1. See core-specific chapter for the internal memory map.

2. In Lockstep mode the R5FSS*x* CORE**1** memory region is not accessible.
3. The size of these memories will change based on Dual-Core vs Lockstep operation.
   For more information about Dual-Core and Lockstep modes see the *R5FSS* chapter.
   For more information about ATCM and BTCM, see the *Tightly-Coupled Memories (TCM)* section within the *R5FSS* chapter.
4. This memory region is used by each CPU core to access the TCM/Cache memory space of other CPU cores.

2 AM263x Control Module Registers (CTRLMMR)

The Control module is the main controller for top-level device behavior in various states. It contains registers for configuration, bootstrap signals, I/O pad multiplexing, clock selection, and many others. There are various CTRLMMR modules in this device:

General SoC Control Modules

- CTRLMMR1 (MSS_CTRL) : Contains Peripheral-level (non-CONTROLSS) configuration options
- CTRLMMR2 (CONTROLSS_GLOBAL_CTRL): Contains CONTROLSS-level configuration options (General control, reset, and clocking-related functions)

Pad Configuration Control Modules

- PADCFG_CTRLMMR0 (MSS_IOMUX) : Controls the SoC-level terminal configuration options

Reset and Clocking Control Modules

- RCM_CTRLMMR0 (MSS_TOPRCM) : Contains SoC-level Clock and Reset controls
- RCM_CTRLMMR1 (MSS_RCM) : Contains Peripheral-level Clock and Reset controls

3	XTAL_XI_OE_N	RW	0h	When gz is low, the padxo output is enabled, padxi to padxo is a single stage inverter, and the oscillator can oscillate with an external crystal plus capacitors/resistor. When gz is high, padxo is in high impedance mode, padxi and Y are driven low, and the oscillator is disabled. With gz high, the internal bias resistor between padxi and padxo is disconnected regardless of the state of resselect.
2	XTAL_XO_RESSELECT	RW	0h	When resselect is low, an internal 1Meg Ohm resistor is connected between padxi and padxo for oscillator bias. When resselect is asserted (high), the internal resistor is disconnected. For oscillation with a crystal while resselect is high, an external resistor must be connected between padxi and padxo to provide bias.

15	SOC15	RW RRETURNS0S	0h	SOC15 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC15 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC15 flag bit to 1. This will cause a conversion to start once priority is given to SOC15. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC15 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Bit	Field	Type	Reset	Description
31 - 16	KEY	RW	0h	ADC Linearity Trim Control Write Key. Any write to this register must contain the value 0xA5A5 in these bit locations. If a write request attempts to load any other value into these bits, the write for the entire register is ignored. These bits always read back a zero.
15 - 6	RESERVED	RO		Reserved
5 - 1	CALIBSTEP	RW	0h	ADC Linearity Calibration Step. Defines which of the 24 steps of calibration is to be executed. Never set this bit field while the ADC SELFTRIM is in progress. The R-M-W operation could unintentionally set the CALIBMODE bit again.

Bit	Field	Type	Reset	Description
31 - 16	SIGN	RO	0h	Sign Extended Bits. These bits reflect the same value as bit 16.[[br]] [[br]]NOTE: If the conversion associated with this Post Processing Block is a 12-bit conversion, the SIGN bits extend down to bit 12, and all reflect the same value as bit 12.

Bit	Field	Type	Reset	Description
15 - 14	MODCNTRSTS	RW	0h	This bit field reads current status on modulo counter 00b (R) = CAP1 register gets loaded on next capture event. 01b (R) = CAP2 register gets loaded on next capture event. 10b (R) = CAP3 register gets loaded on next capture event. 11b (R) = CAP4 register gets loaded on next capture event.
13 - 12	DMAEVTSEL	RW	0h	DMA event select Capture Mode: 00b (R/W) = DMA interrupt source is CEVT1 01b (R/W) = DMA interrupt source is CEVT2 10b (R/W) = DMA interrupt source is CEVT3 11b (R/W) = DMA interrupt source is CEVT4 APWM Mode: 00b (R/W) = DMA interrupt source is period match 01b (R/W) = DMA interrupt source is compare match 10b (R/W) = DMA interrupt source is period match or compare match 11b (R/W) = Disabled
11	CTRFILTRESET	RW RRETURNS0S	0h	Reset Bit 0h (R) = No effect 1h (W) = Resets event filter, counter, modulo counter and CEVT[1,2,3,4] and CNTOVF , HRERROR flags Note: This provides an ability start capture module from known state in case spurious inputs are captured while ECAP is configured.

Table 3-735. ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	APWMPOL	RW	0h	APWM output polarity select. This is applicable only in APWM operating mode. 0 | ECAP_OUTPUT_ACTIVE_HIGHOutput is active high (Compare value defines high time) 1 | ECAP_OUTPUT_ACTIVE_LOWOutput is active low (Compare value defines low time)
9	CAP_APWM	RW	0h	CAP/APWM operating mode select 0 | ECAP_MODULEECAP module operates in capture mode. This mode forces the following configuration: - Inhibits TSCTR resets via CTR = PRD event - Inhibits shadow loads on CAP1 and 2 registers - Permits user to enable CAP1-4 register load - CAPx/APWMx pin operates as a capture input 1 | ECAP_MODULE_APWMECAP module operates in APWM mode. This mode forces the following configuration: - Resets TSCTR on CTR = PRD event (period boundary - Permits shadow loading on CAP1 and 2 registers - Disables loading of time-stamps into CAP1-4 registers - CAPx/APWMx pin operates as a APWM output
8	SWSYNC	RW RRETURNS 0S	0h	Software-forced Counter (TSCTR) Synchronizer. This provides the user a method to generate a synchronization pulse through software. In APWM mode, the synchronization pulse can also be sourced from the CTR = PRD event. 0 | ECAP_ZERO_NOEFFECTWriting a zero has no effect. Reading always returns a zero 1 | ECAP_WRITE_TSCTRWriting a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to a zero. Note: Selection CTR = PRD is meaningful only in APWM mode; however, you can choose it in CAP mode if you find doing so useful.
7 - 6	SYNCO_SEL	RW	0h	Sync-Out Select 0x0 | SWSYNCsync out signal is SWSYNC 0x1 | ECAP_CTR_PRD_TO_SYNCOUTSelect CTR = PRD event to be the sync-out signal 0x2 | ECAP_DISABLE_SYNC_OUTDisable sync out signal 0x3 | ECAP_DISABLE_SYNC_OUTDisable sync out signal
5	SYNCI_EN	RW	0h	Counter (TSCTR) Sync-In select mode 0 | ECAP_DISABLE_SYNC_INDisable sync-in option 1 | ECAP_ENABLE_COUNTER_REGISTEREnable counter (TSCTR) to be loaded from CTRPHS register upon either a SYNCI signal or a S/W force event.
4	TSCTRSTOP	RW	0h	Time Stamp (TSCTR) Counter Stop (freeze) Control 0 | ECAP_TSCTR_STOPPEDTSCTR stopped 1 | ECAP_TSCTR_FREE_RUNNINGTSCTR free-running
3	REARM	RW RRETURNS 0S	0h	Re-Arming Control. Note: The re-arm function is valid in one shot or continuous mode 0 | ECAP_NO_EFFECT_RETURNS_0Has no effect (reading always returns a 0) 1 | ECAP_ARMS_ONESHOTArms the one-shot sequence as follows: 1) Resets the Mod4 counter to zero 2) Unfreezes the Mod4 counter 3) Enables capture register loads
2 - 1	STOP_WRAP	RW	Bh	Stop value for one-shot mode. This is the number (between 1-4) of captures allowed to occur before the CAP(1-4) registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number (between 1-4) of the capture register in which the circular buffer wraps around and starts again. Notes: STOP_WRAP is compared to Mod4 counter and, when equal, 2 actions occur: - Mod4 counter is stopped (frozen) - Capture register loads are inhibited In one-shot mode, further interrupt events are blocked until re-armed. 0x0 | ECAP_STOPEVENT1_WRAPEVENT2Stop after Capture Event 1 in one-shot mode Wrap after Capture Event 1 in continuous mode. 0x1 | ECAP_STOPEVENT2_WRAPEVENT2Stop after Capture Event 2 in one-shot mode Wrap after Capture Event 2 in continuous mode. 0x2 | ECAP_STOPEVENT3_WRAPEVENT2Stop after Capture Event 3 in one-shot mode Wrap after Capture Event 3 in continuous mode. 0x3 | ECAP_STOPEVENT4_WRAPEVENT2Stop after Capture Event 4 in one-shot mode Wrap after Capture Event 4 in continuous mode.

3.7.10 CONTROLSS_ECAP0_ECEINT Register (Offset = 2Ch) [reset = h]

Short Description: The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ ECCLR registers. The proper procedure for configuring peripheral modes and interrupts is as follows: - Disable global interrupts - Stop eCAP counter - Disable eCAP interrupts - Configure peripheral registers - Clear spurious eCAP interrupt flags - Enable eCAP interrupts - Start eCAP counter - Enable global interrupts

Table 3-809. QPOSCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	QPOSCNT	RW	0h	Position Counter This 32-bit position counter register counts up/down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. This Register acts as a Read ONLY register while counter is counting up/down. Note: It is recommended to only write to the position counter register (QPOSCNT) during initialization, i.e. when the eQEP position counter is disabled (QPEN bit of QEPCTL is zero). Once the position counter is enabled (QPEN bit is one), writing to the eQEP position counter register (QPOSCNT) may cause unexpected results.

Bit	Field	Type	Reset	Description
7	SWI	RW	0h	Software init position counter 0 | SWI_NOTHINGDo nothing (action disabled) 1 | SWI_INITPOSInitialize position counter (QPOSCNT=QPOSINIT). This bit is not cleared automatically
6	SEL	RW	0h	Strobe event latch of position counter 0 | SEL_QEPSRISINGThe position counter is latched on the rising edge of QEPS strobe (QPOSSLAT = POSCCNT). Latching on the falling edge can be done by inverting the strobe input using the QSP bit in the QDECCTL register 1 | SEL_QEPSCLOCKClockwise Direction: Position counter is latched on rising edge of QEPS strobe Counter Clockwise Direction: Position counter is latched on falling edge of QEPS strobe
5 - 4	IEL	RW	0h	Index event latch of position counter (software index marker) 0x0 | IEL_RSVDReserved 0x1 | IEL_POSRISINGLatches position counter on rising edge of the index signal 0x2 | IEL_POSFALLINGLatches position counter on falling edge of the index signal 0x3 | IEL_SIMSoftware index marker. Latches the position counter and quadrature direction flag on index event marker. The position counter is latched to the QPOSILAT register and the direction flag is latched in the QEPSTS[QDLF] bit. This mode is useful for software index marking.
3	QPEN	RW	0h	Quadrature position counter enable/software reset 0 | QPEN_RESETReset the eQEP peripheral internal operating flags/ read-only registers. Control/configuration registers are not disturbed by a software reset. When QPEN is disabled, some flags in the QFLG register do not get reset or cleared and show the actual state of that flag. 1 | QPEN_ENABLEeQEP position counter is enabled
2	QCLM	RW	0h	QEP capture latch mode 0 | QCLM_CPULatch on position counter read by CPU. Capture timer and capture period values are latched into QCTMRLAT and QCPRDLAT registers when CPU reads the QPOSCNT register. 1 | QCLM_TIMEOUTLatch on unit time out. Position counter, capture timer and capture period values are latched into QPOSLAT, QCTMRLAT and QCPRDLAT registers on unit time out.
1	UTE	RW	0h	QEP unit timer enable 0 | UTE_DISABLEDisable eQEP unit timer 1 | UTE_ENABLEEnable unit timer
0	WDE	RW	0h	QEP watchdog enable 0 | WDE_DISABLEDisable the eQEP watchdog timer 1 | WDE_ENABLEEnable the eQEP watchdog timer

Bit	Field	Type	Reset	Description
15 - 8	KEY	WO	0h	Write Key. In order to write to this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every change to this register.
7 - 5	RESERVED	RO		Reserved
4	DATA_FILTER_EN	RW	0h	Data Filter Enable Bit. 0h (R/W) = Data filtering is disabled. 1h (R/W) = Data filtering is enabled.
3	INPUT_ISOLATE	RW	0h	When set to 1, the FSI RX inputs (RXCLK, RXD0 and RXD1) will be isolated from what is driven from the device pins and will be held at inactive level of '1'.This isolation facilitates the user to switch the RX inputs to a different set of device pins and hence any potential glitch that could occur during the process of switching will not affect the RX module itself.
2	SPI_PAIRING	RW	0h	Clock Pairing for SPI-like Behavior Enable bit This bit enables the internal clock pairing with the FSI TX module. This feature internally connects the TXCLK to RXCLK allowing the FSI TX module, acting as a SPI master, to clock data into the receiver and out of the transmitter like a standard SPI module. This configuration is valid when the Module is in SPI mode only (RX_OPER_CTRL.SPI_MODE = 1) 0h (R/W) = SPI clock pairing is not enabled. 1h (R/W) = SPI clock pairing is enabled. The RXCLK will be internally connected to the TXCLK of the corresponding FSI module. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Table 3-867. RX_MASTER_CTRL_ALTC_ Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	INT_LOOPBACK	RW	0h	Internal Loopback Enable bit This bit enables the internal loopback functionality of the FSI receiver. By enabling this bit, a mux will select the signals coming directly from the corresponding FSI transmitter module rather than from the pins. 0h (R/W) = Internal loopback is disabled. The FSI RX module will receive signals coming from the pins. 1h (R/W) = Internal loopback is enabled. The FSI RX module will receive signals from the directly from FSI TX module rather than the pins. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.
0	CORE_RST	RW	0h	Receiver Master Core Reset bit This bit controls the receiver master core reset. In order to receive any frame, this bit must be cleared. Note: For reset to take affect, the FSI RX module must be held in reset for at least 4 SYSCLK cycles. 0h (R/W) = Receiver core is not in reset and can receive frames. 1h (R/W) = Receiver core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

8	PING_WD_RST_MODE	RW	0h	Ping Watchdog Timeout Mode Select bit This bit selects the mode by which the ping watchdog counter is reset. The watchdog counter can be reset and restarted only by ping frames or by any received frame. 0h (R/W) = The ping watchdog counter will reset and restart only by ping frames. 1h (R/W) = The ping watchdog counter will reset and restart by any received frame.
7	ECC_SEL	RW	0h	ECC Data Width Select bit This bit selects between whether the ECC computation is done on 16-bit or 32-bit words. 0h (R/W) = 32-bit ECC is used. 1h (R/W) = 16-bit ECC is used.
6 - 3	N_WORDS	RW	0h	Number of Words to Receive This field defines the number of words which will be received in a DATA_N_WORD frame. This is a user-defined field that must match the corresponding field in the transmitter. Set this bitfield to be one less than the number of words to be received. This value is only applicable when the frame type received is DATA_N_WORD. 0h (R/W) = 1 data word frame (16-bit data). 1h (R/W) = 2 data word frame (32-bit data). .. Fh (R/W) = 16 data word frame (256-bit data).
2	SPI_MODE	RW	0h	SPI Mode Enable bit This bit enables and disables the SPI compatibility mode of the FSI RX. The received data must be formatted as an FSI frame in order for the data to properly be received. SPI compatibility mode will allow FSI RX to receive data that is sent using SPI signal format. Refer to the applicable section in the FSI TRM chapter for more information. 0h (R/W) = FSI is in normal mode of operation. 1h (R/W) = FSI is operating in SPI compatibility mode.
1 - 0	DATA_WIDTH	RW	0h	Receive Data Width Select bit These bits decide the number of data lines used for receiving data. 0h (R/W) = Data will be received on one data line, RXD0. 1h (R/W) = Data will be received on two data lines, RXD0 and RXD1. 2h, 3h (R/W) = Reserved

Bit	Field	Type	Reset	Description
15 - 2	RESERVED	RO		Reserved
1	PING_WD_EN	RW	0h	Ping Watchdog Counter Enable bit This bit will enable or disable the ping watchdog counter. The counter (RX_PING_WD_CNT) will begin counting from 0 when it is enabled. When the reference value (RX_PING_WD_REF) is reached, it will generate a ping watchdog timeout event (RX_EVT_STS.PING_WD_TO) and the counter value will reset to 0, and resume counting 0h (R/W) = The ping watchdog counter is disabled and not running. 1h (R/W) = The ping watchdog counter logic is enabled and running.
0	PING_WD_RST	RW	0h	Ping Watchdog Counter Reset bit This bit will reset the ping watchdog counter to 0. Writing a 1 to this bit will reset the ping watchdog counter to 0. The counter will stay in reset as long as this bit is set to 1. This bit needs to be cleared to 0 to use the counter 0h (R/W) = Clear the PING_WD_RST. 1h (W) = The ping watchdog counter will be reset to 0.

31 - 16	DATA_HIGH	RW	0h	Upper 16 bits of ECC Data Writing to this bitfield will cause the ECC logic to compute the ECC(SEC-DED) the entire 32-bit register and update TX_ECC_VAL register with the results. Software should write to these 16 bits of the register in a 32-bit write when needing to compute ECC for 32-bits for the full TX_ECC_DATA register.

15 - 8	KEY	WO	0h	Write Key In order to write to any bit in this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every change to this register.
7 - 2	RESERVED	RO		Reserved
1	FLUSH	RW	0h	Flush Operation Start bit This bit will cause the transmitter to initiate a flush pattern of a single toggle on the TXD0 and TXD1 followed by five full cycles of TXCLK. This bit should be written only when the CORE_RST bit is 0 and the clock to the Transmitter core is turned on. 0h (R/W) = Clear this bit. 1h (R/W) = Setting this bit will Initiate flush sequence. To properly execute a flush sequence, Set FLUSH to 1, wait for five TXCLK cycles then clear FLUSH to 0. Note: The KEY field must contain 0xA5 for any write to this bit to take effect. The software must keep this bit set to 1 for at least five TXCLK cycles before setting it back to 0.
0	CORE_RST	RW	0h	Transmitter Master Core Reset bit This bit controls the transmitter master core reset. In order to send any frame, this bit must be cleared. 0h (R/W) = Transmitter core is not in reset and can transmit frames. 1h (R/W) = Transmitter core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.
