

AM273x Technical Reference Manual

Technical Reference Manual

Literature Number: SPRUIU0
JANUARY 2022

1 Introduction	9
1.1 Device Overview.....	9
1.2 Device Block Diagram.....	11
2 Memory Map	13
2.1 Master Subsystem Cortex R5F Memory Map.....	13
2.2 DSP Subsystem C66x Memory Map.....	17
2.3 Radar Control Subsystem Memory Map.....	22
3 System Interconnect	27
3.1 Master Subsystem R5F Infrastructure.....	27
3.2 DSP Subsystem C66x Infrastructure.....	29
3.3 Radar Control Subsystem Infrastructure.....	30
4 Device Initialization	33
4.1 Initialization Overview.....	33
4.2 Boot Process.....	33
4.2.1 ROM Code Overview.....	33
4.2.2 Boot Modes.....	34
4.2.3 SOP Mode Pins.....	34
4.2.4 BOOT-ROM Architecture (RBL).....	34
4.2.5 R5F SBL Loading.....	35
5 Device Configuration	37
5.1 Overview.....	37
5.2 Control Registers.....	37
5.2.1 Kick Protection Registers.....	37
5.2.2 TOP_RCM Registers.....	39
5.2.3 MSS_RCM Registers.....	200
5.2.4 DSS_RCM Registers.....	365
5.2.5 RCSS_RCM Registers.....	508
5.2.6 DSS_CTRL Registers.....	613
5.2.7 MSS_CTRL_memory_map Registers.....	822
5.2.8 RCSS_CTRL_memory_map Registers.....	1063
5.2.9 MSS_IOMUX Registers.....	1159
5.3 Device Clock Architecture.....	1251
5.3.1 Clock Overview.....	1251
5.3.2 External Clocks.....	1252
5.3.3 Clock Selection.....	1253
5.3.4 Analog Modules.....	1264
5.4 Power Domains.....	1267
5.4.1 DSP Power Domain.....	1267
5.4.2 DSP Subsystem L3 Power Domain.....	1268
5.5 Resets.....	1269
6 Processors and Accelerators	1271
6.1 MCU Subsystem Cortex R5F.....	1271
6.1.1 MCU ARM SubSystem Features.....	1271
6.1.2 TCM Initialization.....	1272
6.1.3 TCM ROM-RAM SWAP.....	1272
6.1.4 Lock-Step to Dual Core Switching.....	1274
6.1.5 Vectored Interrupt Manager (VIM) Module.....	1274
6.1.6 Resets.....	1567
6.2 TI C66x DSP Subsystem (DSS)Overview.....	1568
6.2.1 C66x DSP Subsystem.....	1569

6.2.2 DSP Subsystem Integration.....	1575
6.3 Radar Processing Hardware Accelerator.....	1578
6.3.1 Radar Accelerator Features Overview.....	1578
6.3.2 Radar Accelerator Architecture.....	1579
6.4 Radar Hardware Accelerator 2.0.....	1579
6.4.1 Radar Hardware Accelerator – Overview.....	1580
6.4.2 Accelerator Engine – State Machine.....	1586
6.4.3 Accelerator Engine – Input Formatter.....	1593
6.4.4 Accelerator Engine – Output Formatter.....	1602
6.4.5 Accelerator Engine – Core Computational Unit.....	1608
6.4.6 Parameter Set Layouts.....	1619
6.4.7 FFT Engine – Pre-Processing.....	1621
6.4.8 Core Computational Unit - CFAR Engine.....	1640
6.4.9 Core Computational Unit – Statistics.....	1652
6.4.10 Core Computational Unit – Local Maxima Engine.....	1663
6.4.11 Context Switching.....	1669
6.4.12 Compression Engine.....	1673
6.4.13 Radar Hardware Accelerator Registers.....	1673
7 Interprocessor Communication.....	2159
7.1 Mailbox.....	2159
7.1.1 Mailbox Message Scheme.....	2160
8 Interrupts.....	2161
8.1 Master Subsystem Cortex R5F Interrupt Map.....	2161
8.2 DSP Subsystem C66x Interrupt Map.....	2166
8.3 DSP Subsystem Cortex M4 Interrupt Map.....	2168
8.4 Master Subsystem ESM Interrupt Map.....	2170
8.5 DSP Subsystem ESM Interrupt Map.....	2178
9 Data Movement Architecture.....	2187
9.1 Enhanced Direct Memory Access (EDMA).....	2188
9.1.1 EDMA Module Overview.....	2189
9.1.2 EDMA Integration.....	2190
9.1.3 EDMA Controller Functional Description.....	2194
9.1.4 EDMA Transfer Examples.....	2242
9.1.5 EDMA Debug Checklist and Programming Tips.....	2249
9.1.6 EDMA Event Map.....	2251
9.1.7 EDMA Registers.....	2251
10 Peripherals.....	2493
10.1 General Connectivity Peripherals.....	2493
10.1.1 General-Purpose Input/Output (GPIO) Module.....	2493
10.1.2 Inter-Integrated Circuit (I2C) Module.....	2588
10.1.3 UART/SCI.....	2628
10.1.4 Multi-Buffered Serial Peripheral Interface Module (MibSPI) with Parallel Pin Option (MibSPIP).....	2680
10.1.5 GPADC.....	2805
10.2 High-speed Serial Interfaces.....	3362
10.2.1 Ethernet SubSystem (MCU_CPSW0).....	3362
10.2.2 LVDS.....	3675
10.2.3 MDO/Aurora.....	3780
10.3 Memory Interfaces.....	3886
10.3.1 Quad Serial Peripheral Interface (QSPI).....	3887
10.4 Industrial and Control Interfaces.....	3909
10.4.1 Enhanced Capture (eCAP) Module.....	3909
10.4.2 Enhanced Pulse Width Modulator (ePWM) Module.....	3943
10.4.3 CANFD.....	4073
10.5 Timer Modules.....	4179
10.5.1 Real-Time Interrupt (RTI) and Watchdog Module.....	4179
10.6 Internal Diagnostics Modules.....	4235
10.6.1 Data Modification Module (DMM).....	4235
10.6.2 Safety Modules.....	4286
10.7 Audio Interfaces.....	4658
10.7.1 Multichannel Audio Serial Port (McASP).....	4658
10.8 Camera Subsystem.....	4782

10.8.1 CSI2-RX.....	4782
11 On-chip Debug.....	4933
11.1 AM273x DebugSS Architecture.....	4934
11.1.1 DebugSS Overview.....	4934
11.1.2 DebugSS Architecture.....	4934
11.1.3 Debug Subsystem Address Map.....	4935
11.1.4 Trace Subsystem.....	4936
11.1.5 Cross Triggering.....	4936
11.1.6 Suspend Peripherals.....	4939
11.1.7 MSS_DEBUGSS Registers.....	4941

This chapter introduces the features, subsystems, and architecture of AM273x (TI Processor for Radar) Systems on Chip (SoCs).

1.1 Device Overview

The AM273x is targeted for automotive applications such as Advanced Driver Assistance System (ADAS), automotive premium audio and amplifiers, industrial and broad-market applications such as edge analytics, low-end motor drives, entry-level industrial communication gateways, and audio applications.

The SoC has been designed as a low power, high performance, and highly integrated device architecture, adding significant enhancement on processing power and coherent memory support. In addition, they support state of art security and functional safety features.

The device is composed of the following main subsystems:

- One Dual Core Lock-step Cortex R5F microcontroller at up to 400 MHz.
- One TI C66x variant Single Core Floating point DSP at up to 450 MHz
- Radar Hardware Accelerators running at 400 MHz
- Cortex M4-based Hardware Security Module for running security services in a secure island.

The device provides a rich set of peripherals, such as:

- General connectivity peripherals, including:
 - Three Inter-Integrated Circuit (I2C) interfaces
 - Four Controller/Peripheral Multi-Buffered Serial Peripheral Interfaces (MiBSPi)
 - Four configurable Universal Asynchronous Receiver/Transmitter (UART) interfaces
 - One General-Purpose Input/Output (GPIO) module
 - One 10-bit Analog to Digital Convertors.
- High-speed interfaces, including:
 - Two 4-Lane CSI2 receiver interface
 - One 100Mbps Ethernet switch (CPSW)
- Control and Communication interfaces, including:
 - Two Controller Area Network (CAN-FD) interfaces with full flexible data rate support
 - Three Enhanced Pulse Width Modulation (EPWM) modules
 - One Enhanced Capture (ECAP) module.
- EMIF Interface
 - One Quad-Serial Peripheral Interface (QSPI) at up to 67 MHz
- Timers and Watchdog Module
 - Five Real Time Interrupts (RTI) modules, three in MSS and two in DSS.
 - Two Watchdog modules, one in DSS and one in MSS (Same RTI IP but in Watchdog configuration)
- Interprocessor Communication (IPC) interface
 - Mailbox module for interprocessor communication between the different modules
- Sub-system Reset and control module with device top-level configurations:
 - Power distribution, reset controls, and clock management components.

- Registers for the following functions:
 - I/O Configurations
 - PLL control and associated High-speed Dividers (HSDIV)
 - Clock Selection
 - System boot mode decoding logic
- Up to 5 MB of on-chip memory split across DSS, MSS, and the shared memory L3 bank.
- Debug and trace capabilities.

The AM273x device has distinguished characteristics for ADAS applications:

- High Performance Radar Processing Accelerators with the capability to offload the DSP/CPU almost all the pre-processing functions.
- Radar Hardware Accelerators running at 400 MHz capable of the 256 pt FFT for 4Rx channels in 3.2 μ s.
- High Performance/Cost ratio. Highly optimized, area efficient infrastructure to support the radar data flow with maximum cost effectiveness and efficiency.
- One 4-Lane LVDS TX interface with Xilinx AURORA protocol.

The device includes different modules for functional safety requirements support:

- Logic BIST mechanism for all the CPU cores
- PBIST mechanism for all the memories
- ECC on the critical memories
- MPU on all critical shared resources – MMRs and memories
- Voltage monitor on all the primary supplies with >90% DC
- Clock monitors to monitor all the primary clocks. At least one Watchdog per each subsystem.
- PLL Lock monitors – PHASELOCK, FREQLOCK
- Temperature sensors with an accuracy of $\pm 5^{\circ}\text{C}$ near DSP, Master R5F, HSM, and all other temperature sensitive locations.
- Separate safety island (MCU) with Lock-Step/Dual-Core Cortex-R5F.
- Safety enabled interconnect
- Two Error Signaling Modules (ESM) to enable error monitoring, 1 each in DSS and MSS.
- Temperature monitoring sensors
- Dedicated hardware Memory Cyclic Redundancy Check (MCRC) blocks.

1.2 Device Block Diagram

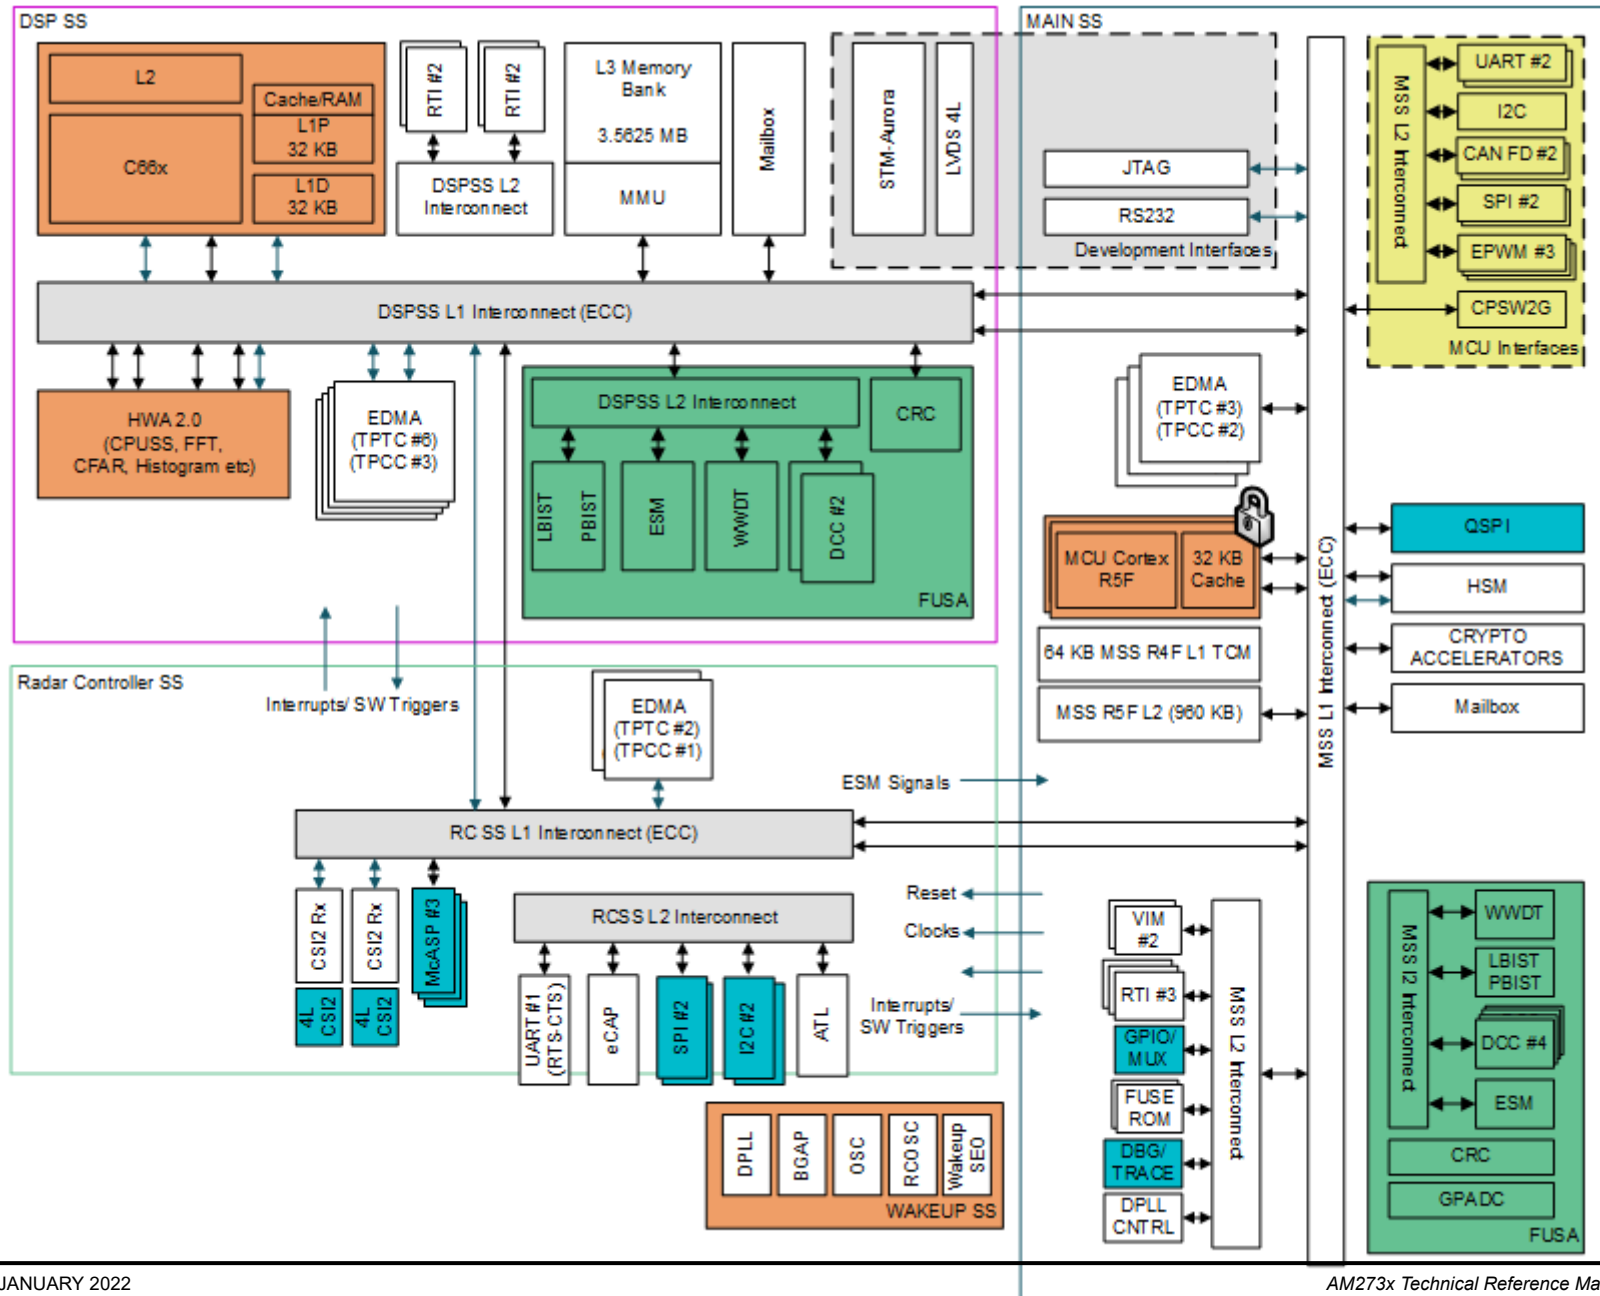

Table 1-1. Module Allocation and Instances within the Device

Module Full Name	Module Abbreviation	MSS	DSS	RCSS
ARM Lockstep R5F Subsystem	R5FSS	1		
TI C66x DSP	C66x		1	
ARM Cortex M4 Hardware Security Module Subsystem	HSM	1		
Common Platform Ethernet Switch	CPSW	1		
Quad-Serial Peripheral Interface	QSPI	1		
Enhanced Direct Memory Access	EDMA_TPCC EDMA_TPTC	TPCC- 2 TPTC-3	TPCC- 3 TPTC-6	TPCC- 1 TPTC-2
Controller Area Network	CANFD/MCAN	2		
Serial Peripheral Interface	MiBSPI	2		2
Vectored Interrupt Manager	VIM	2		
Real Time Interrupt Timer	RTI	3	2	
Windowed Watchdog Timer	RTI-WWDT	1	1	
Universal Asynchronous Receiver/Transmitter	UART	2	1	1
RS232	RS232	1		
Inter Integrated Circuit	I2C	1		2
General Purpose Input Output	GPIO	1		1
EFUSE Controller	EFUSE	2		
Debug Subsystem	DEBUGSS	1		
Dual Clock Comparator	DCC	4	2	
Cyclic Redundancy Check	CRC	1	1	
General Purpose Analog to Digital Convertor	GPADC	1		
Enhanced Pulse Width Modulation	EPWM	3		
Error Signaling Module	ESM	1	1	
Radar Accelerators	HWA2.0		1	
LVDS Interface	LVDS		1	
CSI2-Receiver	CSI2-RX			2
Multi-Channel Audio Serial Port	McASP			3
Interprocess Communication	MAILBOX	1	1	
Enhanced Capture Module	ECAP			1
Data Modification Module	DMM	1

Note

TPTC-C2, TPTC-C3, TPTC-C4, and TPTC-C5 modules and their functionality are not supported in this family of devices. *Any information regarding these modules has been retained in the documentation solely for the purpose of clarifying memory map read/write attributes. Features noted as “not supported” must not be used.*

The device implements a system interconnect based on TI's common bus architecture, comprising of VBUSM and VBUSP protocols.

The system interconnect is designed for the high-performance needs of the system. The interconnect structure is a full crossbar implementation, wherein every master has an independent communication path with every salve such that transactions from each masters have access to full interconnect bandwidth. Arbitration only happens at slave end point. It's divided into interconnect systems local to each subsystem: the Master R5F subsystem, DSP subsystem, and Radar Control subsystem.

3.1 Master Subsystem R5F Infrastructure

In the master subsystem, the primary VBUSM SCR is responsible for managing the arbitration priority between accesses from multiple masters to each of the slaves. The arbitration priority is always round-robin.

The master subsystem has PCR interconnect that manages the accesses to the peripheral registers and peripheral memories, and provides a global reset for all peripherals. It also supports the capability to selectively enable or disable the clock for each peripheral individually. The PCR also manages the accesses to the system module registers required to configure the device clocks, interrupts, and so forth.

The system module registers include status flags for indicating exception conditions – resets, aborts, errors, and interrupts.

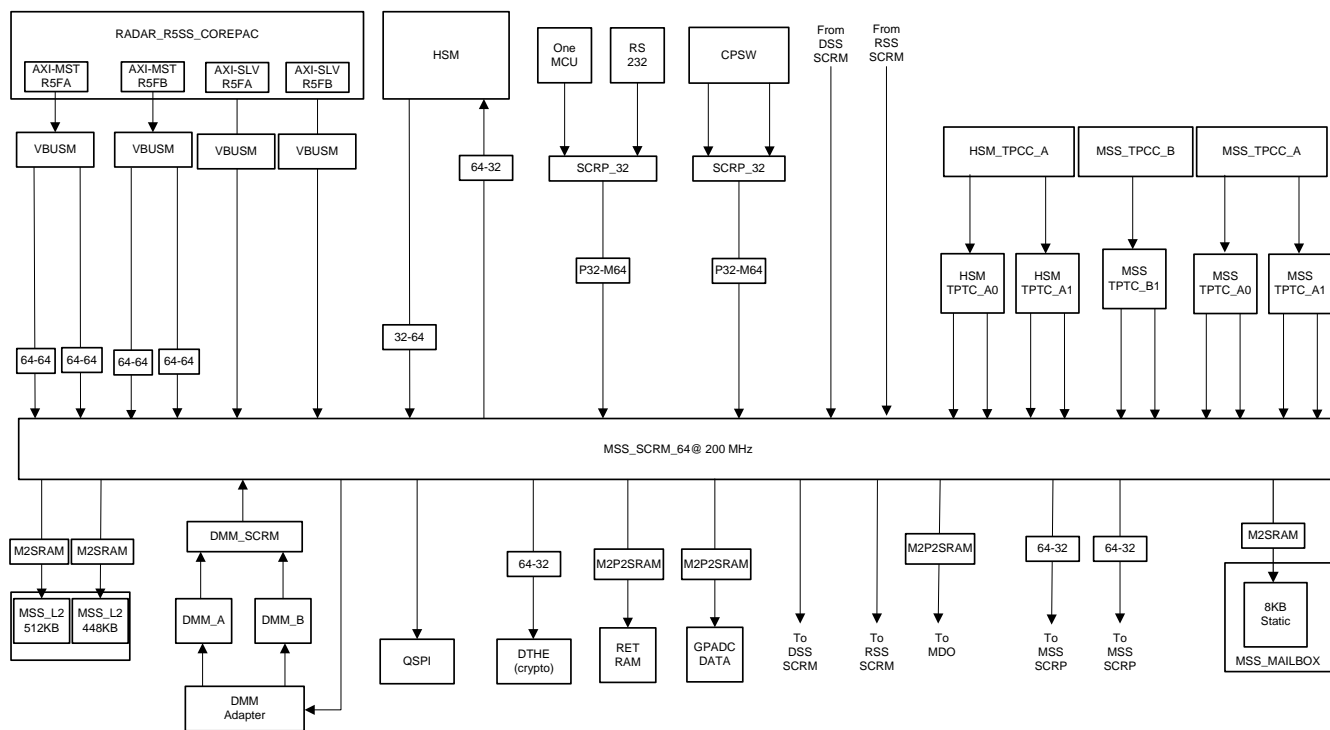

Figure 3-1. Master Subsystem R5F Infrastructure

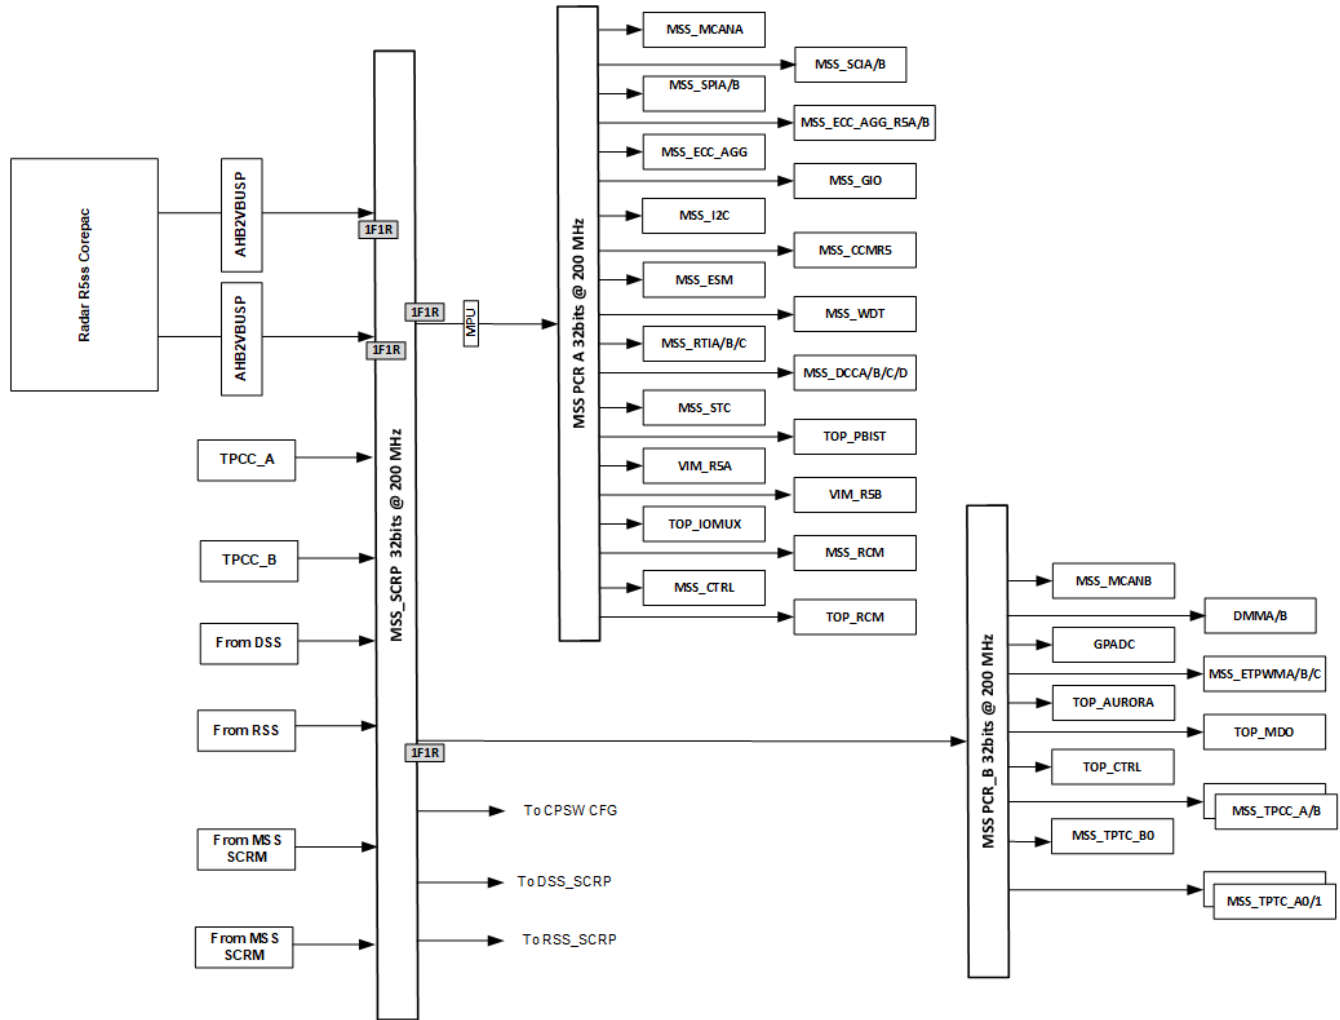

Figure 3-2. MSS Peripheral Infrastructure

3.2 DSP Subsystem C66x Infrastructure

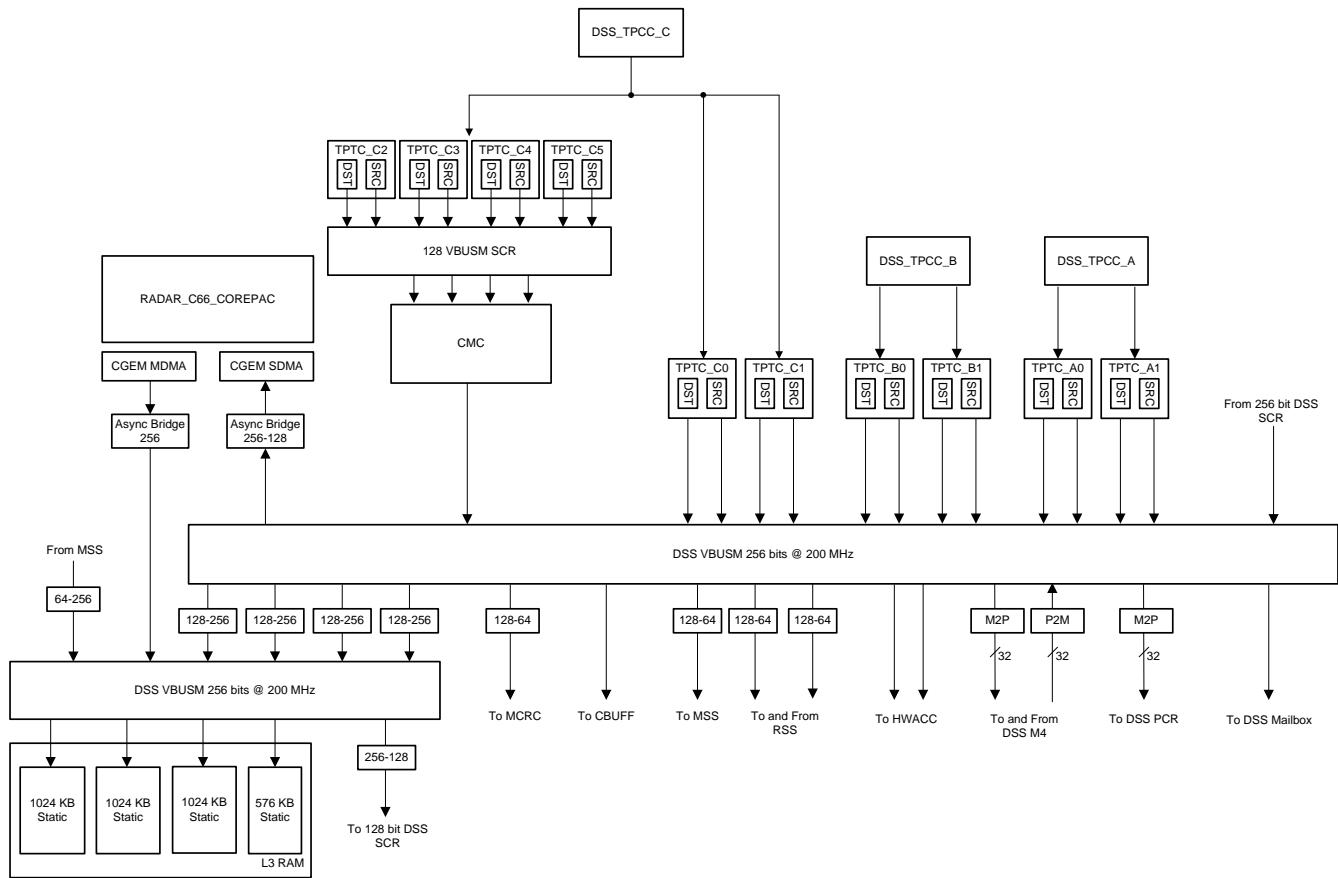

Figure 3-3. DSS Infrastructure

The DSS has a hybrid infrastructure of 256-bit and 128-bit data SCRs. This is to match the L3 and DSP MDMA port data widths. The area overhead of hooking up all the other masters and slaves to a 256-bit SCR because the number of bridges required was too large. The MSS Master also sits on the 256-bit SCR, so that the latency to L3 is reduced.

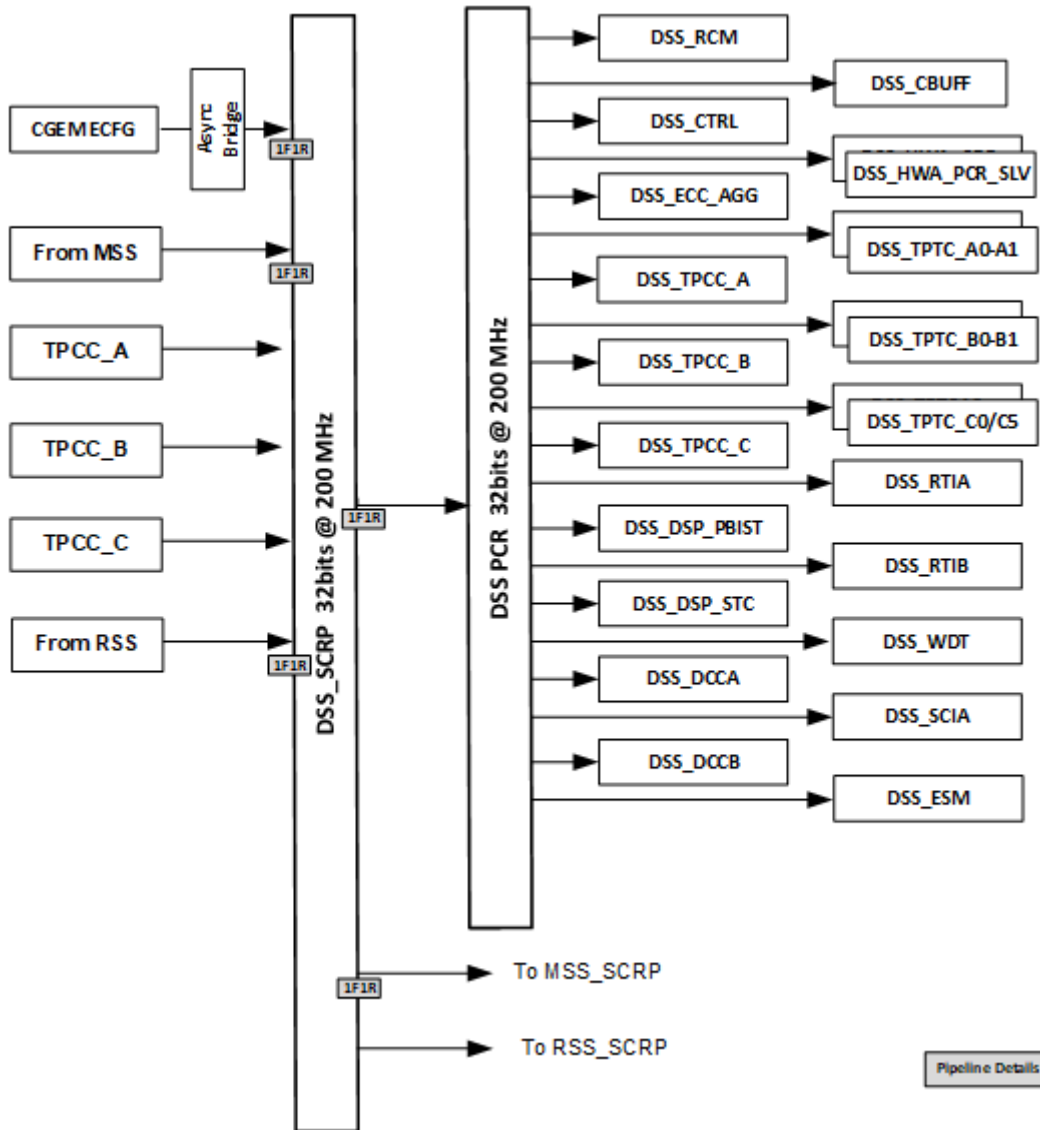

Figure 3-4. DSS Peripheral Infrastructure

Note

TPTC-C2, TPTC-C3, TPTC-C4, and TPTC-C5 modules and their functionality are not supported in this family of devices. *Any information regarding these modules has been retained in the documentation solely for the purpose of clarifying memory map read/write attributes. Features noted as “not supported” must not be used.*

3.3 Radar Control Subsystem Infrastructure

The RCSS has a 64-bit data SCR

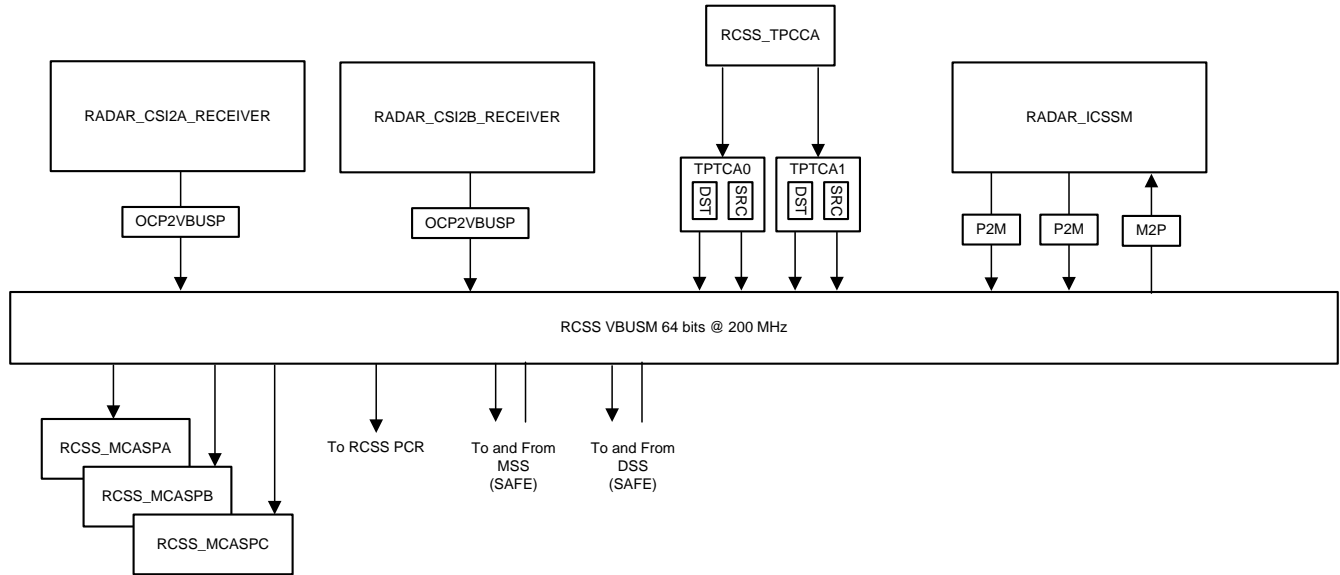

Figure 3-5. Radar Control Subsystem Infrastructure

This page intentionally left blank.

4.1 Initialization Overview

Figure 4-1. Device Initialization

Below is an overview of the initialization process and its steps:

- **Preinitialization:** Power, clock, and control connections must be present, and the boot configuration pins must be held at the desired logical levels.
- **Power, clock, reset ramp sequence:** Specific sequence that is applied by the power-management chip
- **ROM code:** Responsible for finding, downloading, and executing the initial software (SBL)
- **Initial software:** Software that loads, prepares, and passes control to application software.
- **Application Image:** The application that runs on the main core/processor.

The first two steps in the initialization process are hardware-oriented; however, they require an understanding of the process of configuring these system interface pins (balls on the device), which have software-configurable functionality. This configuration is an essential part of the chip configuration and is application-dependent. This chapter discusses these system-interface pins, the associated configuration registers, and memory structures that are vital to the correct initialization of the device.

4.2 Boot Process

4.2.1 ROM Code Overview

ROM bootloader (or ROM Code) is a software that resides in a on-chip read-only memory (ROM) to assist the customer in transferring and executing their application code. The device has two ROM codes that work together – the MCU ROM (R5F ROM) code and the HSM ROM code.

To accommodate various system scenarios, the ROM code supports several boot modes. These boot modes can be broadly classified as:

- Host boot modes
- Memory boot modes.

During a host boot, the device is configured to receive code from a host through the selected interface (such as UART). Either the host writes the application code directly into internal memory over UART, or the ROM code receives the application code on the selected interface and stores it in internal memory.

During a memory boot, the device transfers code from non-volatile memory to internal memory for execution.

In all boot modes, the entire boot operation can be partitioned into two sections:

- Hardware initialization phase
- Boot process

During initialization, the ROM code configures the device resources (PLLs, peripherals, pins) as needed to support the boot process. The resources used depend on the boot mode requirements. During the boot process,

the boot image can be loaded into device memory and executed, depending on the boot peripheral. HSM ROM code performs code verification and allows or forbids the image execution.

The main configuration source for boot after power-up are the SOP mode pins sampled automatically after reset release and stored in device status registers. At ROM code startup, these pin values are read from the registers to create the boot peripheral list, and the boot configuration tables used later to initialize and startup the PLLs and boot peripherals.

4.2.2 Boot Modes

MCU ROM supports the functionality of loading the secondary boot loader (SBL). The SBL can be loaded through QSPI (primary/secondary SBL) and UART. The primary use case of QSPI programming through UART interface is to support the uniFlash utility. UART QSPI programming may be applicable for certain use cases, such as initial FLASH programming in volume mass production, that can be achieved with special in-circuit gang programming tools.

Primary functional boot mode is through QSPI FLASH. MCU ROM supports managing multiple (primary and backup) QSPI SBL images. It can identify the primary image, and switch to secondary image load if primary image load fails.

Table 4-1. Boot Modes and Boot Media

Boot Mode/Peripheral	Boot Media/Host	Notes
QSPI	QSPI flash	Download and boot SBL from QSPI flash. Attempt Primary SBL, followed by Secondary SBL if primary loading fails: If above is not successful
UART	External host	Download and boot SBL from UART. Device is expected to get SBL from UART. We will support the XMODEM protocol for download over UART.

4.2.3 SOP Mode Pins

Table 4-2 lists the functional mode pin settings to be done for the SOP lines of the device to boot using different peripheral. New SOP modes will be added later.

Table 4-2. Functional Mode Pin Settings

Functional Mode	SOP Mode	PMIC_OUT	SYNC_OUT	TDO
Func Mode –QSPI	SOP_MODE4	0	0	1
Func Mode –UART	SOP_MODE5	1	0	1

4.2.4 BOOT-ROM Architecture (RBL)

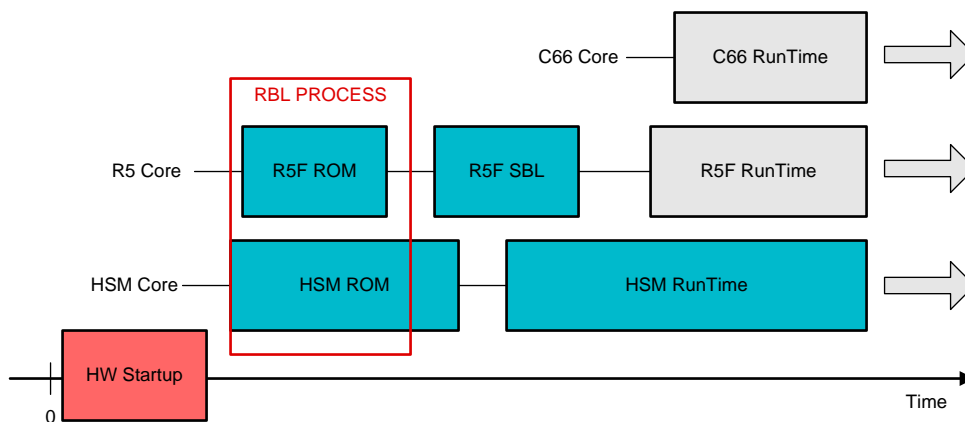

Figure 4-2. Boot Flow and Boot ROM Architecture

The RBL process goal is to load, verify, optionally decrypt, and launch an authentic R5F software image that accomplishes general-purpose/secure boot goals. The RBL process is implemented jointly by the R5F and HSM ROM as illustrated in Figure 4-3.

HSM ROM

This HSM ROM contains the first set of software instructions that is executed by any processor core on all TPR devices. All state changes in the device after the external reset is released but prior to the beginning of the HSM ROM code execution are purely a function of hardware logic. This hardware logic must perform sufficient ramp up and initialization to allow the Cortex M4 core of the HSM to leave reset and begin execution from its reset vector. The HSM ROM code is “time zero” software. The HSM ROM code is only intended to be used during the initial load of the secondary boot loader (SBL) and HSM RunTime image. HSM ROM is also responsible for providing Test/Debug capabilities when functional boot is interrupted.

MCU ROM

The MCU ROM code is only intended to be used during the initial load of the secondary boot loader (SBL). Its use at any other time in the lifecycle of a system is not supported. MCU ROM executes set of self-tests: PBIST (DATA SRAM, PROGRAM SRAM, and ROM Code Integrity) using a hardware-defined interface. If unsuccessful, the error condition is indicated, external ESM signal asserted, and boot does not proceed.

R5F SBL

This SBL can perform complete boot sequence on general purpose devices. Customers are expected to develop their own SBLs, supporting a wider range of requirements (such as different interfaces, additional protocols, different image formats, and so forth).

HSM RunTime/R5F Runtime/C66 Runtime

Out of scope of this document.

4.2.5 R5F SBL Loading

The SBL process starts with R5F executing loaded and verified R5F SBL code.

The only service exposed to R5F SBL by HSM ROM is the API to load the HSM RunTime. All other HSM services are outside of the HSM ROM. The R5 Boot ROM and HSM Boot ROM work together to load the R5F SBL. When the R5F SBL has been successfully validated and loaded, the R5F Boot-ROM is eclipsed and the R5F SBL executes.

Figure 4-3 is the simplified sequence of the boot process. It is provided for illustration purposes only. An illustration of the SBL and HSM RunTime is similar to what is shown in Figure 4-3.

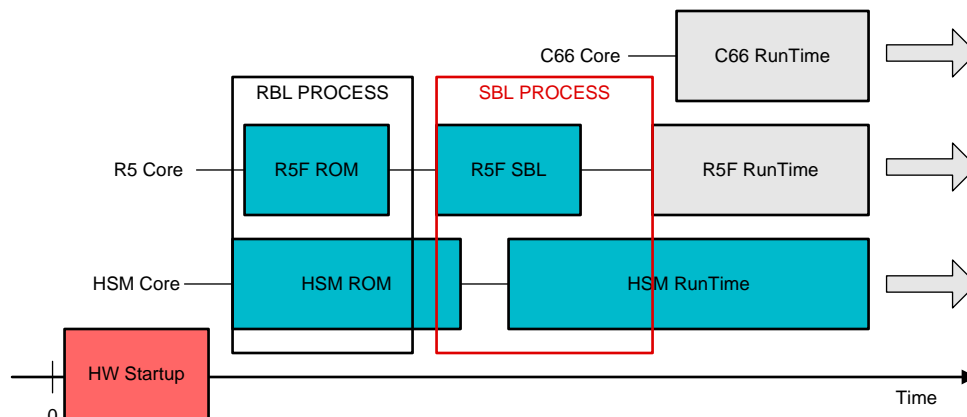

Figure 4-3. R5F SBL

The HSM ROM configures IPC mechanism, and releases R5F from reset, sends boot options message to R5F, and awaits for R5F service calls. R5F reads the boot options and configures QSPI. R5F reads the R5F SBL image. The image may or may not be integrity checked. The HSM ROM switches the memory map and restarts

the R5F to SBL. The HSM-ROM for GP devices is now locked (black-boxed). SBL now runs the multicore loader to the DMA-copy image sections to R5F and C66 loading addresses. SBL loads images of R5F and C66, and restarts/jumps to R5F RunTime. R5F RunTime releases the C66 from reset.

5.1 Overview

PRCM manages clocks, resets, and power domain control of subsystems and modules inside the device. Additionally, configuration of certain device-level features is also performed through this module. PRCM has control and status registers to achieve this functionality. The Clock and Reset Management in AM273x is distributed. The Master subsystem TOPRCM module controls all the Subsystem Resets and Clocks. The SubSystem RCM modules control their respective subsystem IPs

The available address space of PRCM is divided as in [Figure 5-1](#).

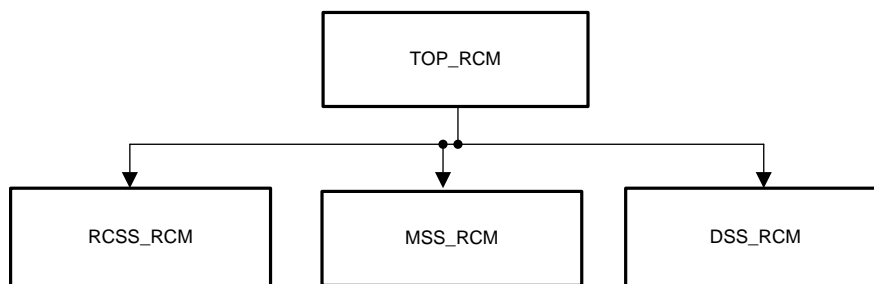

Figure 5-1. Device Configuration

Table 5-1. PRCM Space

PRCM Space	Description
MSS_TOPRCM	Top-level reset, clock management registers
MSS_RCM	Master subsystem reset, clock management registers
RCSS_RCM	Radar Control subsystem reset, clock management registers
DSS_RCM	DSP reset, clock management registers

5.2 Control Registers

5.2.1 Kick Protection Registers

The Control MMR modules have a protection mechanism which prevents spurious writes from changing the values of its registers. The LOCKi_KICK0 and LOCKi_KICK1 registers are used for this purpose. A write is required first to the LOCKi_KICK0[31-1] KEY field and then to the LOCKi_KICK1[31-0] KEY field with exact data values to unlock the protection mechanism. Once released then all registers within Partition "i" having write permissions can be written to. The read only registers are still read only. An indication for unlocked Partition "i" is when the LOCKi_KICK0[0] UNLOCKED bit is set to 1h. When the protection mechanism is locked (indicated by LOCKi_KICK0[0] UNLOCKED = 0h) none of the registers within Partition "i" can be written to. They can only be read.

The table below shows the values that must be written to the LOCKi_KICK0 and LOCKi_KICK1 registers to unlock each partition. Writing any other data value to either of these registers locks the protection mechanism and blocks any writes to the registers that reside in Partition "i".

The MSS_IOMUX module also has kick protection registers.

Table 5-2. Kick Protection Register Unlock Values

Protected Register	Kick Register	Unlock Value
MSS_TOPRCM	LOCK0_KICK0	0x01234567

Table 5-48. PLL_CORE_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES�IPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading. SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	9h	Trim value for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.

Table 5-48. PLL_CORE_CLKCTRL Register Field Descriptions (continued)

Table 5-80. PLL_DSP_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	Status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	Status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
26-12	RESERVED	R	X	
11	CLKDCOLDOACK	R	0h	Status on PHASELOCK output pin
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	0h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status

Table 5-80. PLL_DSP_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

5.2.2.78 PLL_DSP_HSDIVIDER Register (Offset = 828h) [reset = X]

PLL_DSP_HSDIVIDER is shown in [Figure 5-79](#) and described in [Table 5-81](#).

Table 5-95. PLL_PER_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	Status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	Status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
26-12	RESERVED	R	X	
11	CLKDCOLDOACK	R	0h	Status on PHASELOCK output pin
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	0h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status

Table 5-95. PLL_PER_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

5.2.2.93 PLL_PER_HSDIVIDER Register (Offset = 864h) [reset = X]

Table 5-105. ANA_REG_CLK_CTRL_REG1_XO_SLICER Register Field Descriptions

Bit	Field	Type	Reset	Description
31	OSC_CLKOUT_EN	R/W	0h	OSC_CLKOUT Enable Enables the Slicer clock to drive the OSC_CLKOUT output buffer. It is recommended that this bit be activated as the last step after fields OSC_CLKOUT_DRV, OSC_CLKOUT_CLRZ_DIV, and OSC_CLKOUT_FREQ_SEL have been configured. 0 = Clock Disabled 1 = Clock Enabled 0x00 = Functional Reset
30-29	OSC_CLKOUT_FREQ_SEL	R/W	0h	OSC_CLKOUT Frequency Selection Selects the output frequency as a division of the XTAL (or externally driven CLKP) frequency. x0 = XTAL/2 10 = XTAL/1 11 = XTAL/4 0x00 = Functional Reset
28	OSC_CLKOUT_CLRZ_DIV	R/W	0h	OSC_CLKOUT Divider ClearZ This active low signal permits the output frequency dividers to be properly cleared before enabling. 0 = All dividers cleared 1 = Normal divider function enabled 0x1 = Functional Reset
27-24	OSC_CLKOUT_DRV	R/W	0h	OSC_CLKOUT Drive This bit controls the drive strength of the OSC_CLKOUT buffer. 4'b0000 = No Test Output, Hi-Z Output Drive Ctrl = [4/9X][2/9X][2/9X][1/9X] 0xF = Functional Reset
23-13	RESERVED	R/W	0h	Reserved Reads return 0x0 and writes have no effect. 0x0 = Functional Reset

Table 5-105. ANA_REG_CLK_CTRL_REG1_XO_SLICER Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	XTAL_DETECT_XO_SLICER	R/W	0h	XTAL Detect Enable This bit connects a pullup and sense circuitry to CLKM to detect the presence or absence of a crystal. This operation will conflict with oscillator functionality, so this bit must be asserted only when the oscillator is disabled (CTRL_CLKTOP_REG1 bit 2 must be "0"). After asserted, the internal XTAL_SENSE signal will reflect a "1" if a crystal is present (CLKM sees a high impedance) or "0" if CLKM is tied to ground. After the sense operation is detected, this bit must be cleared before the oscillator will function properly if enabled. 0 = Normal operation (pullup and sense circuitry are disconnected from CLKM, XTAL_SENSE outputs "1") 1 = XTAL sense function enabled (pullup and sense circuitry connected to CLKM, output of XTAL_SENSE reads "1" if high impedance, "0" if CLKM is tied to ground) 0x0 = Functional Reset
11	SLICER_DCCPL_XO_SLICER	R/W	0h	Slicer DC-Coupled Mode 0 = Normal operation (AC-couple CLKP to internal slicer) 1 = DC-couple CLKP to internal slicer to CLKP 0x0 = Functional Reset
10	SLICER_HIPWR_XO_SLICER	R/W	0h	Slicer High-power Mode This bit bypasses the input clock slicer current-starving/filtering circuitry to increase gain and reduce device phase-noise at the expense of power and reduced supply noise rejection. This permits the use of a high-speed external test clock (660MHz max). 0 = Normal operation (current-limiting present) 1 = High-power/high-speed test mode 0x0 = Functional Reset
9	FASTCHARGEZ_BIAS_XO_SLICER	R/W	0h	Bias Fast-charge Enable (Active Low) This bit bypasses the RC filtering on the XOSC/SLICER Bias to permit more rapid power-up. 0 = Bias fast-charge 1 = Normal operation (filtering present) 0x1 = Functional Reset
8-4	XOSC_DRIVE_XO_SLICER	R/W	0h	Crystal Oscillator Output Drive Binary-weighted oscillator drive control 0x0 = Functional Reset
3-0	RTRIM_BIAS_XO_SLICER	R/W	0h	Crystal Oscillator and Slicer Bias RTrim Binary-weighted bias control 0x0 = Functional Reset

5.2.2.103 ANA_REG_CLK_CTRL_REG1_CLKTOP Register (Offset = C04h) [reset = 7h]

R/W-X					R/W-0h		
7	6	5	4	3	2	1	0
RESERVED					lock_step		
R/W-X					R/W-7h		

Table 5-1385. R5_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	X	
26-24	rom_wait_state	R/W	0h	writing '111' enables a single cycle wait state with respect to CR5A_clk for rom access. This needs to be set when R5 clock is at 400MHZ and Interconnect-clk is at 200MHZ. (because it is a timing issue in this scenario)
23-19	RESERVED	R/W	X	
18-16	reset_fsm_trigger	R/W	0h	Write pulse bit field: writing 3'b111 will trigger the reset FSM. Reset FSM ensures reset to R5SS and inturn ensures the latching of lock_step and also mem_swap bit
15-11	RESERVED	R/W	X	
10-8	lock_step_switch_wait	R/W	0h	writing 3'b111 ensures switch happens only after R5SS reset. Orelse it will be a immediate switch.
7-3	RESERVED	R/W	X	
2-0	lock_step	R/W	7h	writing 3'b000 ensures R5 to be in Dual-Core mode. Note: The change happens after the R5SS reset assertion if R5_CONTROL_lock_step_switch_wait is set. Or else the switching to Dual-core happens on the fly.

5.2.7.442 R5_ROM_ECLIPSE Register (Offset = 804h) [reset = X]

R5_ROM_ECLIPSE is shown in [Figure 5-1379](#) and described in [Table 5-1386](#).

Return to the [Table 5-944](#).

7	6	5	4	3	2	1	0
RESERVED						memswap	
R/W-X						R/W-0h	

Table 5-1386. R5_ROM_ECLIPSE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	X	
10-8	memswap_wait	R/W	0h	writing 3'b111 ensures ROM-Eclipsing happens only after R5SS reset. Orelse it will be a immediate change.
7-3	RESERVED	R/W	X	
2-0	memswap	R/W	0h	writing '111' ensures eclipsing of CR5A_ROM immediately if memswap_wait is not set. If memswap_wait is set then ROM is eclipsed after R5SS reset assertion.

5.2.7.443 R5_COREA_HALT Register (Offset = 808h) [reset = X]

R5_COREA_HALT is shown in [Figure 5-1380](#) and described in [Table 5-1387](#).

Return to the [Table 5-944](#).

Bit	Field	Type	Reset	Description
31-0	IOCFGKICK1	R/W	0h	Kicker 1 Register. The value 95A4 F1E0h must be written to the KICK1 as part of the process to unlock the CPU write access to above PINMUX registers (excluding IOCFGKICK0). IOCFGKICK0 has to be written with 83E70B13h to enable access to IOCFGKICK1.

5.3 Device Clock Architecture

5.3.1 Clock Overview

[Figure 5-1700](#) shows a high-level overview of the device clock architecture. The figure captures the key clock sources and the configuration options available to select the appropriate clock source. The detailed structure is captured under each PLL clocking section.

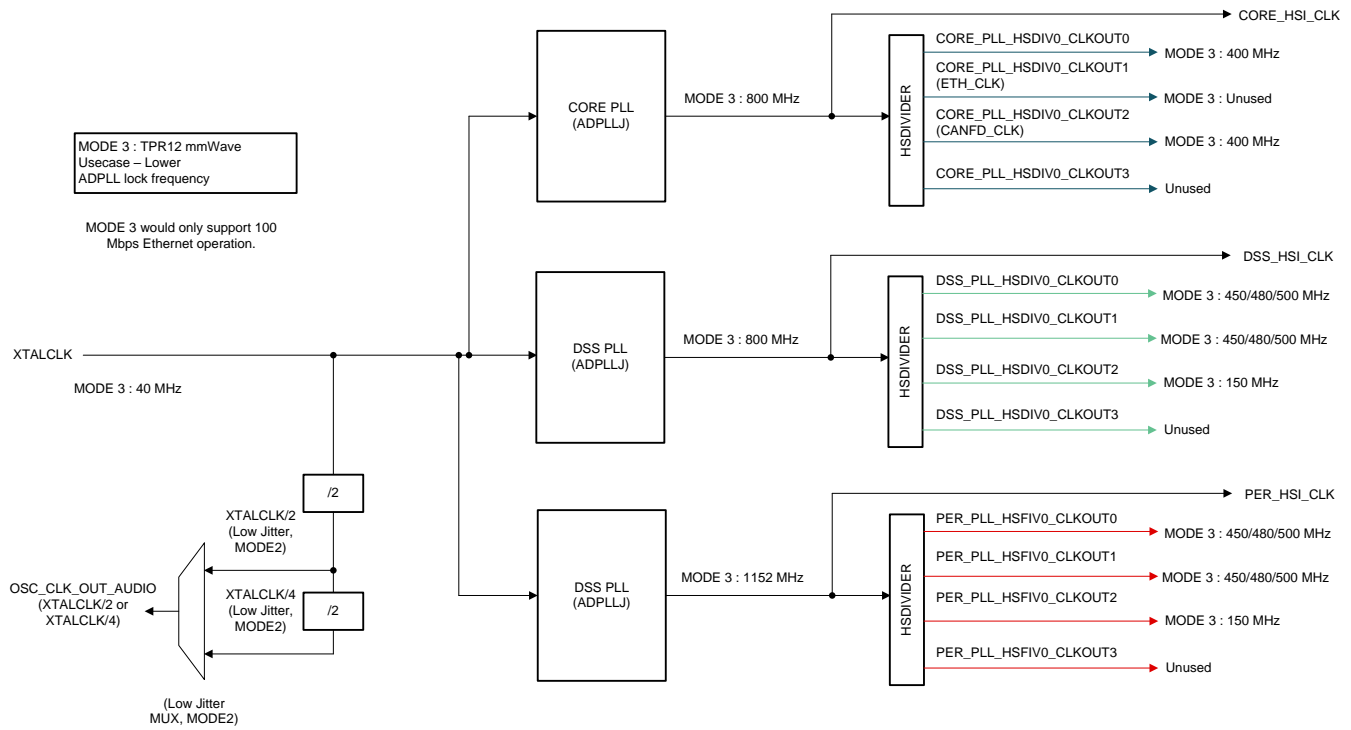

Figure 5-1700. Clock Tree Configuration

5.3.2 External Clocks

The clocks in the AM273x device to the supported peripherals are as depicted in [Figure 5-1701](#).

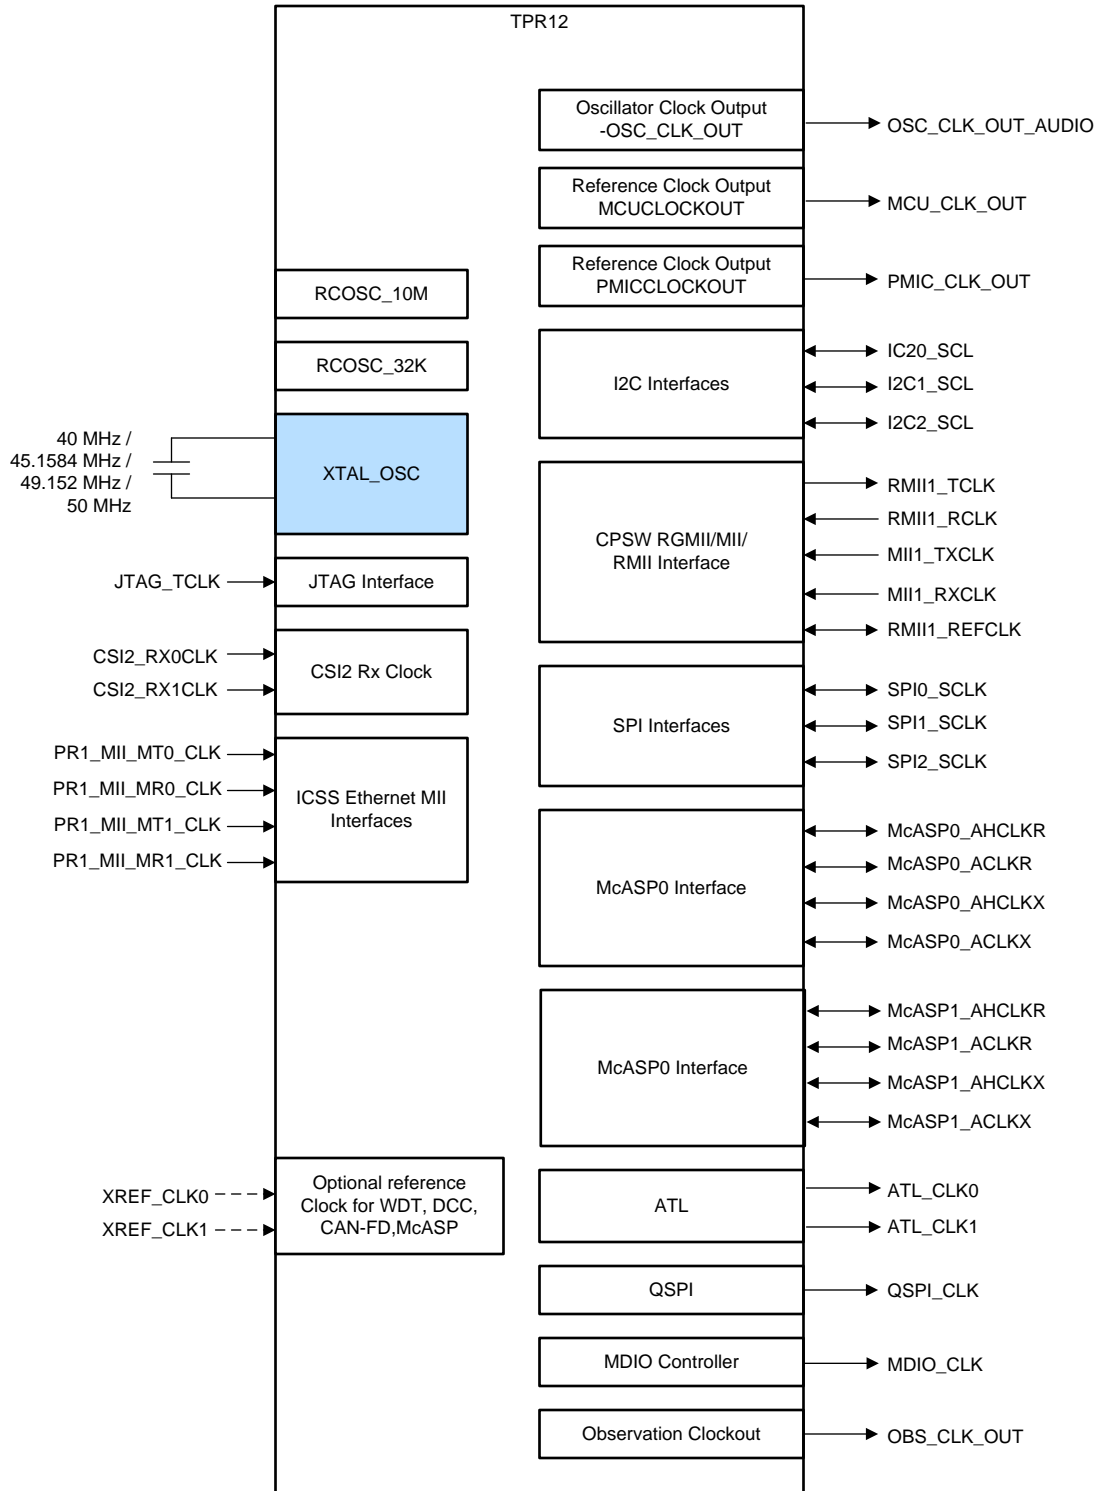

Figure 5-1701. External Clocks

5.3.3 Clock Selection

Table 5-1709 lists the configuration options for the clock source, divider, and gating selections for different peripheral clocks.

5.3.4 Analog Modules

5.3.4.1 ADPLLJ (Low-Jitter DPLL)

General features of the ADPLLJ module are:

- Low Jitter Phase-Locked Loop
- RHEA, OCP, and Direct Access interface
- Programmable 8-bit input divider: N

- Programmable 12-bit integer, 18-bit fractional loop multiplier: M
- Programmable 7-bit post divider: M2
- Digital control and loop filter
- User-selectable multiple in-built oscillators for power-jitter optimization
- Primary output clock on digital core domain: $CLKOUT = (M / (N+1)) * CLKINP * (1/M2)$
- Additional output clock on internal LDO domain: $CLKOUTLDO = (M / (N+1)) * CLKINP * (1/M2)$
- Internal oscillator clock on internal LDO domain: $CLKDCOLDO = (M / (N+1)) * CLKINP$
- Output clock gating control: CLKOUTEN / CLKOUTLDOEN / CLKOUTDCOLDOEN
- Digital LOCK indicators for frequency and phase lock
- Fast re-lock
- Input to output bypass on CLKOUT
- Bypass programmable 4-bit divider: N2: $CLKOUT = CLKINP / (N2 + 1)$
- Optional low frequency bypass clock control: ULOWCLKEN CLKOUT = CLKINPULOW
- Power management modes:
 - Power down
 - Idle bypass
 - Stop Clock-input Bypass
 - Retention
- Output clock Spread spectrum clocking supported

5.3.4.2 ADPLLJ Programming Model

5.3.4.2.1 ADPLLJ Programming Sequence

The following sequence is for PLL_PER. Similar registers exist for PLL_CORE and PLL_DSP.

1. Program the values M and N2 in TOP_RCM: PLL_PER_MN2DIV.
2. Program the values of N and M2 in TOP_RCM:PLL_PER_M2NDIV.
3. Program the Fractional M in TOP_RCM:PLL_PER_FRACDIV_FRACTIONALM.
4. Program the Sigma Delta Divider (SD) in TOP_RCM:PLL_PER_FRACDIV_REGSD.
5. Copy the NWEELL TRIM from EFUSE to TOP_RCM:PLL_PER_CLKCTRL_NWEELLTRIM.
6. Write 0x0 to TOP_RCM:PLL_PER_CLKCTRL_IDLE.
7. Write 0x1 to TOP_RCM:PLL_PER_TENABLE.
8. Write 0x1 to TOP_RCM:PLL_PER_CLKCTRL_TINTZ.
9. Write 0x0 to TOP_RCM:PLL_PER_TENABLE.
10. Write 0x1 to TOP_RCM: PLL_PER_TENABLEDIV.
11. Write 0x0 to TOP_RCM: PLL_PER_TENABLEDIV.
12. Poll Lock Status by reading TOP_RCM:PLL_PER_STATUS_PHASELOCK until it is 0x1.

5.3.4.2.2 HS Divider Programming Sequence

1. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT0_DIV.
2. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT1_DIV.
3. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT2_DIV.
4. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT3_DIV.
5. Write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_TENABLEDIV.
6. Write 0x0 to TOP_RCM:PLL_PER_HSDIVIDER_TENABLEDIV.
7. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT0_GATE_CTRL.
8. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT1_GATE_CTRL.
9. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT2_GATE_CTRL.
10. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT3_GATE_CTRL.

5.3.4.2.3 ADPLLLJ (Low Jitter DPLL)

The ADPLLLJ is a low jitter PLL with a 2-GHz maximum output. ADPLLLJ has a predivide feature which allows user to divide, for instance, a 24-MHz or 26-MHz reference clock to 1 MHz and then multiply up to 2 GHz maximum.

All PLLs will come-up in bypass mode at reset. SW needs to program all the PLL settings appropriately and then wait for PLL to be locked. For more details, see the configuration procedure for each PLL.

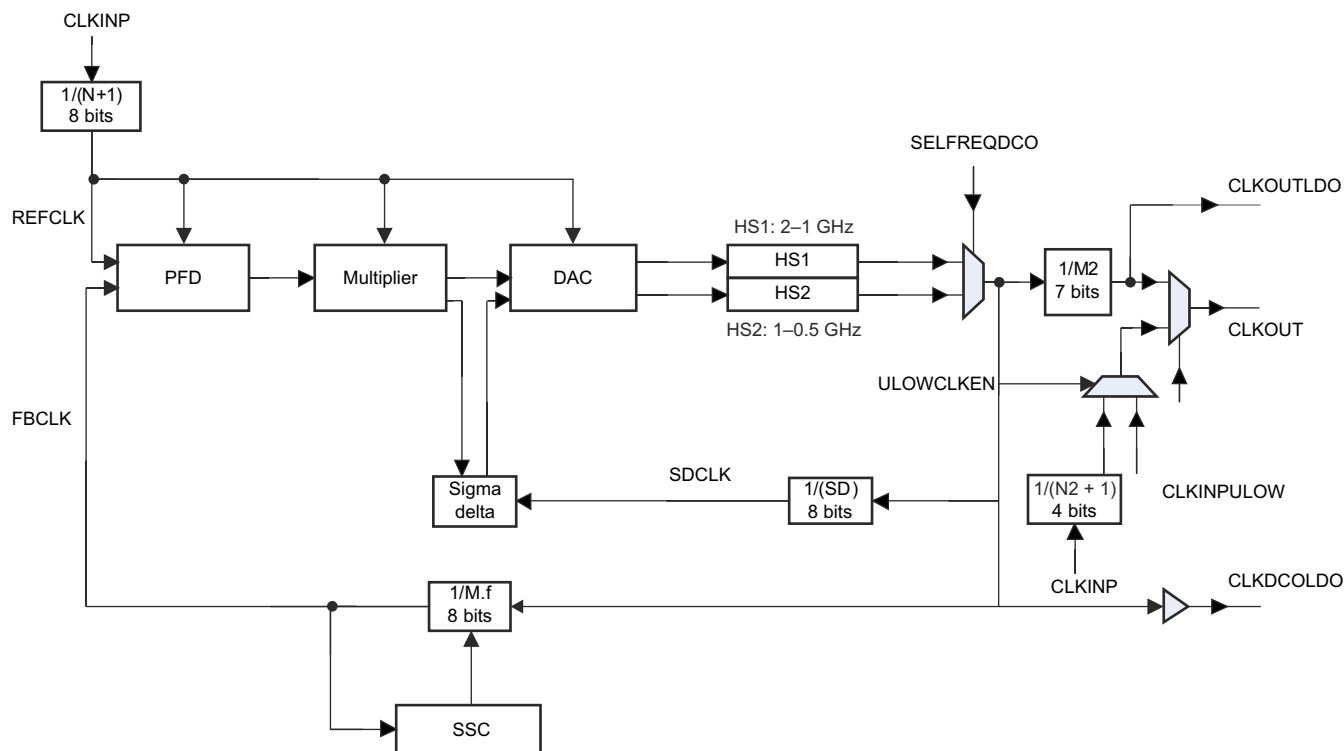

Figure 5-1702. Basic Structure of the ADPLLJ

The peripheral PLL and EXTDEV PLL belong to type ADPLLJ:

The DPLL has two input clocks:

- CLKINP: Reference input clock
- CLKINPULOW: Bypass input clock.

The DPLL has two internal clocks:

- REFCLK (Internal reference clock): This is generated by dividing the input clock CLKINP by the programmed value N+1. The entire loop of the PLL runs on the REFCLK.

Here, $REFCLK = CLKINP / (N+1)$.

- CLKDCO (Internal Oscillator clock.): This is the raw clock directly out of the digitally controlled oscillator (DCO) before the post-divider. The PLL output clock is synthesized by an internal oscillator which is phase locked to the refclk. There are two oscillators built within ADPLLJ. The oscillators are user selectable based on the synthesized output clock frequency requirement. In locked condition, $CLKDCO = CLKINP * [M / (N+1)]$.

The ADPLLJ lock frequency is defined as follows: $f_{DPLL} = CLKDCO_{OUT}$

The DPLL has three external output clocks:

- CLKOUTLDO: Primary output clock in VDDLDOOUT domain. Bypass option not available on this output.

$$CLKOUTLDO = (M / (N+1)) * CLKINP * (1/M2)$$

- CLKOUT:

Primary output clock on digital core domain

$$CLKOUT = (M / (N+1)) * CLKINP * (1/M2)$$

- CLKDCOLDO:

Oscillator (DCO) output clock before post-division in VDDLDOOUT domain. Bypass option is not available on this output.

$$\text{CLKDCOLDO} = (M / (N+1)) * \text{CLKINP}$$

All clock outputs of the DPLL can be gated. The Control module provides the DPLL with a clock gating control signal to enable or disable the clock, and the DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. Output clock gating control for various clockouts: CLKOUTEN/CLKOUTLDOEN/CLKDCOLDOEN.

5.3.4.2.3.1 Clock Functions

Table 5-1710. Output Clocks in Locked Condition

Pin Name	Frequency
CLKOUT	$[M / (N+1)] * \text{CLKINP} * [1/M2]$
CLKOUTLDO	$[M / (N+1)] * \text{CLKINP} * [1/M2]$
CLKDCOOUT	$[M / (N+1)] * \text{CLKINP}$

Table 5-1711. Output Clocks Before Lock and During Relock Modes

Pin Name	Frequency	Comments
CLKOUT	CLKINP/(N2+1)	ULOWCLKEN='0'
	CLKINPLOW	ULOWCLKEN='1'
CLKDCOLDO	LOW	
CLKOUTLDO	LOW	

5.3.4.2.4 M2 and N2 Change On-the-Fly

The dividers M2 and N2 are designed to change on the fly and provide a glitch-free frequency switch from the old to new frequencies. In other words, they can be changed while the PLL is in a locked condition, without having to switch to bypass mode. A status toggle bit will give an indication if the new divisor was accepted. These dividers can also be changed in bypass mode, and the new divisor value will be reflected on output after the PLL relocks. For more details, see the PLL configuration procedures for each PLL.

5.4 Power Domains

The device has two power domains:

- Always-on power domain: This power domain supplies power to entire device except for the DSP core. It cannot be switched off dynamically within the device.
- DSP power domain: The DSP core inside the DSP subsystem is placed on switchable power domain, and can be switched on or off as needed. This feature can be used to reduce power consumption of the device when the DSP core is not in use. By default, the state of this power domain is OFF.

5.4.1 DSP Power Domain

The C66x DSP is off by default on bootup. The DSS_RCM controls the power cycling of the DSP. Software can trigger a power on/off sequence by writing to the DSP_PD registers in DSS_RCM space.

5.4.1.1 Software Sequence To Power On DSP

1. Unmask the wakeup trigger related to DSS_DSP_WAKEUP. This is DSP interrupt number 16. Thus, unmask the 16th bit in the register DSS_RCM.DSP_PD_WAKEUP_MASK0 by writing 0xFFFFFFF
2. Trigger DSP wakeup by writing 0x1 to register DSS_RCM.DSP_PD_TRIGGER_WAKU.
3. Poll DSS_RCM.DSP_PD_STATUS.STATE for the value 13. This indicates that the L2 memory can now be written to or preloaded with code.
4. Download the DSP code into L2.
5. Write 0x0 to DSS_RCM.DSP_PD_CTRL.PROC_HALT to un halt the processor and begin execution.

5.4.1.2 Software Sequence To Power OFF DSP

1. Ensure that all previous registered events during the previous power down are cleared.
2. Set up the DSP interrupt routine for DSS_DSP_PDC_INT (Gem event number : 118) as below:
 - a. Set the bit DSP_ICFG.PDCCMD.GEMPD.

- b. Execute the idle instruction
3. If DSP powers up in autonomous mode without the program download, set the DSS_REG.GEMPWRSMCFG4.PWRSMRLRSTHALT bit to 0x0.
4. Unmask the events to use as wakeup events in DSS_RCM:DSP_PD_WAKEUP_MASK[0-2].
5. Unmask the events to receive as hardware event pulses after the next power up in DSS_RCM:DSP_PD_MISSED_EVENT_MASK [0-2].
6. Mask all interrupts from DSP by setting the DSS_RCM:DSP_PD_CTRL:DSP_PD_CTRL_INTERRUPT_MASK field to 0x1.
7. Trigger a power down by setting the DSS_RCM:DSP_PD_TRIGGER_SLEEP field to 0x1, and wait in a while loop. This triggers the interrupt DSS_DSP_PDC_INT, followed by the power-down of the DSP core by the control module.
8. The state of the DSP power domain can be polled by other master subsystem CR4F cores to ensure the DSP power down. DSS_RCM:DSP_PD_STATUS_PD_STATUS field

5.4.2 DSP Subsystem L3 Power Domain

The DSS L3 memory can be controlled from DSS_RCM registers by the software.

By default, all the L3 memory is Power ON.

When partially switching off banks, it is the software's responsibility to ensure that the banks are disabled from the last 256 KB bank, that is, DSS L3 BANK D3. A bank should not be powered off if all its higher banks are not powered off. For example, if DSS L3 BANK D1 is powered down, BANK D2 and D3 are also powered down.

Table 5-1712. Banks

Bank 256 KB	Bank Name	Control Registers
0	DSS L3 BANK A0	DSS_L3_BANKA0_PD_CTRL_AGOODINDSS_L3_BANKA0_PD_CTRL_AONINDSS_L3_BANKA0_PD_CTRL_ISO

5.5 Resets

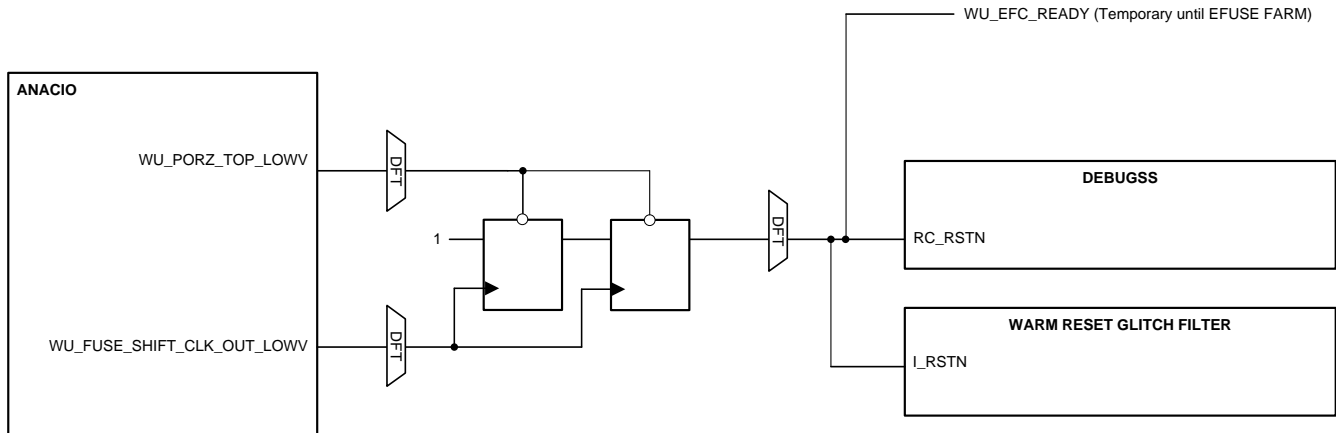

Figure 5-1703. Resets

Two device resets are available that can be controlled from the device pins: the power-on reset pin NRESET and the bidirectional WARM_RESET signal. The warm reset signal is implemented as an I/O, so that an external monitor can be used to detect changes to the state of the internal warm reset control signal.

Device registers can capture recent reset events, and can be used by software to manage failure recovery. Certain registers in the device are immune to WARM_RESET, and can only be reset by power-on reset.

This page intentionally left blank.

AM273x includes the following processor core and accelerators:

- MCU Subsystem ARM Cortex dual core lockstep R5F
- DSP Subsystem TI C66x DSP
- Radar Processing Hardware Accelerators
- Radar Processing M4 Subsystem

6.1 MCU Subsystem Cortex R5F

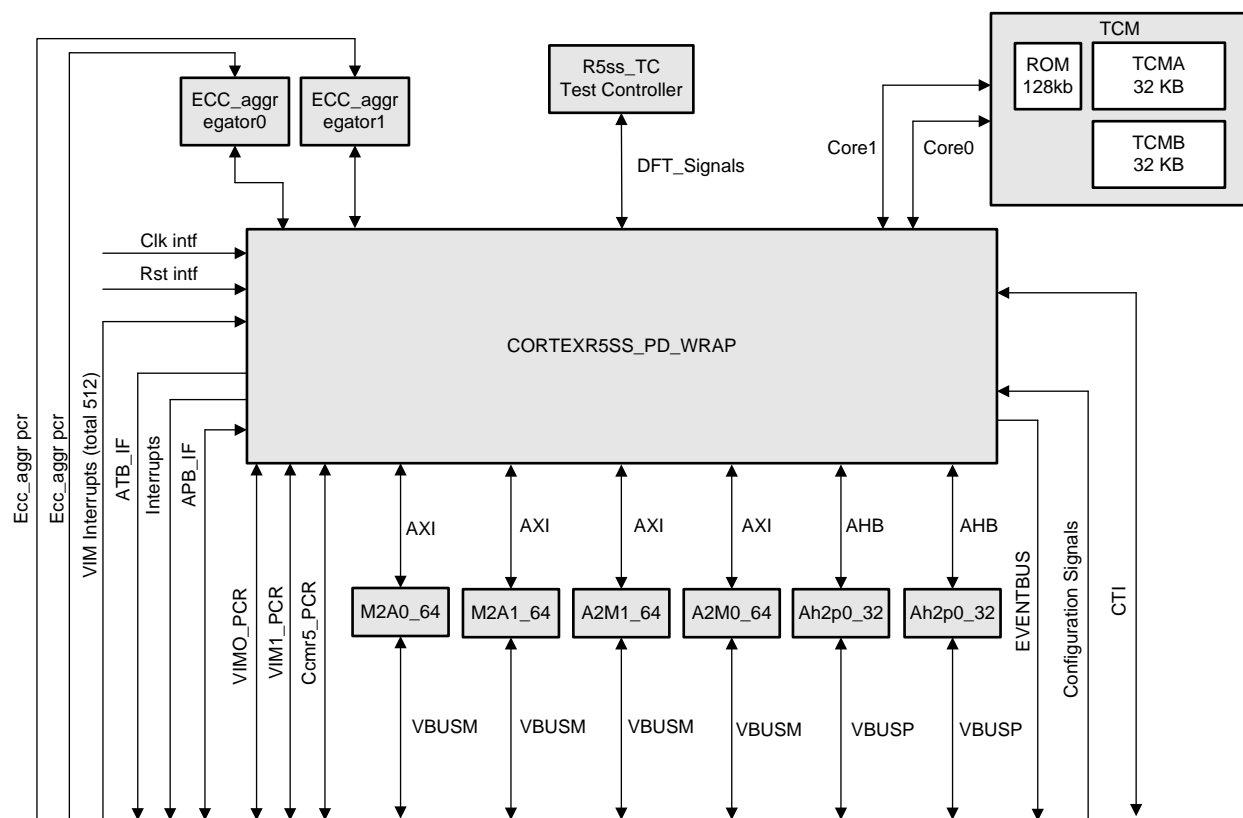

Figure 6-1. MCU Subsystem

The Master SubSystem is a dual-core implementation of the Arm Cortex-R5F processor configured for split/lock operation. It also includes accompanying memories (L1 caches and tightly-coupled memories), standard Arm® CoreSight™ debug and trace architecture, integrated Vectored Interrupt Manager (VIM), ECC Aggregators, and various other modules for protocol conversion and address translation for easy integration into the SoC.

6.1.1 MCU ARM SubSystem Features

The MCU SS supports the following features:

- ARMv7-R architecture with the following extensions:

- Advanced SIMD extension for integer and floating-point vector operations
- Vector Floating Point Version 3 (VFPv3) with Single/Double Precision
- Dynamic branch prediction with a global history buffer, and a 4-entry return stack
- Lock step and dual core modes are supported:
 - Switching to dual core mode is possible by the application (if switching to performance mode is enabled by EFUSE), even if the boot has happened in lock step mode – using a CPU reset triggered by application software.
- L1 memory architecture (per each CPU in split mode, or single lock-step CPU):
 - 16KByte I-Cache with 64-bit ECC
 - 16Kbyte D-cache with 32-bit ECC
 - Minimum 64KB TCM with 32-bit ECC
 - 32KB TCMA and 32KB TCMB in lock-step mode
 - 16KB TCMA and 16KB TCMB for each core in split-mode
- L2 Interface
 - 64-bit Master interface for peripheral access
 - 64-bit Slave interface for cache and TCM access
 - 32-bit Master interface for MCU peripherals
 - ECC on the interfaces and parity on Control bus
- Vectored Interrupt Manager with ECC protection on Vector Table RAM
 - VIM1 and VIM2 in lockstep pair when CPU cores are in lock step mode
 - VIM1 and VIM2 supports interrupt generation for its corresponding cores in dual core/split mode.
- Static (boot time) configuration for either lockstep mode or dual-CPU mode
- Mechanism to clock gate the CPU and comparator logic in a non-Lockstep mode.
- CPU Self-Test Controller for CPU core, VIM, and Comparator modules
- PBIST controller for test of all the RAMs
- Support to test ECC functionality in safety-critical applications
- Built in debug features
 - Up to 8 hardware breakpoints per CPU
 - Up to 8 watch points per CPU
- 32-bit Slave Debug interface to access Debug components (CTI, ETM, ATB)
- Trace interface to a Core Sight ETM-R5
- Performance Monitoring Unit (PMU)

6.1.2 TCM Initialization

Auto-init module has been implemented for initializing the TCMs. Paths from TCMA and TCMB are timing-critical, so the initialization of these memories occur through the test path. Initialization of TCMA and TCMB occurs in parallel.

Below are the registers used for the TCM initialization

- Writing 1 to MSS_CTRL:MSS_<A/B>TCM_MEM_INIT:MSS_<A/B>TCM_MEM_INIT_MEM_INIT starts the mem-init for MSS_TCM<A/B>_CR5A/B.
- Reading 1 from MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_DONE: MSS_<A/B>TCM_MEM_INIT_DONE_MEM_INIT_DONE confirms the end of initialization for MSS_TCM<A/B>_CR5A/B.
- Writing 1 to MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_DONE: MSS_<A/B>TCM_MEM_INIT_DONE_MEM_INIT_DONE clears the field.
- Reading 1 from MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_STATUS: MSS_<A/B>TCM_MEM_INIT_STATUS_MEM_STATUS confirms progress of initialization for MSS_TCM<A/B>_CR5A/B.

6.1.3 TCM ROM-RAM SWAP

6.1.3.1 R5 as Master

Sequence for Swapping for ROM with RAM:

1. Write '3'b111' to "MSS_CTRL: R5_ROM_ECLIPSE: R5_ROM_ECLIPSE_MEMSWAP_WAIT". This ensures swapping happens only on CR5A/B reset.
2. Write '3'b111' to "MSS_CTRL: R5_ROM_ECLIPSE: R5_ROM_ECLIPSE_MEMSWAP". This decides whether to swap or not.
3. Write '0xFFFFFFFF' to "MSS_RCM:RST_WFICHECK" to ensure Reset-Sequencer would look for 'WFI' state of CR5A/B before asserting the reset.
4. Write '3'b111' to "MSS_CTRL: R5_CONTROL: R5_CONTROL_RESET_FSM_TRIGGER". This will trigger the reset sequencer which will be waiting for WFI from CR5A/B as we are ensuring step-3 is done.
5. Go to "WFI" with arm-command "asm(wfi)".
6. R5 goes through a reset-cycle and starts booting.
7. Read bit9 of "MSS_RCM: MSS_RST_STATUS:MSS_RST_STATUS_CAUSE". That being '1' will ensure reset is happened because of Reset-Sequencer.
8. Write '3'b111' to "MSS_RCM: MSS_RST_CAUSE_CLR:MSS_RST_CAUSE_CLR_CLR" will clear the "MSS_RCM: MSS_RST_STATUS:MSS_RST_STATUS_CAUSE" register.

6.1.3.2 HSM as Master

HSM can only follow the below sequence before unhalting CR5A. HSM will never know the state of CR5A after unhalting it.

Sequence for Swapping for ROM with RAM:

1. Write '3'b000' to "MSS_CTRL: R5_ROM_ECLIPSE: R5_ROM_ECLIPSE_MEMSWAP_WAIT". This ensures swapping happens immediately after changing the "MSS_CTRL: R5_ROM_ECLIPSE: R5_ROM_ECLIPSE_MEMSWAP".
2. Write '3'b111' to "MSS_CTRL: R5_ROM_ECLIPSE: R5_ROM_ECLIPSE_MEMSWAP". This decides whether to swap or not.
3. Swapping is done. So now HSM can unhalt the CR5A by writing '3'b000' to MSS_CTRL: R5_COREA_HALT: R5_COREA_HALT_HALT"

6.1.3.3 Address Information

For use cases where the devices will be operating in lockstep mode, the TCMA and TCMB ROM sizes are 32KB.

Before Eclipsing, the addresses are as follows in [Table 6-1](#).

Table 6-1. Address Information

Address	Region	Details
0x0	TCMA_ROM (128KB)	Dedicated Rom for R5 CORE-A
0x1FFFF		
0x20000	TCMA0_RAM (16KB)	Dedicated-Ram for R5 CORE-A
0x23FFF		
0x24000	TCMA1_RAM (16KB)	Gives an TCM_ERROR during Dual core mode
0x27FFF		
0x80000	TCMB0_RAM (16KB)	Dedicated-Ram for R5 CORE-A
0x83FFF		
0x84000	TCMB1_RAM (16KB)	Gives an TCM_ERROR during Dual core mode
0x87FFF		

After eclipsing, TCMA RAM address is relocated to start at 0x0, (up to 32KB). TCMB, L2, and L3 addresses do not change.

6.1.4 Lock-Step to Dual Core Switching

1. Write 3'b111 to MSS_CTRL: R5_CONTROL: R5_CONTROL_LOCK_STEP_SWITCH_WAIT. This ensures switching happens only on CR5A/B reset.
2. Write 3'b000 to MSS_CTRL: R5_CONTROL: R5_CONTROL_LOCK_STEP. This decides whether to switch or not.
3. Write 0xFFFFFFFF to MSS_RCM:RST_WFICHECK to ensure the Reset-Sequencer looks for WFI state of CR5A/B before asserting the reset.
4. Write 3'b111 to MSS_CTRL: R5_CONTROL: R5_CONTROL_RESET_FSM_TRIGGER. This triggers the reset sequencer, which is waiting for WFI from CR5A/B as it ensures step-3 is done. Go to WFI with arm-command asm(wfi).
5. R5F goes through a reset-cycle and starts booting.
6. Read bit9 of MSS_RCM: MSS_RST_STATUS:MSS_RST_STATUS_CAUSE. That being '1' ensures the reset has happened because of the Reset-Sequencer.
7. Write 3'b111 to MSS_RCM: MSS_RST_CAUSE_CLR:MSS_RST_CAUSE_CLR_CLR to clear the MSS_RCM: MSS_RST_STATUS:MSS_RST_STATUS_CAUSE register.

Note

The switch can only be performed from Lock Step mode to Dual core mode and not vice versa. This switch cannot be done multiple times; it is allowed only once.

6.1.5 Vectored Interrupt Manager (VIM) Module

This chapter describes the behavior of the vectored interrupt manager (VIM) module of the device family.

6.1.5.1 VIM Overview

The VIM aggregates device interrupts and sends them to the R5F CPU(s). It can be used in either split or lockstep configuration. In split, it has two independent interrupt cores, one per CPU. In lockstep, CPU1 acts as a diagnostic on CPU0; only CPU0's outputs are used but all outputs are compared to CPU1 to provide diagnostic coverage.

The VIM module supports the following features:

- 256 interrupt inputs per R5F core
- Each interrupt has its own 4-bit programmable priority
 - Defined via the INTPRIORITY_j register
 - The VIM provides support for priority interruption of interrupts
- Each interrupt has its own enable mask
 - Interrupt enable is done via the INTR_EN_SET_j register
 - Interrupt disable is done via the INTR_EN_CLR_j register
- Each interrupt can be programmed as either an IRQ or FIQ
 - Defined via the INTMAP_j register
- Each interrupt has its own programmable 32-bit vector address associated with it
 - Defined via the INTVECTOR_j register
 - Protected with SECEDED
- One IRQn and one FIQn output per core
- Vectored interrupt interface
 - Compatible with R5F VIC port
- Default vector provided when a double-bit error is detected
- Split or lockstep capable
 - In lockstep mode, only interrupts connected to VIM interrupt core 0 are available
- Software interrupt generation

6.1.5.2 VIM Interrupt Inputs

The VIM supports 256 interrupt inputs per core. Each interrupt can be either a level or a pulse (both active-high). The interrupt mapping for the two R5F cores can be found in [Chapter 8, Interrupts](#).

6.1.5.3 VIM Interrupt Outputs

The VIM has two interrupt outputs per core:

- *CoreN_IRQn*: This is a normal interrupt for core *N* (active-low level). It can be serviced via the VIC interface or through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an IRQ (via the INTMAP_j register) and is enabled (via the INTR_EN_SET_j register), then it will cause an IRQ to assert
- *CoreN_FIQn*: This is a fast (or non-maskable) interrupt for core *N* (active-low level). FIQs always have priority over IRQs. An FIQ can be serviced through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an FIQ and is enabled, then it will cause an FIQ to assert

6.1.5.4 VIM Interrupt Vector Table (VIM RAM)

For each VIM interrupt core, there is an associated interrupt vector table (VIM RAM) that is used to store the address of ISRs. During register vectored interrupt and hardware vectored interrupt, VIM accesses the interrupt vector table using the vector value to fetch the address of the corresponding ISR. Note that both interrupt vector tables are identical in their memory organization.

The VIM RAM is basically comprised of a set of interrupt vector registers (INTVECTOR_j). Hence, the interrupt vector table is organized in 256 words of 30 bits, with a base address corresponding to the physical address of the first register in the group.

Note

The lower two bits of the 32-bit interrupt vector are always 0s.

Figure 6-2 shows the VIM RAM interrupt vector map.

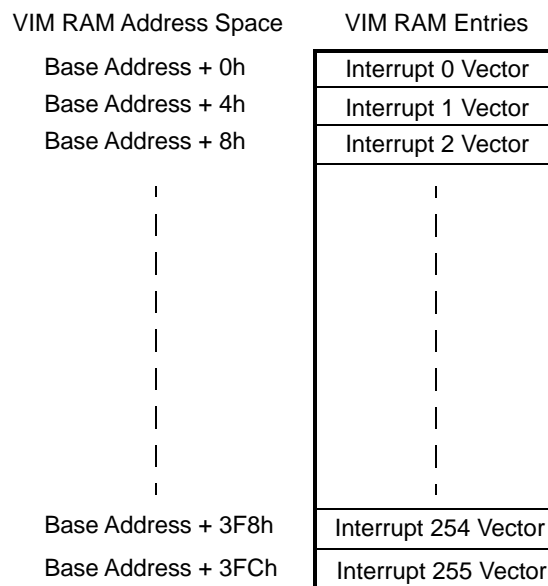

Figure 6-2. VIM RAM Interrupt Vector Map

The interrupt vector table has protection by ECC to indicate corruption due to soft errors. The ECC logic inside VIM supports SECDED. Refer to the ECC aggregator map for the VIM RAM ID.

6.1.5.5 VIM Interrupt Prioritization

The VIM supports the interruption of the currently active interrupt by one with a higher priority. FIQs and IRQs are completely separate but both use the same mechanism.

When an interrupt goes from pending to active (FIQ: reading the FIQVEC register; IRQ: reading the IRQVEC register, then the interrupt is loaded into the corresponding active register (ACTFIQ / ACTIRQ), and all interrupts of an equal or lesser priority are masked (discarded). If prior to this interrupt being cleared (by writing to the FIQVEC register, or IRQVEC register) another interrupt of higher priority arrives, then the FIQn/IRQn will be asserted and that interrupt made pending as normal. If the CPU switches this interrupt to active (by reading the FIQVEC / IRQVEC register), then the currently active interrupt will be pushed onto a stack. When an interrupt is cleared by reading the FIQVEC / IRQVEC register, if there are any interrupts on the stack, the first entry is popped off and put back into the ACTFIQ / ACTIRQ register, so that software may continue where it left off.

6.1.5.6 VIM ECC Support

The memory that holds the interrupt vector for each interrupt is protected by SECDED ECC. Single-bit errors are corrected and written back. Double-bit errors are not corrected. If a double-bit error occurs while trying to load a vector, then the DEDVEC register is used to provide the default vector for the *coreN_IRQADDRV* signal, the IRQVEC register, and the FIQVEC register. The DEDVEC should point to an ISR that handles the fact that there was an uncorrectable error in the interrupt handling.

Some possible remediating actions would be to:

1. Reconstruct the vector table and re-start the application
 - a. Potentially switch to a completely software interrupt handler in the mean time
2. Restart the application from scratch
3. Reset the device
4. Sit in a loop (or WFI) while something external (for example, the ESM) responds to the DED interrupt that will be generated

It is up to the user and the application to determine the appropriate action.

Note

An interrupt that has an uncorrectable vector error (and thus uses the DED vector) will still have the priority of the original interrupt. This makes it possible for a higher priority interrupt to supercede the handling of the error.

Control and reporting are done by the ECC aggregator.

6.1.5.7 VIM Lockstep Mode

In lockstep mode, CPU1 is used as a diagnostic for CPU0. In this mode, only the interrupt inputs for CPU0 are used. Besides to CPU0, these interrupt inputs are also internally routed to CPU1 (through the level-sync / edge-detect logic dedicated to CPU1, and additionally through some delay circuits). The outputs from both VIM interrupt cores are then sent to the MSS CCMR5 module through dedicated compare buses (with CPU0's outputs delayed). The CCMR5 module is responsible for comparing the two sets of output signals and for reporting any mismatches by generating an interrupt (MSS_CCMR5_ERR).

Note

In lockstep mode, only the RAM dedicated to CPU0 is used, so software *must not* do anything with the ECC interface on the RAM dedicated to CPU1.

6.1.5.8 VIM IDLE State

The VIM will indicate IDLE when there are no pending unmasked interrupts or MMR accesses. The VIM does not have a clock stop interface.

6.1.5.9 VIM Interrupt Handling

There are multiple ways to service an interrupt depending on how much of the hardware assistance offered by the VIM the software wants to take advantage of.

For IRQs, it is recommended to use the procedure in [Section 6.1.5.9.1](#), but the procedures in [Section 6.1.5.9.2](#) or [Section 6.1.5.9.3](#) (if a user wants to implement a fully software prioritization scheme) may be used as alternatives.

For FIQs, it is recommended to use the procedure in [Section 6.1.5.9.4](#), but the procedure in [Section 6.1.5.9.5](#) may be used as an alternative.

Note

These descriptions do not include steps such as stack pushes and state retention that software must take in order to return from the ISR. It is assumed that the programmer is aware of these steps.

6.1.5.9.1 Servicing IRQ Through Vector Interface

If the associated CPU has the vector (VIC) interface enabled, then the following method is used for servicing IRQs:

1. Hardware handshake
 - a. CPU asserts *coreN_IRQACK* high
 - b. VIM asserts *coreN_IRQADDRV* to indicate that the *coreN_IRQADDR* bus is stable with the correct vector address
 - c. CPU reads *coreN_IRQADDR*, jumps to that address, and de-asserts *coreN_IRQACK* low
 - d. VIM de-asserts *coreN_IRQn* and *coreN_IRQADDRV*, VIM masks (discards) all IRQs with the same or lower priority
 - e. VIM loads the value from the PRIIRQ[9:0] NUM bit field (which corresponds to the vector address) into the ACTIRQ[9:0] NUM bit field, which causes the ACTIRQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTIRQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE_j register to determine type)
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the IRQSTS_j register, or STS_j register
 - ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
 - b. Level
 - i. Clear the interrupt at the source
 - ii. Clear the status by writing a '1' to the appropriate bit in the IRQSTS_j register, or STS_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the IRQVEC register
 - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
 - b. This will also clear the ACTIRQ[31] VALID bit

6.1.5.9.2 Servicing IRQ Through MMR Interface

When an IRQ interrupt is received, the CPU should follow these steps if not using the vector interface:

1. Read the IRQVEC register and jump to that address to service the ISR
 - a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN_IRQn* output. If another interrupt of a higher priority becomes available, the *coreN_IRQn* will re-assert, allowing priority interruption of an interrupt

- b. Reading this register will cause the value from the PRIIRQ[9:0] NUM bit field to be loaded into the ACTIRQ[9:0] NUM bit field, and the ACTIRQ[31] VALID bit to be set
 2. Service the interrupt
 3. Depending on whether the original source of the interrupt was a pulse or a level
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
 - ii. Clear the interrupt at the source
 - b. Level
 - i. Clear the interrupt at the source
 - ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
 4. Write any value to the IRQVEC register
 - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
 - b. This will also clear the ACTIRQ[31] VALID bit

6.1.5.9.3 Servicing IRQ Through MMR Interface (Alternative)

If a user does not want to use the IRQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the IRQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
 - a. Read the PRIIRQ register to determine which interrupt is the highest priority IRQ currently asserted, OR
 - b. Optionally read the IRQGSTS register to determine which groups have IRQs pending, then read the IRQSTS_j register and use a software prioritization scheme to determine which IRQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
 - ii. Clear the interrupt at the source.
 - b. Level
 - i. Clear the interrupt at the source
 - ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register

6.1.5.9.4 Servicing FIQ

When an FIQ interrupt is received, the CPU should follow these steps:

1. Read the FIQVEC register and jump to that address to service the ISR
 - a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN_FIQn* output. If another interrupt of a higher priority becomes available, the *coreN_FIQn* will re-assert, allowing priority interruption of an interrupt.
 - b. Reading this register will cause the value from the PRIFIQ[9:0] NUM bit field to be loaded into the ACTFIQ[9:0] NUM bit field, and the ACTFIQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTFIQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE_j register to determine type)
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register
 - ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
 - b. Level
 - i. Clear the interrupt at the source

- ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the FIQVEC register
 - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
 - b. This will also clear the ACTFIQ[31] VALID bit

6.1.5.9.5 Servicing FIQ (Alternative)

If a user does not want to use the FIQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the FIQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
 - a. Read the PRIFIQ register to determine which interrupt is the highest priority FIQ currently asserted, OR
 - b. Optionally read the FIQGSTS register to determine which groups have IRQs pending, then read the FIQSTS_j register and use a software prioritization scheme to determine which FIQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register
 - ii. Clear the interrupt at the source.
 - b. Level
 - i. Clear the interrupt at the source
 - ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register.

6.1.5.10 MSS_VIM Registers

Table 6-3 lists the memory-mapped registers for the MSS_VIM registers. All register offset addresses not listed in Table 6-3 should be considered as reserved locations and the register contents should not be modified.

Table 6-2. VIM Instances

Instance	Base Address

Table 6-10. IRQVEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address. Only valid if the Prioritized IRQ Register valid flag is true.
1-0	RES21	R	0h	RESERVE FIELD

6.1.5.10.8 FIQVEC Register (Offset = 1Ch) [Reset = 0h]

FIQVEC is shown in [Figure 6-10](#) and described in [Table 6-11](#).

Return to the [Table 6-3](#).

The FIQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pending FIQ.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES19																PRI															
R-0h																R/W-Fh															

Table 6-173. INTPRIORITY_94 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.5.10.171 INTPRIORITY_95 Register (Offset = 117Ch) [Reset = Fh]

INTPRIORITY_95 is shown in [Figure 6-173](#) and described in [Table 6-174](#).

Return to the [Table 6-3](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h99

Figure 6-173. INTPRIORITY_95 Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES19																PRI															
R-0h																R/W-Fh															

Table 6-174. INTPRIORITY_95 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD

Table 6-174. INTPRIORITY_95 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.5.10.172 INTPRIORITY_96 Register (Offset = 1180h) [Reset = Fh]

INTPRIORITY_96 is shown in [Figure 6-174](#) and described in [Table 6-175](#).

Return to the [Table 6-3](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h100

Figure 6-174. INTPRIORITY_96 Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES19																PRI															
R-0h																R/W-Fh															

Table 6-175. INTPRIORITY_96 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.5.10.173 INTPRIORITY_97 Register (Offset = 1184h) [Reset = Fh]

INTPRIORITY_97 is shown in [Figure 6-175](#) and described in [Table 6-176](#).

Return to the [Table 6-3](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h101

Figure 6-175. INTPRIORITY_97 Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES19																PRI															
R-0h																R/W-Fh															

Table 6-176. INTPRIORITY_97 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)
