

bq25601 I²C Controlled 3-A Single-Cell Battery Charger for High Input Voltage and Narrow Voltage DC (NVDC) Power Path Management

1 Features

- High-Efficiency, 1.5-MHz, Synchronous Switch-Mode Buck Charger
 - 92% Charge Efficiency at 2 A from 5-V Input
 - Optimized for USB Voltage Input (5 V)
 - Selectable Low Power Pulse Frequency Modulation (PFM) Mode for Light Load Operations
- Supports USB On-The-Go (OTG)
 - Boost Converter With Up to 1.2-A Output
 - 92% Boost Efficiency at 1-A Output
 - Accurate Constant Current (CC) Limit
 - Soft-Start Up To 500- μ F Capacitive Load
 - Output Short Circuit Protection
 - Selectable Low Power PFM Mode for Light Load Operations
- Single Input to Support USB Input and High Voltage Adaptors
 - Support 3.9-V to 13.5-V Input Voltage Range With 22-V Absolute Maximum Input Voltage Rating
 - Programmable Input Current Limit (100 mA to 3.2 A With 100-mA Resolution) to Support USB 2.0, USB 3.0 Standards and High Voltage Adaptors (IINDPM)
 - Maximum Power Tracking by Input Voltage Limit Up to 5.4 V (VINDPM)
 - VINDPM Threshold Automatically Tracks Battery Voltage
 - Auto Detect USB SDP, DCP and Non-Standard Adaptors
- High Battery Discharge Efficiency With 19.5-m Ω Battery Discharge MOSFET
- Narrow VDC (NVDC) Power Path Management
 - Instant-On Works with No Battery or Deeply Discharged Battery
 - Ideal Diode Operation in Battery Supplement Mode
- BATFET Control to Support Ship Mode, Wake Up and Full System Reset
- Flexible Autonomous and I²C Mode for Optimal

System Performance

- High Integration Includes All MOSFETs, Current Sensing and Loop Compensation
- High Accuracy
 - $\pm 0.5\%$ Charge Voltage Regulation
 - $\pm 5\%$ at 1.5-A Charge Current Regulation
- Create a Custom Design Using the bq25601 With the [WEBENCH[®] Power Designer](#)

2 Applications

- Smart Phones
- Portable Internet Devices and Accessory

3 Description

The bq25601 device is a highly-integrated 3-A switch-mode battery charge management and system power path management device for single cell Li-Ion and Li-polymer battery. The low impedance power path optimizes switch-mode operation efficiency, reduces battery charging time and extends battery life during discharging phase. The I²C serial interface with charging and system settings makes the device a truly flexible solution.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|-----------|-------------------|
| bq25601 | WQFN (24) | 4.00 mm x 4.00 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Description (continued)

The bq25601 is a highly-integrated 3.0-A switch-mode battery charge management and system power path management device for single cell Li-Ion and Li-polymer battery. It features fast charging with high input voltage support for a wide range of smart phones, tablets and portable devices. Its low impedance power path optimizes switch-mode operation efficiency, reduces battery charging time and extends battery life during discharging phase. Its input voltage and current regulation deliver maximum charging power to battery. The solution is highly integrated with input reverse-blocking FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), and battery FET (BATFET, Q4) between system and battery. It also integrates the bootstrap diode for the high-side gate drive for simplified system design. The I²C serial interface with charging and system settings makes the device a truly flexible solution.

The device supports a wide range of input sources, including standard USB host port, USB charging port, and USB compliant high voltage adapter. The device sets default input current limit based on the built-in USB interface. To set the default input current limit, the device takes the result from detection circuit in the system, such as USB PHY device. The device is compliant with USB 2.0 and USB 3.0 power spec with input current and voltage regulation. The device also meets USB On-the-Go (OTG) operation power rating specification by supplying 5.15 V on VBUS with constant current limit up to 1.2A.

The power path management regulates the system slightly above battery voltage but does not drop below 3.5 V minimum system voltage (programmable). With this feature, the system maintains operation even when the battery is completely depleted or removed. When the input current limit or voltage limit is reached, the power path management automatically reduces the charge current to zero. As the system load continues to increase, the power path discharges the battery until the system power requirement is met. This Supplement Mode prevents overloading the input source.

The device initiates and completes a charging cycle without software control. It senses the battery voltage and charges the battery in three phases: pre-conditioning, constant current and constant voltage. At the end of the charging cycle, the charger automatically terminates when the charge current is below a preset limit and the battery voltage is higher than recharge threshold. If the fully charged battery falls below the recharge threshold, the charger automatically starts another charging cycle.

The charger provides various safety features for battery charging and system operations, including battery negative temperature coefficient thermistor monitoring, charging safety timer and overvoltage and overcurrent protections. The thermal regulation reduces charge current when the junction temperature exceeds 110°C (programmable). The STAT output reports the charging status and any fault conditions. Other safety features include battery temperature sensing for charge and boost mode, thermal regulation and thermal shutdown and input UVLO and overvoltage protection. The VBUS_GD bit indicates if a good power source is present. The INT output Immediately notifies host when fault occurs.

The device also provides $\overline{\text{QON}}$ pin for BATFET enable and reset control to exit low power ship mode or full system reset function.

The device is available in 24-pin, 4 mm x 4 mm x 0.75 mm thin WQFN package.

6 Pin Configuration and Functions

Pin Functions

| Pin | | TYPE ⁽¹⁾ | DESCRIPTION |
|------------------|-----|---------------------|---|
| NAME | NO. | | |
| BAT | 13 | P | Battery connection point to the positive terminal of the battery pack. The internal BATFET and current sensing is connected between SYS and BAT. Connect a 10 μ F close to the BAT pin. |
| | 14 | | |
| BTST | 21 | P | PWM high side driver positive supply. Internally, the BTST pin is connected to the cathode of the boost-strap diode. Connect the 0.047- μ F bootstrap capacitor from SW to BTST. |
| \overline{CE} | 9 | DI | Charge enable pin. When this pin is driven low, battery charging is enabled. |
| GND | 17 | — | Ground pins. |
| | 18 | | |
| \overline{INT} | 7 | DO | Open-drain interrupt Output. Connect the INT to a logic rail through 10-k Ω resistor. The \overline{INT} pin sends an active low, 256- μ s pulse to host to report charger device status and fault. |
| NC | 8 | — | No Connect. Keep the pins float. |
| | 10 | | |
| \overline{PG} | 3 | DO | Open drain active low power good indicator. Connect to the pull up rail through 10-k Ω resistor. LOW indicates a good input source if the input voltage is between UVLO and ACOV, above SLEEP mode threshold, and current limit is above 30 mA. |
| PMID | 23 | DO | Connected to the drain of the reverse blocking MOSFET (RBFET) and the drain of HSFET. Put 10 μ F ceramic capacitor on PMID to GND. |
| PSEL | 2 | DI | Power source selection input. Set 500 mA input current limit by pulling this pin high and set 2.4A input current limit by pulling this pin low. Once the device gets into host mode, the host can program different input current limits to IINDPM register. |
| \overline{QON} | 12 | DI | BATFET enable/reset control input. When BATFET is in ship mode, a logic low of $t_{SHIPMODE}$ duration turns on BATFET to exit shipping mode. When VBUS is not plugged-in, a logic low of t_{QON_RST} (minimum 8 s) duration resets SYS (system power) by turning BATFET off for t_{BATFET_RST} (minimum 250 ms) and then re-enable BATFET to provide full system power reset. The pin contains an internal pull-up to maintain default high logic. |
| REGN | 22 | P | LSFET driver and internal supply output. Internally, REGN is connected to the anode of the boost-strap diode. Connect a 4.7- μ F (10-V rating) ceramic capacitor from REGN to GND. The capacitor should be placed close to the IC. |
| SCL | 5 | DI | I ² C interface clock. Connect SCL to the logic rail through a 10-k Ω resistor. |
| SDA | 6 | DIO | I ² C interface data. Connect SDA to the logic rail through a 10-k Ω resistor. |

(1) AI = Analog input, AO = Analog Output, AIO = Analog input Output, DI = Digital input, DO = Digital Output, DIO = Digital input Output, P = Power

Pin Functions (continued)

| Pin | | TYPE ⁽¹⁾ | DESCRIPTION |
|-------------|-----|---------------------|---|
| NAME | NO. | | |
| STAT | 4 | DO | Open-drain charge status output. Connect the STAT pin to a logic rail via 10-kΩ resistor. The STAT pin indicates charger status. Collect a current limit resistor and a LED from a rail to this pin. Charge in progress: LOW Charge complete or charger in SLEEP mode: HIGH Charge suspend (fault response): 1-Hz, 50% duty cycle Pulses This pin can be disabled via EN_ICHG_MON[1:0] register bits. |
| SW | 19 | P | Switching node output. Connected to output inductor. Connect the 0.047-μF bootstrap capacitor from SW to BTST. |
| | 20 | | |
| SYS | 15 | P | Converter output connection point. The internal current sensing network is connected between SYS and BAT. Connect a 20 μF capacitor close to the SYS pin. |
| | 16 | | |
| TS | 11 | AI | Temperature qualification voltage input to support JEITA profile. Connect a negative temperature coefficient thermistor. Program temperature window with a resistor divider from REGN to TS to GND. Charge suspends when TS pin is out of range. When TS pin is not used, connect a 10-kΩ resistor from REGN to TS and connect a 10-kΩ resistor from TS to GND. It is recommended to use a 103AT-2 thermistor. |
| VAC | 1 | AI | Charge input voltage sense. This pin must be connected to VBUS pin. |
| VBUS | 24 | P | Charger input. The internal n-channel reverse block MOSFET (RBFET) is connected between VBUS and PMID pins. Place a 1-μF ceramic capacitor from VBUS to GND close to device. |
| Thermal Pad | — | P | Thermal pad and ground reference. This pad is ground reference for the device and it is also the thermal pad used to conduct heat from the device. This pad should be tied externally to a ground plane through PCB vias under the pad. |

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|--|--|------|-----|------|
| Voltage Range (with respect to GND) | VAC, VBUS (converter not switching) ⁽²⁾ | -2 | 22 | V |
| Voltage Range (with respect to GND) | BTST, PMID (converter not switching) ⁽²⁾ | -0.3 | 22 | V |
| Voltage Range (with respect to GND) | SW | -2 | 16 | V |
| Voltage Range (with respect to GND) | BTST to SW | -0.3 | 7 | V |
| Voltage Range (with respect to GND) | PSEL | -0.3 | 7 | V |
| Voltage Range (with respect to GND) | REGN, TS, \overline{CE} , \overline{PG} , BAT, SYS (converter not switching) | -0.3 | 7 | V |
| Output Sink Current | STAT | | 6 | mA |
| Voltage Range (with respect to GND) | SDA, SCL, INT, /QON, STAT | -0.3 | 7 | V |
| Voltage Range (with respect to GND) | PGND to GND (QFN package only) | -0.3 | 0.3 | V |
| Output Sink Current | INT | | 6 | mA |
| Operating junction temperature, T _J | | -40 | 150 | °C |
| Storage temperature, T _{stg} | | -65 | 150 | °C |

- (1) Stresses beyond those listed under Absolute maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to the network ground terminal unless otherwise noted.
- (2) VBUS is specified up to 22 V for a maximum of one hour at room temperature

7.2 ESD Ratings

| | | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
| V _(ESD) | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾ | ±2000 | V |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾ | ±250 | |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

| | | MIN | NOM | MAX | UNIT |
|--------------------|----------------------------------|-----|-----|---------------------|------|
| V _{BUS} | Input voltage | 3.9 | | 13.5 ⁽¹⁾ | V |
| I _{in} | Input current (VBUS) | | | 3.25 | A |
| I _{SWOP} | Output current (SW) | | | 3.25 | A |
| V _{BATOP} | Battery voltage | | | 4.624 | V |
| I _{BATOP} | Fast charging current | | | 3.0 | A |
| I _{BATOP} | Discharging current (continuous) | | | 6 | A |
| T _A | Operating ambient temperature | -40 | | 85 | °C |

- (1) The inherent switching noise voltage spikes should not exceed the absolute maximum voltage rating on either the BTST or SW pins. A tight layout minimizes switching noise.

7.4 Thermal information

| THERMAL METRIC ⁽¹⁾ | | bq25601 | |
|-------------------------------|--|------------|------|
| | | RTW (WQFN) | UNIT |
| | | 24 PinS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 35.6 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 22.7 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 11.9 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 0.2 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 12 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | 2.6 | °C/W |

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, SPRA953.

7.5 Electrical Characteristics

$V_{VAC_UVLOZ} < V_{VAC} < V_{VAC_OV}$ and $V_{VAC} > V_{BAT} + V_{SLEEP}$, $T_J = -40^{\circ}\text{C}$ to 125°C and $T_J = 25^{\circ}\text{C}$ for typical values (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT | |
|---------------------------------------|--|--|------|------|---------------|----|
| QUIESCENT CURRENTS | | | | | | |
| I_{BAT} | Battery discharge current (BAT, SW, SYS) in buck mode | $V_{BAT} = 4.5\text{ V}$, $V_{BUS} < V_{VAC_UVLOZ}$, leakage between BAT and VBUS, $T_J < 85^{\circ}\text{C}$ | | 5 | μA | |
| I_{BAT} | Battery discharge current (BAT) in buck mode | $V_{BAT} = 4.5\text{ V}$, HIZ Mode and OVPFET_DIS = 1 or No VBUS, I2C disabled, BATFET Disabled. $T_J < 85^{\circ}\text{C}$ | 17 | 33 | μA | |
| I_{BAT} | Battery discharge current (BAT, SW, SYS) | $V_{BAT} = 4.5\text{ V}$, HIZ Mode and OVPFET_DIS = 1 or No VBUS, I2C Disabled, BATFET Enabled. $T_J < 85^{\circ}\text{C}$ | 58 | 85 | μA | |
| I_{VBUS_HIZ} | Input supply current (VBUS) in buck mode | $V_{VBUS} = 5\text{ V}$, High-Z Mode and OVPFET_DIS = 1, No battery | 37 | 50 | μA | |
| I_{VBUS_HIZ} | Input supply current (VBUS) in buck mode | $V_{VBUS} = 12\text{ V}$, High-Z Mode and OVPFET_DIS = 1, No battery | 68 | 90 | μA | |
| I_{VBUS} | Input supply current (VBUS) in buck mode | $V_{VBUS} = 12\text{ V}$, $V_{VBUS} > V_{VBAT}$, converter not switching | 1.5 | 3 | mA | |
| I_{VBUS} | Input supply current (VBUS) in buck mode | $V_{VBUS} > V_{UVLO}$, $V_{VBUS} > V_{VBAT}$, converter switching, $V_{BAT} = 3.8\text{ V}$, $I_{SYS} = 0\text{ A}$ | 3 | | mA | |
| I_{BOOST} | Battery Discharge Current in boost mode | $V_{BAT} = 4.2\text{ V}$, boost mode, $I_{VBUS} = 0\text{ A}$, converter switching | 3 | | mA | |
| VBUS, VAC AND BAT PIN POWER-UP | | | | | | |
| V_{BUS_OP} | VBUS operating range | V_{VBUS} rising | 3.9 | 13.5 | V | |
| V_{VAC_UVLOZ} | VBUS for active I ² C, no battery Sense VAC pin voltage | V_{VAC} rising | 3.3 | 3.6 | V | |
| $V_{VAC_UVLOZ_HYS}$ | I ² C active hysteresis | V_{AC} falling from above V_{VAC_UVLOZ} | 300 | | mV | |
| $V_{VAC_PRESENT}$ | One of the conditions to turn on REGN | V_{VAC} rising | 3.65 | 3.9 | V | |
| $V_{VAC_PRESENT_HYS}$ | One of the conditions to turn on REGN | V_{VAC} falling | 500 | | mV | |
| V_{SLEEP} | Sleep mode falling threshold | $(V_{VAC} - V_{VBAT})$, $V_{BUSMIN_FALL} \leq V_{BAT} \leq V_{REG}$, VAC falling | 15 | 60 | 110 | mV |
| V_{SLEEPZ} | Sleep mode rising threshold | $(V_{VAC} - V_{VBAT})$, $V_{BUSMIN_FALL} \leq V_{BAT} \leq V_{REG}$, VAC rising | 115 | 220 | 340 | mV |
| $V_{VAC_OV_RISE}$ | VAC 6.5-V Overvoltage rising threshold | VAC rising; OVP (REG06[7:6]) = '01' | 6.1 | 6.4 | 6.7 | V |

Electrical Characteristics (continued)

$V_{VAC_UVLOZ} < V_{VAC} < V_{VAC_OV}$ and $V_{VAC} > V_{BAT} + V_{SLEEP}$, $T_J = -40^{\circ}\text{C}$ to 125°C and $T_J = 25^{\circ}\text{C}$ for typical values (unless otherwise noted)

| | PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |

8 Detailed Description

8.1 Overview

The bq25601 device is a highly integrated 3.0-A switch-mode battery charger for single cell Li-Ion and Li-polymer battery. It includes the input reverse-blocking FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), and battery FET (BATFET, Q4), and bootstrap diode for the high-side gate drive.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Power-On-Reset (POR)

The device powers internal bias circuits from the higher voltage of VBUS and BAT. When VBUS rises above V_{VBUS_UVLOZ} or BAT rises above V_{BAT_UVLOZ} , the sleep comparator, battery depletion comparator and BATFET driver are active. I²C interface is ready for communication and all the registers are reset to default value. The host can access all the registers after POR.

8.3.2 Device Power Up from Battery without Input Source

If only battery is present and the voltage is above depletion threshold ($V_{BAT_DPL_RISE}$), the BATFET turns on and connects battery to system. The REGN stays off to minimize the quiescent current. The low R_{DS(on)} of BATFET and the low quiescent current on BAT minimize the conduction loss and maximize the battery run time.

The device always monitors the discharge current through BATFET (*Supplement Mode*). When the system is overloaded or shorted ($I_{BAT} > I_{BATFET_OCP}$), the device turns off BATFET immediately and set BATFET_DIS bit to indicate BATFET is disabled until the input source plugs in again or one of the methods described in *BATFET Enable (Exit Shipping Mode)* is applied to re-enable BATFET.

8.3.3 Power Up from Input Source

When an input source is plugged in, the device checks the input source voltage to turn on REGN LDO and all the bias circuits. It detects and sets the input current limit before the buck converter is started. The power up sequence from input source is as listed:

1. Power Up REGN LDO
2. Poor Source Qualification
3. Input Source Type Detection is based on or PSEL to set default input current limit (IINDPM) register or input source type.
4. Input Voltage Limit Threshold Setting (VINDPM threshold)
5. Converter Power-up

8.3.3.1 Power Up REGN Regulation

The REGN LDO supplies internal bias circuits as well as the HSFET and LSFET gate drive. The REGN also provides bias rail to TS external resistors. The pull-up rail of STAT can be connected to REGN as well. The REGN is enabled when all the below conditions are valid:

- V_{VAC} above $V_{VAC_PRESENT}$
- V_{VAC} above $V_{BAT} + V_{SLEEPZ}$ in buck mode or VBUS below $V_{BAT} + V_{SLEEP}$ in boost mode
- After 220-ms delay is completed

If any one of the above conditions is not valid, the device is in high impedance mode (HIZ) with REGN LDO off. The device draws less than I_{VBUS_HIZ} from VBUS during HIZ state. The battery powers up the system when the device is in HIZ.

8.3.3.2 Poor Source Qualification

After REGN LDO powers up, the device confirms the current capability of the input source. The input source must meet both of the following requirements in order to start the buck converter.

- VBUS voltage below V_{VAC_OV}
- VBUS voltage above $V_{VBUSMIN}$ when pulling I_{BADSRC} (typical 30 mA)

Once the input source passes all the conditions above, the status register bit VBUS_GD is set high and the \overline{INT} pin is pulsed to signal to the host. If the device fails the poor source detection, it repeats poor source qualification every 2 seconds.

8.3.3.3 Input Source Type Detection

After the VBUS_GD bit is set and REGN LDO is powered, the device runs input source detection through or the PSEL pin. The bq25601 sets input current limit through PSEL pins.

Feature Description (continued)

After input source type detection is completed, an INT pulse is asserted to the host. In addition, the following registers and pin are changed:

1. Input Current Limit (IINDPM) register is changed to set current limit
2. PG_STAT bit is set
3. VBUS_STAT bit is updated to indicate USB or other input source

The host can over-write IINDPM register to change the input current limit if needed. The charger input current is always limited by the IINDPM register.

8.3.3.3.1 PSEL Pins Sets Input Current Limit in bq25601

The bq25601 has PSEL pin for input current limit setting to interface with USB PHY. It directly takes the USB PHY device output to decide whether the input is USB host or charging port. When the device operates in host-control mode, the host needs to IINDET_EN bit to read the PSEL value and update the IINDPM register. When the device is in default mode, PSEL value updates IINDPM in real time.

Table 1. Input Current Limit Setting from PSEL

| Input Detection | PSEL Pin | INPUT CURRENT LIMIT (ILIM) | VBUS_STAT |
|-----------------|----------|----------------------------|-----------|
| USB SDP | High | 500 mA | 001 |
| Adapter | Low | 2.4A | 011 |

8.3.3.4 Input Voltage Limit Threshold Setting (VINDPM Threshold)

The device supports wide range of input voltage limit (3.9 V – 5.4V) for USB. The device's VINDPM is set at 4.5V. The device supports dynamic VINDPM tracking settings which tracks the battery voltage. This function can be enabled via the VDPM_BAT_TRACK[1:0] register bits. When enabled, the actual input voltage limit will be the higher of the VINDPM register and VBAT + VDPM_BAT_TRACK offset.

8.3.3.5 Converter Power-Up

After the input current limit is set, the converter is enabled and the HSFET and LSFET start switching. If battery charging is disabled, BATFET turns off. Otherwise, BATFET stays on to charge the battery.

The device provides soft-start when system rail is ramped up. When the system rail is below 2.2 V, the input current is limited to is to the lower of 200 mA or IINDPM register setting. After the system rises above 2.2 V, the device limits input current to the value set by IINDPM register.

As a battery charger, the device deploys a highly efficient 1.5 MHz step-down switching regulator. The fixed frequency oscillator keeps tight control of the switching frequency under all conditions of input voltage, battery voltage, charge current and temperature, simplifying output filter design.

The device switches to PFM control at light load or when battery is below minimum system voltage setting or charging is disabled. The PFM_DIS bit can be used to prevent PFM operation in either buck or boost configuration.

8.3.4 Boost Mode Operation From Battery

The device supports boost converter operation to deliver power from the battery to other portable devices through USB port. The boost mode output current rating meets the USB On-The-Go 500 mA output requirement. The maximum output current is up to 1.2 A. The boost operation can be enabled if the conditions are valid:

1. BAT above V_{OTG_BAT}
2. VBUS less than $BAT + V_{SLEEP}$ (in sleep mode)
3. Boost mode operation is enabled (OTG_CONFIG bit = 1)
4. Voltage at TS (thermistor) pin is within acceptable range ($V_{BHOT} < V_{TS} < V_{BCOLD}$)
5. After 30-ms delay from boost mode enable

During boost mode, the status register VBUS_STAT bits is set to 111, the VBUS output is 5.15 V and the output current can reach up to 1.2 A, selected through I²C (BOOST_LIM bit). The boost output is maintained when BAT is above V_{OTG_BAT} threshold.

When OTG is enabled, the device starts up with PFM and later transits to PWM to minimize the overshoot. The PFM_DIS bit can be used to prevent PFM operation in either buck or boost configuration.

8.3.5 Host Mode and Standalone Power Management

8.3.5.1 Host Mode and Default Mode in bq25601

The bq25601 is a host controlled charger, but it can operate in default mode without host management. In default mode, the device can be used as an autonomous charger with no host or while host is in sleep mode. When the charger is in default mode, WATCHDOG_FAULT bit is HIGH. When the charger is in host mode, WATCHDOG_FAULT bit is LOW.

After power-on-reset, the device starts in default mode with watchdog timer expired, or default mode. All the registers are in the default settings. During default mode, any change on PSEL pin will make real time IINDPM register changes.

In default mode, the device keeps charging the battery with default 10-hour fast charging safety timer. At the end of the 10-hour, the charging is stopped and the buck converter continues to operate to supply system load.

Writing a 1 to the WD_RST bit transitions the charger from default mode to host mode. All the device parameters can be programmed by the host. To keep the device in host mode, the host has to reset the watchdog timer by writing 1 to WD_RST bit before the watchdog timer expires (WATCHDOG_FAULT bit is set), or disable watchdog timer by setting WATCHDOG bits = 00.

When the watchdog timer expires (WATCHDOG_FAULT bit = 1), the device returns to default mode and all registers are reset to default values except IINDPM, VINDPM, BATFET_RST_EN, BATFET_DLY, and BATFET_DIS bits.

Figure 10. Watchdog Timer Flow Chart

8.3.6 Power Path Management

The device accommodates a wide range of input sources from USB, wall adapter, to car charger. The device provides automatic power path selection to supply the system (SYS) from input source (VBUS), battery (BAT), or both.

8.3.7 Battery Charging Management

The device charges 1-cell Li-Ion battery with up to 3.0-A charge current for high capacity tablet battery. The 19.5-mΩ BATFET improves charging efficiency and minimize the voltage drop during discharging.

8.3.7.1 Autonomous Charging Cycle

With battery charging is enabled (CHG_CONFIG bit = 1 and \overline{CE} pin is LOW), the device autonomously completes a charging cycle without host involvement. The device default charging parameters are listed in [Table 2](#). The host can always control the charging operations and optimize the charging parameters by writing to the corresponding registers through I²C.

Table 2. Charging Parameter Default Setting

| Default Mode | bq25601 |
|---------------------|----------|
| Charging voltage | 4.208V |
| Charging current | 2.048 A |
| Pre-charge current | 180 mA |
| Termination current | 180 mA |
| Temperature profile | JEITA |
| Safety timer | 10 hours |

A new charge cycle starts when the following conditions are valid:

- Converter starts
- Battery charging is enabled (CHG_CONFIG bit = 1 and I_{CHG} register is not 0 mA and \overline{CE} is low)
- No thermistor fault on TS
- No safety timer fault
- BATFET is not forced to turn off (BATFET_DIS bit = 0)

The charger device automatically terminates the charging cycle when the charging current is below termination threshold, battery voltage is above recharge threshold, and device not is in DPM mode or thermal regulation. When a fully charged battery is discharged below recharge threshold (selectable through VRECHG bit), the device automatically starts a new charging cycle. After the charge is done, toggle \overline{CE} pin or CHG_CONFIG bit can initiate a new charging cycle.

The STAT output indicates the charging status: charging (LOW), charging complete or charge disable (HIGH) or charging fault (Blinking). The STAT output can be disabled by setting EN_I_{CHG}_MON bits = 11. In addition, the status register (CHRG_STAT) indicates the different charging phases: 00-charging disable, 01-precharge, 10-fast charge (constant current) and constant voltage mode, 11-charging done. Once a charging cycle is completed, an INT is asserted to notify the host.

8.3.7.2 Battery Charging Profile

The device charges the battery in five phases: battery short, preconditioning, constant current, constant voltage and top-off trickle charging (optional). At the beginning of a charging cycle, the device checks the battery voltage and regulates current and voltage accordingly.

Table 3. Charging Current Setting

| V _{BAT} | CHARGING CURRENT | REGISTER DEFAULT SETTING | CHRG_STAT |
|------------------|---------------------|--------------------------|-----------|
| < 2.2 V | I _{SHORT} | 100 mA | 01 |
| 2.2 V to 3 V | I _{PRECHG} | 180 mA | 01 |
| > 3 V | I _{CHG} | 2.048 A | 10 |

If the charger device is in DPM regulation or thermal regulation during charging, the actual charging current will be less than the programmed value. In this case, termination is temporarily disabled and the charging safety timer is counted at half the clock rate.

Figure 11. Battery Charging Profile

8.3.7.3 Charging Termination

The device terminates a charge cycle when the battery voltage is above recharge threshold, and the current is below termination current. After the charging cycle is completed, the BATFET turns off. The converter keeps running to power the system, and BATFET can turn on again to engage *Supplement Mode*.

When termination occurs, the status register `CHRG_STAT` is set to 11, and an INT pulse is asserted to the host. Termination is temporarily disabled when the charger device is in input current, voltage or thermal regulation. Termination can be disabled by writing 0 to `EN_TERM` bit prior to charge termination.

At low termination currents (25 mA-50 mA), due to the comparator offset, the actual termination current may be 10 mA-20 mA higher than the termination target. In order to compensate for comparator offset, a programmable top-off timer can be applied after termination is detected. The termination timer will follow safety timer constraints, such that if safety timer is suspended, so will the termination timer. Similarly, if safety timer is doubled, so will the termination timer. `TOPOFF_ACTIVE` bit reports whether the top off timer is active or not. The host can read `CHRG_STAT` and `TOPOFF_ACTIVE` to find out the termination status.

Top off timer gets reset at one of the following conditions:

1. Charge disable to enable
2. Termination status low to high
3. `REG_RST` register bit is set

The top-off timer settings are read in once termination is detected by the charger. Programming a top-off timer value after termination will have no effect unless a recharge cycle is initiated. An INT is asserted to the host when entering top-off timer segment as well as when top-off timer expires.

8.3.7.4 Thermistor Qualification

The charger device provides a single thermistor input for battery temperature monitor.

8.3.7.5 JEITA Guideline Compliance During Charging Mode

To improve the safety of charging Li-ion batteries, JEITA guideline was released on April 20, 2007. The guideline emphasized the importance of avoiding a high charge current and high charge voltage at certain low and high temperature ranges.

To initiate a charge cycle, the voltage on TS pin must be within the VT1 to VT5 thresholds. If TS voltage exceeds the T1-T5 range, the controller suspends charging and waits until the battery temperature is within the T1 to T5 range.

At cool temperature (T1-T2), JEITA recommends the charge current to be reduced to half of the charge current or lower. At warm temperature (T3-T5), JEITA recommends charge voltage less than 4.1 V.

The charger provides flexible voltage/current settings beyond the JEITA requirement. The voltage setting at warm temperature (T3-T5) can be VREG or 4.1V (configured by JEITA_VSET). The current setting at cool temperature (T1-T2) can be further reduced to 20% of fast charge current (JEITA_ISET).

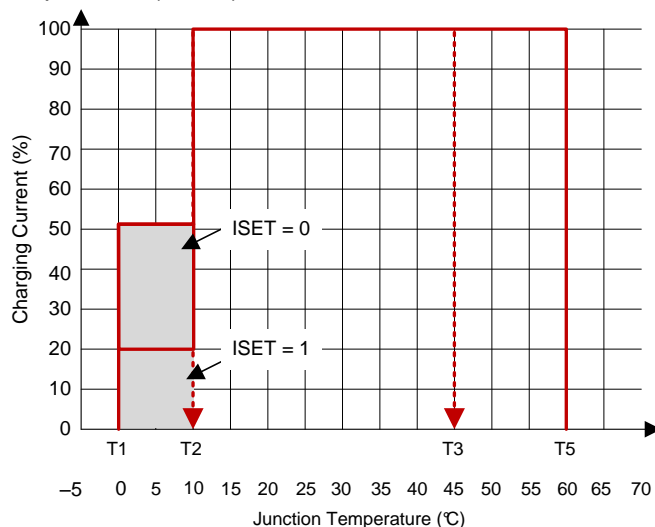

Figure 12. JEITA Profile: Charging Current

Figure 13. JEITA Profile: Charging Voltage

Equation 1 through Equation 2 describe updates to the resistor bias network.

$$RT2 = \frac{V_{REGN} \times RTH_{COLD} \times RTH_{HOT} \times \left(\frac{1}{VT1} - \frac{1}{VT5} \right)}{RTH_{HOT} \times \left(\frac{V_{REGN}}{VT5} - 1 \right) - RTH_{COLD} \times \left(\frac{V_{REGN}}{VT1} - 1 \right)} \quad (1)$$

$$RT1 = \frac{\left(\left(\frac{V_{REGN}}{VT1} \right) - 1 \right)}{\left(\frac{1}{RT2} \right) + \left(\frac{1}{RTH_{COLD}} \right)} \quad (2)$$

Select 0°C to 60°C range for Li-ion or Li-polymer battery:

- $RTH_{COLD} = 27.28 \text{ K}\Omega$
- $RTH_{HOT} = 3.02 \text{ K}\Omega$
- $RT1 = 5.23 \text{ K}\Omega$
- $RT2 = 30.9 \text{ K}\Omega$

8.3.7.6 Boost Mode Thermistor Monitor during Battery Discharge Mode

For battery protection during boost mode, the device monitors the battery temperature to be within the to thresholds. When temperature is outside of the temperature thresholds, the boost mode is suspended. In additional, VBUS_STAT bits are set to 000 and NTC_FAULT is reported. Once temperature returns within thresholds, the boost mode is recovered and NTC_FAULT is cleared.

Figure 14. TS Pin Thermistor Sense Threshold in Boost Mode

8.3.7.7 Charging Safety Timer

The device has built-in safety timer to prevent extended charging cycle due to abnormal battery conditions. The safety timer is 2 hours when the battery is below $V_{BATLOWV}$ threshold and 10 hours when the battery is higher than $V_{BATLOWV}$ threshold.

The user can program fast charge safety timer through I²C (CHG_TIMER bits). When safety timer expires, the fault register CHRG_FAULT bits are set to 11 and an INT is asserted to the host. The safety timer feature can be disabled through I²C by setting EN_TIMER bit

During input voltage, current, JEITA cool or thermal regulation, the safety timer counts at half clock rate as the actual charge current is likely to be below the register setting. For example, if the charger is in input current regulation (IDPM_STAT = 1) throughout the whole charging cycle, and the safety time is set to 5 hours, the safety timer will expire in 10 hours. This half clock rate feature can be disabled by writing 0 to TMR2X_EN bit.

During the fault, timer is suspended. Once the fault goes away, fault resumes. If user stops the current charging cycle, and start again, timer gets reset (toggle CE pin or CHRG_CONFIG bit).

8.3.7.8 Narrow VDC Architecture

The device deploys Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by SYS_Min bits. Even with a fully depleted battery, the system is regulated above the minimum system voltage.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode), and the system is typically 180 mV above the minimum system voltage setting. As the battery voltage rises above the minimum system voltage, BATFET is fully on and the voltage difference between the system and battery is the VDS of BATFET.

When the battery charging is disabled and above minimum system voltage setting or charging is terminated, the system is always regulated at typically 50mV above battery voltage. The status register VSYS_STAT bit goes high when the system is in minimum system voltage regulation.

Figure 15. System Voltage vs Battery Voltage

8.3.7.9 Dynamic Power management

To meet maximum current limit in USB spec and avoid over loading the adapter, the device features Dynamic Power management (DPM), which continuously monitors the input current and input voltage. When input source is over-loaded, either the current exceeds the input current limit (IIDPM) or the voltage falls below the input voltage limit (VINDPM). The device then reduces the charge current until the input current falls below the input current limit and the input voltage rises above the input voltage limit.

When the charge current is reduced to zero, but the input source is still overloaded, the system voltage starts to drop. Once the system voltage falls below the battery voltage, the device automatically enters the supplement mode where the BATFET turns on and battery starts discharging so that the system is supported from both the input source and battery.

During DPM mode, the status register bits VDPM_STAT (VINDPM) or IDPM_STAT (IINDPM) goes high. Figure 16 shows the DPM response with 9-V/1.2-A adapter, 3.2-V battery, 2.8-A charge current and 3.5-V minimum system voltage setting.

Figure 16. DPM Response

8.3.7.10 Supplement Mode

When the system voltage falls 180 mV ($V_{BAT} > V_{SYSMin}$) or 45 mV ($V_{BAT} < V_{SYSMin}$) below the battery voltage, the BATFET turns on and the BATFET gate is regulated the gate drive of BATFET so that the minimum BATFET VDS stays at 30 mV when the current is low. This prevents oscillation from entering and exiting the supplement mode.

As the discharge current increases, the BATFET gate is regulated with a higher voltage to reduce $R_{DS(on)}$ until the BATFET is in full conduction. At this point onwards, the BATFET VDS linearly increases with discharge current. Figure 17 shows the V-I curve of the BATFET gate regulation operation. BATFET turns off to exit supplement mode when the battery is below battery depletion threshold.

Figure 17. BATFET V-I Curve

8.3.8 Shipping Mode and \overline{QON} Pin

8.3.8.1 BATFET Disable Mode (Shipping Mode)

To extend battery life and minimize power when system is powered off during system idle, shipping, or storage, the device can turn off BATFET so that the system voltage is zero to minimize the battery leakage current. When the host set BATFET_DIS bit, the charger can turn off BATFET immediately or delay by t_{SM_DLY} as configured by BATFET_DLY bit.

8.3.8.2 BATFET Enable (Exit Shipping Mode)

When the BATFET is disabled (in shipping mode) and indicated by setting BATFET_DIS, one of the following events can enable BATFET to restore system power:

1. Plug in adapter
2. Clear BATFET_DIS bit
3. Set REG_RST bit to reset all registers including BATFET_DIS bit to default (0)
4. A logic high to low transition on \overline{QON} pin with $t_{SHIPMODE}$ deglitch time to enable BATFET to exit shipping mode

8.3.8.3 BATFET Full System Reset

The BATFET functions as a load switch between battery and system when input source is not plugged-in. By changing the state of BATFET from on to off, systems connected to SYS can be effectively forced to have a power-on-reset. The \overline{QON} pin supports push-button interface to reset system power without host by changing the state of BATFET.

When the \overline{QON} pin is driven to logic low for t_{QON_RST} while input source is not plugged in and BATFET is enabled (BATFET_DIS = 0), the BATFET is turned off for t_{BATFET_RST} and then it is re-enabled to reset system power. This function can be disabled by setting BATFET_RST_EN bit to 0.

8.3.8.4 \overline{QON} Pin Operations

The \overline{QON} pin incorporates two functions to control BATFET.

1. **BATFET Enable:** A \overline{QON} logic transition from high to low with longer than $t_{SHIPMODE}$ deglitch turns on BATFET and exit shipping mode
2. **BATFET Reset:** When \overline{QON} is driven to logic low by at least t_{QON_RST} while adapter is not plugged in (and $BATFET_DIS = 0$), the BATFET is turned off for t_{BATFET_RST} . The BATFET is re-enabled after t_{BATFET_RST} duration. This function allows systems connected to SYS to have power-on-reset. This function can be disabled by setting $BATFET_RST_EN$ bit to 0.

Figure 18 shows the sample external configurations for each.

Figure 18. \overline{QON} Timing

Figure 19. \overline{QON} Circuit

8.3.9 Status Outputs (\overline{PG} , STAT, \overline{INT})

8.3.9.1 Power Good indicator (\overline{PG} Pin and PG_STAT Bit)

The PG_STAT bit goes HIGH and \overline{PG} pin goes LOW to indicate a good input source when:

- VBUS above V_{VBUS_UVLO}
- VBUS above battery (not in sleep)
- VBUS below V_{VAC_OV} threshold
- VBUS above $V_{VBUSMin}$ (typical 3.8 V) when I_{BADSRC} (typical 30 mA) current is applied (not a poor source)
- Completed *input Source Type Detection*

8.3.9.2 Charging Status indicator (STAT)

The device indicates charging state on the open drain STAT pin. The STAT pin can drive LED. The STAT pin function can be disabled by setting the EN_ICHG_MON bits = 11.

Table 4. STAT Pin State

| CHARGING STATE | STAT INDICATOR |
|---|------------------|
| Charging in progress (including recharge) | LOW |
| Charging complete | HIGH |
| Sleep mode, charge disable | HIGH |
| Charge suspend (input overvoltage, TS fault, timer fault or system overvoltage) Boost Mode suspend (due to TS fault) | Blinking at 1 Hz |

8.3.9.3 Interrupt to Host (\overline{INT})

In some applications, the host does not always monitor the charger operation. The INT pulse notifies the system on the device operation. The following events will generate 256- μ s INT pulse.

- USB/adaptor source identified (through PSEL detection)
- Good input source detected
 - VBUS above battery (not in sleep)
 - VBUS below V_{VAC_OV} threshold
 - VBUS above $V_{VBUSMin}$ (typical 3.8 V) when I_{BADSRC} (typical 30 mA) current is applied (not a poor source)
- input removed
- Charge Complete
- Any FAULT event in REG09
- VINDPM / IINDPM event detected (maskable)

When a fault occurs, the charger device sends out INT and keeps the fault state in REG09 until the host reads the fault register. Before the host reads REG09 and all the faults are cleared, the charger device would not send any INT upon new faults. To read the current fault status, the host has to read REG09 two times consecutively. The first read reports the pre-existing fault register status and the second read reports the current fault register status.

8.3.10 Protections

8.3.10.1 Voltage and Current Monitoring in Converter Operation

The device closely monitors the input and system voltage, as well as internal FET currents for safe buck and boost mode operation.

8.3.10.1.1 Voltage and Current Monitoring in Buck Mode

8.3.10.1.1.1 Input Overvoltage (ACOV)

If VBUS voltage exceeds V_{VAC_OV} (programmable via OVP[2:0] bits), the device stops switching immediately.

During input overvoltage event (ACOV), the fault register CHRG_FAULT bits are set to 01. An INT pulse is asserted to the host. The device will automatically resume normal operation once the input voltage drops back below the OVP threshold.

8.3.10.1.1.2 System Overvoltage Protection (SYSOVP)

The charger device clamps the system voltage during load transient so that the components connect to system would not be damaged due to high voltage. SYSOVP threshold is 350 mV above minimum system regulation voltage when the system is regulate at V_{SYSMin} . Upon SYSOVP, converter stops switching immediately to clamp the overshoot. The charger provides 30 mA discharge current to bring down the system voltage.

8.3.10.2 Voltage and Current Monitoring in Boost Mode

The device closely monitors the VBUS voltage, as well as RBFET and LSFET current to ensure safe boost mode operation.

8.3.10.2.1 VBUS Soft Start

When the boost function is enabled, the device soft-starts boost mode to avoid inrush current.

8.3.10.2.2 VBUS Output Protection

The device monitors boost output voltage and other conditions to provide output short circuit and overvoltage protection. The Boost build in accurate constant current regulation to allow OTG to adaptive to various types of load. If short circuit is detected on VBUS, the Boost turns off and retry 7 times. If retries are not successful, OTG is disabled with OTG_CONFIG bit cleared. In addition, the BOOST_FAULT bit is set and INT pulse is generated. The BOOST_FAULT bit can be cleared by host by re-enabling boost mode

8.3.10.2.3 Boost Mode Overvoltage Protection

When the VBUS voltage rises above regulation target and exceeds VOTG_OVP, the device enters overvoltage protection which stops switching, clears OTG_CONFIG bit and exits boost mode. At Boost overvoltage duration, the fault register bit (BOOST_FAULT) is set high to indicate fault in boost operation. An INT is also asserted to the host.

8.3.10.3 Thermal Regulation and Thermal Shutdown

8.3.10.3.1 Thermal Protection in Buck Mode

The bq25601 monitors the internal junction temperature T_j to avoid overheat the chip and limits the IC surface temperature in buck mode. When the internal junction temperature exceeds thermal regulation limit (110°C), the device lowers down the charge current. During thermal regulation, the actual charging current is usually below the programmed battery charging current. Therefore, termination is disabled, the safety timer runs at half the clock rate, and the status register THERM_STAT bit goes high.

Additionally, the device has thermal shutdown to turn off the converter and BATFET when IC surface temperature exceeds T_{SHUT} (160°C). The fault register CHRG_FAULT is set to 1 and an INT is asserted to the host. The BATFET and converter is enabled to recover when IC temperature is T_{SHUT_HYS} (30°C) below T_{SHUT} (160°C).

8.3.10.3.2 Thermal Protection in Boost Mode

The device monitors the internal junction temperature to provide thermal shutdown during boost mode. When IC junction temperature exceeds T_{SHUT} (160°C), the boost mode is disabled by setting OTG_CONFIG bit low and BATFET is turned off. When IC junction temperature is below T_{SHUT} (160°C) - T_{SHUT_HYS} (30°C), the BATFET is enabled automatically to allow system to restore and the host can re-enable OTG_CONFIG bit to recover.

8.3.10.4 Battery Protection

8.3.10.4.1 Battery overvoltage Protection (BATOVP)

The battery overvoltage limit is clamped at 4% above the battery regulation voltage. When battery over voltage occurs, the charger device immediately disables charging. The fault register BAT_FAULT bit goes high and an INT is asserted to the host.

8.3.10.4.2 Battery Over-Discharge Protection

When battery is discharged below $V_{BAT_DPL_FALL}$, the BATFET is turned off to protect battery from over discharge. To recover from over-discharge latch-off, an input source plug-in is required at VBUS. The battery is charged with I_{SHORT} (typically 100 mA) current when the $V_{BAT} < V_{SHORT}$, or precharge current as set in IPRECHG register when the battery voltage is between V_{SHORTZ} and V_{BAT_LOWV} .

8.3.10.4.3 System Over-Current Protection

When the system is shorted or significantly overloaded ($IBAT > IBATOP$) and the current exceeds BATFET overcurrent limit, the BATFET latches off. Section BATFET Enable (Exit Shipping Mode) can reset the latch-off condition and turn on BATFET.

8.3.11 Serial interface

The device uses I²C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I²CTM is a bi-directional 2-wire serial interface developed by Philips Semiconductor (now NXP Semiconductors). Only two bus lines are required: a serial data line (SDA) and a serial clock line (SCL). Devices can be considered as masters or slaves when performing data transfers. A master is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a slave.

The device operates as a slave device with address 6BH, receiving control inputs from the master device like micro controller or a digital signal processor through REG00-REG0B. Register read beyond REG0B (0x0B) returns 0xFF. The I²C interface supports both standard mode (up to 100 kbits), and fast mode (up to 400 kbits). connecting to the positive supply voltage via a current source or pull-up resistor. When the bus is free, both lines are HIGH. The SDA and SCL pins are open drain.

8.3.11.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. One clock pulse is generated for each data bit transferred.

Figure 20. Bit Transfer on the I²C Bus

8.3.11.2 START and STOP Conditions

All transactions begin with a START (S) and can be terminated by a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition. START and STOP conditions are always generated by the master. The bus is considered busy after the START condition, and free after the STOP condition.

Figure 21. TS START and STOP conditions

8.3.11.3 Byte Format

Every byte on the SDA line must be 8 bits long. The number of bytes to be transmitted per transfer is unrestricted. Each byte has to be followed by an Acknowledge bit. Data is transferred with the Most Significant Bit (MSB) first. If a slave cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the clock line SCL low to force the master into a wait state (clock stretching). Data transfer then continues when the slave is ready for another byte of data and release the clock line SCL.

Figure 22. Data Transfer on the I²C Bus

8.3.11.4 Acknowledge (ACK) and Not Acknowledge (NACK)

The acknowledge takes place after every byte. The acknowledge bit allows the receiver to signal the transmitter that the byte was successfully received and another byte may be sent. All clock pulses, including the acknowledge ninth clock pulse, are generated by the mAsTter. The transmitter releases the SDA line during the acknowledge clock pulse so the receiver can pull the SDA line LOW and it remains stable LOW during the HIGH period of this clock pulse.

When SDA remains HIGH during the ninth clock pulse, this is the Not Acknowledge signal. The mAsTter can then generate either a STOP to abort the transfer or a repeated START to start a new transfer.

8.3.11.5 Slave Address and Data Direction Bit

After the START, a slave address is sent. This address is 7 bits long followed by the eighth bit as a data direction bit (bit R/W). A zero indicates a transmission (WRITE) and a one indicates a request for data (READ).

Figure 23. Complete Data Transfer

8.3.11.6 Single Read and Write

If the register address is not defined, the charger IC send back NACK and go back to the idle state.

Figure 24. Single Write

Figure 25. Single Read

8.3.11.7 Multi-Read and Multi-Write

The charger device supports multi-read and multi-write on REG00 through REG0B.

Figure 26. Multi-Write

Figure 27. Multi-Read

REG09 is a fault register. It keeps all the fault information from last read until the host issues a new read. For example, if Charge Safety Timer Expiration fault occurs but recovers later, the fault register REG09 reports the fault when it is read the first time, but returns to normal when it is read the second time. In order to get the fault information at present, the host has to read REG09 for the second time. The only exception is NTC_FAULT which always reports the actual condition on the TS pin. In addition, REG09 does not support multi-read and multi-write.

9 Application and Implementation

NOTE

information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application information

A typical application consists of the device configured as an I²C controlled power path management device and a single cell battery charger for Li-Ion and Li-polymer batteries used in a wide range of smart phones and other portable devices. It integrates an input reverse-block FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), and battery FET (BATFET Q4) between the system and battery. The device also integrates a bootstrap diode for the high-side gate drive.

9.2 Typical Application Diagram

Figure 28. Power Path Management Application

9.2.1 Design Requirements

9.2.2 Detailed Design Procedure

9.2.2.1 inductor Selection

The 1.5-MHz switching frequency allows the use of small inductor and capacitor values to maintain an inductor saturation current higher than the charging current (I_{CHG}) plus half the ripple current (I_{RIPPLE}):

$$I_{SAT} \geq I_{CHG} + (1/2) I_{RIPPLE} \quad (3)$$

The inductor ripple current depends on the input voltage (V_{VBUS}), the duty cycle ($D = V_{BAT}/V_{VBUS}$), the switching frequency (f_s) and the inductance (L).

$$I_{RIPPLE} = \frac{V_{IN} \times D \times (1 - D)}{f_s \times L} \quad (4)$$

The maximum inductor ripple current occurs when the duty cycle (D) is 0.5 or approximately 0.5. Usually inductor ripple is designed in the range between 20% and 40% maximum charging current as a trade-off between inductor size and efficiency for a practical design.

Typical Application Diagram (continued)

9.2.2.2 Input Capacitor

Design input capacitance to provide enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current when duty cycle is 0.5. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current I_{CIN} occurs where the duty cycle is closest to 50% and can be estimated using [Equation 5](#).

$$I_{CIN} = I_{CHG} \times \sqrt{D \times (1 - D)} \quad (5)$$

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed to the drain of the high-side MOSFET and source of the low-side MOSFET as close as possible. Voltage rating of the capacitor must be higher than normal input voltage level. A rating of 25-V or higher capacitor is preferred for 15 V input voltage. Capacitance of 22- μ F is suggested for typical of 3A charging current.

9.2.2.3 Output Capacitor

Ensure that the output capacitance has enough ripple current rating to absorb the output switching ripple current. [Equation 6](#) shows the output capacitor RMS current I_{COUT} calculation.

$$I_{COUT} = \frac{I_{RIPPLE}}{2 \times \sqrt{3}} \approx 0.29 \times I_{RIPPLE} \quad (6)$$

The output capacitor voltage ripple can be calculated as follows:

$$\Delta V_O = \frac{V_{OUT}}{8LCfs^2} \left(1 - \frac{V_{OUT}}{V_{IN}} \right) \quad (7)$$

At certain input and output voltage and switching frequency, the voltage ripple can be reduced by increasing the output filter LC.

The charger device has internal loop compensation optimized for >20 μ F ceramic output capacitance. The preferred ceramic capacitor is 10V rating, X7R or X5R.

10 Power Supply Recommendations

in order to provide an output voltage on SYS, the bq25601 device requires a power supply between 3.9 V and 14.2 V input with at least 100-mA current rating connected to VBUS and a single-cell Li-Ion battery with voltage $> V_{BATUVLO}$ connected to BAT. The source current rating needs to be at least 3 A in order for the buck converter of the charger to provide maximum output power to SYS.

11 Layout

11.1 Layout Guidelines

The switching node rise and fall times should be minimized for minimum switching loss. Proper layout of the components to minimize high frequency current path loop (see [Figure 29](#)) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Follow this specific order carefully to achieve the proper layout.

1. Place input capacitor as close as possible to PMID pin and GND pin connections and use shortest copper trace connection or GND plane.
2. Place inductor input pin to SW pin as close as possible. Minimize the copper area of this trace to lower electrical and magnetic field radiation but make the trace wide enough to carry the charging current. Do not use multiple layers in parallel for this connection. Minimize parasitic capacitance from this area to any other trace or plane.
3. Put output capacitor near to the inductor and the device. Ground connections need to be tied to the IC ground with a short copper trace connection or GND plane.
4. Route analog ground separately from power ground. Connect analog ground and connect power ground separately. Connect analog ground and power ground together using thermal pad as the single ground connection point. Or using a 0- Ω resistor to tie analog ground to power ground.
5. Use single ground connection to tie charger power ground to charger analog ground. Just beneath the device. Use ground copper pour but avoid power pins to reduce inductive and capacitive noise coupling.
6. Place decoupling capacitors next to the IC pins and make trace connection as short as possible.
7. It is critical that the exposed thermal pad on the backside of the device package be soldered to the PCB ground. Ensure that there are sufficient thermal vias directly under the IC, connecting to the ground plane on the other layers.
8. Ensure that the number and sizes of vias allow enough copper for a given current path.

See the EVM user's guide [SLUUBL3](#) for the recommended component placement with trace and via locations. For the VQFN information, refer to [SCBA017](#) and [SLUA271](#).

12 Device and Documentation Support

12.1 Documentation Support

12.1.1 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

12.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.3 Trademarks

E2E is a trademark of Texas Instruments.

WEBENCH is a registered trademark of Texas Instruments.

12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|-----------------|------|-------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|-------------------------|
| BQ25601RTWR | ACTIVE | WQFN | RTW | 24 | 3000 | RoHS & Green | NIPDAU NIPDAUAG | Level-2-260C-1 YEAR | -40 to 85 | BQ25601 | Samples |
| BQ25601RTWT | ACTIVE | WQFN | RTW | 24 | 250 | RoHS & Green | NIPDAU NIPDAUAG | Level-2-260C-1 YEAR | -40 to 85 | BQ25601 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - Quad Flatpack, No-Leads (QFN) package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTES: A. All linear dimensions are in millimeters

RTW (S-PWQFN-N24)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.
