABLEInterrupt is enabled.

4.14.5 LIN0_SCICLEARINT Register (Offset = 10h) [reset = h]

Short Description: The SCICLEARINT register is used to disable the enabled interrupts without accessing the SCISETINT register.

Bit	Field	Type	Reset	Description
31	CLRBEINT	RW	0h	Clear Bit Error Interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the bit error interrupt.[[br]] [[br]]This field is writable in LIN mode only. 0 | CLRBEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRBEINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
30	CLRPBEINT	RW	0h	Clear Physical Bus Error Interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the physical-bus error interrupt.[[br]] [[br]]This field is writable in LIN mode only. 0 | CLRPBEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRPBEINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
29	CLRCEINT	RW	0h	Clear checksum-error Interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the checksum-error interrupt. [[br]] [[br]]This field is writable in LIN mode only. 0 | CLRCEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRCEINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
28	CLRISFEINT	RW	0h	Clear Inconsistent-Sync-Field-Error Interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the ISFE interrupt. [[br]] [[br]]This field is writable in LIN mode only. 0 | CLRISFEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRISFEINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.

Table 4-1378. SCICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	CLRNREINT	RW	0h	Clear No-Reponse-Error Interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the no-response error interrupt.[[br]] [[br]]This field is writable in LIN mode only. 0 | CLRNREINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRNREINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
26	CLRFEINT	RW	0h	Clear Framing-Error Interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit disables framing-error interrupt. 0 | CLRFEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRFEINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
25	CLROEINT	RW	0h	Clear Overrun-Error Interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the overrun interrupt. 0 | CLROEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLROEINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
24	CLRPEINT	RW	0h	Clear Parity Interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the parity error interrupt. 0 | CLRPEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRPEINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
23 - 19	RESERVED_6	RO	0h	Reserved
18	RESERVED_5	RO	0h	Reserved
17	SETRXDMA	RW	0h	Clear receiver DMA.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the receive DMA request. 0 | CLRRXDMA_DISABLEReceiver DMA request is disabled. Writing a 0 to this bit has no effect. 1 | CLRRXDMA_ENABLEReceiver DMA request is enabled. Writing a 1 to this bit will disable the DMA request and clear this bit.
16	CLRTXDMA	RW	0h	Clear transmit DMA.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the transmit DMA request. 0 | CLRTXDMA_DISABLETransmit DMA request is disabled. Writing a 0 to this bit has no effect. 1 | CLRTXDMA_ENABLETransmit DMA request is enabled. Writing a 1 to this bit will disable the DMA request and clear this bit.
15 - 14	RESERVED_4	RO	0h	Reserved
13	CLRIDINT	RW	0h	Clear Identifier interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the ID interrupt. 0 | CLRIDINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRIDINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
12 - 10	RESERVED_3	RO	0h	Reserved
9	CLRRXINT	RW	0h	Clear Receiver interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the receiver interrupt. 0 | CLRRXINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRRXINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
8	CLRTXINT	RW	0h	Clear Transmitter interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the transmitter interrupt. 0 | CLRTXINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRTXINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
7	CLRTOA3WUSINT	RW	0h	Clear Timeout After 3 Wakeup Signals interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the timeout after 3 wakeup signals interrupt.[[br]] [[br]]This field is writable in LIN mode only. 0 | CLRTOA3WUSINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRTOA3WUSINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.

Table 4-1378. SCICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	CLRTOAWUSINT	RW	0h	Clear Timeout After Wakeup Signal interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the timeout after one wakeup signal interrupt.[[br]] [[br]]This field is writable in LIN mode only. 0 | CLRTOAWUSINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRTOAWUSINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
5	RESERVED_2	RO	0h	Reserved
4	CLRTIMEOUTINT	RW	0h	Clear Timeout interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit disables the timeout (LIN bus idle) interrupt.[[br]] [[br]]This field is writable in LIN mode only. 0 | CLRTIMEOUTINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRTIMEOUTINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
3 - 2	RESERVED_1	RO	0h	Reserved
1	CLRWAKEUPINT	RW	0h	Clear Wake-up interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the wake-up interrupt. 0 | CLRWAKEUPINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRWAKEUPINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
0	CLRBRKDTINT	RW	0h	Clear Break-detect interrupt.[[br]]This bit is effective in SCI-compatible mode only. Setting this bit disables the Break-detect interrupt.[[br]] [[br]]This field is writable in SCI mode only. 0 | CLRBRKDTINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | CLRBRKDTINT_ENABLEInterrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.

4.14.6 LIN0_SCISETINTLVL Register (Offset = 14h) [reset = h]

Short Description: The SCISETINTLVL register is used to map individual interrupt sources to the INT1 interrupt line.

Long Description:

Table 4-1384. SCIFLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BE	RW	0h	Bit Error Flag.[[br]]This bit is effective in LIN mode only. This bit is set when there has been a bit error. This is detected by the bit monitor in the internal bit monitor. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]This field is writable in LIN mode only. 0 | BE_NO_EFFECTNo bit error detected. 1 | BE_EFFECTBit error detected.
30	PBE	RW	0h	Physical Bus Error Flag.[[br]]This bit is effective in LIN mode only. This bit is set when there has been a physical bus error. This is detected by the bit monitor in TED. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]Note: thie PBE will ony be flagged if no sync break can be generated. (because of a bus shortage to VBAT) or if no sync break delimeter can be generated (because of a bus shortage to GND).[[br]] [[br]]This field is writable in LIN mode only. 0 | PBE_NO_EFFECTNo physiscal bus error detected. 1 | PBE_EFFECTPhysical bus error detected.

Table 4-1384. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	CE	RW	0h	Checksum Error Flag. [[br]]This bit is effective in LIN mode only. This bit is set when there is checksum error detected by a receiving node. The type of checksum to be used depends on the SCIGCR1.CTYPE bit. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]This field is writable in LIN mode only. 0 | CE_NO_EFFECTNo Checksum error detected. 1 | CE_EFFECTChecksum error detected.
28	ISFE	RW	0h	Inconsistent Sync Field Error Flag.[[br]]This bit is effective in LIN mode only. This bit is set when there has been an inconsistent Sync Field error detected by the synchronizer during header reception. See the "Header Reception and Adaptive Baudrate" section for more information. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]This field is writable in LIN mode only. 0 | ISFE_NO_EFFECTNo Inconsistent Sync Field error detected. 1 | ISFE_EFFECTInconsistent Sync Field error detected.
27	NRE	RW	0h	No-Response Error Flag.[[br]]This bit is effective in LIN mode only. This bit is set when there is no response to a master's header completed within TFRAME_MAX. This timeout period is applied for message frames of unknown length (identifiers 0 to 61). This error is detected by the synchronizer of the module. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]This field is writable in LIN mode only. 0 | NRE_NO_EFFECTNo No-Response error detected. 1 | NRE_EFFECTNo-Response error detected.
26	FE	RW	0h	Framing error flag.[[br]]This bit is effective in LIN or SCI-compatible mode. This bit is set when an expected stop bit is not found. In SCI compatible mode, only the first stop bit is checked. The missing stop bit indicates that synchronization with the start bit has been lost and that the character is incorrectly framed. Detection of a framing error causes the SCI to generate an error interrupt if the RXERR INT ENA bit is set. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new character (SCI-compatible mode), or frame (LIN mode)[[br]]In multibuffer mode the frame is defined in the SCIFORMAT register. 0 | FE_NO_EFFECTNo framing error detected. 1 | FE_EFFECTFraming error detected.
25	OE	RW	0h	Overrun error flag.[[br]]This bit is effective in LIN or SCI-compatible mode. This bit is set when the transfer of data from SCIRXSHF to SCIRD overwrites unread data already in SCIRD or the RDy buffers. Detection of an overrun error causes the LIN to generate an error interrupt if the SET OE INT bit is one. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit 0 | OE_NO_EFFECTNo overrun error detected. 1 | OE_EFFECTOverrun error detected.

Table 4-1384. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	PE	RW	0h	Parity error flag.[[br]]This bit is effective in LIN or SCI-compatible mode. This bit is set when a parity error is detected in the received data. In SCI address-bit mode, the parity is calculated on the data and address bit fields of the received frame. In idle-line mode, only the data is used to calculate parity. An error is generated when a character is received with a mismatch between the number of 1s and its parity bit. For more information on parity checking, see the "SCI Global Control Register (SCIGCR1)" description. If the parity function is disabled (that is, SCIGCR1.2 = 0), the PE flag is disabled and read as 0. Detection of a parity error causes the LIN to generate an error interrupt if the SET PE INT bit = 1. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Reception of a new charcter (SCI-compatible mode) orframe (LIN mode)[[br]]- Writing a 1 to this bit 0 | PE_NO_EFFECTNo parity error or parity disabled. 1 | PE_EFFECTParity error detected.
23 - 16	RESERVED_3	RO	0h	Reserved
15	RESERVED_2	RO	0h	Reserved
14	IDRXFLAG	RW	0h	Identifier On Receive Flag.[[br]]This bit is effective in LIN mode only. This flag is set once an identifier is received with an RX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on an RX match. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Reading the LINID register[[br]]- Writing a 1 to this bit[[br]] [[br]]This field is writable in LIN mode only. 0 | IDRXFLAG_NO_EFFECTNo valid ID received. 1 | IDRXFLAG_EFFECTValid ID RX received in LINID[23:16] on RX match.
13	IDTXFLAG	RW	0h	Identifier On Transmit Flag.[[br]]This bit is effective in LIN mode only. This flag is set once an identifier is received with a TX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on a TX match. This bit is cleared by: [[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- RESET bit (SCIGCR0.0)[[br]]- Setting SWnRESET[[br]]- System reset[[br]]- Reading the LINID register[[br]]- Writing a 1 to this bit [[br]] [[br]]This field is writable in LIN mode only. 0 | IDTXFLAG_NO_EFFECTNo valid ID received. 1 | IDTXFLAG_EFFECTValid ID received in LINID[23:16] on TX match.
12	RXWAKE	RO	0h	Receiver wakeup detect flag.[[br]]This bit is effective in SCI-compatible mode only. The SCI sets this bit to indicate that the data currently in SCIRD is an address. This bit is cleared by: [[br]]- RESET bit[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- System reset[[br]]- Receipt of a data frame[[br]] [[br]]This bit is writable in SCI mode only. Read0 | RXWAKE_NO_EFFECTThe data in SCIRD is not an address. Read1 | RXWAKE_EFFECTThe data in SCIRD is an address.[[br]]See [1] Section 3.4.4, Sleep Mode for Multiprocessor Communication, on page 16 for more information on using the RXWAKE bit with sleep mode.

Table 4-1384. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	TXEMPTY	RO	1h	Transmitter Empty flag.[[br]]The value of this flag indicates the contents of the transmitter's buffer register(s) (SCITD/TDy) and shift register (SCITXSHF). In multibuffer mode, this flag indicates the value of the TDx registers and shift register (SCITXSHF). In non multibuffer mode, this flag indicates the value of LINTD0 (byte) and shift register (SCITXSHF). This bit is set by: [[br]]- RESET bit (SCIGCR0.0)[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- System reset. [[br]] [[br]]Note: This bit does not cause an interrupt request. Read0 | TXEMPTY_NO_EFFECTCompatible mode or LIN with no multibuffer:[[br]]Transmitter buffer or shift register (or both) are loaded with data.[[br]]In LIN mode using multibuffer mode: [[br]]Multibuffer or shift register (or all) are loaded with data. Read1 | TXEMPTY_EFFECTCompatible mode or LIN with no multibuffer: [[br]]Transmitter buffer and shift registers are both empty.[[br]]In LIN mode using multibuffer mode:[[br]]Multibuffer and shift registers are all empty.
10	TXWAKE	RW	0h	SCI transmitter wakeup method select.[[br]]This bit is effective in SCI-compatible mode only. The TXWAKE bit controls whether the data in SCITD should be sent as an address or data frame using multiprocessor communication format. This bit is set to 1 or 0 by software before a byte is written to SCITD and is cleared by the SCI when data is transferred from SCITD to SCITXSHF or by a system reset. TXWAKE is not cleared by the SWnRESET bit (SCIGCR1.7). 0 | TXWAKE_ADDR0Address-bit mode: Frame to be transmitted will be data (address bit = 0).[[br]]Idle-line mode: Frame to be transmitted will be data. 1 | TXWAKE_ADDR1Address-bit mode:[[br]]Frame to be transmitted will be an address (address bit=1).[[br]]Idle-line mode: [[br]]Following frame to be transmitted will be an address (writing a 1 to this bit followed by writing dummy data to the SCITD will result in a idle period of 11 bit periods before the next frame is transmitted).
9	RXRDY	RW	0h	Receiver ready flag. [[br]]In SCI compatibility mode, the receiver sets this bit to indicate that the SCIRD contains new data and is ready to be read by the CPU. In LIN mode, RXRDY is set once a valid frame is received in multibuffer mode, a valid frame being a message frame received with no errors. In non multibuffer mode RXRDY is set for each received byte and will be set for the last byte of the frame if there are no errors. The SCI/LIN generates a receive interrupt when RXRDY flag bit is set[[br]]if the interrupt-enable bit is set (SCISETINT.9). RXRDY is cleared by:[[br]]- RESET bit (SCIGCR0.0)[[br]]- Setting the SWnRESET[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reading SCIRD in while in SCI compatibility mode[[br]]- Reading last data byte RDy of the response in LIN mode [[br]] [[br]]Note: The RXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0/1 register. 0 | RXRDY_NO_EFFECTNo new data in SCIRD/RDy. 1 | RXRDY_EFFECTNew data ready to be read from SCIRD.
8	TXRDY	RO	1h	Transmitter buffer register ready flag.[[br]]When set, this bit indicates that the transmit buffer(s) register (SCITD in compatibility mode and LINTD0, LINTD1 in MBUF mode) is/are ready to get another character from a CPU write. [[br]]In SCI compatibility mode, writing data to SCITD automatically clears this bit. In LIN mode, this bit is cleared once byte 0 (TD0) is written to LINTD0. This bit is set after the data of the TX buffer are shifted into the SCITXSHF register. This event can trigger a transmit DMA event if the DMA enable bit is set. This bit is set to 1 by:[[br]]- RESET bit (SCIGCR0.0)[[br]]- Setting the SWnRESET (SCIGCR1.7)[[br]]- System reset[[br]] [[br]]Note: The TXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0/1 register.[[br]] [[br]]Note: The transmit interrupt request can be eliminated until the next series of data is written into the transmit buffers LINTD0 and LINTD1, by disaLINg the corresponding interrupt via theSCICLEARINT register or by disaLINg the transmitter via the TXENA bit (SCIGCR1.25=0). Read0 | TXRDY_FULLCompatible mode: SCITD is full.[[br]]LIN mode: The multibuffers are full. Read1 | TXRDY_EMPTYCompatible mode: SCITD is ready to receive the next character.[[br]]LIN mode: The multibuffers are ready to receive the next character(s).

Table 4-1384. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	TOA3WUS	RW	0h	Timeout After 3 Wakeup Signals flag.[[br]]This bit is effective in LIN mode only. This flag is set if there is no Sync Break received after 3 wakeup signals and a period of 1.5 seconds have passed. Such expiration time is used before issuing another round of wakeup signals. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]] [[br]]This field is writable in LIN mode only. 0 | TOA3WUS_NO_EFFECTNo timeout after 3 wakeup signals. 1 | TOA3WUS_EFFECTTimeout after 3 wakeup signals and 1.5s time.
6	TOAWUS	RW	0h	Timeout After Wakeup Signal flag.[[br]]This bit is effective in LIN mode only. This bit is set if there is no Sync Break received after a wakeup signal has been sent. A minimum of 150 ms expiration time is used before issuing another wakeup signal. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]] [[br]]This field is writable in LIN mode only. 0 | TOAWUS_NO_EFFECTNo timeout after one wakeup signal (150 ms). 1 | TOAWUS_EFFECTTimeout after one wakeup signal.
5	RESERVED_1	RO	0h	Reserved
4	TIMEOUT	RW	0h	LIN Bus IDLE timeout flag.[[br]]This bit is effective in LIN mode only. This bit is set if there is no LIN bus activity for at least 4 seconds. LIN bus activity being a transition from recessive to dominant. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]] [[br]]This field is writable in LIN mode only. 0 | TIMEOUT_NO_EFFECTNo bus idle detected. 1 | TIMEOUT_EFFECTLIN bus idle detected.
3	BUSY	RO	0h	Bus BUSY flag.[[br]]This bit is effective in LIN mode and SCI-compatible mode. This bit indicates whether the receiver is in the process of receiving a frame. As soon as the receiver detects the beginning of a start bit, the BUSY bit is set to 1. When the reception of a frame is complete, the BUSY bit is cleared. If SET WAKEUP INT is set and power down is requested while this bit is set, the SCI/LIN automatically prevents low-power mode from being entered and generates wakeup interrupt. The BUSY bit is controlled directly by the SCI receiver but can be cleared by:[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset. Read0 | BUSY_NO_EFFECTReceiver is not currently receiving a frame. Read1 | BUSY_EFFECTReceiver is currently receiving a frame.
2	IDLE	RO	1h	SCI receiver in idle state.[[br]]This bit is effective in SCI-compatible mode only. While this bit is set, the SCI looks for an idle period to resynchronize itself with the bit stream. The receiver does not receive any data while the bit is set. The bus must be idle for 11 bit periods to clear this bit. The SCI enters this state:[[br]]- After a system reset[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- After coming out of power down[[br]] [[br]]This bit is writable in SCI mode only. Read0 | IDLE_NO_EFFECTIdle period detected, the SCI is ready to receive. Read1 | IDLE_EFFECTIdle period not detected, the SCI will not receive any data.
1	WAKEUP	RW	0h	Wake-up flag.[[br]]This bit is effective in LIN mode only. This bit is set by the SCI/LIN when receiver or transmitter activity has taken the module out of power-down mode. An interrupt is generated if the SET WAKEUP INT bit (SCISETINT.1) is set. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register.[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit.[[br]] [[br]]This field is writable in LIN mode only. 0 | WAKEUP_NO_EFFECTDo not wake up from power-down mode. 1 | WAKEUP_EFFECTWake up from power-down mode.

Table 4-1384. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	BRKDT	RW	0h	SCI break-detect flag.[[br]]This bit is effective in SCI-compatible mode only. This bit is set when the SCI detects a break condition on the LINRX pin. A break condition occurs when the LINRX pin remains continuously low for at least 10 bits after a missing first stop bit, that is, after a framing error. Detection of a break condition causes the SCI to generate an error interrupt if the BRKDT INT ENA bit is set. The BRKDT bit is cleared by the following:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register.[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- By writing a 1 to this bit.[[br]] [[br]]This bit is writable in SCI mode only. 0 | BRKDT_NO_EFFECTNo break condition detected. 1 | BRKDT_EFFECTBreak condition detected.

4.14.9 LIN0_SCIINTVECT0 Register (Offset = 20h) [reset = h]

Short Description: The SCIINTVECT0 register indicates the offset for the INT0 interrupt line.

Long Description:

Return to Summary Table

Bit	Field	Type	Reset	Description
31	RESERVED_1	RO	0h	Reserved
30 - 28	U	RW	0h	Superfractional Divider Selection. (U)[[br]]These bits are an additional fractional part for the baudrate specification. These bits allow a super fine tuning of the fractional baudrate with 7 more intermediate values for each of the M fractional divider values. See the Superfractional Divider section for more details.
27 - 24	M	RW	0h	SCI/LIN 4-bit Fractional Divider Selection. (M)[[br]]These bits are effective in LIN or SCI asynchronous mode. These bits are used to select a baud rate for the SCI/LIN module, and they are a fractional part for the baud rate specification. The M divider allows fine-tuning of the baud rate over the P prescaler with 15 additional intermediate values for each of the P integer values.
23 - 16	SCI_LIN_PSH	RW	0h	PRESCALER P (High Bits).[[br]]SCI/LIN 24-bit Integer Prescaler Selection.[[br]]These bits are used to select a baudrate for the SCI/LIN module. These bits are effective in LIN mode and SCI compatible mode. The SCI/LIN has an internally generated serial clock determined by the LIN module input clock and the prescalers P and M in this register. The SCI/LIN uses the 24-bit integer prescaler P value to select 1 of over 16,700,000 available baud rates. The additional 4-bit fractional prescaler M refines the baudate selection.
15 - 0	SCI_LIN_PSL	RW	0h	PRESCALER P (Low Bits).[[br]]SCI/LIN 24-bit Integer Prescaler Selection.[[br]]These bits are used to select a baudrate for the SCI/LIN module. These bits are effective in LIN mode and SCI compatible mode. The SCI/LIN has an internally generated serial clock determined by the LIN module input clock and the prescalers P and M in this register. The SCI/LIN uses the 24-bit integer prescaler P value to select 1 of over 16,700,000 available baud rates. The additional 4-bit fractional prescaler M refines the baudate selection.

4.14.13 LIN0_SCIED Register (Offset = 30h) [reset = h]

Short Description: The SCIED register is a duplicate copy of SCIRD register that has no affect on the RXRDY flag for use with an emulator.

Long Description:

Return to Summary Table

Table 4-1396. SCIRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 8	RESERVED_1	RO	0h	Reserved
7 - 0	RD	RO	0h	Received Data.[[br]]This bit is effective in SCI-compatible mode only. When a frame has been completely received, the data in the frame is transferred from the receiver shift register SCIRXSHF to this register. As this transfer occurs, the RXRDY flag is set and a receive interrupt is generated if RX INT ENA (SCISETINT0.9) is set. When the data is read from SCIRD, the RXRDY flag is automatically cleared.[[br]] [[br]]When the SCI receives data that is fewer than eight bits in length, it loads the data into this register in a left justified format padded with trailing zeros. Therefore, your software should perform a logical shift on the data by the correct number of positions to make it right justified.

4.14.15 LIN0_SCITD Register (Offset = 38h) [reset = h]

Short Description: The SCITD register is where data to be transmitted is written to by application software.

Long Description:

Return to Summary Table

Table 4-1397. Instance Table

Table 4-1398. SCITD Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 8	RESERVED_1	RO	0h	Reserved
7 - 0	TD	RW	0h	Transmit data[[br]]This bit is effective in SCI-compatible mode only. Data to be transmitted is written to this register. The transfer of data from this register to the transmit shift register SCITXSHF sets the TXRDY flag (SCIFLR.23), which indicates that SCITD is ready to be loaded with another byte of data. Note: If TX INT ENA (SCISETINT.8) is set, this data transfer also causes an interrupt.[[br]] [[br]]Note: Data written to the SCIRD register that is fewer than eight bits long must be right justified, but it does not need to be padded with leading zeros.

4.14.16 LIN0_SCIPIO0 Register (Offset = 3Ch) [reset = h]

Short Description: The SCIPIO0 register is used to enable the LINTX and LINRX pins.

Long Description:

Table 4-1426. LINID Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 24	RESERVED_1	RO	0h	Reserved
23 - 16	RECEIVEDID	RO	0h	Received ID.[[br]]This bit is effective in LIN mode only. This byte contains the current message identifier. During header reception the received ID is copied from the SCIRXSHF register to this byte if there is no ID-parity error and there has been an RX/TX match.[[br]]Note: If a framing error (FE) is detected during ID reception, the received ID will also not be copied to the LINID register.
15 - 8	IDSLAVETASKBYTE	RW	0h	ID Slave Task byte.[[br]]This field is effective in LIN mode only. This byte contains the identifier to which the received ID of an incoming header will be compared in order to decide whether a RX response, a TX response, or no action needs to be done by the LIN node. [[br]] [[br]]These bits are writable in LIN mode only.
7 - 0	IDBYTE	RW	0h	ID byte.[[br]]This field is effective in LIN mode only. This byte is the LIN mode message ID. On a master node, a write to this register by the CPU initiates a header transmission. For a slave task, this byte is used for message filtering when HGENCTRL (SCIGCR1.12) is '0'.[[br]] [[br]]These bits are writable in LIN mode only.

4.14.30 LIN0_LINTD0 Register (Offset = 74h) [reset = h]

Short Description: The LINTD0 register contains the lower 4 bytes of the data to be transmitted.[[br]]NOTE: TD

Long Description:

Return to Summary Table

Table 4-1432. MBRSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 13	RESERVED_1	RO	0h	Reserved
12 - 0	MBR	RW	19A312CE6Ch	Maximum Baud Rate Prescaler.[[br]]This field is effective in LIN mode only. This 13-bit prescaler is used during the synchronization phase (see the "Header Reception and Adaptive Baudrate" section) of a slave module if the ADAPT bit is set. In this way, a SCI/LIN slave using an automatic or select bit rate modes detects any LIN bus legal rate automatically.[[br]] [[br]]The MBR value should be programmed to allow a maximum baud rate that is not more than 10% above the expected operating baud rate in the LIN network. Otherwise a s 0x00 data byte could mistakenly be detected as sync break. [[br]]The default value is for a 70MHz LINCLK (0xDAC).[[br]]This MBR prescaler is used by the wake-up and idle time counters for a constant expiration time relative to a 20kHz rate.

4.14.33 LIN0_RESERVED_1 Register (Offset = 80h) [reset = h]

Short Description: RW

Long Description:

Table 4-1434. RESERVED_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BERRENA	RW	0h	Bit Errror Enable bit.[[br]]This bit is effective in LIN mode only. This bit is used to create a Bit error. When this bit is set, the bit received is ORed with 1 and passed to the Bit monitor circuitry.
30	PBERRENA	RW	0h	Physical Bus Error Enable bit.[[br]]This bit is effective in LIN mode only. This bit is used to create a Physical Bus Error. When this bit is set, the bit received during Sync Break field transmission is ORed with 1 and passed to the Bit monitor circuitry
29	CERRENA	RW	0h	Checksum Error Enable bit.[[br]]This bit is effective in LIN mode only. This bit is used to create a checksum error. When this bit is set, the polarity of the CTYPE (checksum type) in the receive checksum calculator is changed so that a checksum error is generated.
28	ISFERRENA	RW	0h	Inconsistent Sync Field Error Enable bit.[[br]]This bit is effective in LIN mode only. This bit is used to create an ISF error. When this bit is set, the bit widths in the sync field are varied so that the ISF check fails and the error flag is set.
27	RESERVED_4	RO	0h	Reserved
26	FERRENA	RW	0h	This bit is used to create a Frame Error.[[br]]This bit is effective in SCI-compatible mode only. When this bit is set, the stop bit received is ANDed with '0' and passed to the stop bit check circuitry.
25	PERRENA	RW	0h	Compatible Mode only[[br]]This bit is effective in SCI-compatible mode only. This bit is used to create a Parity Error. When this bit is set, in compatible mode, the parity bit received is toggled so that a parity error occurs.

Table 4-1434. RESERVED_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	BRKDTERRENA	RW	0h	Compatible Mode only[[br]]This bit is effective in SCI-compatible mode only. This bit is used to create BRKDT error (SCI mode only). When this bit is set, the stop bit of the frame is ANDed with '0' and passed to the RSM so that a frame error occurs. Then the RX Pin is forced to continuous low for 10 Tbits so that a BRKDT error occurs.
23 - 21	RESERVED_3	RW	0h	Reserved
20 - 19	PINSAMPLEMASK	RW	0h	Pin sample mask.[[br]]These bits define the sample number at which the TX Pin value that is being transmitted will be inverted to verify the receive pin samples correctly with the majority detection circuitry.[[br]]Note: During IODFT mode testing for the pin sample mask, the prescalar P must be programmed to be greater than 2. 0x0 | PINSAMPLEMASK_NONo Mask 0x1 | PINSAMPLEMASK_TBITInvert the TX Pin value at TBIT_CENTER 0x2 | PINSAMPLEMASK_SCLKInvert the TX Pin value at TBIT_CENTER + SCLK 0x3 | PINSAMPLEMASK_2SCLKInvert the TX Pin value at TBIT_CENTER + 2 SCLK
18 - 16	TXSHIFT	RW	0h	Transmit shift.[[br]]These bits define the delay by which the value on LINTX is delayed so that the value on LINRX is asynchronous. (Not applicable to Start Bit) 0x0 | TXSHIFT_DELAY_0No Delay 0x1 | TXSHIFT_DELAY_1Delay by 1 SCLK 0x2 | TXSHIFT_DELAY_2Delay by 2 SCLK 0x3 | TXSHIFT_DELAY_3Delay by 3 SCLK 0x4 | TXSHIFT_DELAY_4Delay by 4 SCLK 0x5 | TXSHIFT_DELAY_5Delay by 5 SCLK 0x6 | TXSHIFT_DELAY_6Delay by 6 SCLK 0x7 | TXSHIFT_DELAY_7Delay by 7 SCLK
15 - 12	RESERVED_2	RO	0h	Reserved
11 - 8	IODFTENA	RW	65h	IO DFT Enable Key[[br]]This field is used to enable the IODFT mode of the SCI/LIN module for testing. 0x0 | IODFTENA_DISABLE_0IODFT is disabled 0x1 | IODFTENA_DISABLE_1IODFT is disabled 0x2 | IODFTENA_DISABLE_2IODFT is disabled 0x3 | IODFTENA_DISABLE_3IODFT is disabled 0x4 | IODFTENA_DISABLE_4IODFT is disabled 0x5 | IODFTENA_DISABLE_5IODFT is disabled 0x6 | IODFTENA_DISABLE_6IODFT is disabled 0x7 | IODFTENA_DISABLE_7IODFT is disabled 0x8 | IODFTENA_DISABLE_8IODFT is disabled 0x9 | IODFTENA_DISABLE_9IODFT is disabled 0xA | IODFTENA_DISABLE_10IODFT is enabled 0xB | IODFTENA_DISABLE_11IODFT is disabled 0xC | IODFTENA_DISABLE_12IODFT is disabled 0xD | IODFTENA_DISABLE_13IODFT is disabled 0xE | IODFTENA_DISABLE_14IODFT is disabled 0xF | IODFTENA_DISABLE_15IODFT is disabled
7 - 2	RESERVED_1	RO	0h	Reserved
1	LPBENA	RW	0h	Module loopback enable.[[br]]In analog loopback mode the complete communication path through the I/Os can be tested, whereas in digital loopback mode the I/O buffers are excluded from this path. 0 | LPBENA_DIGITALDigital loopback is enabled. 1 | LPBENA_ANALOGAnalog loopback is enabled in module I/O DFT mode (when IODFTENA = 1010)
0	RXPENA	RW	0h	Module Analog loopback through receive pin enable.[[br]]This bit defines whether the I/O buffers for the transmit or the receive pin are included in the communication path in analog loopback mode only. 0 | RXPENA_TRANSMITAnalog loopback through the transmit pin is enabled. 1 | RXPENA_RECEIVEAnalog loopback through the receive pin is enabled.
