Table 4-2451. RTICAUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	CAUC0	RW	0h	CAUC0: Capture Up Counter 0.This registers captures the current value of the Up Counter 0 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 0 and Free Running Counter 0. So the RTICAFRC0 register has to be read first, before the RTICAUC0 register is read. This sequence ensures that the value of the RTICAUC0 register is the corresponding value to the RTICAFRC0 register, even if another capture event happens in between the two reads.User and privilege mode (read):value of Up Counter 0 on a capture event

4.21.10 HSM_RTI0_RTIFRC1 Register (Offset = 30h) [reset = h]

Short Description: Free Running Counter 1 current value of free running counter 1

Long Description:

Table 4-2455. RTIUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	UC1	RW	0h	UC1: Up Counter 1.This registers holds the current value of the Up Counter 1 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 1. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 1 and Free Running Counter 1.User and privilege mode (read):value of the counter when the Free Running Counter 1 was readPrivilege mode (write):the counter can be preset by writing to this register. The counter increments then from this written value upwards.Note: Presetting countersIf counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1.Note: Preset value concernIf the preset value is bigger than the compare value stored in register RTICPUC1 then it can take a long time until a compare matches, since RTIUC1 has to count up until it overflows.

4.21.12 HSM_RTI0_RTICPUC1 Register (Offset = 38h) [reset = h]

Short Description: Compare Up Counter 1 compare value compared with prescale counter 1

Long Description:

Return to Summary Table

Table 4-2493. RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 6	RESERVED18	RW	0h	Reserved.Reads return 0 and writes have no effect
5	DWWD_ST	RW	0h	DWWD ST: Windowed Watchdog Status.This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog.User and priviledge mode (read):0 = no time-window violation has occurred.1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.
4	ENDTIMEVIOL	RW	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status.This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag.User and priviledge mode (read):0 = no end-time window violation has occurred.1 = the end-time defined by the windowed watchdog configuration has been violated.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0.
3	STARTTIMEVIOL	RW	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened.User and priviledge mode (read):0 = no start-time window violation has occurred.1 = the start-time defined by the windowed watchdog configuration has been violated.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0.
2	KEYST	RW	0h	KEYST: Watchdog KeyStatus.This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register.User and priviledge mode (read):0 = no wrong key or key-sequence written1 = wrong key or key-sequence written to RTIWDKEY registerPriviledge mode (write):0 = leaves the current value unchanged1 = clears the bit to 0

Table 4-2493. RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DWDST	RW	0h	DWDST: Digital Watchdog Status.This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons.User and priviledge mode (read):0 = DWD timeout period not expired1 = DWD timeout period has expiredPriviledge mode (write):0 = leaves the current value unchanged1 = clears the bit to 0
0	AWDST	RW	0h	AWDST: Analog Watchdog Status.User and priviledge mode (read):0 = AWD pin 0 ?> 1 threshold not exceeded1 = AWD pin 0 ?> 1 threshold exceededPriviledge mode (write):0 = leaves the current value unchanged1 = clears the bit to 0

4.21.31 HSM_RTI0_RTIWDKEY Register (Offset = 9Ch) [reset = h]

Short Description: Watchdog Key correct written key values discharge the external capacitor

Long Description:

Return to Summary Table

Table 4-2495. RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	RESERVED19	RW	0h	Reserved.Reads return 0 and writes have no effect
15 - 0	WDKEY	RW	0h	WDKEY: Watchdog Key.User and privilege mode reads are indeterminate.Privilege mode (write):A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1?s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3.Note: Register write access time precautionThe user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

4.21.32 HSM_RTI0_RTIDWDCNTR Register (Offset = A0h) [reset = h]

Table 4-2545. RTICOMP1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	COMP1	RW	0h	COMP1: compare1.This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request.User and privilege mode (read):current compare valuePrivilege mode (write):update of the compare register with a new compare valueNote: Reset behaviorA reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

4.21.57 HSM_WDT0_RTIUDCP1 Register (Offset = 5Ch) [reset = h]

Short Description: Update Compare 1 value to be added to the compare register 1 value on compare match

Long Description:

Table 4-2569. RTIDWDPRLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 12	RESERVED17	RW	0h	Reserved.Reads return 0 and writes have no effect
11 - 0	DWDPRLD	RW	0h	DWDPRLD: Digital Watchdog Preload Value.User and priviledge mode (read):A read from this register in any CPU mode returns the current preload value.Priviledge mode (write):If the DWD is always enabled after reset is released:The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires.When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value.If the DWD is implemented such that the down counter is enabled by software:The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter.The expiration time of the DWD Down Counter can be determined with following equation:texp = (RTIDWDPRLD+1) x 2 ^ 13 / RTICLK1where: RTIDWDPRLD = 0...4095

4.21.69 HSM_WDT0_RTIWDSTATUS Register (Offset = 98h) [reset = h]

Short Description: Watchdog Status reflects the status of Analog and Digital Watchdog

Long Description:

Table 4-2571. RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 6	RESERVED18	RW	0h	Reserved.Reads return 0 and writes have no effect
5	DWWD_ST	RW	0h	DWWD ST: Windowed Watchdog Status.This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog.User and priviledge mode (read):0 = no time-window violation has occurred.1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.
4	ENDTIMEVIOL	RW	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status.This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag.User and priviledge mode (read):0 = no end-time window violation has occurred.1 = the end-time defined by the windowed watchdog configuration has been violated.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0.
3	STARTTIMEVIOL	RW	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened.User and priviledge mode (read):0 = no start-time window violation has occurred.1 = the start-time defined by the windowed watchdog configuration has been violated.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0.
2	KEYST	RW	0h	KEYST: Watchdog KeyStatus.This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register.User and priviledge mode (read):0 = no wrong key or key-sequence written1 = wrong key or key-sequence written to RTIWDKEY registerPriviledge mode (write):0 = leaves the current value unchanged1 = clears the bit to 0

Table 4-2571. RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DWDST	RW	0h	DWDST: Digital Watchdog Status.This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons.User and priviledge mode (read):0 = DWD timeout period not expired1 = DWD timeout period has expiredPriviledge mode (write):0 = leaves the current value unchanged1 = clears the bit to 0
0	AWDST	RW	0h	AWDST: Analog Watchdog Status.User and priviledge mode (read):0 = AWD pin 0 ?> 1 threshold not exceeded1 = AWD pin 0 ?> 1 threshold exceededPriviledge mode (write):0 = leaves the current value unchanged1 = clears the bit to 0

4.21.70 HSM_WDT0_RTIWDKEY Register (Offset = 9Ch) [reset = h]

Short Description: Watchdog Key correct written key values discharge the external capacitor

Long Description:

Table 4-2573. RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	RESERVED19	RW	0h	Reserved.Reads return 0 and writes have no effect
15 - 0	WDKEY	RW	0h	WDKEY: Watchdog Key.User and privilege mode reads are indeterminate.Privilege mode (write):A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1?s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3.Note: Register write access time precautionThe user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

4.21.71 HSM_WDT0_RTIDWDCNTR Register (Offset = A0h) [reset = h]

Short Description: Digital Watchdog Down Counter current value of DWD down counter

Long Description:

Return to Summary Table

0h	32	MCSPI0_HL_REV	IP Revision Identifier (X.Y.R)Used by software to track features, bugs, and compatibility	5220 3000h	5220 4000h
4h	32	MCSPI0_HL_HWINFO	Information about the IP module's hardware configuration, i.e. typically the module's HDL generics (if any).Actual field format and encoding is up to the module's designer to decide.	5220 3004h	5220 4004h
10h	32	MCSPI0_HL_SYSCONFIG	Clock management configuration	5220 3010h	5220 4010h
100h	32	MCSPI0_REVISION	This register contains the hard coded RTL revision number.	5220 3100h	5220 4100h
110h	32	MCSPI0_SYSCONFIG	This register allows controlling various parameters of the OCP interface.	5220 3110h	5220 4110h
114h	32	MCSPI0_SYSSTATUS	This register provides status information about the module excluding the interrupt status information	5220 3114h	5220 4114h
118h	32	MCSPI0_IRQSTATUS	The interrupt status regroups all the status of the module internal events that can generate an interrupt	5220 3118h	5220 4118h
11Ch	32	MCSPI0_IRQENABLE	This register allows to enable/disable the module internal sources of interrupt, on an event-by-event basis.	5220 311Ch	5220 411Ch
120h	32	MCSPI0_WAKEUPENABLE	The wakeup enable register allows to enable/ disable the module internal sources of wakeup on event-by-event basis.	5220 3120h	5220 4120h

Table 4-2592. MCSPI0, MCSPI0_MCSPI Registers, Base Address=5220 0000H, Length=4 (continued)

Offset	Length	Acronym	Register Name	MCSPI3 Physical Address	MCSPI4 Physical Address
124h	32	MCSPI0_SYST	This register is used to check the correctness of the system interconnect either internally to peripheral bus, or externally to device IO pads, when the module is configured in system test (SYSTEST) mode.	5220 3124h	5220 4124h
128h	32	MCSPI0_MODULCTRL	This register is dedicated to the configuration of the serial port interface.	5220 3128h	5220 4128h
12Ch	32	MCSPI0_CH0CONF	This register is dedicated to the configuration of the channel 0	5220 312Ch	5220 412Ch
130h	32	MCSPI0_CH0STAT	This register provides status information about transmitter and receiver registers of channel 0	5220 3130h	5220 4130h
134h	32	MCSPI0_CH0CTRL	This register is dedicated to enable the channel 0	5220 3134h	5220 4134h
138h	32	MCSPI0_TX0	This register contains a single SPI word to transmit on the serial link, what ever SPI word length is.	5220 3138h	5220 4138h
13Ch	32	MCSPI0_RX0	This register contains a single SPI word received through the serial link, what ever SPI word length is.	5220 313Ch	5220 413Ch
140h	32	MCSPI0_CH1CONF	This register is dedicated to the configuration of the channel.	5220 3140h	5220 4140h
144h	32	MCSPI0_CH1STAT	This register provides status information about transmitter and receiver registers of channel 1	5220 3144h	5220 4144h
148h	32	MCSPI0_CH1CTRL	This register is dedicated to enable the channel 1	5220 3148h	5220 4148h
14Ch	32	MCSPI0_TX1	This register contains a single SPI word to transmit on the serial link, what ever SPI word length is.	5220 314Ch	5220 414Ch
150h	32	MCSPI0_RX1	This register contains a single SPI word received through the serial link, what ever SPI word length is.	5220 3150h	5220 4150h
154h	32	MCSPI0_CH2CONF	This register is dedicated to the configuration of the channel 2	5220 3154h	5220 4154h
158h	32	MCSPI0_CH2STAT	This register provides status information about transmitter and receiver registers of channel 2	5220 3158h	5220 4158h
15Ch	32	MCSPI0_CH2CTRL	This register is dedicated to enable the channel 2	5220 315Ch	5220 415Ch

Table 4-2592. MCSPI0, MCSPI0_MCSPI Registers, Base Address=5220 0000H, Length=4 (continued)

Offset	Length	Acronym	Register Name	MCSPI3 Physical Address	MCSPI4 Physical Address
160h	32	MCSPI0_TX2	This register contains a single SPI word to transmit on the serial link, what ever SPI word length is.	5220 3160h	5220 4160h
164h	32	MCSPI0_RX2	This register contains a single SPI word received through the serial link, what ever SPI word length is.	5220 3164h	5220 4164h
168h	32	MCSPI0_CH3CONF	This register is dedicated to the configuration of the channel 3	5220 3168h	5220 4168h
16Ch	32	MCSPI0_CH3STAT	This register provides status information about transmitter and receiver registers of channel 3	5220 316Ch	5220 416Ch
170h	32	MCSPI0_CH3CTRL	This register is dedicated to enable the channel 3	5220 3170h	5220 4170h
174h	32	MCSPI0_TX3	This register contains a single SPI word to transmit on the serial link, what ever SPI word length is.	5220 3174h	5220 4174h
178h	32	MCSPI0_RX3	This register contains a single SPI word received through the serial link, what ever SPI word length is.	5220 3178h	5220 4178h
17Ch	32	MCSPI0_XFERLEVEL	This register provides transfer levels needed while using FIFO buffer during transfer.	5220 317Ch	5220 417Ch
180h	32	MCSPI0_DAFTX	This register contains the SPI words to transmit on the serial link when FIFO used and DMA address is aligned on 256 bit.This register is an image of one of MCSPI_TX(i) register corresponding to the channel which have its FIFO enabled.	5220 3180h	5220 4180h
1A0h	32	MCSPI0_DAFRX	This register contains the SPI words to received on the serial link when FIFO used and DMA address is aligned on 256 bit.This register is an image of one of MCSPI_RX(i) register corresponding to the channel which have its FIFO enabled.	5220 31A0h	5220 41A0h

4.22.1 MCSPI0_HL_REV Register (Offset = 0h) [reset = h]

Short Description: IP Revision Identifier (X.Y.R)Used by software to track features, bugs, and compatibility

Long Description:

Return to Summary Table

Table 4-2593. Instance Table

Instance Name	Physical Address
MCSPI0	5220 0000h
MCSPI1	5220 1000h
MCSPI2	5220 2000h
MCSPI3	5220 3000h
MCSPI4	5220 4000h

RO				RO				RO		RO					
11				10				0		1011					

Access Types Legend

Table 4-2594. HL_REV Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 30	SCHEME	RO	1h	Used to distinguish between old scheme and current
29 - 28	RSVD	RO	0h	Reserved These bits are initialized to zero, and writes to them are ignored
27 - 16	FUNC	RO	1ADB0h	Function indicates a software compatible module family If there is no level of software compatibility a new Func number [and hence REVISION] should be assigned
15 - 11	R_RTL	RO	Bh	RTL Version [R], maintained by IP design owner RTL follows a numbering such as XYRZ which are explained in this table R changes ONLY when: [1] PDS uploads occur which may have been due to spec changes [2] Bug fixes occur [3] Resets to '0' when X or Y changes Design team has an internal 'Z' [customer invisible] number which increments on every drop that happens due to DV and RTL updates Z resets to 0 when R increments
10 - 8	X_MAJOR	RO	Ah	Major Revision [X], maintained by IP specification owner X changes ONLY when: [1] There is a major feature addition An example would be adding Master Mode to Utopia Level2 The Func field [or Class/ Type in old PID format] will remain the same X does NOT change due to: [1] Bug fixes [2] Change in feature parameters
7 - 6	CUSTOM	RO	0h	Indicates a special version for a particular device Consequence of use may avoid use of standard Chip Support Library [CSL] / Drivers

Table 4-2594. HL_REV Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5 - 0	Y_MINOR	RO	3F3h	Minor Revision [Y], maintained by IP specification owner Y changes ONLY when: [1] Features are scaled [up or down] Flexibility exists in that this feature scalability may either be represented in the Y change or a specific register in the IP that indicates which features are exactly available [2] When feature creeps from Is-Not list to Is list But this may not be the case once it sees silicon; in which case X will change Y does NOT change due to: [1] Bug fixes [2] Typos or clarifications [3] major functional/feature change/addition/ deletion Instead these changes may be reflected via R, S, X as applicable Spec owner maintains a customer-invisible number 'S' which changes due to: [1] Typos/clarifications [2] Bug documentation Note that this bug is not due to a spec change but due to implementation Nevertheless, the spec tracks the IP bugs An RTL release [say for silicon PG11] that occurs due to bug fix should document the corresponding spec number [XYS] in its release notes

4.22.2 MCSPI0_HL_HWINFO Register (Offset = 4h) [reset = h]

Short Description: Information about the IP module's hardware configuration, i.e. typically the module's HDL generics (if any).Actual field format and encoding is up to the module's designer to decide.

Long Description:

Return to Summary Table

Table 4-2595. Instance Table

Table 4-2606. IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 18	RESERVED_8	RO	0h	Reads returns 0
17	EOW	RW	0h	End of word count event when a channel is enabled using the FIFO buffer and the channel had sent the number of SPI word defined by MCSPI_XFERLEVEL[WCNT]
16	WKS	RW	0h	Wake Up event in slave mode when an active control signal is detected on the SPIEN line programmed in the field MCSPI_CH0CONF[SPIENSLV]
15	RESERVED_7	RO	0h	Reads returns 0
14	RX3_FULL	RW	0h	Receiver register is full or almost full Only when Channel 3 is enabled
13	TX3_UNDERFLOW	RW	0h	Transmitter register underflow Only when Channel 3 is enabled The transmitter register is empty [not updated by Host or DMA with new data] before its time slot assignment Exception: No TX_underflow event when no data has been loaded into the transmitter register since channel has been enabled
12	TX3_EMPTY	RW	0h	Transmitter register is empty or almost empty Note: Enabling the channel automatically rises this event
11	RESERVED_9	RO	0h	Reads returns 0
10	RX2_FULL	RW	0h	Receiver register full or almost full Channel 2
9	TX2_UNDERFLOW	RW	0h	Transmitter register underflow Channel 2
8	TX2_EMPTY	RW	0h	Transmitter register empty or almost empty Channel 2
7	RESERVED_10	RO	0h	Reads returns 0
6	RX1_FULL	RW	0h	Receiver register full or almost full Channel 1
5	TX1_UNDERFLOW	RW	0h	Transmitter register underflow Channel 1

Table 4-2606. IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description

Table 4-2612. SYST Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 12	RESERVED_17	RO	0h	Reads returns 0
11	SSB	RW	0h	Set status bit
10	SPIENDIR	RW	0h	Set the direction of the SPIEN[3:0] lines and SPICLK line
9	SPIDATDIR1	RW	0h	Set the direction of the SPIDAT[1]
8	SPIDATDIR0	RW	0h	Set the direction of the SPIDAT[0]
7	WAKD	RW	0h	SWAKEUP output [signal data value of internal signal to system] The signal is driven high or low according to the value written into this register bit
6	SPICLK	RW	0h	SPICLK line [signal data value] If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the CLKSPI line [high or low], and a write into this bit has no effect If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the CLKSPI line is driven high or low according to the value written into this register
5	SPIDAT_1	RW	0h	SPIDAT[1] line [signal data value] If MCSPI_SYST[SPIDATDIR1] = 0 [output mode direction], the SPIDAT[1] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIDATDIR1] = 1 [input mode direction], this bit returns the value on the SPIDAT[1] line [high or low], and a write into this bit has no effect
4	SPIDAT_0	RW	0h	SPIDAT[0] line [signal data value] If MCSPI_SYST[SPIDATDIR0] = 0 [output mode direction], the SPIDAT[0] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIDATDIR0] = 1 [input mode direction], this bit returns the value on the SPIDAT[0] line [high or low], and a write into this bit has no effect

Table 4-2612. SYST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	SPIEN_3	RW	0h	SPIEN[3] line [signal data value] If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the SPIENT[3] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the SPIEN[3] line [high or low], and a write into this bit has no effect
2	SPIEN_2	RW	0h	SPIEN[2] line [signal data value] If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the SPIENT[2] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the SPIEN[2] line [high or low], and a write into this bit has no effect
1	SPIEN_1	RW	0h	SPIEN[1] line [signal data value] If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the SPIENT[1] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the SPIEN[1] line [high or low], and a write into this bit has no effect
0	SPIEN_0	RW	0h	SPIEN[0] line [signal data value] If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the SPIENT[0] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the SPIEN[0] line [high or low], and a write into this bit has no effect

4.22.11 MCSPI0_MODULCTRL Register (Offset = 128h) [reset = h]

Short Description: This register is dedicated to the configuration of the serial port interface.

Long Description:

Return to Summary Table

Table 4-2614. MODULCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 9	RESERVED_11	RO	0h	Reads returns 0
8	FDAA	RW	0h	FIFO DMA Address 256-bit aligned This register is used when a FIFO is managed by the module and DMA connected to the controller provides only 256 bit aligned address If this bit is set the enabled channel which uses the FIFO has its datas managed through MCSPI_DAFTX and MCSPI_DAFRX registers instead of MCSPI_TX[i] and MCSPI_RX[i] registers
7	MOA	RW	0h	Multiple word ocp access: This register can only be used when a channel is enabled using a FIFO It allows the system to perform multiple SPI word access for a single 32-bit OCP word access This is possible for WL < 16
6 - 4	INITDLY	RW	0h	Initial spi delay for first transfer: This register is an option only available in SINGLE master mode, The controller waits for a delay to transmit the first spi word after channel enabled and corresponding TX register filled This Delay is based on SPI output frequency clock, No clock output provided to the boundary and chip select is not active in 4 pin mode within this period
3	SYSTEM_TEST	RW	0h	Enables the system test mode
2	MS	RW	1h	Master/ Slave
1	PIN34	RW	0h	Pin mode selection: This register is used to configure the SPI pin mode, in master or slave mode If asserted the controller only use SIMO,SOMI and SPICLK clock pin for spi transfers
0	SINGLE	RW	0h	Single channel / Multi Channel [master mode only]

4.22.12 MCSPI0_CH0CONF Register (Offset = 12Ch) [reset = h]

Short Description: This register is dedicated to the configuration of the channel 0

Long Description:

Table 4-2616. CH0CONF Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 30	RESERVED_0	RO	0h	read returns 0
29	CLKG	RW	0h	Clock divider granularity This register defines the granularity of channel clock divider: power of two or one clock cycle granularity When this bit is set the register MCSPI_CHCTRL[EXTCLK] must be configured to reach a maximum of 4096 clock divider ratio Then The clock divider ratio is a concatenation of MCSPI_CHCONF[CLKD] and MCSPI_CHCTRL[EXTCLK] values
28	FFER	RW	0h	FIFO enabled for receive:Only one channel can have this bit field set
27	FFEW	RW	0h	FIFO enabled for Transmit:Only one channel can have this bit field set
26 - 25	TCS0	RW	0h	Chip Select Time Control This 2-bits field defines the number of interface clock cycles between CS toggling and first or last edge of SPI clock
24	SBPOL	RW	0h	Start bit polarity
23	SBE	RW	0h	Start bit enable for SPI transfer
22 - 21	SPIENSLV	RW	0h	Channel 0 only and slave mode only: SPI slave select signal detection Reserved bits for other cases
20	FORCE	RW	0h	Manual SPIEN assertion to keep SPIEN active between SPI words [single channel master mode only]
19	TURBO	RW	0h	Turbo mode
18	IS	RW	1h	Input Select
17	DPE1	RW	1h	Transmission Enable for data line 1 [SPIDATAGZEN[1]]
16	DPE0	RW	0h	Transmission Enable for data line 0 [SPIDATAGZEN[0]]

Table 4-2616. CH0CONF Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	DMAR	RW	0h	DMA Read request The DMA Read request line is asserted when the channel is enabled and a new data is available in the receive register of the channel The DMA Read request line is deasserted on read completion of the receive register of the channel
14	DMAW	RW	0h	DMA Write request The DMA Write request line is asserted when The channel is enabled and the transmitter register of the channel is empty The DMA Write request line is deasserted on load completion of the transmitter register of the channel
13 - 12	TRM	RW	0h	Transmit/Receive modes
11 - 7	WL	RW	0h	SPI word length
6	EPOL	RW	0h	SPIEN polarity
5 - 2	CLKD	RW	0h	Frequency divider for SPICLK [only when the module is a Master SPI device] A programmable clock divider divides the SPI reference clock [CLKSPIREF] with a 4-bit value, and results in a new clock SPICLK available to shift-in and shift-out data By default the clock divider ratio has a power of two granularity when MCSPI_CHCONF[CLKG] is cleared, Otherwise this register is the 4 LSB bit of a 12-bit register concatenated with clock divider extension MCSPI_CHCTRL[EXTCLK] registerThe value description below defines the clock ratio when MCSPI_CHCONF[CLKG] is set to 0
1	POL	RW	0h	SPICLK polarity
0	PHA	RW	0h	SPICLK phase

4.22.13 MCSPI0_CH0STAT Register (Offset = 130h) [reset = h]

Short Description: This register provides status information about transmitter and receiver registers of channel 0

Table 4-2636. CH2CONF Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 30	RESERVED_0	RO	0h	read returns 0
29	CLKG	RW	0h	Clock divider granularity This register defines the granularity of channel clock divider: power of two or one clock cycle granularity When this bit is set the register MCSPI_CHCTRL[EXTCLK] must be configured to reach a maximum of 4096 clock divider ratio Then The clock divider ratio is a concatenation of MCSPI_CHCONF[CLKD] and MCSPI_CHCTRL[EXTCLK] values
28	FFER	RW	0h	FIFO enabled for receive:Only one channel can have this bit field set
27	FFEW	RW	0h	FIFO enabled for Transmit:Only one channel can have this bit field set
26 - 25	TCS2	RW	0h	Chip Select Time Control This 2-bits field defines the number of interface clock cycles between CS toggling and first or last edge of SPI clock
24	SBPOL	RW	0h	Start bit polarity
23	SBE	RW	0h	Start bit enable for SPI transfer
22 - 21	RESERVED_1	RO	0h	read returns 0
20	FORCE	RW	0h	Manual SPIEN assertion to keep SPIEN active between SPI words [single channel master mode only]
19	TURBO	RW	0h	Turbo mode
18	IS	RW	1h	Input Select
17	DPE1	RW	1h	Transmission Enable for data line 1 [SPIDATAGZEN[1]]
16	DPE0	RW	0h	Transmission Enable for data line 0 [SPIDATAGZEN[0]]
15	DMAR	RW	0h	DMA Read request The DMA Read request line is asserted when the channel is enabled and a new data is available in the receive register of the channel The DMA Read request line is deasserted on read completion of the receive register of the channel

Table 4-2636. CH2CONF Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	DMAW	RW	0h	DMA Write request The DMA Write request line is asserted when The channel is enabled and the transmitter register of the channel is empty The DMA Write request line is deasserted on load completion of the transmitter register of the channel
13 - 12	TRM	RW	0h	Transmit/Receive modes
11 - 7	WL	RW	0h	SPI word length
6	EPOL	RW	0h	SPIEN polarity
5 - 2	CLKD	RW	0h	Frequency divider for SPICLK [only when the module is a Master SPI device] A programmable clock divider divides the SPI reference clock [CLKSPIREF] with a 4-bit value, and results in a new clock SPICLK available to shift-in and shift-out data By default the clock divider ratio has a power of two granularity when MCSPI_CHCONF[CLKG] is cleared, Otherwise this register is the 4 LSB bit of a 12-bit register concatenated with clock divider extension MCSPI_CHCTRL[EXTCLK] registerThe value description below defines the clock ratio when MCSPI_CHCONF[CLKG] is set to 0
1	POL	RW	0h	SPICLK polarity
0	PHA	RW	0h	SPICLK phase

4.22.23 MCSPI0_CH2STAT Register (Offset = 158h) [reset = h]

Short Description: This register provides status information about transmitter and receiver registers of channel 2

Long Description:

4.29 MSS_UART Registers

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
0h	8	UART0_DLL	Divisor Latches Low Register	5230 0000h	5230 1000h	5230 2000h
0h	32	UART0_RHR	The receiver section consists of the receiver holding register (RHR) and the receiver shift register. The RHR is actually a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the RHR. If the FIFO is disabled location zero of the FIFO is used to store the single data character. Note: If an overflow occurs the data in the RHR is not overwritten.	5230 0000h	5230 1000h	5230 2000h
0h	32	UART0_THR	The transmitter section consists of the transmit holding register (THR) and the transmit shift register. The transmit holding register is actually a 64-byte FIFO. The LH writes data to the THR. The data is placed into the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled location zero of the FIFO is used to store the data.	5230 0000h	5230 1000h	5230 2000h
4h	8	UART0_DLH	Divisor Latches High Register	5230 0004h	5230 1004h	5230 2004h

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
4h	8	UART0_IER_CIR	The interrupt enable register (IER) can be programmed to enable/disable any interrupt. There are 6 types of interrupt in these modes, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/ disabled individually.	5230 0004h	5230 1004h	5230 2004h
4h	8	UART0_IER_IRDA	The interrupt enable register (IER) can be programmed to enable/disable any interrupt. There are 8 types of interrupt in these modes, received EOF, LSR interrupt, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/disabled individually.	5230 0004h	5230 1004h	5230 2004h
4h	32	UART0_IER_UART	The interrupt enable register (IER) can be programmed to enable/disable any interrupt. There are seven types of interrupt in this mode: receiver error, RHR interrupt, THR interrupt, XOFF received and CTS*/ RTS* change of state from low to high. Each interrupt can be enabled/disabled individually. There is also a sleep mode enable bit.	5230 0004h	5230 1004h	5230 2004h
8h	8	UART0_EFR	Enhanced Feature Register	5230 0008h	5230 1008h	5230 2008h
8h	32	UART0_FCR	Notes: Bits 4 and 5 can only be written to when EFR[4] = 1 Bits 0 to 3 can be changed only when the baud clock is not running (DLL and DLH set to 0) See Table 31 for FCR[5:4] setting restriction when SCR[6]=1 See Table 32 for FCR[7:6] setting restriction when SCR[7]=1	5230 0008h	5230 1008h	5230 2008h

14h	32	UART0_LSR_UART	RO	5230 0014h	5230 1014h	5230 2014h
18h	8	UART0_TCR	Transmission Control Register	5230 0018h	5230 1018h	5230 2018h
18h	8	UART0_XOFF1	XOFF1 Register	5230 0018h	5230 1018h	5230 2018h
18h	32	UART0_MSR	This register provides information about the current state of the control lines from the modem, data set or peripheral device to the LH. It also indicates when a control input from the modem changes state.	5230 0018h	5230 1018h	5230 2018h
1Ch	8	UART0_TLR	Trigger Level Register	5230 001Ch	5230 101Ch	5230 201Ch
1Ch	8	UART0_XOFF2	XOFF2 Register	5230 001Ch	5230 101Ch	5230 201Ch

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
1Ch	32	UART0_SPR	This read/write register does not control the module in anyway. It is intended as a scratchpad register to be used by the programmer to hold temporary data.	5230 001Ch	5230 101Ch	5230 201Ch
20h	32	UART0_MDR1	The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to	5230 0020h	5230 1020h	5230 2020h
24h	32	UART0_MDR2	IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.	5230 0024h	5230 1024h	5230 2024h

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
28h	32	UART0_TXFLL	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 0028h	5230 1028h	5230 2028h
28h	32	UART0_SFLSR	IrDA modes only.Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).	5230 0028h	5230 1028h	5230 2028h
2Ch	32	UART0_TXFLH	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 002Ch	5230 102Ch	5230 202Ch
2Ch	32	UART0_RESUME	IR-IrDA and IR-CIR modes only.This register is used to clear internal flags, which halt transmission/ reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.	5230 002Ch	5230 102Ch	5230 202Ch

ADVANCE INFORMATION

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
30h	32	UART0_RXFLL	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 0030h	5230 1030h	5230 2030h
30h	32	UART0_SFREGL	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 0030h	5230 1030h	5230 2030h

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
34h	32	UART0_RXFLH	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 0034h	5230 1034h	5230 2034h
34h	32	UART0_SFREGH	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 0034h	5230 1034h	5230 2034h
38h	8	UART0_UASR	UART Autobauding Status Register	5230 0038h	5230 1038h	5230 2038h

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
38h	32	UART0_BLR	IrDA modes only.Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).	5230 0038h	5230 1038h	5230 2038h
3Ch	32	UART0_ACREG	IR-IrDA and IR-CIR modes only.	5230 003Ch	5230 103Ch	5230 203Ch
40h	32	UART0_SCR	Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.	5230 0040h	5230 1040h	5230 2040h
44h	32	UART0_SSR	Note: Bit 1 is reset only when SCR[4] is reset to 0.	5230 0044h	5230 1044h	5230 2044h

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
48h	32	UART0_EBLR	IR-IrDA and IR-CIR modes only.In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to	5230 0048h	5230 1048h	5230 2048h

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
50h	32	UART0_MVR	The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returnedNotes: UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification). UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification). UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8	5230 0050h	5230 1050h	5230 2050h
54h	32	UART0_SYSC	The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.	5230 0054h	5230 1054h	5230 2054h
58h	32	UART0_SYSS	RO	5230 0058h	5230 1058h	5230 2058h
5Ch	32	UART0_WER	The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.	5230 005Ch	5230 105Ch	5230 205Ch

Table 4-2732. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
60h	32	UART0_CFPS	Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.	5230 0060h	5230 1060h	5230 2060h
64h	32	UART0_RXFIFO_LVL	Level of the RX FIFO	5230 0064h	5230 1064h	5230 2064h
68h	32	UART0_TXFIFO_LVL	Level of the TX FIFO	5230 0068h	5230 1068h	5230 2068h
6Ch	32	UART0_IER2	Enables RX/TX FIFOs empty corresponding interrupts.	5230 006Ch	5230 106Ch	5230 206Ch
70h	32	UART0_ISR2	Status of RX/TX FIFOs empty corresponding interrupts.	5230 0070h	5230 1070h	5230 2070h
74h	32	UART0_FREQ_SEL	Sample per bit value selector	5230 0074h	5230 1074h	5230 2074h
78h	32	UART0_ABAUD_1ST_CHAR	Unused	5230 0078h	5230 1078h	5230 2078h
7Ch	32	UART0_BAUD_2ND_CHAR	Unused	5230 007Ch	5230 107Ch	5230 207Ch
80h	32	UART0_MDR3	Mode definition register 3.	5230 0080h	5230 1080h	5230 2080h
84h	32	UART0_TX_DMA_THRESHOLD	Use to manually set the TX DMA threshold level.MDR3[2] SET_TX_DMA_THRESHOLD must be one and must be value + tx_trigger_level <= 64 (TX FIFO size).If not, 64-tx_trigger_level will be used w/o modifying the value of this register.	5230 0084h	5230 1084h	5230 2084h

1Ch	32	UART0_SPR	This read/write register does not control the module in anyway. It is intended as a scratchpad register to be used by the programmer to hold temporary data.	5230 301Ch	5230 401Ch	5230 501Ch
20h	32	UART0_MDR1	The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to	5230 3020h	5230 4020h	5230 5020h

Table 4-2733. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
24h	32	UART0_MDR2	IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.	5230 3024h	5230 4024h	5230 5024h
28h	32	UART0_TXFLL	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 3028h	5230 4028h	5230 5028h
28h	32	UART0_SFLSR	IrDA modes only.Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).	5230 3028h	5230 4028h	5230 5028h

Table 4-2733. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
2Ch	32	UART0_TXFLH	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 302Ch	5230 402Ch	5230 502Ch
2Ch	32	UART0_RESUME	IR-IrDA and IR-CIR modes only.This register is used to clear internal flags, which halt transmission/ reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.	5230 302Ch	5230 402Ch	5230 502Ch
30h	32	UART0_RXFLL	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 3030h	5230 4030h	5230 5030h

Table 4-2733. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
30h	32	UART0_SFREGL	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 3030h	5230 4030h	5230 5030h
34h	32	UART0_RXFLH	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 3034h	5230 4034h	5230 5034h

Table 4-2733. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
34h	32	UART0_SFREGH	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 3034h	5230 4034h	5230 5034h
38h	8	UART0_UASR	UART Autobauding Status Register	5230 3038h	5230 4038h	5230 5038h
38h	32	UART0_BLR	IrDA modes only.Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).	5230 3038h	5230 4038h	5230 5038h
3Ch	32	UART0_ACREG	IR-IrDA and IR-CIR modes only.	5230 303Ch	5230 403Ch	5230 503Ch
40h	32	UART0_SCR	Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.	5230 3040h	5230 4040h	5230 5040h

Table 4-2733. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
44h	32	UART0_SSR	Note: Bit 1 is reset only when SCR[4] is reset to 0.	5230 3044h	5230 4044h	5230 5044h
48h	32	UART0_EBLR	IR-IrDA and IR-CIR modes only.In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to	5230 3048h	5230 4048h	5230 5048h

Table 4-2733. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
50h	32	UART0_MVR	The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returnedNotes: UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification). UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification). UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8	5230 3050h	5230 4050h	5230 5050h
54h	32	UART0_SYSC	The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.	5230 3054h	5230 4054h	5230 5054h
58h	32	UART0_SYSS	RO	5230 3058h	5230 4058h	5230 5058h
5Ch	32	UART0_WER	The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.	5230 305Ch	5230 405Ch	5230 505Ch

Table 4-2733. UART0, UART0_UART Registers, Base Address=5230 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
60h	32	UART0_CFPS	Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.	5230 3060h	5230 4060h	5230 5060h

18h	8	UART1_XOFF1	XOFF1 Register	5230 0018h	5230 1018h	5230 2018h
18h	32	UART1_MSR	This register provides information about the current state of the control lines from the modem, data set or peripheral device to the LH. It also indicates when a control input from the modem changes state.	5230 0018h	5230 1018h	5230 2018h
1Ch	8	UART1_TLR	Trigger Level Register	5230 001Ch	5230 101Ch	5230 201Ch
1Ch	8	UART1_XOFF2	XOFF2 Register	5230 001Ch	5230 101Ch	5230 201Ch
1Ch	32	UART1_SPR	This read/write register does not control the module in anyway. It is intended as a scratchpad register to be used by the programmer to hold temporary data.	5230 001Ch	5230 101Ch	5230 201Ch
20h	32	UART1_MDR1	The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to	5230 0020h	5230 1020h	5230 2020h

Table 4-2734. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
24h	32	UART1_MDR2	IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.	5230 0024h	5230 1024h	5230 2024h
28h	32	UART1_TXFLL	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 0028h	5230 1028h	5230 2028h
28h	32	UART1_SFLSR	IrDA modes only.Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).	5230 0028h	5230 1028h	5230 2028h

Table 4-2734. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
2Ch	32	UART1_TXFLH	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 002Ch	5230 102Ch	5230 202Ch
2Ch	32	UART1_RESUME	IR-IrDA and IR-CIR modes only.This register is used to clear internal flags, which halt transmission/ reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.	5230 002Ch	5230 102Ch	5230 202Ch
30h	32	UART1_RXFLL	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 0030h	5230 1030h	5230 2030h

Table 4-2734. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
30h	32	UART1_SFREGL	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 0030h	5230 1030h	5230 2030h
34h	32	UART1_RXFLH	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 0034h	5230 1034h	5230 2034h

Table 4-2734. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
34h	32	UART1_SFREGH	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 0034h	5230 1034h	5230 2034h
38h	8	UART1_UASR	UART Autobauding Status Register	5230 0038h	5230 1038h	5230 2038h
38h	32	UART1_BLR	IrDA modes only.Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).	5230 0038h	5230 1038h	5230 2038h
3Ch	32	UART1_ACREG	IR-IrDA and IR-CIR modes only.	5230 003Ch	5230 103Ch	5230 203Ch
40h	32	UART1_SCR	Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.	5230 0040h	5230 1040h	5230 2040h

Table 4-2734. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
44h	32	UART1_SSR	Note: Bit 1 is reset only when SCR[4] is reset to 0.	5230 0044h	5230 1044h	5230 2044h
48h	32	UART1_EBLR	IR-IrDA and IR-CIR modes only.In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to	5230 0048h	5230 1048h	5230 2048h

Table 4-2734. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
50h	32	UART1_MVR	The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returnedNotes: UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification). UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification). UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8	5230 0050h	5230 1050h	5230 2050h
54h	32	UART1_SYSC	The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.	5230 0054h	5230 1054h	5230 2054h
58h	32	UART1_SYSS	RO	5230 0058h	5230 1058h	5230 2058h
5Ch	32	UART1_WER	The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.	5230 005Ch	5230 105Ch	5230 205Ch

Table 4-2734. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
60h	32	UART1_CFPS	Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.	5230 0060h	5230 1060h	5230 2060h

18h	32	UART1_MSR	This register provides information about the current state of the control lines from the modem, data set or peripheral device to the LH. It also indicates when a control input from the modem changes state.	5230 3018h	5230 4018h	5230 5018h
1Ch	8	UART1_TLR	Trigger Level Register	5230 301Ch	5230 401Ch	5230 501Ch
1Ch	8	UART1_XOFF2	XOFF2 Register	5230 301Ch	5230 401Ch	5230 501Ch
1Ch	32	UART1_SPR	This read/write register does not control the module in anyway. It is intended as a scratchpad register to be used by the programmer to hold temporary data.	5230 301Ch	5230 401Ch	5230 501Ch
20h	32	UART1_MDR1	The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to	5230 3020h	5230 4020h	5230 5020h

Table 4-2735. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
24h	32	UART1_MDR2	IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.	5230 3024h	5230 4024h	5230 5024h
28h	32	UART1_TXFLL	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 3028h	5230 4028h	5230 5028h
28h	32	UART1_SFLSR	IrDA modes only.Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).	5230 3028h	5230 4028h	5230 5028h

Table 4-2735. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
2Ch	32	UART1_TXFLH	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 302Ch	5230 402Ch	5230 502Ch
2Ch	32	UART1_RESUME	IR-IrDA and IR-CIR modes only.This register is used to clear internal flags, which halt transmission/ reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.	5230 302Ch	5230 402Ch	5230 502Ch
30h	32	UART1_RXFLL	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 3030h	5230 4030h	5230 5030h

Table 4-2735. UART1, UART1_UART Registers, Base Address=5230 1000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
30h	32	UART1_SFREGL	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 3030h	5230 4030h	5230 5030h
34h	32	UART1_RXFLH	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 3034h	5230 4034h	5230 5034h

38h	32	UART2_BLR	IrDA modes only.Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).	5230 0038h	5230 1038h	5230 2038h
3Ch	32	UART2_ACREG	IR-IrDA and IR-CIR modes only.	5230 003Ch	5230 103Ch	5230 203Ch
40h	32	UART2_SCR	Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.	5230 0040h	5230 1040h	5230 2040h

Table 4-2736. UART2, UART2_UART Registers, Base Address=5230 2000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
44h	32	UART2_SSR	Note: Bit 1 is reset only when SCR[4] is reset to 0.	5230 0044h	5230 1044h	5230 2044h
48h	32	UART2_EBLR	IR-IrDA and IR-CIR modes only.In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to	5230 0048h	5230 1048h	5230 2048h

Table 4-2736. UART2, UART2_UART Registers, Base Address=5230 2000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
50h	32	UART2_MVR	The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returnedNotes: UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification). UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification). UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8	5230 0050h	5230 1050h	5230 2050h
54h	32	UART2_SYSC	The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.	5230 0054h	5230 1054h	5230 2054h
58h	32	UART2_SYSS	RO	5230 0058h	5230 1058h	5230 2058h
5Ch	32	UART2_WER	The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.	5230 005Ch	5230 105Ch	5230 205Ch

Table 4-2736. UART2, UART2_UART Registers, Base Address=5230 2000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
60h	32	UART2_CFPS	Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.	5230 0060h	5230 1060h	5230 2060h

1Ch	32	UART3_SPR	This read/write register does not control the module in anyway. It is intended as a scratchpad register to be used by the programmer to hold temporary data.	5230 001Ch	5230 101Ch	5230 201Ch
20h	32	UART3_MDR1	The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to	5230 0020h	5230 1020h	5230 2020h

Table 4-2738. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
24h	32	UART3_MDR2	IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.	5230 0024h	5230 1024h	5230 2024h
28h	32	UART3_TXFLL	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 0028h	5230 1028h	5230 2028h
28h	32	UART3_SFLSR	IrDA modes only.Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).	5230 0028h	5230 1028h	5230 2028h

Table 4-2738. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
2Ch	32	UART3_TXFLH	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 002Ch	5230 102Ch	5230 202Ch
2Ch	32	UART3_RESUME	IR-IrDA and IR-CIR modes only.This register is used to clear internal flags, which halt transmission/ reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.	5230 002Ch	5230 102Ch	5230 202Ch
30h	32	UART3_RXFLL	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 0030h	5230 1030h	5230 2030h

Table 4-2738. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
30h	32	UART3_SFREGL	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 0030h	5230 1030h	5230 2030h
34h	32	UART3_RXFLH	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 0034h	5230 1034h	5230 2034h

1Ch	32	UART3_SPR	This read/write register does not control the module in anyway. It is intended as a scratchpad register to be used by the programmer to hold temporary data.	5230 301Ch	5230 401Ch	5230 501Ch
20h	32	UART3_MDR1	The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to	5230 3020h	5230 4020h	5230 5020h

Table 4-2739. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
24h	32	UART3_MDR2	IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.	5230 3024h	5230 4024h	5230 5024h
28h	32	UART3_TXFLL	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 3028h	5230 4028h	5230 5028h
28h	32	UART3_SFLSR	IrDA modes only.Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).	5230 3028h	5230 4028h	5230 5028h

Table 4-2739. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
2Ch	32	UART3_TXFLH	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 302Ch	5230 402Ch	5230 502Ch
2Ch	32	UART3_RESUME	IR-IrDA and IR-CIR modes only.This register is used to clear internal flags, which halt transmission/ reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.	5230 302Ch	5230 402Ch	5230 502Ch
30h	32	UART3_RXFLL	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 3030h	5230 4030h	5230 5030h

Table 4-2739. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
30h	32	UART3_SFREGL	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 3030h	5230 4030h	5230 5030h
34h	32	UART3_RXFLH	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 3034h	5230 4034h	5230 5034h

Table 4-2739. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
34h	32	UART3_SFREGH	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 3034h	5230 4034h	5230 5034h
38h	8	UART3_UASR	UART Autobauding Status Register	5230 3038h	5230 4038h	5230 5038h
38h	32	UART3_BLR	IrDA modes only.Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).	5230 3038h	5230 4038h	5230 5038h
3Ch	32	UART3_ACREG	IR-IrDA and IR-CIR modes only.	5230 303Ch	5230 403Ch	5230 503Ch
40h	32	UART3_SCR	Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.	5230 3040h	5230 4040h	5230 5040h

Table 4-2739. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
44h	32	UART3_SSR	Note: Bit 1 is reset only when SCR[4] is reset to 0.	5230 3044h	5230 4044h	5230 5044h
48h	32	UART3_EBLR	IR-IrDA and IR-CIR modes only.In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to	5230 3048h	5230 4048h	5230 5048h

Table 4-2739. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
50h	32	UART3_MVR	The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returnedNotes: UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification). UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification). UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8	5230 3050h	5230 4050h	5230 5050h
54h	32	UART3_SYSC	The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.	5230 3054h	5230 4054h	5230 5054h
58h	32	UART3_SYSS	RO	5230 3058h	5230 4058h	5230 5058h
5Ch	32	UART3_WER	The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.	5230 305Ch	5230 405Ch	5230 505Ch

Table 4-2739. UART3, UART3_UART Registers, Base Address=5230 3000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
60h	32	UART3_CFPS	Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.	5230 3060h	5230 4060h	5230 5060h

18h	32	UART4_MSR	This register provides information about the current state of the control lines from the modem, data set or peripheral device to the LH. It also indicates when a control input from the modem changes state.	5230 0018h	5230 1018h	5230 2018h
1Ch	8	UART4_TLR	Trigger Level Register	5230 001Ch	5230 101Ch	5230 201Ch
1Ch	8	UART4_XOFF2	XOFF2 Register	5230 001Ch	5230 101Ch	5230 201Ch
1Ch	32	UART4_SPR	This read/write register does not control the module in anyway. It is intended as a scratchpad register to be used by the programmer to hold temporary data.	5230 001Ch	5230 101Ch	5230 201Ch
20h	32	UART4_MDR1	The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to	5230 0020h	5230 1020h	5230 2020h

Table 4-2740. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
24h	32	UART4_MDR2	IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.	5230 0024h	5230 1024h	5230 2024h
28h	32	UART4_TXFLL	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 0028h	5230 1028h	5230 2028h
28h	32	UART4_SFLSR	IrDA modes only.Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).	5230 0028h	5230 1028h	5230 2028h

Table 4-2740. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
2Ch	32	UART4_TXFLH	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 002Ch	5230 102Ch	5230 202Ch
2Ch	32	UART4_RESUME	IR-IrDA and IR-CIR modes only.This register is used to clear internal flags, which halt transmission/ reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.	5230 002Ch	5230 102Ch	5230 202Ch
30h	32	UART4_RXFLL	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 0030h	5230 1030h	5230 2030h

Table 4-2740. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
30h	32	UART4_SFREGL	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 0030h	5230 1030h	5230 2030h
34h	32	UART4_RXFLH	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 0034h	5230 1034h	5230 2034h

Table 4-2740. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
34h	32	UART4_SFREGH	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 0034h	5230 1034h	5230 2034h
38h	8	UART4_UASR	UART Autobauding Status Register	5230 0038h	5230 1038h	5230 2038h
38h	32	UART4_BLR	IrDA modes only.Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).	5230 0038h	5230 1038h	5230 2038h
3Ch	32	UART4_ACREG	IR-IrDA and IR-CIR modes only.	5230 003Ch	5230 103Ch	5230 203Ch
40h	32	UART4_SCR	Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.	5230 0040h	5230 1040h	5230 2040h

Table 4-2740. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
44h	32	UART4_SSR	Note: Bit 1 is reset only when SCR[4] is reset to 0.	5230 0044h	5230 1044h	5230 2044h
48h	32	UART4_EBLR	IR-IrDA and IR-CIR modes only.In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to	5230 0048h	5230 1048h	5230 2048h

Table 4-2740. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
50h	32	UART4_MVR	The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returnedNotes: UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification). UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification). UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8	5230 0050h	5230 1050h	5230 2050h
54h	32	UART4_SYSC	The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.	5230 0054h	5230 1054h	5230 2054h
58h	32	UART4_SYSS	RO	5230 0058h	5230 1058h	5230 2058h
5Ch	32	UART4_WER	The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.	5230 005Ch	5230 105Ch	5230 205Ch

Table 4-2740. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART0 Physical Address	UART1 Physical Address	UART2 Physical Address
60h	32	UART4_CFPS	Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.	5230 0060h	5230 1060h	5230 2060h

1Ch	32	UART4_SPR	This read/write register does not control the module in anyway. It is intended as a scratchpad register to be used by the programmer to hold temporary data.	5230 301Ch	5230 401Ch	5230 501Ch
20h	32	UART4_MDR1	The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to	5230 3020h	5230 4020h	5230 5020h

Table 4-2741. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
24h	32	UART4_MDR2	IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.	5230 3024h	5230 4024h	5230 5024h
28h	32	UART4_TXFLL	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 3028h	5230 4028h	5230 5028h
28h	32	UART4_SFLSR	IrDA modes only.Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).	5230 3028h	5230 4028h	5230 5028h

Table 4-2741. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
2Ch	32	UART4_TXFLH	IrDA modes only.The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.	5230 302Ch	5230 402Ch	5230 502Ch
2Ch	32	UART4_RESUME	IR-IrDA and IR-CIR modes only.This register is used to clear internal flags, which halt transmission/ reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.	5230 302Ch	5230 402Ch	5230 502Ch
30h	32	UART4_RXFLL	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 3030h	5230 4030h	5230 5030h

Table 4-2741. UART4, UART4_UART Registers, Base Address=5230 4000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
30h	32	UART4_SFREGL	IrDA modes only.The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.	5230 3030h	5230 4030h	5230 5030h
34h	32	UART4_RXFLH	IrDA modes only.The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).	5230 3034h	5230 4034h	5230 5034h

38h	32	UART5_BLR	IrDA modes only.Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).	5230 3038h	5230 4038h	5230 5038h
3Ch	32	UART5_ACREG	IR-IrDA and IR-CIR modes only.	5230 303Ch	5230 403Ch	5230 503Ch
40h	32	UART5_SCR	Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.	5230 3040h	5230 4040h	5230 5040h

Table 4-2743. UART5, UART5_UART Registers, Base Address=5230 5000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
44h	32	UART5_SSR	Note: Bit 1 is reset only when SCR[4] is reset to 0.	5230 3044h	5230 4044h	5230 5044h
48h	32	UART5_EBLR	IR-IrDA and IR-CIR modes only.In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to	5230 3048h	5230 4048h	5230 5048h

Table 4-2743. UART5, UART5_UART Registers, Base Address=5230 5000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
50h	32	UART5_MVR	The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returnedNotes: UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification). UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification). UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8	5230 3050h	5230 4050h	5230 5050h
54h	32	UART5_SYSC	The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.	5230 3054h	5230 4054h	5230 5054h
58h	32	UART5_SYSS	RO	5230 3058h	5230 4058h	5230 5058h
5Ch	32	UART5_WER	The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.	5230 305Ch	5230 405Ch	5230 505Ch

Table 4-2743. UART5, UART5_UART Registers, Base Address=5230 5000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	UART3 Physical Address	UART4 Physical Address	UART5 Physical Address
60h	32	UART5_CFPS	Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.	5230 3060h	5230 4060h	5230 5060h

4.29.2 UART0_RHR Register (Offset = 0h) [reset = h]

Short Description: The receiver section consists of the receiver holding register (RHR) and the receiver shift register. The RHR is actually a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the RHR. If the FIFO is disabled location zero of the FIFO is used to store the single data character. Note: If an overflow occurs the data in the RHR is not overwritten.

4.29.3 UART0_THR Register (Offset = 0h) [reset = h]

Short Description: The transmitter section consists of the transmit holding register (THR) and the transmit shift register. The transmit holding register is actually a 64-byte FIFO. The LH writes data to the THR. The data is placed into the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled location zero of the FIFO is used to store the data.

4.29.27 UART0_MDR2 Register (Offset = 24h) [reset = h]

Short Description: IR-IrDA and IR-CIR modes only.MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.

Long Description:

Table 4-2819. ACREG Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 8	RESERVED_24	RO	0h	Not Defined
7	PULSE_TYPE	RW	0h	SIR pulse width select: 0 | PULSE_TYPE_VALUE_03/16 of baud-rate pulse width 1 | PULSE_TYPE_VALUE_11.6us
6	SD_MOD	RW	0h	Primary output used to configure transceivers. Connected to the SD/MODE input pin of IrDA transceivers. 0 | SD_MOD_VALUE_0SD pin is set to high 1 | SD_MOD_VALUE_1SD pin is set to low
5	DIS_IR_RX	RW	0h	Not Defined 0 | DIS_IR_RX_VALUE_0Normal operation (RX input automatically disabled during transmit but enabled outside of transmit operation). 1 | DIS_IR_RX_VALUE_1Disables RX input (permanent state - independent of transmit).
4	DIS_TX_UNDERRUN	RW	0h	It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting ACREG[4]=1, garbage data is sent over TX line. 0 | DIS_TX_UNDERRUN_VALUE_0Long stop bits cannot be transmitted, TX underrun is enabled 1 | DIS_TX_UNDERRUN_VALUE_1Long stop bits can be transmitted, TX underrun is disabled
3	SEND_SIP	RW	0h	MIR/FIR Modes only.Send Serial Infrared Interaction Pulse [SIP]If this bit is set during a MIR/FIR transmission, the SIP will be send at the end of it.This bit automatically gets cleared at the end of the SIP transmission. 0 | SEND_SIP_VALUE_0No action 1 | SEND_SIP_VALUE_1Send SIP pulse.
2	SCTX_EN	RW	0h	Store and controlled TX start. When MDR1[5] = 1 and the LH writes 1 to this bit the TX state machine starts frame transmission. This bit is self-clearing.

Table 4-2819. ACREG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	ABORT_EN	RW	0h	Frame Abort. The LH can intentionally abort transmission of a frame by writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame. If transmit FIFO is not empty and MDR1[5]=1, UART IrDA will start a new transfer with data of previous frame as soon as abort frame has been sent. Therefore, TX FIFO must be reset before sending an abort frame.
0	EOT_EN	RW	0h	EOT [end of transmission] bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit automatically gets cleared when the LH writes to the THR [TX FIFO].

4.29.39 UART0_SCR Register (Offset = 40h) [reset = h]

Short Description: Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.

Long Description:

4.29.41 UART0_EBLR Register (Offset = 48h) [reset = h]

Short Description: IR-IrDA and IR-CIR modes only.In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to

4.29.43 UART0_SYSC Register (Offset = 54h) [reset = h]

Short Description: The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.

4.29.45 UART0_WER Register (Offset = 5Ch) [reset = h]

Short Description: The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.

4.29.46 UART0_CFPS Register (Offset = 60h) [reset = h]

Short Description: Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.

4.30 MSS_VIM Registers

Table 4-2879. VIM, VIM_VIM Registers, Base Address=50F0 0000H, Length=9

Offset	Length	Acronym	Register Name	VIM Physical Address
0h	32	VIM_PID	The Revision Register contains the major and minor revisions for the module.	50F0 0000h
4h	32	VIM_INFO	The Info Register gives the configuration Inforrmation of this VIM.	50F0 0004h
8h	32	VIM_PRIIRQ	The Prioritized IRQ Register shows the number of the highest priority pending IRQ.	50F0 0008h
Ch	32	VIM_PRIFIQ	The Prioritized FIQ Register shows the number of the highest priority pending FIQ.	50F0 000Ch
10h	32	VIM_IRQGSTS	The IRQ Group Status Register indicates which groups have pending IRQ interrupts.	50F0 0010h
14h	32	VIM_FIQGSTS	The FIQ Group Status Register indicates which groups have pending FIQ interrupts.	50F0 0014h
18h	32	VIM_IRQVEC	The IRQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pendind IRQ.	50F0 0018h
1Ch	32	VIM_FIQVEC	The FIQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pendind FIQ.	50F0 001Ch
20h	32	VIM_ACTIRQ	The Active IRQ Register shows the number of the currently active IRQ.	50F0 0020h
24h	32	VIM_ACTFIQ	The Active FIQ Register shows the number of the currently active FIQ.	50F0 0024h
28h	32	VIM_IRQPRIMSK	The IRQ Priority Mask Register allows all IRQs of a particular priority to be enabled or disabled.	50F0 0028h
2Ch	32	VIM_FIQPRIMSK	The FIQ Priority Mask Register allows all FIQs of a particular priority to be enabled or disabled.	50F0 002Ch
30h	32	VIM_DEDVEC	The DED Vector Address contains a default vector address for when an uncorrectable error is detected for an active IRQ or FIQ.	50F0 0030h
400h	32	VIM_RAW	Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00	50F0 0400h
404h	32	VIM_STS	Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04	50F0 0404h

Table 4-2879. VIM, VIM_VIM Registers, Base Address=50F0 0000H, Length=9 (continued)

Offset	Length	Acronym	Register Name	VIM Physical Address
408h	32	VIM_INTR_EN_SET	Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08	50F0 0408h

Table 4-3017. INTTYPE_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	VAL	RW	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit0 Level (default)1 Pulse

Table 4-3547. INTVECTOR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

4.30.335 VIM_INTVECTOR_1 Register (Offset = 2004h) [reset = h]

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

4.30.337 VIM_INTVECTOR_3 Register (Offset = 200Ch) [reset = h]

Short Description: Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h7

It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

4.30.589 VIM_INTVECTOR_255 Register (Offset = 23FCh) [reset = h]

Short Description: Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h259

Long Description:

Table 4-4057. INTVECTOR_255 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

4.33 TPCC Registers

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
0h	32	HSM_TPCC0_PID	Peripheral ID Register	4702 0000h
4h	32	HSM_TPCC0_CCCFG	CC Configuration Register	4702 0004h
200h	32	HSM_TPCC0_QCHMAPN	QDMA Channel N Mapping Register	4702 0200h
240h	32	HSM_TPCC0_DMAQNUMN	DMA Queue Number Register n Contains the Event queue number to be used for the corresponding DMA Channel.	4702 0240h
260h	32	HSM_TPCC0_QDMAQNUM	QDMA Queue Number Register Contains the Event queue number to be used for the corresponding QDMA Channel.	4702 0260h
280h	32	HSM_TPCC0_QUETCMAP	Queue to TC Mapping	4702 0280h
284h	32	HSM_TPCC0_QUEPRI	Queue Priority	4702 0284h
300h	32	HSM_TPCC0_EMR	Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.	4702 0300h
304h	32	HSM_TPCC0_EMRH	Event Missed Register (High Part): The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.	4702 0304h
308h	32	HSM_TPCC0_EMCR	Event Missed Clear Register: CPU write of '1' to the EMCR.En bit causes the EMR.En bit to be cleared. CPU write of '0' has no effect.. All error bits must be cleared before additional error interrupts will be asserted by CC.	4702 0308h

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
30Ch	32	HSM_TPCC0_EMCRH	Event Missed Clear Register (High Part): CPU write of '1' to the EMCR.En bit causes the EMR.En bit to be cleared. CPU write of '0' has no effect.. All error bits must be cleared before additional error interrupts will be asserted by CC.	4702 030Ch
310h	32	HSM_TPCC0_QEMR	QDMA Event Missed Register: The QDMA Event Missed register is set if 2 QDMA events are detected without the first event being cleared or if a Null TR is serviced.. If any bit in the QEMR register is set (and all errors (including EMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.	4702 0310h
314h	32	HSM_TPCC0_QEMCR	QDMA Event Missed Clear Register: CPU write of '1' to the QEMCR.En bit causes the QEMR.En bit to be cleared. CPU write of '0' has no effect.. All error bits must be cleared before additional error interrupts will be asserted by CC.	4702 0314h
318h	32	HSM_TPCC0_CCERR	CC Error Register	4702 0318h
31Ch	32	HSM_TPCC0_CCERRCLR	CC Error Clear Register	4702 031Ch
320h	32	HSM_TPCC0_EEVAL	Error Eval Register	4702 0320h
340h	32	HSM_TPCC0_DRAEM	DMA Region Access enable for bit N in Region M: En = 0 : Accesses via Region M address space to Bit N in any DMA Channel Register are not allowed. Reads will return 'b0 on Bit N and writes will not modify the state of bit N. Enabled interrupt bits for bit N do not contribute to the generation of the TPCC region M interrupt. En = 1 : Accesses via Region M address space to Bit N in any DMA Channel Register are allowed. Reads will return the value from Bit N and writes will modify the state of bit N. Enabled interrupt bits for bit N do contribute to the generation of the TPCC region M interrupt.	4702 0340h

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
1000h	32	HSM_TPCC0_ER	Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.	4702 1000h
1004h	32	HSM_TPCC0_ERH	Event Register (High Part): If ERH.En bit is set and the EERH.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ERH.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EERH.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ERH.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EERH register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECRH pseudo-register.	4702 1004h
1008h	32	HSM_TPCC0_ECR	Event Clear Register: CPU write of '1' to the ECR.En bit causes the ER.En bit to be cleared. CPU write of '0' has no effect.	4702 1008h
100Ch	32	HSM_TPCC0_ECRH	Event Clear Register (High Part): CPU write of '1' to the ECRH.En bit causes the ERH.En bit to be cleared. CPU write of '0' has no effect.	4702 100Ch
1010h	32	HSM_TPCC0_ESR	Event Set Register: CPU write of '1' to the ESR.En bit causes the ER.En bit to be set. CPU write of '0' has no effect.	4702 1010h
1014h	32	HSM_TPCC0_ESRH	Event Set Register (High Part) CPU write of '1' to the ESRH.En bit causes the ERH.En bit to be set. CPU write of '0' has no effect.	4702 1014h

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
1018h	32	HSM_TPCC0_CER	Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.	4702 1018h
101Ch	32	HSM_TPCC0_CERH	Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.	4702 101Ch
1020h	32	HSM_TPCC0_EER	Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.	4702 1020h

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
1024h	32	HSM_TPCC0_EERH	Event Enable Register (High Part): Enables DMA transfers for ERH.En pending events. ERH.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CERH) or Event Set Register (ESRH). Note that if a bit is set in ERH.En while EERH.En is disabled no action is taken. If EERH.En is enabled at a later point (and ERH.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EERH.En is not directly writeable. Events can be enabled via writes to EESRH and can be disabled via writes to EECRH register. EERH.En = 0: ER.En is not enabled to trigger DMA transfers. EERH.En = 1: ER.En is enabled to trigger DMA transfers.	4702 1024h
1028h	32	HSM_TPCC0_EECR	Event Enable Clear Register: CPU write of '1' to the EECR.En bit causes the EER.En bit to be cleared. CPU write of '0' has no effect..	4702 1028h
102Ch	32	HSM_TPCC0_EECRH	Event Enable Clear Register (High Part): CPU write of '1' to the EECRH.En bit causes the EERH.En bit to be cleared. CPU write of '0' has no effect..	4702 102Ch
1030h	32	HSM_TPCC0_EESR	Event Enable Set Register: CPU write of '1' to the EESR.En bit causes the EER.En bit to be set. CPU write of '0' has no effect..	4702 1030h
1034h	32	HSM_TPCC0_EESRH	Event Enable Set Register (High Part): CPU write of '1' to the EESRH.En bit causes the EERH.En bit to be set. CPU write of '0' has no effect..	4702 1034h
1038h	32	HSM_TPCC0_SER	Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.	4702 1038h
103Ch	32	HSM_TPCC0_SERH	Secondary Event Register (High Part): The secondary event register is used along with the Event Register (ERH) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.	4702 103Ch

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
1040h	32	HSM_TPCC0_SECR	Secondary Event Clear Register: The secondary event clear register is used to clear the status of the SER registers. CPU write of '1' to the SECR.En bit clears the SER register. CPU write of '0' has no effect.	4702 1040h
1044h	32	HSM_TPCC0_SECRH	Secondary Event Clear Register (High Part): The secondary event clear register is used to clear the status of the SERH registers. CPU write of '1' to the SECRH.En bit clears the SERH register. CPU write of '0' has no effect.	4702 1044h
1050h	32	HSM_TPCC0_IER	Int Enable Register: IER.In is not directly writeable. Interrupts can be enabled via writes to IESR and can be disabled via writes to IECR register. IER.In = 0: IPR.In is NOT enabled for interrupts. IER.In = 1: IPR.In IS enabled for interrupts.	4702 1050h
1054h	32	HSM_TPCC0_IERH	Int Enable Register (High Part): IERH.In is not directly writeable. Interrupts can be enabled via writes to IESRH and can be disabled via writes to IECRH register. IERH.In = 0: IPRH.In is NOT enabled for interrupts. IERH.In = 1: IPRH.In IS enabled for interrupts.	4702 1054h
1058h	32	HSM_TPCC0_IECR	Int Enable Clear Register: CPU write of '1' to the IECR.In bit causes the IER.In bit to be cleared. CPU write of '0' has no effect..	4702 1058h
105Ch	32	HSM_TPCC0_IECRH	Int Enable Clear Register (High Part): CPU write of '1' to the IECRH.In bit causes the IERH.In bit to be cleared. CPU write of '0' has no effect..	4702 105Ch
1060h	32	HSM_TPCC0_IESR	Int Enable Set Register: CPU write of '1' to the IESR.In bit causes the IESR.In bit to be set. CPU write of '0' has no effect..	4702 1060h
1064h	32	HSM_TPCC0_IESRH	Int Enable Set Register (High Part): CPU write of '1' to the IESRH.In bit causes the IESRH.In bit to be set. CPU write of '0' has no effect..	4702 1064h
1068h	32	HSM_TPCC0_IPR	Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.	4702 1068h
106Ch	32	HSM_TPCC0_IPRH	Interrupt Pending Register (High Part): IPRH.In bit is set when a interrupt completion code with TCC of N is detected. IPRH.In bit is cleared via software by writing a '1' to ICRH.In bit.	4702 106Ch

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
1070h	32	HSM_TPCC0_ICR	Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.	4702 1070h
1074h	32	HSM_TPCC0_ICRH	Interrupt Clear Register (High Part): CPU write of '1' to the ICRH.In bit causes the IPRH.In bit to be cleared. CPU write of '0' has no effect. All IPRH.In bits must be cleared before additional interrupts will be asserted by CC.	4702 1074h
1078h	32	HSM_TPCC0_IEVAL	Interrupt Eval Register	4702 1078h
1080h	32	HSM_TPCC0_QER	QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.	4702 1080h
1084h	32	HSM_TPCC0_QEER	QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/ latched in QER.En.	4702 1084h
1088h	32	HSM_TPCC0_QEECR	QDMA Event Enable Clear Register: CPU write of '1' to the QEECR.En bit causes the QEER.En bit to be cleared. CPU write of '0' has no effect..	4702 1088h
108Ch	32	HSM_TPCC0_QEESR	QDMA Event Enable Set Register: CPU write of '1' to the QEESR.En bit causes the QEESR.En bit to be set. CPU write of '0' has no effect..	4702 108Ch

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
1090h	32	HSM_TPCC0_QSER	QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.	4702 1090h
1094h	32	HSM_TPCC0_QSECR	QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..	4702 1094h
2000h	32	HSM_TPCC0_ER_RN	Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.	4702 2000h

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
2004h	32	HSM_TPCC0_ERH_RN	Event Register (High Part): If ERH.En bit is set and the EERH.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ERH.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EERH.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ERH.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EERH register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECRH pseudo-register.	4702 2004h
2008h	32	HSM_TPCC0_ECR_RN	Event Clear Register: CPU write of '1' to the ECR.En bit causes the ER.En bit to be cleared. CPU write of '0' has no effect.	4702 2008h
200Ch	32	HSM_TPCC0_ECRH_RN	Event Clear Register (High Part): CPU write of '1' to the ECRH.En bit causes the ERH.En bit to be cleared. CPU write of '0' has no effect.	4702 200Ch
2010h	32	HSM_TPCC0_ESR_RN	Event Set Register: CPU write of '1' to the ESR.En bit causes the ER.En bit to be set. CPU write of '0' has no effect.	4702 2010h
2014h	32	HSM_TPCC0_ESRH_RN	Event Set Register (High Part) CPU write of '1' to the ESRH.En bit causes the ERH.En bit to be set. CPU write of '0' has no effect.	4702 2014h
2018h	32	HSM_TPCC0_CER_RN	Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.	4702 2018h

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
201Ch	32	HSM_TPCC0_CERH_RN	Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.	4702 201Ch
2020h	32	HSM_TPCC0_EER_RN	Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.	4702 2020h

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
2024h	32	HSM_TPCC0_EERH_RN	Event Enable Register (High Part): Enables DMA transfers for ERH.En pending events. ERH.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CERH) or Event Set Register (ESRH). Note that if a bit is set in ERH.En while EERH.En is disabled no action is taken. If EERH.En is enabled at a later point (and ERH.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EERH.En is not directly writeable. Events can be enabled via writes to EESRH and can be disabled via writes to EECRH register. EERH.En = 0: ER.En is not enabled to trigger DMA transfers. EERH.En = 1: ER.En is enabled to trigger DMA transfers.	4702 2024h
2028h	32	HSM_TPCC0_EECR_RN	Event Enable Clear Register: CPU write of '1' to the EECR.En bit causes the EER.En bit to be cleared. CPU write of '0' has no effect..	4702 2028h
202Ch	32	HSM_TPCC0_EECRH_RN	Event Enable Clear Register (High Part): CPU write of '1' to the EECRH.En bit causes the EERH.En bit to be cleared. CPU write of '0' has no effect..	4702 202Ch
2030h	32	HSM_TPCC0_EESR_RN	Event Enable Set Register: CPU write of '1' to the EESR.En bit causes the EER.En bit to be set. CPU write of '0' has no effect..	4702 2030h
2034h	32	HSM_TPCC0_EESRH_RN	Event Enable Set Register (High Part): CPU write of '1' to the EESRH.En bit causes the EERH.En bit to be set. CPU write of '0' has no effect..	4702 2034h
2038h	32	HSM_TPCC0_SER_RN	Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.	4702 2038h
203Ch	32	HSM_TPCC0_SERH_RN	Secondary Event Register (High Part): The secondary event register is used along with the Event Register (ERH) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.	4702 203Ch

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
2040h	32	HSM_TPCC0_SECR_RN	Secondary Event Clear Register: The secondary event clear register is used to clear the status of the SER registers. CPU write of '1' to the SECR.En bit clears the SER register. CPU write of '0' has no effect.	4702 2040h
2044h	32	HSM_TPCC0_SECRH_RN	Secondary Event Clear Register (High Part): The secondary event clear register is used to clear the status of the SERH registers. CPU write of '1' to the SECRH.En bit clears the SERH register. CPU write of '0' has no effect.	4702 2044h
2050h	32	HSM_TPCC0_IER_RN	Int Enable Register: IER.In is not directly writeable. Interrupts can be enabled via writes to IESR and can be disabled via writes to IECR register. IER.In = 0: IPR.In is NOT enabled for interrupts. IER.In = 1: IPR.In IS enabled for interrupts.	4702 2050h
2054h	32	HSM_TPCC0_IERH_RN	Int Enable Register (High Part): IERH.In is not directly writeable. Interrupts can be enabled via writes to IESRH and can be disabled via writes to IECRH register. IERH.In = 0: IPRH.In is NOT enabled for interrupts. IERH.In = 1: IPRH.In IS enabled for interrupts.	4702 2054h
2058h	32	HSM_TPCC0_IECR_RN	Int Enable Clear Register: CPU write of '1' to the IECR.In bit causes the IER.In bit to be cleared. CPU write of '0' has no effect..	4702 2058h
205Ch	32	HSM_TPCC0_IECRH_RN	Int Enable Clear Register (High Part): CPU write of '1' to the IECRH.In bit causes the IERH.In bit to be cleared. CPU write of '0' has no effect..	4702 205Ch
2060h	32	HSM_TPCC0_IESR_RN	Int Enable Set Register: CPU write of '1' to the IESR.In bit causes the IESR.In bit to be set. CPU write of '0' has no effect..	4702 2060h
2064h	32	HSM_TPCC0_IESRH_RN	Int Enable Set Register (High Part): CPU write of '1' to the IESRH.In bit causes the IESRH.In bit to be set. CPU write of '0' has no effect..	4702 2064h
2068h	32	HSM_TPCC0_IPR_RN	Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.	4702 2068h
206Ch	32	HSM_TPCC0_IPRH_RN	Interrupt Pending Register (High Part): IPRH.In bit is set when a interrupt completion code with TCC of N is detected. IPRH.In bit is cleared via software by writing a '1' to ICRH.In bit.	4702 206Ch

Table 4-4109. HSM_TPCC0, HSM_TPCC0_HSM_TPCC Registers, Base Address=4702 0000H, Length=1 (continued)

Offset	Length	Acronym	Register Name	HSM_TPCC0 Physical Address
2070h	32	HSM_TPCC0_ICR_RN	Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.	4702 2070h
2074h	32	HSM_TPCC0_ICRH_RN	Interrupt Clear Register (High Part): CPU write of '1' to the ICRH.In bit causes the IPRH.In bit to be cleared. CPU write of '0' has no effect. All IPRH.In bits must be cleared before additional interrupts will be asserted by CC.	4702 2074h
2078h	32	HSM_TPCC0_IEVAL_RN	Interrupt Eval Register	4702 2078h
2080h	32	HSM_TPCC0_QER_RN	QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.	4702 2080h
2084h	32	HSM_TPCC0_QEER_RN	QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/ latched in QER.En.	4702 2084h
2088h	32	HSM_TPCC0_QEECR_RN	QDMA Event Enable Clear Register: CPU write of '1' to the QEECR.En bit causes the QEER.En bit to be cleared. CPU write of '0' has no effect..	4702 2088h
208Ch	32	HSM_TPCC0_QEESR_RN	QDMA Event Enable Set Register: CPU write of '1' to the QEESR.En bit causes the QEESR.En bit to be set. CPU write of '0' has no effect..	4702 208Ch

4.33.8 HSM_TPCC0_EMR Register (Offset = 300h) [reset = h]

Short Description: Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

Bit	Field	Type	Reset	Description
31 - 17	RES33	RO	0h	RESERVE FIELD
16	TCERR	RO	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors were previously clear) then an error will be signaled with TPCC error interrupt.
15 - 8	RES34	RO	0h	RESERVE FIELD
7	QTHRXCD7	RO	0h	Queue Threshold Error for Q7: QTHRXCD7 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD7 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD7 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
6	QTHRXCD6	RO	0h	Queue Threshold Error for Q6: QTHRXCD6 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD6 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD6 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
5	QTHRXCD5	RO	0h	Queue Threshold Error for Q5: QTHRXCD5 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD5 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD5 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

Table 4-4137. CCERR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	QTHRXCD4	RO	0h	Queue Threshold Error for Q4: QTHRXCD4 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD4 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD4 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
3	QTHRXCD3	RO	0h	Queue Threshold Error for Q3: QTHRXCD3 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD3 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD3 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
2	QTHRXCD2	RO	0h	Queue Threshold Error for Q2: QTHRXCD2 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD2 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD2 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
1	QTHRXCD1	RO	0h	Queue Threshold Error for Q1: QTHRXCD1 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD1 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD1 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
0	QTHRXCD0	RO	0h	Queue Threshold Error for Q0: QTHRXCD0 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD0 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD0 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

Bit	Field	Type	Reset	Description
31 - 2	RES37	RO	0h	RESERVE FIELD
1	SET	WO	0h	Error Interrupt Set: CPU write of '1' to the SET bit causes the TPCC error interrupt to be pulsed regardless of state of EMR/EMRH QEMR or CCERR. CPU write of '0' has no effect.
0	EVAL	WO	0h	Error Interrupt Evaluate: CPU write of '1' to the EVAL bit causes the TPCC error interrupt to be pulsed if any errors have not been cleared in the EMR/EMRH QEMR or CCERR registers. CPU write of '0' has no effect.

4.33.17 HSM_TPCC0_DRAEM Register (Offset = 340h) [reset = h]

Short Description: DMA Region Access enable for bit N in Region M: En = 0 : Accesses via Region M address space to Bit N in any DMA Channel Register are not allowed. Reads will return 'b0 on Bit N and writes will not modify the state of bit N. Enabled interrupt bits for bit N do not contribute to the generation of the TPCC region M interrupt. En = 1 : Accesses via Region M address space to Bit N in any DMA Channel Register are allowed. Reads will return the value from Bit N and writes will modify the state of bit N. Enabled interrupt bits for bit N do contribute to the generation of the TPCC region M interrupt.

0	CLR	WO	0h	AET Clear command: CPU write of '1' to the CLR bit causes the tpcc_aet output signal and AETSTAT.STAT register to be cleared. CPU write of '0' has no effect..

4.33.42 HSM_TPCC0_ER Register (Offset = 1000h) [reset = h]

Short Description: Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.33.43 HSM_TPCC0_ERH Register (Offset = 1004h) [reset = h]

Short Description: Event Register (High Part): If ERH.En bit is set and the EERH.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ERH.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EERH.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ERH.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EERH register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECRH pseudo-register.

4.33.48 HSM_TPCC0_CER Register (Offset = 1018h) [reset = h]

Short Description: Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.33.50 HSM_TPCC0_EER Register (Offset = 1020h) [reset = h]

Short Description: Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

Long Description:

4.33.57 HSM_TPCC0_SERH Register (Offset = 103Ch) [reset = h]

Short Description: Secondary Event Register (High Part): The secondary event register is used along with the Event Register (ERH) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Long Description:

Table 4-4249. IEVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	RES69	RO	0h	RESERVE FIELD
1	SET	WO	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	WO	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

4.33.71 HSM_TPCC0_QER Register (Offset = 1080h) [reset = h]

Short Description: QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Long Description:

4.33.72 HSM_TPCC0_QEER Register (Offset = 1084h) [reset = h]

Short Description: QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

4.33.77 HSM_TPCC0_ER_RN Register (Offset = 2000h) [reset = h]

Short Description: Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.33.83 HSM_TPCC0_CER_RN Register (Offset = 2018h) [reset = h]

Short Description: Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.33.85 HSM_TPCC0_EER_RN Register (Offset = 2020h) [reset = h]

Short Description: Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

4.33.94 HSM_TPCC0_SECRH_RN Register (Offset = 2044h) [reset = h]

Short Description: Secondary Event Clear Register (High Part): The secondary event clear register is used to clear the status of the SERH registers. CPU write of '1' to the SECRH.En bit clears the SERH register. CPU write of '0' has no effect.

Long Description:

Table 4-4319. IEVAL_RN Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	RES76	RO	0h	RESERVE FIELD
1	SET	WO	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	WO	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

4.33.106 HSM_TPCC0_QER_RN Register (Offset = 2080h) [reset = h]

Short Description: QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Long Description:

4.33.107 HSM_TPCC0_QEER_RN Register (Offset = 2084h) [reset = h]

Short Description: QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

Table 4-4333. OPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PRIV	RO	0h	Privilege level: privilege level (supervisor vs. user) for the host/cpu/dma that programmed this PaRAM Entry. Value is set with the vbus priv value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus. PRIV = 0 : User level privilege PRIV = 1 : Supervisor level privilege
30 - 28	RES83	RO	0h	RESERVE FIELD
27 - 24	PRIVID	RO	0h	Privilege ID: Privilege ID for the external host/cpu/dma that programmed this PaRAM Entry. This value is set with the vbus privid value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus.
23	ITCCHEN	RW	0h	Intermediate transfer completion chaining enable: 0: Intermediate transfer complete chaining is disabled. 1: Intermediate transfer complete chaining is enabled.
22	TCCHEN	RW	0h	Transfer complete chaining enable: 0: Transfer complete chaining is disabled. 1: Transfer complete chaining is enabled.
21	ITCINTEN	RW	0h	Intermediate transfer completion interrupt enable: 0: Intermediate transfer complete interrupt is disabled. 1: Intermediate transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
20	TCINTEN	RW	0h	Transfer complete interrupt enable: 0: Transfer complete interrupt is disabled. 1: Transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
19	WIMODE	RW	0h	Backward compatibility mode: 0: Normal operation 1 : WI Backwards Compatibility mode forces BCNT to be adjusted by '1' upon TR submission (0 means 1 1 means 2 ...) and forces ACNT to be treated as a word-count (left shifted by 2 by hardware to create byte cnt for TR submission)
18	RES84	RO	0h	RESERVE FIELD
17 - 12	TCC	RW	0h	Transfer Complete Code: The 6-bit code is used to set the relevant bit in CER (bit CER[TCC]) for chaining or in IER (bit IER[TCC]) for interrupts.

Table 4-4333. OPT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	TCCMODE	RW	0h	Transfer complete code mode: Indicates the point at which a transfer is considered completed. Applies to both chaining and interrupt. 0: Normal Completion A transfer is considered completed after the transfer parameters are returned to the CC from the TC (which was returned from the peripheral). 1: Early Completion A transfer is considered completed after the CC submits a TR to the TC. CC generates completion code internally .
10 - 8	FWID	RW	0h	FIFO width: Applies if either SAM or DAM is set to FIFO mode. Pass-thru to TC.
7 - 4	RES85	RO	0h	RESERVE FIELD
3	STATIC	RW	0h	Static Entry: 0: Entry is updated as normal 1: Entry is static Count and Address updates are not updated after TRP is submitted. Linking is not performed.
2	SYNCDIM	RW	0h	Transfer Synchronization Dimension: 0: A-Sync Each event triggers the transfer of ACNT elements. 1: AB-Sync Each event triggers the transfer of BCNT arrays of ACNT elements
1	DAM	RW	0h	Destination Address Mode: Destination Address Mode within an array. Pass-thru to TC. 0: INCR Dst addressing within an array increments. Dst is not a FIFO. 1: FIFO Dst addressing within an array wraps around upon reaching FIFO width.
0	SAM	RW	0h	Source Address Mode: Source Address Mode within an array. Pass-thru to TC. 0: INCR Src addressing within an array increments. Source is not a FIFO. 1: FIFO Src addressing within an array wraps around upon reaching FIFO width.

Table 4-4337. ABCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	BCNT	RW	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 (64K-1 arrays). BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ...
15 - 0	ACNT	RW	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes (64K-1 bytes). ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation (to translate between a word count and a byte count) will dropthe 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT.

LINK															
RW															
0															

Access Types Legend

Table 4-4343. LNK Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	BCNTRLD	RW	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT (conceptually) reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field.
15 - 0	LINK	RW	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination (i.e. after count fields are decremented to '0') with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case (5-lsbs) behavior is undefined forthe user (i.e. don't have to test it). In the former case (2 msbs) user should be able to take advantage of this feature (i.e. do have to test it). If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.

4.33.118 HSM_TPCC0_CIDX Register (Offset = 4018h) [reset = h]

Table 4-4345. CIDX Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	DCIDX	RW	0h	Destination Frame Index: DCIDX is a 16-bit signed value (2's complement) used for destination address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when DCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a ABsync transfer is the first array in the frame.
15 - 0	SCIDX	RW	0h	Source Frame Index: SCIDX is a 16-bit signed value (2's complement) used for source address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when SCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a AB-sync transfer is the first array in the frame.

Access Types Legend

Table 4-4356. TCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
13 - 12	DFSTRTPTR	RO	0h	Dst FIFO Start PointerRepresents the offset to the head entry of Dst Register FIFO in units of entries. Legal values = 0x0 to 0x3
	RESERVED	NONE		Reserved
8	ACTV	RO	1h	Channel ActiveChannel Active is a logical-OR of each of the BUSY/ ACTV signals. The ACTV bit must remain high through the life of a TR.ACTV = 0 : Channel is idle.ACTV = 1 : Channel is busy.
	RESERVED	NONE		Reserved
6 - 4	DSTACTV	RO	0h	Destination Active StateSpecifies the number of TRs that are resident in the Dst Register FIFO at a given instant.Legal values are constrained by the DSTREGDEPTH parameter.
	RESERVED	NONE		Reserved
2	WSACTV	RO	0h	Write Status ActiveWSACTV = 0 : Write status is not pending. Write status has been received for all previously issued write commands.WSACTV = 1 : Write Status is pending. Write status has not been received for all previously issued write commands.
1	SRCACTV	RO	0h	Source Active StateSRCACTV = 0 : Source Active set is idle. Any TR written to Prog Set will immediately transition to Source Active set as long as the Dst FIFO Set is not full [DSTFULL == 1].SRCACTV = 1 : Source Active set is busy either performing read transfers or waiting to perform read transfers for current Transfer Request.
0	PROGBUSY	RO	0h	Program Register Set BusyPROGBUSY = 0 : Prog set idle and is available for programming.PROGBUSY = 1 : Prog set busy. User should poll for PROGBUSY equal to '0' prior to re-programming the Program Register set.

Table 4-4372. ERRDET Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
17	TCCHEN	RO	0h	Contains the OPT.TCCHEN value programmed by the user for the Read or Write transaction that resulted in an error.
16	TCINTEN	RO	0h	Contains the OPT.TCINTEN value programmed by the user for the Read or Write transaction that resulted in an error.
	RESERVED	NONE		Reserved
13 - 8	TCC	RO	0h	Transfer Complete Code: Contains the OPT.TCC value programmed by the user for the Read or Write transaction that resulted in an error.
	RESERVED	NONE		Reserved
3 - 0	STAT	RO	0h	Transaction Status:Stores the non-zero status/error code that was detected on the read status or write status bus.MS-bit effectively serves as the read vs. write error code.If read status and write status are returned on the same cycle then the TC chooses non-zero version. If both are non-zero then write status is treated as higher priority.Encoding of errors matches the CBA spec.

4.34.12 HSM_TPTC00_ERRCMD Register (Offset = 130h) [reset = h]

Table 4-4446. TCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
13 - 12	DFSTRTPTR	RO	0h	Dst FIFO Start PointerRepresents the offset to the head entry of Dst Register FIFO in units of entries. Legal values = 0x0 to 0x3
	RESERVED	NONE		Reserved
8	ACTV	RO	1h	Channel ActiveChannel Active is a logical-OR of each of the BUSY/ ACTV signals. The ACTV bit must remain high through the life of a TR.ACTV = 0 : Channel is idle.ACTV = 1 : Channel is busy.
	RESERVED	NONE		Reserved
6 - 4	DSTACTV	RO	0h	Destination Active StateSpecifies the number of TRs that are resident in the Dst Register FIFO at a given instant.Legal values are constrained by the DSTREGDEPTH parameter.
	RESERVED	NONE		Reserved
2	WSACTV	RO	0h	Write Status ActiveWSACTV = 0 : Write status is not pending. Write status has been received for all previously issued write commands.WSACTV = 1 : Write Status is pending. Write status has not been received for all previously issued write commands.
1	SRCACTV	RO	0h	Source Active StateSRCACTV = 0 : Source Active set is idle. Any TR written to Prog Set will immediately transition to Source Active set as long as the Dst FIFO Set is not full [DSTFULL == 1].SRCACTV = 1 : Source Active set is busy either performing read transfers or waiting to perform read transfers for current Transfer Request.
0	PROGBUSY	RO	0h	Program Register Set BusyPROGBUSY = 0 : Prog set idle and is available for programming.PROGBUSY = 1 : Prog set busy. User should poll for PROGBUSY equal to '0' prior to re-programming the Program Register set.

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
29 - 28	DBG_ID	RW	0h	Debug IDValue driven on the read (tptc_r_dbg_channel_id) and write (tptc_w_dbg_channel_id) command bus.Used at system level for trace/profiling of user selected transfers in systems that include this feature.
	RESERVED	NONE		Reserved
22	TCCHEN	RW	0h	Transfer complete chaining enable:0: Transfer complete chaining is disabled.1: Transfer complete chaining is enabled.
	RESERVED	NONE		Reserved
20	TCINTEN	RW	0h	Transfer complete interrupt enable:0: Transfer complete interrupt is disabled.1: Transfer complete interrupt is enabled.
	RESERVED	NONE		Reserved
17 - 12	TCC	RW	0h	Transfer Complete Code: The 6-bit code is used to set the relevant bit in CER or IPR of the TPCC module.
	RESERVED	NONE		Reserved
10 - 8	FWID	RW	0h	FIFO width control: Applies if either SAM or DAM is set to FIFO mode.
	RESERVED	NONE		Reserved
6 - 4	PRI	RW	0h	Transfer Priority:0: Priority 0 - Highest priority1: Priority 1 ...7: Priority 7 - Lowest priority
	RESERVED	NONE		Reserved
1	DAM	RW	0h	Destination Address Mode within an array:0: INCR Dst addressing within an array increments.1: FIFO Dst addressing within an array wraps around upon reaching FIFO width.
0	SAM	RW	0h	Source Address Mode within an array:0: INCR Src addressing within an array increments.1: FIFO Src addressing within an array wraps around upon reaching FIFO width.

4.34.85 HSM_TPTC01_DFSRC1 Register (Offset = 344h) [reset = h]

Short Description: Dst FIFO Set Src Address

Long Description:

Return to Summary Table
