

# Capturing Bluetooth Host Controller Interface (HCI) Logs

Hari Nagalla

## ABSTRACT

Identifying and debugging Bluetooth® issues can be challenging, especially in two-processor architecture with functionality spread across the host processor and the Bluetooth controller. Bluetooth specification allows the separation of the Bluetooth controller and hosts by partitioning the radio and physical/link handling to the controllers, and to the higher level profile, logical link, and connection/pairings to the host resident Bluetooth stack. This delineation allows flexible dual processor Bluetooth system architectures. The interface between the host and the controller is specified as host controller interface (HCI) in Bluetooth specification, and allows interoperability between various vendor host Bluetooth stacks and Bluetooth controllers.

TI's CC256x and WL18xx class of dual-mode Bluetooth controllers is in this two-processor category. TI provides a royalty-free Bluetooth host stack (Bluetopia) for MCU and Linux host environments. As these controllers conform to the HCI specification, they can also be integrated with other third party Bluetooth host stacks, such as Bluez, Bluedroid, BlueKitchen, and so forth.

This application note discusses various options to log or snoop HCI packets between the host and the controller to identify issues and failures. It considers both MCU and Linux/application processor host environments, discusses the available options for HCI logging, and proposes a new approach for resource-constrained MCU environments with Cortex®-M cores.

# 1 Introduction

Debugging Bluetooth protocol-related issues is challenging without proper event and data logging between the host, controller, and peer devices. Bluetooth air sniffers (such as Ellisys or Frontline) provide a comprehensive overview of radio, protocol, and profile-level message and data exchange between the peer Bluetooth devices. These sniffer tools work by “spying” on the communication between the master and slave or central and peripheral devices, and they can identify both radio and profile-level issues. However, these tools can be very expensive, and a piece for each Bluetooth developer is not always feasible.

However, HCI message and event logging and BT firmware (at the controller) logs can also help identify many of the Bluetooth issues, and can supplement the air sniffer logs.

In this application note, the focus is to illustrate HCI logging at the host Bluetooth stack, UART driver level, or externally tapping the HCI/UART Tx/Rx lines to facilitate application and stack debugging.

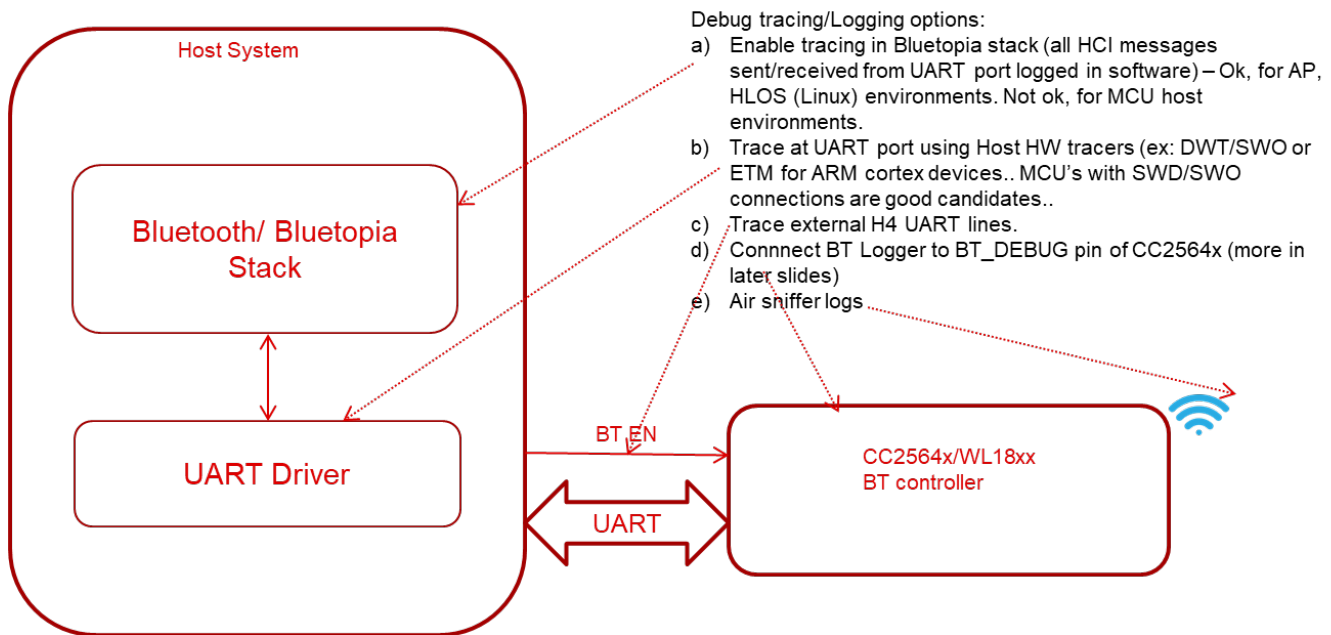

Figure 1. Logging Options in a Bluetooth System

## 1.1 Terminology

Table 1. Acronyms

Acronym	Description
CCS	Code Composer Studio
SWD	Serial Wire Debug
SWO	Serial Wire Output
JTAG	Joint Test Action Group/ boundary scan. Technique used for testing and debugging PCBs, SoCs etc..
HCI	Host Controller Interface
ITM	Instrumentation Trace Macrocell
DWT	Data Watch Point Trace
UART	Universal Async Receiver, Transmitter
H4	4-wire HCI protocol
H5	3-wire HCI protocol
SWV	Serial WireViewer

## 2 Host Controller Interface

The HCI interface defines a physical and protocol connection between a Bluetooth Host (such as the MCU, application processor, and so forth) and a controller (such as the TICC256x/WL18xx). The Bluetooth specification defines UART, SDIO, and USB-based physical transports for the host interface. The TICC256x and WL18xx Bluetooth controllers only support the UART HCI interface. The UART HCI interface is further divided into two categories – a) 4-wire UART with RTS/CTS hardware flow control, or H4 protocol; and b) 3-wire UART, with no hardware flow control, or H5.

The UART, H4 protocol assumes the UART lines are free from errors and any line errors mandate a controller reset. On the other UART, H5 protocol is tolerant to bit errors and uses SLIP protocol to transmit packets and to deal with packet and bit losses by re-transmission. This adds extra complexity and reduces the effective HCI bandwidth. H4 is the predominantly-used protocol in the industry, and is the recommended protocol for the CC256x and WL18xx HCI interfaces.

### 2.1 HCI Protocol

HCI protocol defines how commands, events, and asynchronous and synchronous data packets are exchanged. Asynchronous packets (ACL) are used for data transfer, while synchronous packets (SCO) are used for voice with handset and hands-free profiles.

**Figure 4. HCI Protocol**

Table 2. HCI Protocol

HCI Packet Type	HCI Packet Indicator
HCI Command Packet	0x01
HCI ACL Data Packet	0x02
HCI Synchronous Data Packet	0x03
HCI Event Packet	0x04

Bluetooth stack is loosely based around the OSI model. In two-processor Bluetooth system architecture, the HCI layer is the hardware interface along with the HCI protocol between the host and controller as described earlier. Figure 5 shows the various layers of the host and controller stacks. L2CAP is placed above the HCI, and works across ACL connections. It facilitates the use of Bluetooth links by higher layers.

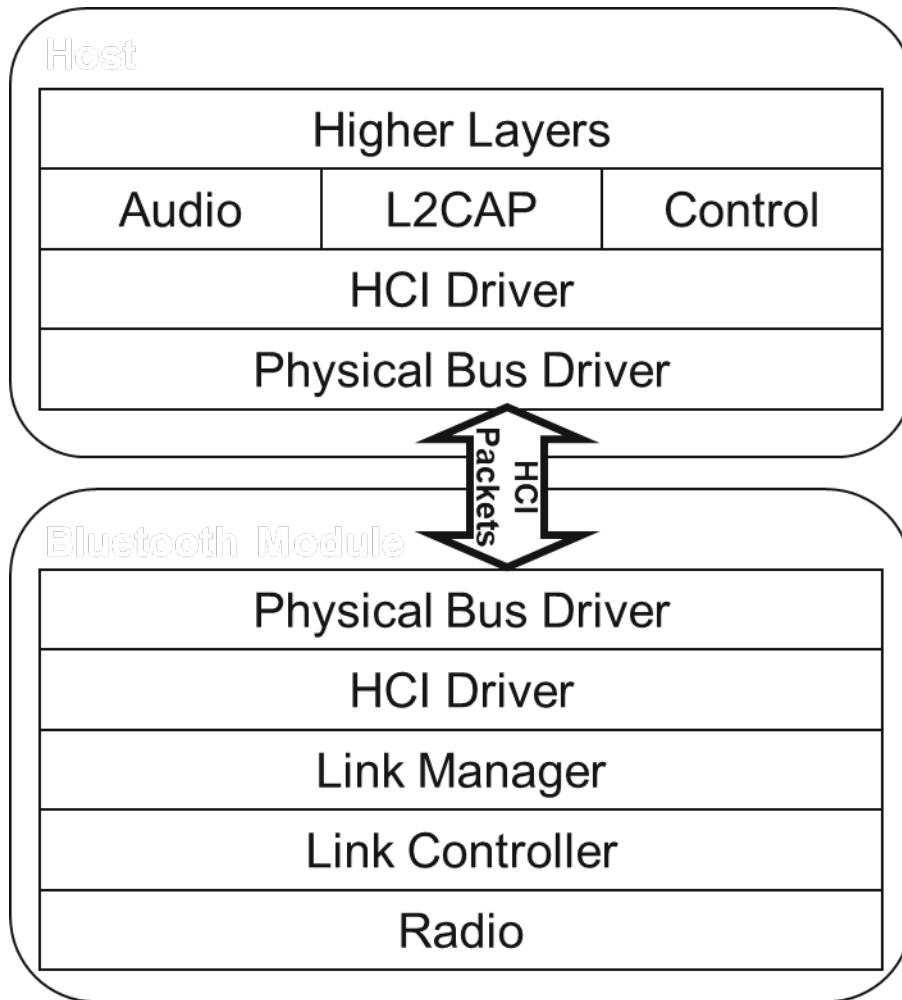

Figure 5. Bluetooth® Stack Layers

### 3 BTSnoop Logs in a Linux/Android Environment

Application processors with Linux® or Android™ operating systems, provide HCI logging at the stack level before the HCI packets are transferred to the UART driver. The following sections provide details for enabling BT snoop logs in Bluetopia, BlueZ, and Bluedroid (Android) stacks.

#### 3.1 Logging With Bluetopia Stack

TI's Bluetopia stack provides logging features to capture HCI message and event transfers across the host and controller. The logs can be stored in BTSnoop format.

The following DEVM API can be used to enable logging from applications.

```
int BTPSAPI DEVM_EnableBluetoothDebug
(
    Boolean_t
    Enable,
    unsigned int      DebugType,
    unsigned long     DebugFlags,
    unsigned int      DebugParameterLength,
    unsigned char *   DebugParameter
)

```

##### Parameters

**Enable** Boolean value (TRUE/FALSE) to enable or disable output debugging.

**DebugType** Indicates the type of debugging. May be one of the following:

DEVM\_BLUETOOTH\_DEBUG\_TYPE\_ASCII\_LOG\_FILE DEVM\_BLUETOOTH\_DEBUG\_TYPE\_TERMINAL

DEVM\_BLUETOOTH\_DEBUG\_TYPE\_FTS\_LOG\_FILE

**DebugFlags** Optional flag for debugging. Currently the only optional value is the following:

DEVM\_BLUETOOTH\_DEBUG\_FLAGS\_APPEND\_FILE

**DebugParameterLength** Length (in bytes) of the optional DebugParameter.

**DebugParameter** Optional name for FTS or ASCII debug log file. Note that if ASCII or FTS Log file is specified than a valid filename must be specified (the preceding parameter and this parameter).

##### Returns

This function returns zero if successful, or a negative return error code if there was an error.

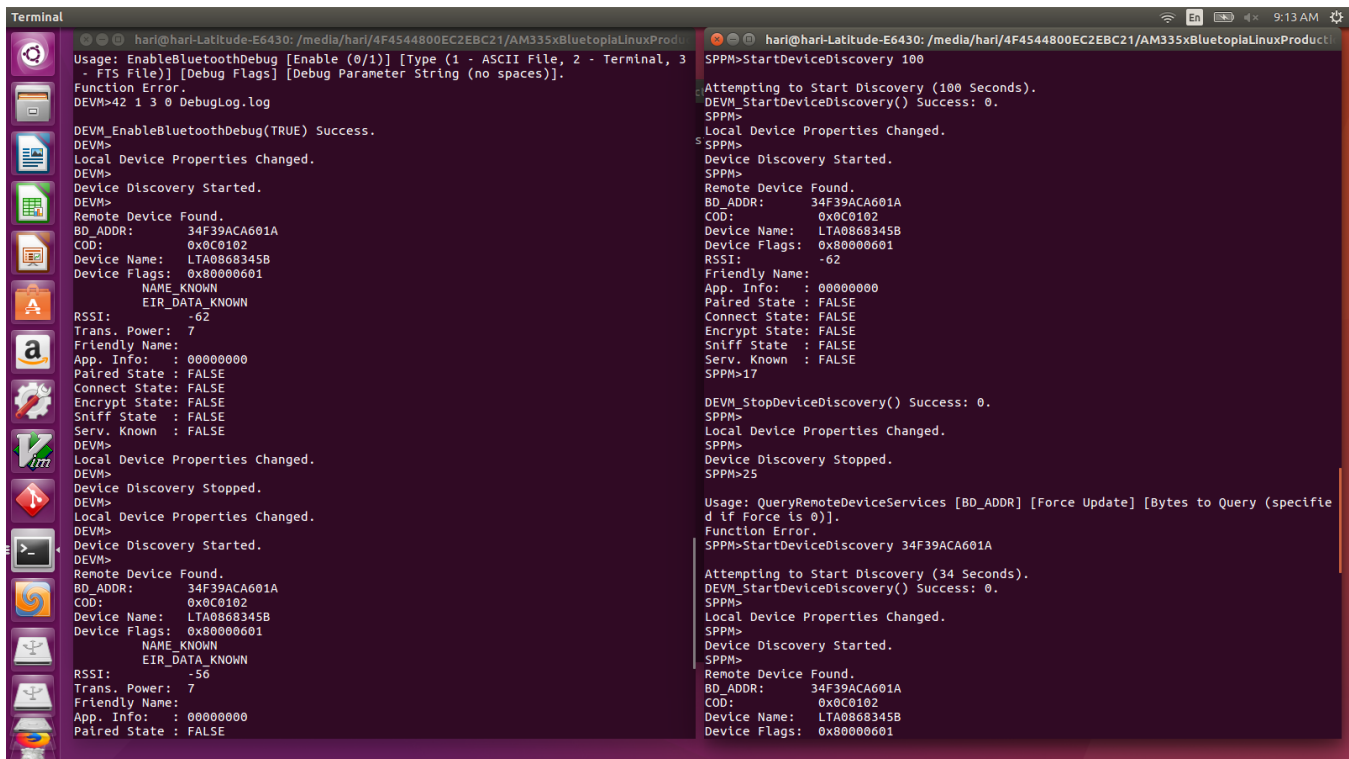

Typically, applications in a BluetopiaPM environment may use a background process to handle device-level control and maintenance. When using TI BluetopiaPM stack demos, the user can open a new terminal and enable logging. The DEVM demo (LinuxDEVM.c) has a console command to enable and disable HCI logging at runtime.

```
DEVM>EnableBluetoothDebug
```

```
Usage: EnableBluetoothDebug [Enable (0/1)] [Type (1 - ASCII File, 2 - Terminal, 3 -
    FTS File)] [Debug Flags] [Debug Parameter String (no spaces)].
```

```
Function Error.

### 3.2 Logging With Linux BlueZ Stack

BlueZ supports two tools for capturing HCI traffic. 'hcidump' is an older tool and is being deprecated by the 'btmon' tool. Both tools support the BTsnoop file format, and the captured files can be opened in Wireshark or Frontline HCI viewer.

```
#hcidump -B -w <BTsnoop file name>
```

Or

```
#hcidump -Xt -w <BTsnoop file name>
```

```

### 3.3 Logging With Bluedroid/Android

Figure 9. Enable Bluetooth HCI Snoop Log

There are two options for retrieving the HCI log from the Android device.

- Attach the Android device to the computer. The `/sdcard/btsnoop_hci.log` file is in the root of one of the mountable drives. Copy the file to the `C:/Users/Public/Public Documents/Frontline Test Equipment/My Capture File/` directory.
- Use the Android Debug Bridge (ADB) with the following steps. The debug bridge is included with the Android Software Developer Kit.
  1. On the Android device Development screen, select Android debugging or USB debugging.
  2. Connect the computer and Android device with a USB cable.
  3. Open a terminal on the computer and run the following command.

```
adb devices
```

4. The Android device should appear in this list confirming that ADB is working.

```
List of devices attached
XXXXXXXXXX device
```

5. In the terminal, enter the following command to copy the HCI Log to the computer.

```
adb pull /sdcard/btsnoop_hci.log
```

## 4 HCI Logging in the MCU Host Environment

Because of a lack of a file system and limited CPU processing power on the MCU, it is untenable to do stack-level HCI logging in an MCU environment. This leaves two options for logging:

- External HCI/UART line sniffing with either Ellisys, Frontline, or custom probes
- Using data tracers with DWT/ITM on Cortex-M based MCUs

### 4.1 Tapping UART Lines

When the HCI/UART TX and RX lines between the host and controller are accessible for tapping, use the HCI sniffer to capture the data.

#### 4.1.1 FTE and Ellisys HCI Sniffer

Commercial HCI sniffers use serial sniffers (UART) to externally capture the HCI traffic and process it at runtime, or offline to present the message and data exchanges in a user-friendly GUI.

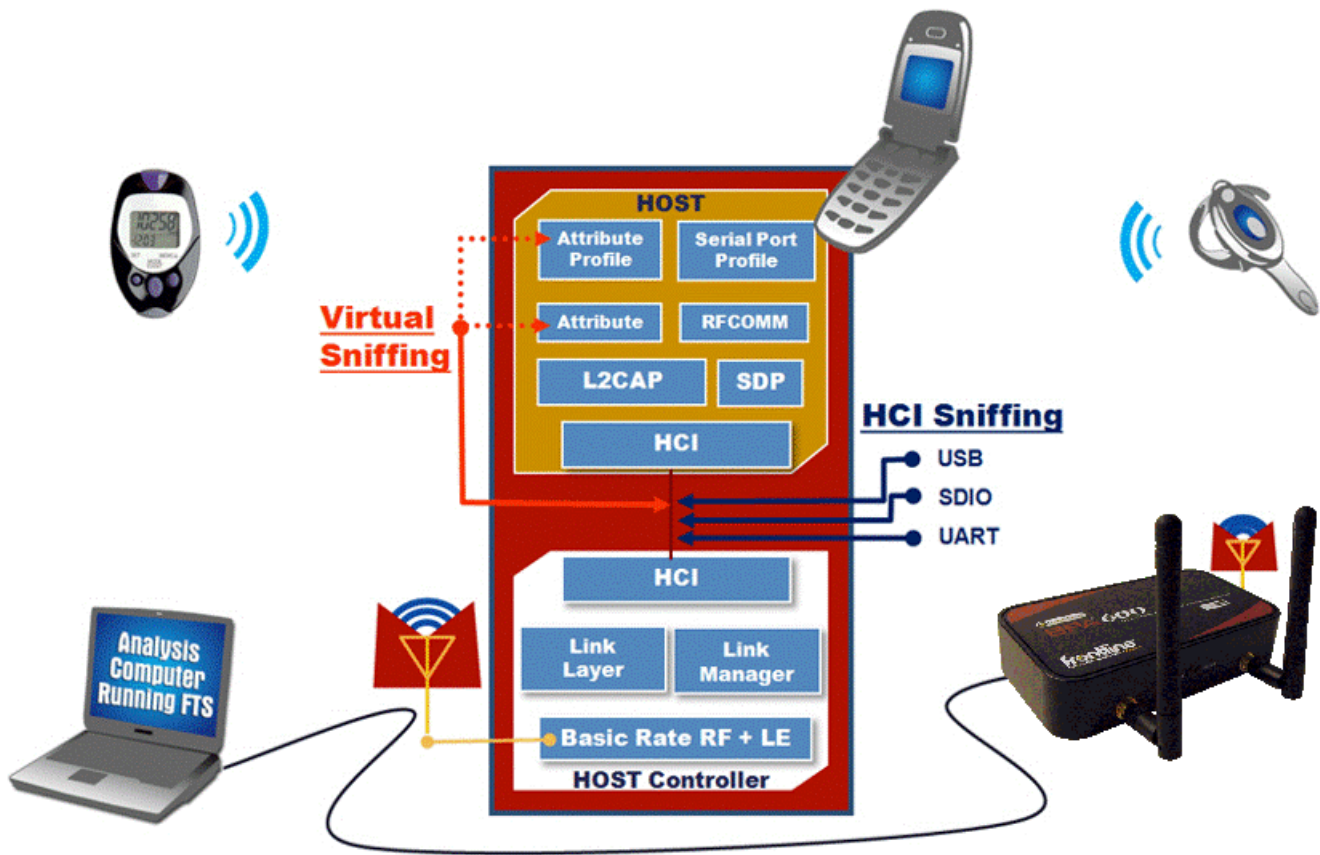

Figure 10. Frontline Technologies HCI Sniffer (Using Serial Sniffer)

#### 4.1.2 Custom HCI Sniffer

Custom probes can sniff HCI/UART TX and RX lines, and post process into a BTSnoop file format. The reformatted BTSnoop data/log can be viewed with Wireshark, FTE, or the Ellisys HCI viewer GUI to analyze.

This is one example of a custom procedure to sniff HCI Tx/Rx lines on the MSP432 with CC2564C.

1. Identify the HCI Tx/Rx pins for sniffing.

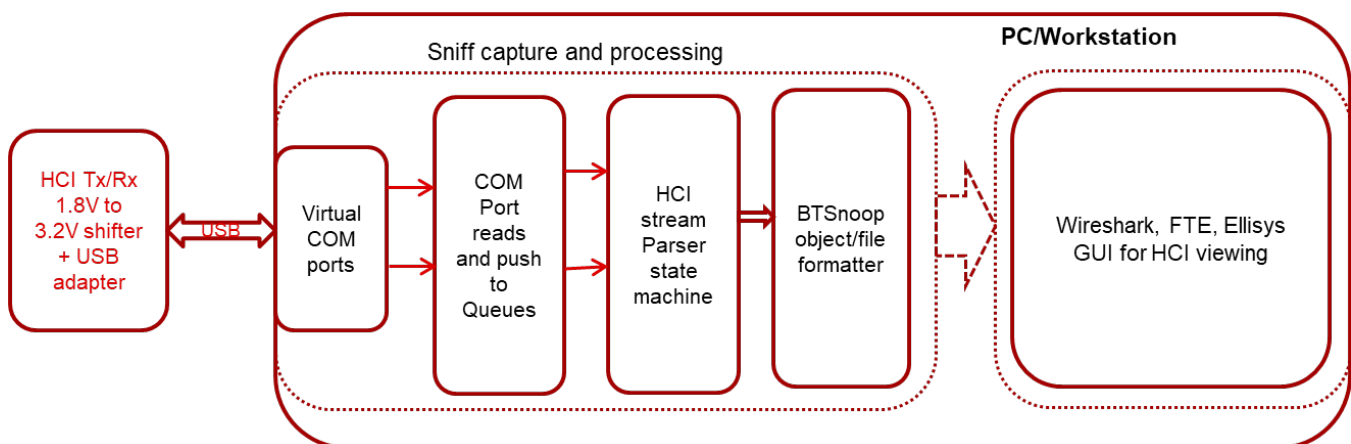

Figure 11. MSP432 Launchpad With CC2564xQFN-EM

2. Use a suitable level shifter along with the UART to USB adapter to read the ports on a PC or workstation.

**Figure 12. HCI TX/RX Sniff With CC2564xQFN-EM Module**

3. Use the HCIsniffer tool on the PC. This tool is developed in Java, and assumes a Java runtime environment on the PC/workstation. It takes port numbers and HCI baud rate as parameters. The tool outputs a BTSnoop format file, which can be opened with Wireshark or FTE HCI viewer GUIs.

**Figure 13. PC-Based HCIsniffer Tool**

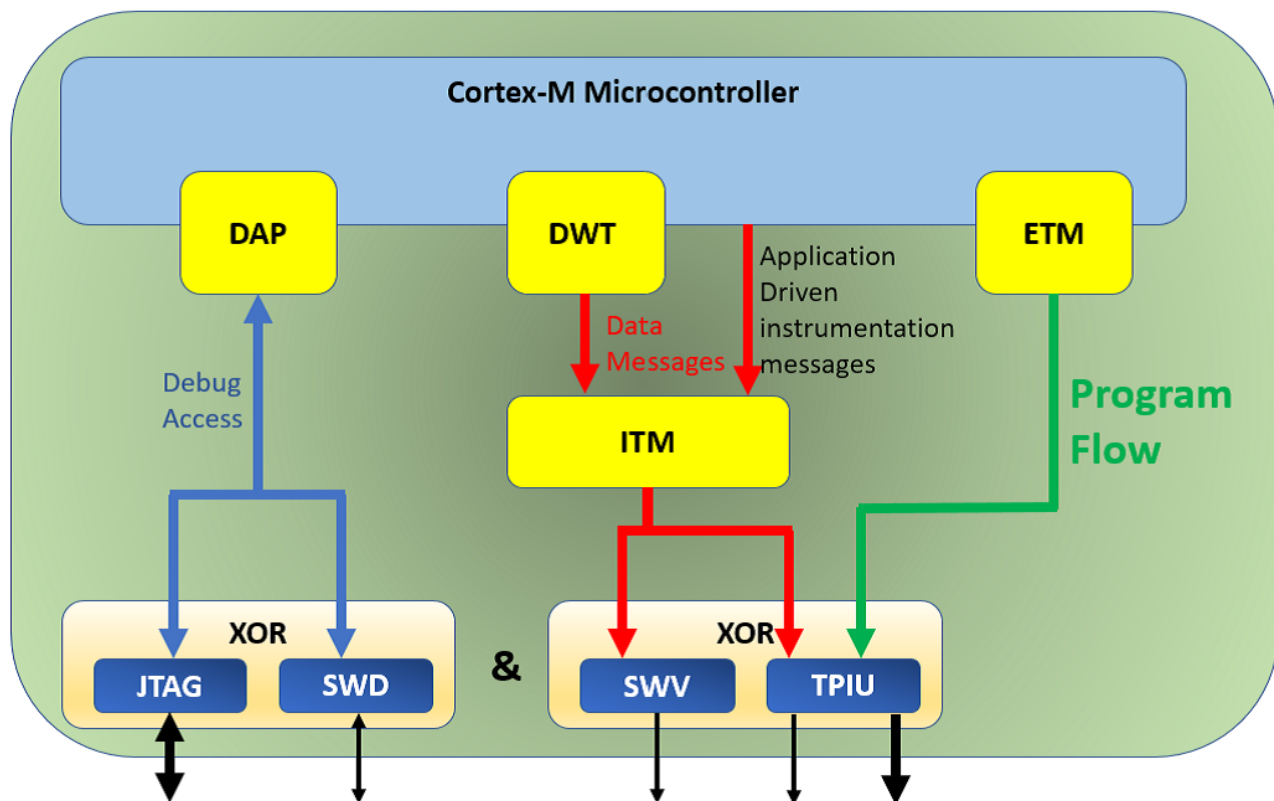

Figure 14 and Figure 15 show the execution of the tool and the resulting BTSnoop log, viewed with the Frontline HCI viewer.

**NOTE:** H4 protocol assumes error-free UART lines, and there are no synchronization patterns in the HCI byte stream. This poses challenges to HCI serial sniffers to properly sync on the HCI byte stream. TI recommends starting the serial HCI sniffer from a known anchor point, such as start hci sniffer, when the host and controller are in sleep or in low activity state. Or, start the hcisniffer at the beginning, with the board unpowered. Though the hcisniffer has detectors to detect when it is out of sync with the HCI stream and attempts to resync with the stream, it is advised to maintain one HCI baudrate (115200) from the time the board is started. This facilitates easy synchronization and is suited when debugging startup, pairing, and connection-related issues..

## 4.2 Cortex-M Data Tracers

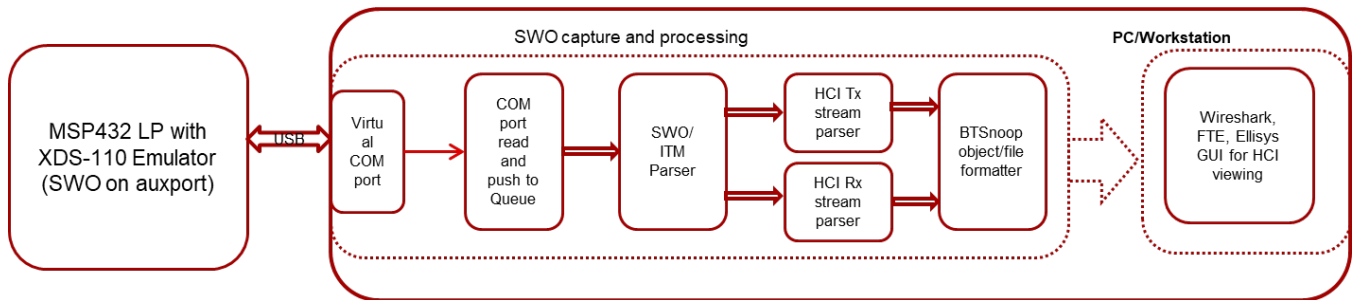

Cortex-M3/4's CoreSight technology allows data tracing. The user can exploit this feature to trace data read and writes to the UART RX and TX registers on the MCU/SoC. The Cortex-M ITM/DWT tracing incurs no CPU penalties, and is an effective way to capture data at runtime from the core. Typically, Cortex-M based MCUs provide SWD/SWO output, as the pins needed to bring out debug and tracing capabilities are much less compared to JTAG and TPIU. Figure 16 shows the main components of the CoreSight technology components.

**Figure 16. Cortex-M With CoreSight Technology Components**

The MSP432 uses Cortex-M4F with ITM and DWT CoreSight technology components. It does not have ETM, so instruction trace is not possible. However, using DWT the user can perform PC sampling and data trace. The MSP432 LP comes with an XDS-110 emulator and is preconfigured for SWD and SWO output, with SDO routed to the auxiliary port. The emulation package with XDS-110 must be above "7.0.89.0".

**Figure 17. SWO/ITM Stream Capture and Processing**

The following code snippets illustrate the configuration of ITM/DWT for data tracing on the MSP432. Similar configurations would be required on any MCU host with Cortex-M3/M4 CoreSight technology.

```

/** Initialize ITM module */
void ITM_initModule(const ITM_config itm_config)
{
    // Disable module
    SCS_DEMCR &= (~SCS_DEMCR_TRCEN);
    ITM_TCR = 0x00000000;

    // Enable trace
    SCS_DEMCR |= SCS_DEMCR_TRCEN;

    // Unlock and Setup TPIU for SWO UART mode
    TPIU_LAR = CS_LAR_UNLOCK;
    TPIU_SPPR = TPIU_SPPR_SWO_UART;
    TPIU_CSPSR = TPIU_CSPSR_PIN_1;

    // Unlock and enable all ITM stimulus ports with default settings
    ITM_LAR = CS_LAR_UNLOCK;
    ITM_TER = ITM_TER_ENABLE_ALL;
    ITM_TPR = ITM_TPR_ENABLE_USER_ALL;

    // Setup Baud rate
    if (itm_config.systemClock)
    {
        uint32_t prescalar = itm_config.systemClock / itm_config.baudRate;

        // Offset with current prescalar value
        uint32_t diff1 = itm_config.systemClock - (prescalar * itm_config.baudRate);
        // Offset with prescalar+1 value
        uint32_t diff2 = ((prescalar+1) * itm_config.baudRate) - itm_config.systemClock;

        if (diff2 < diff1) prescalar++;
        // Program prescalar value as (prescalar factor - 1)
        TPIU_ACPR = (prescalar - 1);
    }

    // Disable formatter
    TPIU_FFCR = 0;

    // Unlock DWT
    DWT_LAR = CS_LAR_UNLOCK;
}

/** Enable ITM */
void ITM_enableModule()
{
    // Enable ITM module
    ITM_TCR |= ITM_TCR_ENABLE_ITM;
}

```

```

/** Enable Data trace */
bool ITM_enableDataTrace(const uint32_t *variable, uint8_t index)
{
    uint_least8_t numDwtComp = (DWT_CTRL & DWT_CTRL_MASK_NUM_COMP) >>
DWT_CTRL_SHIFT_NUM_COMP;
    uint_least8_t dwtIndex = 0;
    bool dwtAvailable = false;
    DWT_COMP(index) = (uint32_t)variable;
    DWT_MASK(index) = 0x0;
    DWT_FUNC(index) = ( DWT_FUNC_ENABLE_ADDR_OFFSET | DWT_FUNC_ENABLE_COMP_RW);
    dwtAvailable = true;
    ITM_TCR |= ITM_TCR_ENABLE_DWT_TX;
    return dwtAvailable;
}

/** Enable ITM timing */
void ITM_enableTiming(ITM_tsPrescale tsPrescale)
{
    // Set timestamp prescaler enable timestamp generation
    ITM_TCR |= ((tsPrescale << ITM_TCR_TS_PRESCALE_SHIFT) & ITM_TCR_TS_PRESCALE_MASK);
    ITM_TCR |= (ITM_TCR_ENABLE_TS);
}

    /** Enable Sync packets */
void ITM_enableSyncPackets(ITM_syncPacketRate syncPacketRate)
{
    // Clear sync packet rate
    DWT_CTRL &= ~(DWT_CTRL_MASK_SYNCTAP);
    // Set sync packet rate
    DWT_CTRL |= ((syncPacketRate << DWT_CTRL_SHIFT_SYNCTAP) & DWT_CTRL_MASK_SYNCTAP);
    // Enable sync packet generation
    DWT_CTRL |= DWT_CTRL_ENABLE_CYC_CNT;
    ITM_TCR |= (ITM_TCR_ENABLE_SYNC);
}

/** Insert the below code snippet to Initialize ITM and enable data trace */
ITM_config itm_config = { 48000000, ITM_12000000};
    /** Setup ITM */
    {
        uint32_t *hci_rx_ptr = (uint32_t*) 0x4000180C; // MSP432 UART Rx register
        uint32_t *hci_tx_ptr = (uint32_t*) 0x4000180E; // MSP432 UART Tx register
        ITM_initModule(itm_config);
        ITM_enableDataTrace(hci_rx_ptr,0);
        ITM_enableDataTrace(hci_tx_ptr,1);
        ITM_enableModule();
    }
}

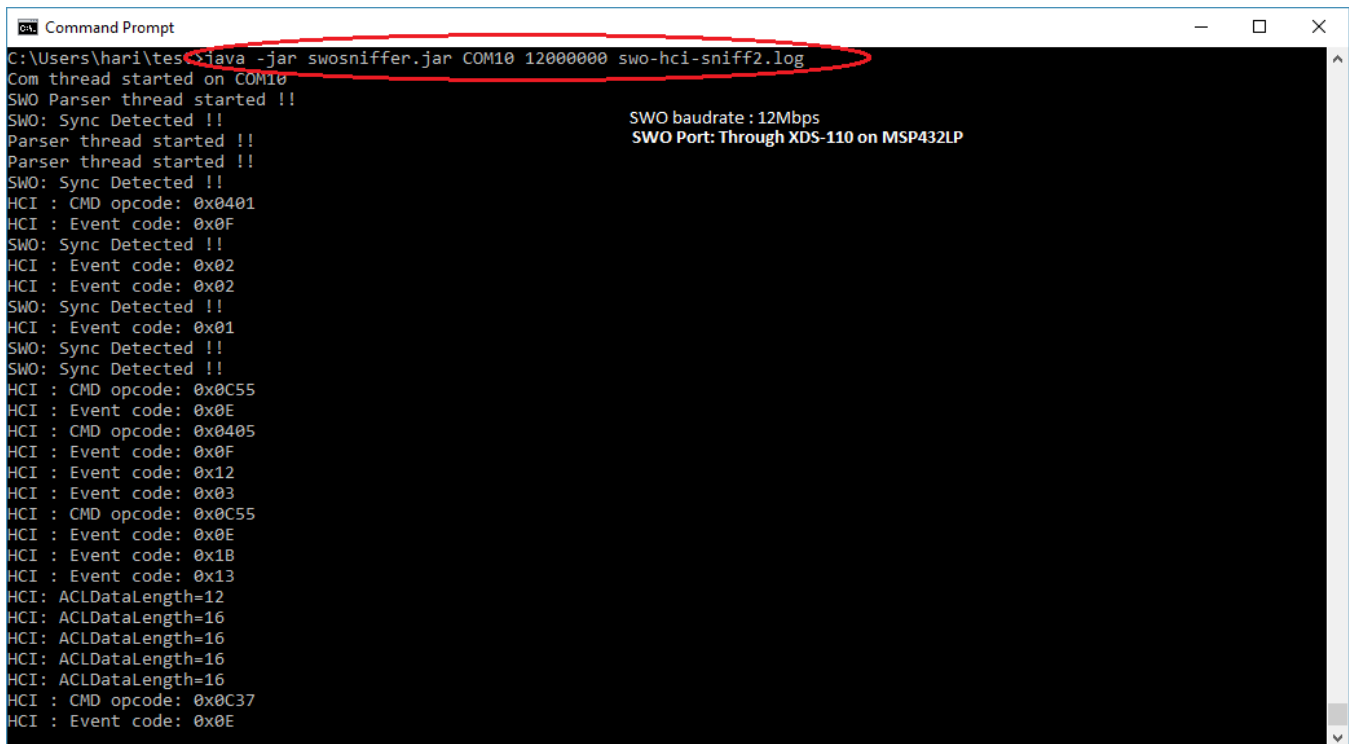

```

---

**NOTE:** The selected SWO baud rate must be supported by the MCU. On the MSP432E4, speeds up to 15 MHz are supported. Thus, in the above example code snippets SWO is configured for 12 MHz, with the MSP432 running at 48 MHz. If too much data is generated, ITM may insert overflow packets (0x70), thus the parser must be able to handle them and resync on the next synchronization packet.

---

## 5 BTSnoop File Format

The BTSnoop file format is suitable for storing Bluetooth HCI traffic. It closely resembles the snoop format, as documented in RFC 1761. Wireshark, FTE, and Ellisys BT analyzers accept BT snoop formatted files to display the message, event, and data sequences between the BT host and controllers.

Refer to the following link from Frontline Technologies for details on BTsnoop file format:  
[http://www.fte.com/webhelp/bpa600/Content/Technical\\_Information/BT\\_Snoop\\_File\\_Format.htm](http://www.fte.com/webhelp/bpa600/Content/Technical_Information/BT_Snoop_File_Format.htm).

### 5.1 HCI Viewers

Wireshark is a free and open source protocol analyzer. Both Frontline and Ellisys also provide free HCI viewers that can be used with BTsnoop files.

#### 5.1.1 Frontline HCI Sniffer

Download Frontline HCI sniffer [here](#). 

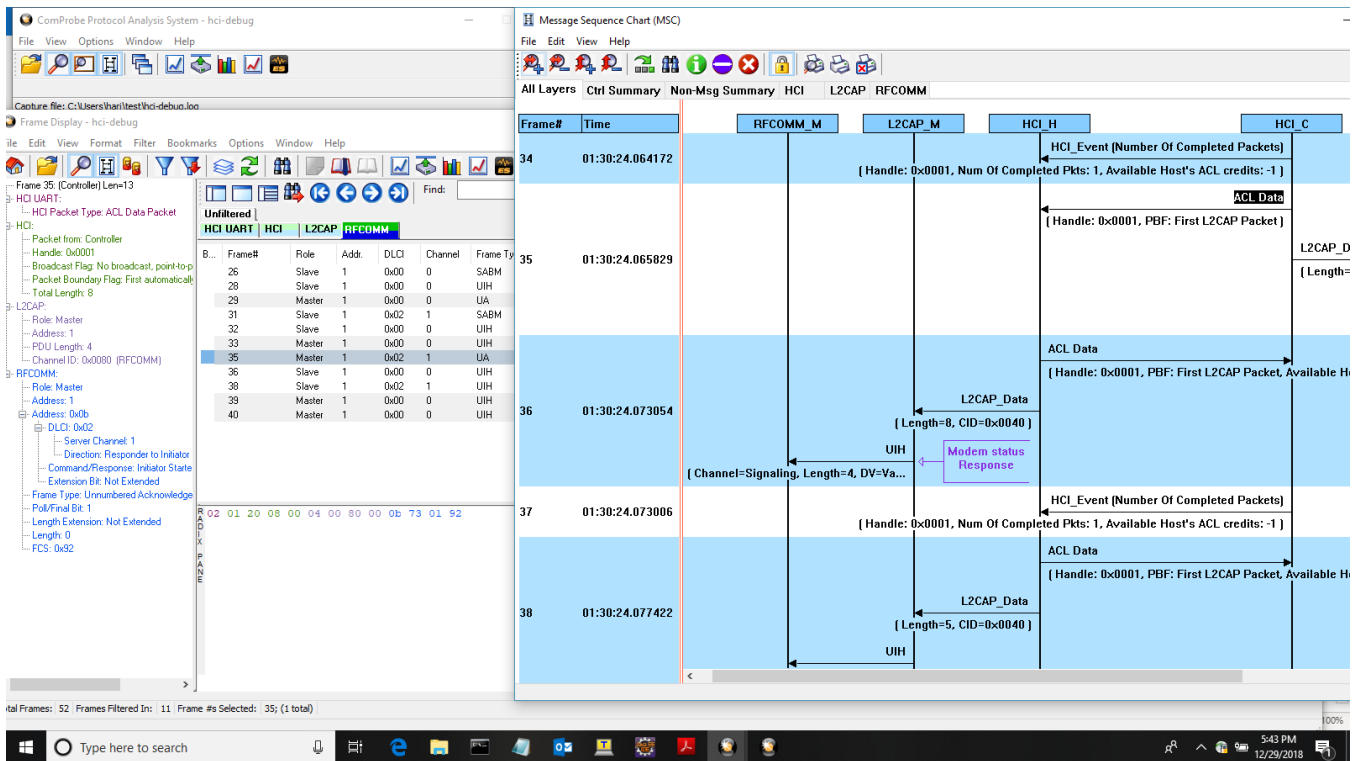

Figure 19. Frontline HCI Sniffer

Frontline HCI viewer accepts BTSnoop format files, and provides multiple views to analyze the data.

### 5.1.2 Wireshark

Wireshark is an open source, network protocol analyzer. It accepts capture files, in BTSnoop format, captured with 'hcidump' and 'btmon' utilities in a Linux host environment. Download it [here](#).

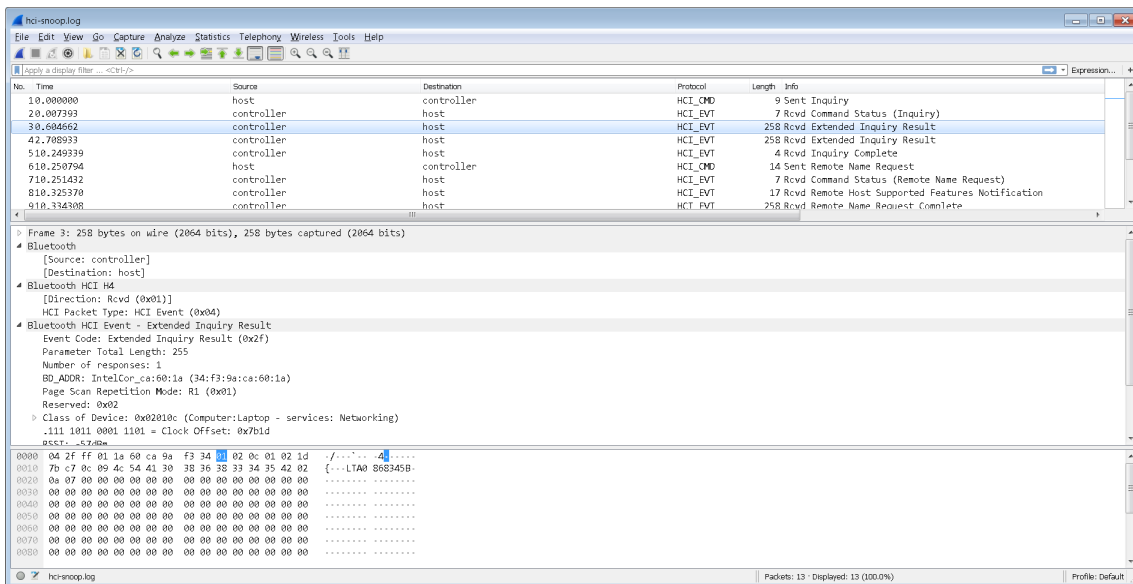

Figure 20. Wireshark

### 5.1.3 Ellisys

Ellisys protocol analyzer allows the import of BTSnoop format files. Use the Analyzer version 6928 or higher. Download it [here](#).
