Table 3-579. PPSE15MSTID_H Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPSE15_QUAD3_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPSE15_QUAD2_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.142 PPSE16MSTID_L Register (Offset = 4C0h) [Reset = 00000000h]

PPSE16MSTID_L is shown in PPSE16MSTID_L Register Field Descriptions.

Return to the DSS_PCR Registers.

Privileged Peripheral Extended Frame Master-ID Protection Register16_L

Table 3-580. PPSE16MSTID_L Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPSE16_QUAD1_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPSE16_QUAD0_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.143 PPSE16MSTID_H Register (Offset = 4C4h) [Reset = 00000000h]

PPSE16MSTID_H is shown in PPSE16MSTID_H Register Field Descriptions.

Return to the DSS_PCR Registers.

Privileged Peripheral Extended Frame Master-ID Protection Register16_H

Table 3-581. PPSE16MSTID_H Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPSE16_QUAD3_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. Return to the DSS_PCR Registers.

Privileged Peripheral Extended Frame Master-ID Protection Register24_L

Table 3-596. PPSE24MSTID_L Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPSE24_QUAD1_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPSE24_QUAD0_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.159 PPSE24MSTID_H Register (Offset = 504h) [Reset = 00000000h]

PPSE24MSTID_H is shown in PPSE24MSTID_H Register Field Descriptions.

Return to the DSS_PCR Registers.

Privileged Peripheral Extended Frame Master-ID Protection Register24_H

Table 3-597. PPSE24MSTID_H Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPSE24_QUAD3_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPSE24_QUAD2_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.160 PPSE25MSTID_L Register (Offset = 508h) [Reset = 00000000h]

PPSE25MSTID_L is shown in PPSE25MSTID_L Register Field Descriptions.

Return to the DSS_PCR Registers.

Privileged Peripheral Extended Frame Master-ID Protection Register25_L

Table 3-598. PPSE25MSTID_L Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPSE31_QUAD3_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPSE31_QUAD2_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.174 PCS0MSTID Register (Offset = 540h) [Reset = FFFFFFFFh]

PCS0MSTID is shown in PCS0MSTID Register Field Descriptions.

Return to the DSS_PCR Registers.

Memory Frame Master ID Protection Register0

Table 3-612. PCS0MSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PCS1MSTID	R/W	FFFFh	There are 16 bits for each frame in PCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The following examples shows the usage of these register bits. (a) If bits 15:0 is 1010_1010_1010_1010, memory frame mapped to PCSm can be addressed by Masters with Master-ID equals 1,3,5,7,9,11,13,15. (b) If bits 31:24 is 1100_1100_1100_1100, memory frame mapped to PCS(m+1) can be addressed by Masters with Master-ID equals 2,3,6,7,10,11,14,15. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERRORr. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0
15-0	PCS0MSTID	R/W	FFFFh	There are 16 bits for each frame in PCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The following examples shows the usage of these register bits. (a) If bits 15:0 is 1010_1010_1010_1010, memory frame mapped to PCSm can be addressed by Masters with Master-ID equals 1,3,5,7,9,11,13,15. (b) If bits 31:24 is 1100_1100_1100_1100, memory frame mapped to PCS(m+1) can be addressed by Masters with Master-ID equals 2,3,6,7,10,11,14,15. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERRORr. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0

3.4.3.175 PCS1MSTID Register (Offset = 544h) [Reset = FFFFFFFFh]

PCS1MSTID is shown in PCS1MSTID Register Field Descriptions.

Return to the DSS_PCR Registers.

Memory Frame Master ID Protection Register1

Table 3-613. PCS1MSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PCS3MSTID	R/W	FFFFh	There are 16 bits for each frame in PCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The following examples shows the usage of these register bits. (a) If bits 15:0 is 1010_1010_1010_1010, memory frame mapped to PCSm can be addressed by Masters with Master-ID equals 1,3,5,7,9,11,13,15. Table 3-624. PCS12MSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PCS25MSTID	R/W	0h	There are 16 bits for each frame in PCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The following examples shows the usage of these register bits. (a) If bits 15:0 is 1010_1010_1010_1010, memory frame mapped to PCSm can be addressed by Masters with Master-ID equals 1,3,5,7,9,11,13,15. (b) If bits 31:24 is 1100_1100_1100_1100, memory frame mapped to PCS(m+1) can be addressed by Masters with Master-ID equals 2,3,6,7,10,11,14,15. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERRORr. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0
15-0	PCS24MSTID	R/W	0h	There are 16 bits for each frame in PCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The following examples shows the usage of these register bits. (a) If bits 15:0 is 1010_1010_1010_1010, memory frame mapped to PCSm can be addressed by Masters with Master-ID equals 1,3,5,7,9,11,13,15. (b) If bits 31:24 is 1100_1100_1100_1100, memory frame mapped to PCS(m+1) can be addressed by Masters with Master-ID equals 2,3,6,7,10,11,14,15. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERRORr. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0

3.4.3.187 PCS13MSTID Register (Offset = 574h) [Reset = 00000000h]

PCS13MSTID is shown in PCS13MSTID Register Field Descriptions.

Return to the DSS_PCR Registers.

Memory Frame Master ID Protection Register13

Table 3-625. PCS13MSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PCS27MSTID	R/W	0h	There are 16 bits for each frame in PCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The following examples shows the usage of these register bits. (a) If bits 15:0 is 1010_1010_1010_1010, memory frame mapped to PCSm can be addressed by Masters with Master-ID equals 1,3,5,7,9,11,13,15. PPCS4MSTID is shown in PPCS4MSTID Register Field Descriptions.

Return to the DSS_PCR Registers.

Memory Frame Master ID Protection Register36

Table 3-648. PPCS4MSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPCS9MSTID	R/W	0h	There are 16 bits for each frame in PPCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPCS8MSTID	R/W	0h	There are 16 bits for each frame in PPCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.211 PPCS5MSTID Register (Offset = 5D4h) [Reset = 00000000h]

PPCS5MSTID is shown in PPCS5MSTID Register Field Descriptions.

Return to the DSS_PCR Registers.

Memory Frame Master ID Protection Register37

Table 3-649. PPCS5MSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPCS11MSTID	R/W	0h	There are 16 bits for each frame in PPCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPCS10MSTID	R/W	0h	There are 16 bits for each frame in PPCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.212 PPCS6MSTID Register (Offset = 5D8h) [Reset = 00000000h]

PPCS6MSTID is shown in PPCS6MSTID Register Field Descriptions.

Return to the DSS_PCR Registers.

Memory Frame Master ID Protection Register38

Table 3-650. PPCS6MSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPCS13MSTID	R/W	0h	There are 16 bits for each frame in PPCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPCS12MSTID	R/W	0h	There are 16 bits for each frame in PPCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.213 PPCS7MSTID Register (Offset = 5DCh) [Reset = 00000000h]

PPCS7MSTID is shown in PPCS7MSTID Register Field Descriptions.

Return to the DSS_PCR Registers.

Memory Frame Master ID Protection Register39

Table 3-651. PPCS7MSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPCS15MSTID	R/W	0h	There are 16 bits for each frame in PPCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPCS14MSTID	R/W	0h	There are 16 bits for each frame in PPCS. These bits sets the permission for maximum of 16 masters to address the memory mapped in each of the frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.214 PCREXTMSTID Register (Offset = 5E0h) [Reset = 00000000h]

PCREXTMSTID is shown in PCREXTMSTID Register Field Descriptions.

Return to the DSS_PCR Registers.

Master-ID Protection Register for external PCR

Table 3-652. PCREXTMSTID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	PCREXT_MSTID	R/W	0h	These bits sets the permission for maximum of 16 masters to address the external PCR frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

4.1 Initialization Overview

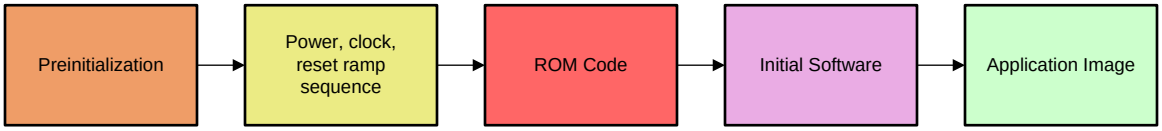

Figure 4-1. Device Initialization

Below is an overview of the initialization process and its steps:

- **Preinitialization:** Power, clock, and control connections must be present, and the boot configuration pins must be held at the desired logical levels.
- **Power, clock, reset ramp sequence:** Specific sequence that is applied by the power-management chip
- **ROM code:** Responsible for finding, downloading, and executing the initial software (SBL)
- **Initial software:** Software that loads, prepares, and passes control to application software.
- **Application Image:** The application that runs on the main core/processor.

The first two steps in the initialization process are hardware-oriented; however, they require an understanding of the process of configuring these system interface pins (balls on the device), which have software-configurable functionality. This configuration is an essential part of the chip configuration and is application-dependent. This chapter discusses these system-interface pins, the associated configuration registers, and memory structures that are vital to the correct initialization of the device.

4.2 Boot Process

4.2.1 ROM Code Overview

ROM bootloader (or ROM Code) is a software that resides in a on-chip read-only memory (ROM) to assist the customer in transferring and executing their application code. The device has two ROM codes that work together – the MCU ROM (R5F ROM) code and the HSM ROM code.

To accommodate various system scenarios, the ROM code supports several boot modes. These boot modes can be broadly classified as:

- Host boot modes
- Memory boot modes.

During a host boot, the device is configured to receive code from a host through the selected interface (such as UART). Either the host writes the application code directly into internal memory over UART, or the ROM code receives the application code on the selected interface and stores it in internal memory.

During a memory boot, the device transfers code from non-volatile memory to internal memory for execution.

In all boot modes, the entire boot operation can be partitioned into two sections:

- Hardware initialization phase
- Boot process

During initialization, the ROM code configures the device resources (PLLs, peripherals, pins) as needed to support the boot process. The resources used depend on the boot mode requirements. During the boot process,

the boot image can be loaded into device memory and executed, depending on the boot peripheral. HSM ROM code performs code verification and allows or forbids the image execution.

The main configuration source for boot after power-up are the SOP mode pins sampled automatically after reset release and stored in device status registers. At ROM code startup, these pin values are read from the registers to create the boot peripheral list, and the boot configuration tables used later to initialize and startup the PLLs and boot peripherals.

4.2.2 Boot Modes

MCU ROM supports the functionality of loading the secondary boot loader (SBL). The SBL can be loaded through QSPI (primary/secondary SBL) and UART. The primary use case of QSPI programming through UART interface is to support the uniFlash utility. UART QSPI programming may be applicable for certain use cases, such as initial FLASH programming in volume mass production, that can be achieved with special in-circuit gang programming tools.

Primary functional boot mode is through QSPI FLASH. MCU ROM supports managing multiple (primary and backup) QSPI SBL images. It can identify the primary image, and switch to secondary image load if primary image load fails.

Table 4-1. Boot Modes and Boot Media

Boot Mode/Peripheral	Boot Media/Host	Notes
QSPI	QSPI flash	Download and boot SBL from QSPI flash. Attempt Primary SBL, followed by Secondary SBL if primary loading fails: If above is not successful
UART	External host	Download and boot SBL from UART. Device is expected to get SBL from UART. We will support the XMODEM protocol for download over UART.

4.2.3 SOP Mode Pins

Table 4-2 lists the functional mode pin settings to be done for the SOP lines of the device to boot using different peripheral. New SOP modes will be added later.

Table 4-2. Functional Mode Pin Settings

Functional Mode	SOP Mode	PMIC_OUT	SYNC_OUT	TDO
Func Mode –QSPI	SOP_MODE4	0	0	1
Func Mode –UART	SOP_MODE5	1	0	1

Table 4-3. XTAL Detection Pin Settings

XTAL Selection	MSS_UARTA_TX (PAD_DB)	MSS_UARTB_TX (PAD_DE)
40MHz	0	0
50MHz	1	1

4.2.4 BOOT-ROM Architecture (RBL)

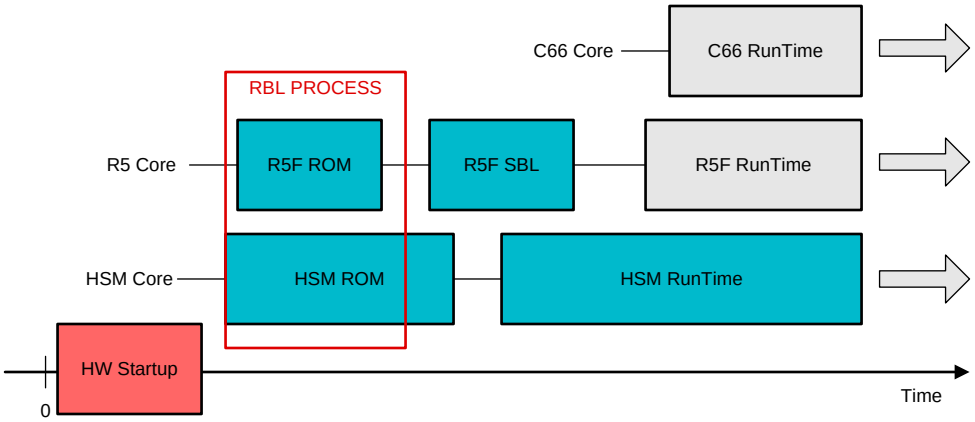

Figure 4-2. Boot Flow and Boot ROM Architecture

The RBL process goal is to load, verify, optionally decrypt, and launch an authentic R5F software image that accomplishes general-purpose/secure boot goals. The RBL process is implemented jointly by the R5F and HSM ROM as illustrated in Figure 4-3.

HSM ROM

This HSM ROM contains the first set of software instructions that is executed by any processor core on all AWR294x devices. All state changes in the device after the external reset is released but prior to the beginning of the HSM ROM code execution are purely a function of hardware logic. This hardware logic must perform sufficient ramp up and initialization to allow the Cortex M4 core of the HSM to leave reset and begin execution from its reset vector. The HSM ROM code is “time zero” software. The HSM ROM code is only intended to be used during the initial load of the secondary boot loader (SBL) and HSM RunTime image. HSM ROM is also responsible for providing Test/Debug capabilities when functional boot is interrupted.

R5F ROM

The R5F ROM code is only intended to be used during the initial load of the secondary boot loader (SBL). Its use at any other time in the lifecycle of a system is not supported. R5F ROM executes set of self-tests: PBIST (DATA SRAM, PROGRAM SRAM, and ROM Code Integrity) using a hardware-defined interface. If unsuccessful, the error condition is indicated, external ESM signal asserted, and boot does not proceed.

R5F SBL

This SBL can perform complete boot sequence on general purpose devices. Customers are expected to develop their own SBLs, supporting a wider range of requirements (such as different interfaces, additional protocols, different image formats, and so forth).

HSM RunTime/R5F Runtime/C66 Runtime

Out of scope of this document.

4.2.5 R5F SBL Loading

The SBL process starts with R5F executing loaded and verified R5F SBL code.

The only service exposed to R5F SBL by HSM ROM is the API to load the HSM RunTime. All other HSM services are outside of the HSM ROM. The R5 Boot ROM and HSM Boot ROM work together to load the R5F SBL. When the R5F SBL has been successfully validated and loaded, the R5F Boot-ROM is eclipsed and the R5F SBL executes.

Figure 4-3 is the simplified sequence of the boot process. It is provided for illustration purposes only. An illustration of the SBL and HSM RunTime is similar to what is shown in Figure 4-3.

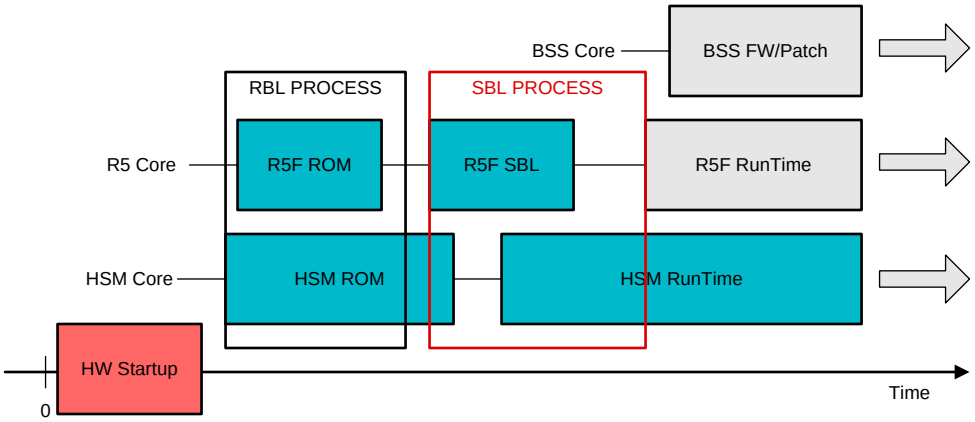

Figure 4-3. R5F SBL

HSM ROM configures the IPC interface, unhalts the R5F core, and then waits for a confirmation message from the R5F Core (over IPC). The R5F core sends a confirmation to the HSM ROM. The R5F ROM then configures the QSPI interface and reads the R5F SBL image from FLASH. The SBL image might or might not have integrity check enabled (based on the certificate). HSM ROM switches the memory map for R5F from ROM to RAM and resets the R5F to execute the SBL image. The HSM-ROM for GP devices is now locked (black-boxed). SBL can now load the multicore image (containing MSS & DSS application and RSS firware/patch images) to the corresponding RAMs and core soft-reset to jump to R5F RunTime. SBL or R5F RunTime can release out-of-reset & unhalt RadarSS and C66x subsysytems.

Note

R5F SBL is user spaced application, so SBL can be written as per customer requirement but within device capability. MMWAVE-MCUPLUS-SDK provides reference SBL implementation for AWR294x device.

5.1 Overview

PRCM manages clocks, resets, and power domain control of subsystems and modules inside the device. Additionally, configuration of certain device-level features is also performed through this module. PRCM has control and status registers to achieve this functionality. The Clock and Reset Management in AWR294x is distributed. The Main subsystem TOPRCM module controls all the Subsystem Resets and Clocks. The SubSystem RCM modules control their respective subsystem IPs

The available address space of PRCM is divided as in Figure 5-1.

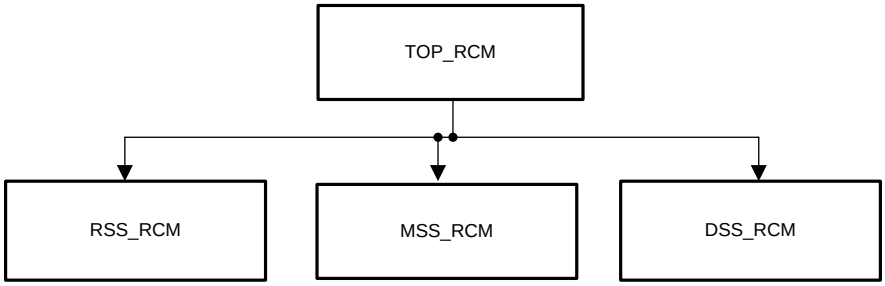

Figure 5-1. Device Configuration

Table 5-1. PRCM Space

PRCM Space	Description
MSS_TOPRCM	Top-level reset, clock management registers
MSS_RCM	Main subsystem reset, clock management registers
RSS_RCM	Radar subsystem reset, clock management registers
DSS_RCM	DSP reset, clock management registers

5.2 Control Registers

5.2.1 MSS_TOPRCM Registers

Table 5-2 lists the MSS_TOPRCM registers. All register offset addresses not listed in Table 5-2 should be considered as reserved locations and the register contents should not be modified.

Table 5-2. MSS_TOPRCM Registers

Offset	Acronym	Register Name	Section
0h	PID	PID register	Section 5.2.1.1
4h - 10h	RESERVED		Section 5.2.1.2

Table 5-47. PLL_CORE_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLESLIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading. SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	9h	Trim value for the PLL

Table 5-47. PLL_CORE_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low powe
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	R/W	X

Table 5-55. PLL_CORE_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	Status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	Status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
26-12	RESERVED	R	X	
11	CLKDCOLDOACK	R	0h	Status on PHASELOCK output pin
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	0h	Status of BYPASSACK output pin

Table 5-55. PLL_CORE_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

Table 5-99. PLL_DSP_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLESLIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading. SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	9h	Trim value for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low powe
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

Table 5-99. PLL_DSP_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	R/W	X	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode

Table 5-107. PLL_DSP_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	Status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	Status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
26-12	RESERVED	R	X	
11	CLKDCOLDOACK	R	0h	Status on PHASELOCK output pin
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	0h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

5.2.1.106 PLL_DSP_HSDIVIDER Register (Offset = 828h) [reset = X]

Table 5-114. PLL_PER_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLESLIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading. SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	9h	Trim value for the PLL

Table 5-114. PLL_PER_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low powe
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	R/W	X	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	RESERVED	R/W	X

R/W-0h				R/W-0h			

Table 5-132. ANA_REG_CLK_CTRL_REG1_XO_SLICER Register Field Descriptions

Bit	Field	Type	Reset	Description
31	OSC_CLKOUT_EN	R/W	0h	OSC_CLKOUT Enable Enables the Slicer clock to drive the OSC_CLKOUT output buffer. It is recommended that this bit be activated as the last step after fields OSC_CLKOUT_DRV, OSC_CLKOUT_CLRZ_DIV, and OSC_CLKOUT_FREQ_SEL have been configured. 0 = Clock Disabled 1 = Clock Enabled 0x00 = Functional Reset
30-29	OSC_CLKOUT_FREQ_SEL	R/W	0h	OSC_CLKOUT Frequency Selection Selects the output frequency as a division of the XTAL (or externally driven CLKP) frequency. x0 = XTAL/2 10 = XTAL/1 11 = XTAL/4 0x00 = Functional Reset
28	OSC_CLKOUT_CLRZ_DIV	R/W	0h	OSC_CLKOUT Divider ClearZ This active low signal permits the output frequency dividers to be properly cleared before enabling. 0 = All dividers cleared 1 = Normal divider function enabled 0x1 = Functional Reset
27-24	OSC_CLKOUT_DRV	R/W	0h	OSC_CLKOUT Drive This bit controls the drive strength of the OSC_CLKOUT buffer. 4'b0000 = No Test Output, Hi-Z Output Drive Ctrl = [4/9X][2/9X][2/9X][1/9X] 0xF = Functional Reset
23-13	RESERVED	R/W	0h	Reserved Reads return 0x0 and writes have no effect. 0x0 = Functional Reset
12	XTAL_DETECT_XO_SLICER	R/W	0h	XTAL Detect Enable This bit connects a pullup and sense circuitry to CLKM to detect the presence or absence of a crystal. This operation will conflict with oscillator functionality, so this bit must be asserted only when the oscillator is disabled (CTRL_CLKTOP_REG1 bit 2 must be "0"). After asserted, the internal XTAL_SENSE signal will reflect a "1" if a crystal is present (CLKM sees a high impedance) or "0" if CLKM is tied to ground. After the sense operation is detected, this bit must be cleared before the oscillator will function properly if enabled. 0 = Normal operation (pullup and sense circuitry are disconnected from CLKM, XTAL_SENSE outputs "1") 1 = XTAL sense function enabled (pullup and sense circuitry connected to CLKM, output of XTAL_SENSE reads "1" if high impedance, "0" if CLKM is tied to ground) 0x0 = Functional Reset
11	SLICER_DCCPL_XO_SLICER	R/W	0h	Slicer DC-Coupled Mode 0 = Normal operation (AC-couple CLKP to internal slicer) 1 = DC-couple CLKP to internal slicer to CLKP 0x0 = Functional Reset
10	SLICER_HIPWR_XO_SLICER	R/W	0h	Slicer High-power Mode This bit bypasses the input clock slicer current-starving/filtering circuitry to increase gain and reduce device phase-noise at the expense of power and reduced supply noise rejection. This permits the use of a high-speed external test clock (660MHz max). 0 = Normal operation (current-limiting present) 1 = High-power/high-speed test mode 0x0 = Functional Reset
9	FASTCHARGEZ_BIAS_XO_SLICER	R/W	0h	Bias Fast-charge Enable (Active Low) This bit bypasses the RC filtering on the XOSC/SLICER Bias to permit more rapid power-up. 0 = Bias fast-charge 1 = Normal operation (filtering present) 0x1 = Functional Reset
8-4	XOSC_DRIVE_XO_SLICER	R/W	0h	Crystal Oscillator Output Drive Binary-weighted oscillator drive control 0x0 = Functional Reset
3-0	RTRIM_BIAS_XO_SLICER	R/W	0h	Crystal Oscillator and Slicer Bias RTrim Binary-weighted bias control 0x0 = Functional Reset

5.2.1.131 ANA_REG_CLK_CTRL_REG1_CLKTOP Register (Offset = C04h) [reset = 7h]

Table 5-340. DSP_PD_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	proc_halt	R/W	1h	Controls the unhalting on the processor during the power-up sequence Write 1 : The DSP is kept in halt state at the end of the power up sequence. The L2 memories can now be initialised and loaded before setting this bit to 0, unhalting the processor and begin execution Write 0 : The processor is unhalted at the end of the power up sequence. Here the assumption is the code is already downloaded in L2 and the processor can immediatey being execution on power up.
3-1	RESERVED	R/W	X	
0	interrupt_mask	R/W	1h	Masks interrupts to the DSP. Write 1 : Mask interrupts to the DSP before powering off the DSP. When masked, any interrupts are now stored in the Missed event register. Write 0 : Send the interrupts to the DSP after power on.

5.2.3.7 DSP_PD_TRIGGER_WAKUP Register (Offset = 18h) [reset = X]

DSP_PD_TRIGGER_WAKUP is shown in Figure 5-338 and described in Table 5-341.

RESERVED						lock_step_switch_wait	
R/W-X						R/W-0h	
7	6	5	4	3	2	1	0
RESERVED						lock_step	
R/W-X						R/W-7h	

Table 5-1338. R5_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	X	
26-24	rom_wait_state	R/W	0h	writing '111' enables a single cycle wait state with respect to CR5A_clk for rom access. This needs to be set when R5 clock is at 400MHZ and Interconnect-clk is at 200MHZ. (because it is a timing issue in this scenario)
23-19	RESERVED	R/W	X	
18-16	reset_fsm_trigger	R/W	0h	Write pulse bit field: writing 3'b111 will trigger the reset FSM. Reset FSM ensures reset to R5SS and inturn ensures the latching of lock_step and also mem_swap bit
15-11	RESERVED	R/W	X	
10-8	lock_step_switch_wait	R/W	0h	writing 3'b111 ensures switch happens only after R5SS reset. Orelse it will be a immediate switch.
7-3	RESERVED	R/W	X	
2-0	lock_step	R/W	7h	writing 3'b000 ensures R5 to be in Dual-Core mode. Note: The change happens after the R5SS reset assertion if R5_CONTROL_lock_step_switch_wait is set. Or else the switiching to Dual-core happens on the fly.

5.2.6.442 R5_ROM_ECLIPSE Register (Offset = 804h) [reset = X]

R5_ROM_ECLIPSE is shown in Figure 5-1333 and described in Table 5-1339.

Return to the Table 5-897.

R/W-X						R/W-0h	
7	6	5	4	3	2	1	0
RESERVED						memswap	
R/W-X						R/W-0h	

Table 5-1339. R5_ROM_ECLIPSE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	X	
10-8	memswap_wait	R/W	0h	writing 3'b111 ensures ROM-Eclipsing happens only after R5SS reset. Orelse it will be a immediate change.
7-3	RESERVED	R/W	X	
2-0	memswap	R/W	0h	writing '111' ensures eclipsing of CR5A_ROM immediately if memswap_wait is not set. If memswap_wait is set then ROM is eclipsed after R5SS reset assertion.

5.2.6.443 R5_COREA_HALT Register (Offset = 808h) [reset = X]

R5_COREA_HALT is shown in Figure 5-1334 and described in Table 5-1340.

Return to the Table 5-897.

Complex bit access types are encoded to fit into small table cells. RSS_CTRL Access Type Codes shows the codes that are used for access types in this section.

Table 5-1365. RSS_CTRL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		

Table 5-1365. RSS_CTRL Access Type Codes (continued)

Access Type	Code	Description
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

5.2.7.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in PID Register Field Descriptions.

Return to the RSS_CTRL Registers.

PID register

Table 5-1366. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.7.2 RSS_TPCC_A_ERRAGG_MASK Register (Offset = 8h) [Reset = X]

RSS_TPCC_A_ERRAGG_MASK is shown in RSS_TPCC_A_ERRAGG_MASK Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1367. RSS_TPCC_A_ERRAGG_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25	tptc_a0_read_access_error	R/W	0h	
24	tpcc_a_read_access_error	R/W	0h

5.2.7.8 RSS_TPCC_MEMINIT_START Register (Offset = 20h) [Reset = X]

RSS_TPCC_MEMINIT_START is shown in RSS_TPCC_MEMINIT_START Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1373. RSS_TPCC_MEMINIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	tpcc_a_meminit_start	R/W	0h	Start Memory intialization of memory. Write 0x1 to start memory initilization. Write 0x0 after ensuring Memory intilization is in progress or has completed.

5.2.7.9 RSS_TPCC_MEMINIT_DONE Register (Offset = 24h) [Reset = X]

RSS_TPCC_MEMINIT_DONE is shown in RSS_TPCC_MEMINIT_DONE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1374. RSS_TPCC_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	tpcc_a_meminit_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is complte. Write 0x1 to clear status.

5.2.7.10 RSS_TPCC_MEMINIT_STATUS Register (Offset = 28h) [Reset = X]

RSS_TPCC_MEMINIT_STATUS is shown in RSS_TPCC_MEMINIT_STATUS Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1375. RSS_TPCC_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	tpcc_a_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is in progress.

5.2.7.11 TPTC_DBS_CFG Register (Offset = 2Ch) [Reset = X]

TPTC_DBS_CFG is shown in TPTC_DBS_CFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1376. TPTC_DBS_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3-2	tptc_a1	R/W	0h	Max Burst size tieoff value for TPTC A1
1-0	tptc_a0	R/W	0h	Max Burst size tieoff value for TPTC A0

5.2.7.12 RSS_TPCC_A_PARITY_CTRL Register (Offset = 30h) [Reset = X]

RSS_TPCC_A_PARITY_CTRL is shown in RSS_TPCC_A_PARITY_CTRL Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1377. RSS_TPCC_A_PARITY_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	X	
2	parity_err_clr	R/W	0h	Write 0x1 to clear the Parit Error status for TPCC
1	parity_testen	R/W	0h	Enable Parity Test for TPCC. Write 0x1 : Parity Test is enabled on PARAM memory
0	parity_en	R/W	0h	Enable Parity for TPCC. Write 0x1 : Parity is enabled on PARAM memory

5.2.7.13 RSS_TPCC_A_PARITY_STATUS Register (Offset = 34h) [Reset = X]

RSS_TPCC_A_PARITY_STATUS is shown in RSS_TPCC_A_PARITY_STATUS Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1378. RSS_TPCC_A_PARITY_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	X	
15-8	parity_addr	R	0h	TPCC Error Address at which Parity Error occurred
7-0	RESERVED	R	X	

5.2.7.14 RSS_CSI2A_CFG Register (Offset = 38h) [Reset = X]

RSS_CSI2A_CFG is shown in RSS_CSI2A_CFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1379. RSS_CSI2A_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	sof_intr1_sel	R/W	0h	Select the Start of Frame Contx to be sent as RCSS_CSI2A_SOF_INT1 Write 0 : Start of Frame for Context 0 will be propagated on this interrupt line Write 7 : Start of Frame for Context 7 will be propagated on this interrupt line
27	RESERVED	R/W	X	
26-24	sof_intr0_sel	R/W	0h	Select the Start of Frame Contx to be sent as RCSS_CSI2A_SOF_INT0 Write 0 : Start of Frame for Context 0 will be propagated on this interrupt line Write 7 : Start of Frame for Context 7 will be propagated on this interrupt line
23	RESERVED	R/W	X	
22-20	eof_intr1_sel	R/W	0h	Select the End of Frame Contx to be sent as RCSS_CSI2A_EOF_INT1 Write 0 : Start of Frame for Context 0 will be propagated on this interrupt line Write 7 : Start of Frame for Context 7 will be propagated on this interrupt line
19-17	eof_intr0_sel	R/W	0h	Select the End of Frame Contx to be sent as RCSS_CSI2A_EOF_INT0 Write 0 : Start of Frame for Context 0 will be propagated on this interrupt line Write 7 : Start of Frame for Context 7 will be propagated on this interrupt line
16	sign_ext_en	R/W	0h	Sign Extention Enable for CSI2 A
15-9	RESERVED	R/W	X	
8	mwait	R/W	0h	Power Idle Protocol related Mwait Port
7-5	RESERVED	R/W	X	
4-0	lane_enable	R/W	0h	Lane enable for CSI2 A

5.2.7.15 RSS_CSI2A_CTX0_LINE_PING_PONG Register (Offset = 3Ch) [Reset = X]

RSS_CSI2A_CTX0_LINE_PING_PONG is shown in RSS_CSI2A_CTX0_LINE_PING_PONG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1380. RSS_CSI2A_CTX0_LINE_PING_PONG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RESERVED	R/W	X	
16	enable	R/W	0h	Enable line based ping pong toggle for Context 0 0 : Diabled 1:Enabled
15-0	num_lines	R/W	0h	Configure the number of lines for ping pong toggle for Context 0

5.2.7.16 RSS_CSI2A_CTX1_LINE_PING_PONG Register (Offset = 40h) [Reset = X]

RSS_CSI2A_CTX1_LINE_PING_PONG is shown in RSS_CSI2A_CTX1_LINE_PING_PONG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1381. RSS_CSI2A_CTX1_LINE_PING_PONG Register Field Descriptions

Return to the RSS_CTRL Registers.

Table 5-1498. RSS_ADCBUF_PONG_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is in progress.

5.2.7.134 SOC_TO_BSS_SW_INT Register (Offset = 2C8h) [Reset = X]

SOC_TO_BSS_SW_INT is shown in SOC_TO_BSS_SW_INT Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1499. SOC_TO_BSS_SW_INT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	trig	R/W	0h	Write Pulse Bit field writing to each bit field <0-7>: 1'b1:triggers BSS_SW_INT_RSS_CTRL<0-7> to BSS

5.2.7.135 RSS_DBG_ACK_CTL0 Register (Offset = 2CCh) [Reset = X]

RSS_DBG_ACK_CTL0 is shown in RSS_DBG_ACK_CTL0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1500. RSS_DBG_ACK_CTL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	X	
2-0	frc	R/W	0h	emulation suspend signal control . Writing '111' would ungate the emulation suspend signal to the FRC

5.2.7.136 DMMSWINT1 Register (Offset = 2D0h) [Reset = X]

DMMSWINT1 is shown in DMMSWINT1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1501. DMMSWINT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	RESERVED	R/W	X	
22	DMMCQWREN	R/W	0h	CQ Write Enable from DMM. 0 --> Write to CQ memory will happen from DFE and Ping-pong select will come from HW FSM (same as ADC Buffer ping-pong select). 1 --> Write to CQ memory will happen from CQ_W slave port in DSS interconnect using DMM as master and Ping-pong select will come from DMMCQPINPONSEL register.
21	DMMCQPINPONSEL	R/W	0h	CQ Ping Pong select for HIL Mode
20-19	RESERVED	R/W	X	
18	DMMCPWREN	R/W	0h	Writing 1'b1: Enables DMM writes in to CP read registers 1'b0: Disables DMM writes to CP read registers
17	DMMADCBUFWREN	R/W	0h	ADC Buffer Write Enable from DMM. 0 --> Write to ADC BUF memory will happen from DFE and Ping-pong select will come from HW FSM (same as ADC Buffer ping-pong select). 1 --> Write to CQ memory will happen from ADCBUF_W slave port in DSS interconnect using DMM as master and Ping-pong select will come from DMMADCBUFPINPONSEL register.
16	DMMADCBUFPINPONSEL	R/W	0h	ADC Buffer Ping Pong select for HIL Mode
15-0	RESERVED	R/W	X	

5.2.7.137 RSS_SHARED_MEM_MEMINIT Register (Offset = 2D4h) [Reset = X]

RSS_SHARED_MEM_MEMINIT is shown in RSS_SHARED_MEM_MEMINIT Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1502. RSS_SHARED_MEM_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	start	R/W	0h	Start Memory intialization of memory. Write 0x1 to start memory initilization. Write 0x0 after ensuring Memory intilization is in progress or has completed.

5.2.7.138 RSS_SHARED_MEM_MEMINIT_DONE Register (Offset = 2D8h) [Reset = X]

RSS_SHARED_MEM_MEMINIT_DONE is shown in RSS_SHARED_MEM_MEMINIT_DONE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1503. RSS_SHARED_MEM_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is complte. Write 0x1 to clear status.

5.2.7.139 RSS_SHARED_MEM_MEMINIT_STATUS Register (Offset = 2DCh) [Reset = X]

RSS_SHARED_MEM_MEMINIT_STATUS is shown in RSS_SHARED_MEM_MEMINIT_STATUS Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1504. RSS_SHARED_MEM_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is in progress.

5.2.7.140 RSS_CSI_ACCESS_MODE Register (Offset = 2E0h) [Reset = X]

RSS_CSI_ACCESS_MODE is shown in RSS_CSI_ACCESS_MODE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1505. RSS_CSI_ACCESS_MODE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	csi2a_sel	R/W	1h	writing 1'b0 : ensures all the accesses from CSI2A are user-mode writing 1'b1 : ensures all the accesses from CSI2A are privilege mode

5.2.7.141 BSS_CONTROL Register (Offset = 400h) [Reset = X]

BSS_CONTROL is shown in BSS_CONTROL Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1506. BSS_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	dss_l3_access	R/W	0h	writing 3'b111 allocates DSS_L3_BANKD 256KB as TCM for RSS_CR4
27	RESERVED	R/W	X	
26-24	halt	R/W	7h	writing 3'b000 unhalts BSS. This is expected to be writen only once per processor reset cycle.
23-19	RESERVED	R/W	X	
18-16	wfi_override	R/W	0h	writing 3'b111 overrides the WFI signal from CR4 and asserts it.
15-12	RESERVED	R/W	X	
11-0	bootmode	R/W	0h	writing 12'h000 : selects the normal boot mode for CR4. 12'h111 : selects the FW dev mode for CR4 12'h222 : selects the orbit mode for CR4 12'h333 : selects the 14xx ROM swap mode

5.2.7.142 BSS_TCM_MEMINIT Register (Offset = 404h) [Reset = X]

BSS_TCM_MEMINIT is shown in BSS_TCM_MEMINIT Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1507. BSS_TCM_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	mem0_init	R/W	0h	Start Memory intialization of memory. Write 0x1 to start memory initilization.

5.2.7.143 BSS_TCM_MEMINIT_DONE Register (Offset = 408h) [Reset = X]

BSS_TCM_MEMINIT_DONE is shown in BSS_TCM_MEMINIT_DONE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1508. BSS_TCM_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	mem0_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is complte. Write 0x1 to clear status.

5.2.7.144 BSS_TCM_MEMINIT_STATUS Register (Offset = 40Ch) [Reset = X]

BSS_TCM_MEMINIT_STATUS is shown in BSS_TCM_MEMINIT_STATUS Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1509. BSS_TCM_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	mem0_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is in progress.

5.2.7.145 BSS_VIM_MEMINIT Register (Offset = 410h) [Reset = X]

BSS_VIM_MEMINIT is shown in BSS_VIM_MEMINIT Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1510. BSS_VIM_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	mem0_init	R/W	0h	Start Memory intialization of memory. Write 0x1 to start memory initilization.

5.2.7.146 BSS_VIM_MEMINIT_DONE Register (Offset = 414h) [Reset = X]

BSS_VIM_MEMINIT_DONE is shown in BSS_VIM_MEMINIT_DONE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1511. BSS_VIM_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	mem0_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is complte. Write 0x1 to clear status.

5.2.7.147 BSS_VIM_MEMINIT_STATUS Register (Offset = 418h) [Reset = X]

BSS_VIM_MEMINIT_STATUS is shown in BSS_VIM_MEMINIT_STATUS Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1512. BSS_VIM_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	mem0_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is in progress.

5.2.7.148 BSS_DFE_MEMINIT Register (Offset = 41Ch) [Reset = X]

BSS_DFE_MEMINIT is shown in BSS_DFE_MEMINIT Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1513. BSS_DFE_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	mem0_init	R/W	0h	Start Memory intialization of memory. Write 0x1 to start memory initilization.

5.2.7.149 BSS_DFE_MEMINIT_DONE Register (Offset = 420h) [Reset = X]

BSS_DFE_MEMINIT_DONE is shown in BSS_DFE_MEMINIT_DONE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1514. BSS_DFE_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	mem0_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is complte. Write 0x1 to clear status.

5.2.7.150 BSS_DFE_MEMINIT_STATUS Register (Offset = 424h) [Reset = X]

BSS_DFE_MEMINIT_STATUS is shown in BSS_DFE_MEMINIT_STATUS Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1515. BSS_DFE_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	mem0_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is in progress.

5.2.7.151 BSS_RAMPGEN_MEMINIT Register (Offset = 428h) [Reset = X]

BSS_RAMPGEN_MEMINIT is shown in BSS_RAMPGEN_MEMINIT Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1516. BSS_RAMPGEN_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	mem0_init	R/W	0h	Start Memory intialization of memory. Write 0x1 to start memory initilization.

5.2.7.152 BSS_RAMPGEN_MEMINIT_DONE Register (Offset = 42Ch) [Reset = X]

BSS_RAMPGEN_MEMINIT_DONE is shown in BSS_RAMPGEN_MEMINIT_DONE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1517. BSS_RAMPGEN_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	mem0_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is complte. Write 0x1 to clear status.

5.2.7.153 BSS_RAMPGEN_MEMINIT_STATUS Register (Offset = 430h) [Reset = X]

BSS_RAMPGEN_MEMINIT_STATUS is shown in BSS_RAMPGEN_MEMINIT_STATUS Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1518. BSS_RAMPGEN_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	mem0_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory intialization of memory is in progress.

5.2.7.154 BSS_DSS_L3_STICKY Register (Offset = 434h) [Reset = X]

BSS_DSS_L3_STICKY is shown in BSS_DSS_L3_STICKY Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1519. BSS_DSS_L3_STICKY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	X	
2-0	sticky_enable	R/W	0h	writing 3'b111 make the BSS_CONTROL::DSS_L3_ACCESS_ENABLE sticky. Further writes to DSS_L3_ACCESS_ENABLE wont impact the register

5.2.7.155 BSS_DSS_L3_ACCESS Register (Offset = 438h) [Reset = X]

BSS_DSS_L3_ACCESS is shown in BSS_DSS_L3_ACCESS Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1520. BSS_DSS_L3_ACCESS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	status	R	0h	reading 1'b0: DSS_L3_BANKD1 is not allocated to BSS_TCMA 1'b1: DSS_L3_BANKD1 is allocated to BSS_TCMA

5.2.7.156 TESTPATTERNRX1ICFG Register (Offset = 800h) [Reset = 00010000h]

TESTPATTERNRX1ICFG is shown in TESTPATTERNRX1ICFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1521. TESTPATTERNRX1ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX1IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.
15-0	TSTPATRX1IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.

5.2.7.157 TESTPATTERNRX2ICFG Register (Offset = 804h) [Reset = 00010000h]

TESTPATTERNRX2ICFG is shown in TESTPATTERNRX2ICFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1522. TESTPATTERNRX2ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX2IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 1.
15-0	TSTPATRX2IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 1.

5.2.7.158 TESTPATTERNRX3ICFG Register (Offset = 808h) [Reset = 00010000h]

TESTPATTERNRX3ICFG is shown in TESTPATTERNRX3ICFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1523. TESTPATTERNRX3ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX3IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 2
15-0	TSTPATRX3IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 2

5.2.7.159 TESTPATTERNRX4ICFG Register (Offset = 80Ch) [Reset = 00010000h]

TESTPATTERNRX4ICFG is shown in TESTPATTERNRX4ICFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1524. TESTPATTERNRX4ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX4IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 3
15-0	TSTPATRX4IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 3

5.2.7.160 TESTPATTERNRX1QCFG Register (Offset = 810h) [Reset = 00010000h]

TESTPATTERNRX1QCFG is shown in TESTPATTERNRX1QCFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1525. TESTPATTERNRX1QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX1QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.
15-0	TSTPATRX1QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.

5.2.7.161 TESTPATTERNRX2QCFG Register (Offset = 814h) [Reset = 00010000h]

TESTPATTERNRX2QCFG is shown in TESTPATTERNRX2QCFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1526. TESTPATTERNRX2QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX2QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 1.
15-0	TSTPATRX2QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 1.

5.2.7.162 TESTPATTERNRX3QCFG Register (Offset = 818h) [Reset = 00010000h]

TESTPATTERNRX3QCFG is shown in TESTPATTERNRX3QCFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1527. TESTPATTERNRX3QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX3QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 2
15-0	TSTPATRX3QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 2

5.2.7.163 TESTPATTERNRX4QCFG Register (Offset = 81Ch) [Reset = 00010000h]

TESTPATTERNRX4QCFG is shown in TESTPATTERNRX4QCFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1528. TESTPATTERNRX4QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX4QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 3
15-0	TSTPATRX4QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 3

5.2.7.164 TESTPATTERNVLDCFG Register (Offset = 820h) [Reset = X]

TESTPATTERNVLDCFG is shown in TESTPATTERNVLDCFG Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1529. TESTPATTERNVLDCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	X	
10-8	TSTPATGENEN	R/W	0h	Enable for test pattern generator. This is used to Mux with the functional data from BSS. 000 -->Disable, 111-->Enable, Others are reserved.
7-0	TSTPATVLDCNT	R/W	8h	Number of DSS Interconnect clocks (200 MHz) between successive samples for the test pattern gen.

5.2.7.165 ADCBUFCFG1 Register (Offset = 824h) [Reset = X]

ADCBUFCFG1 is shown in ADCBUFCFG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1530. ADCBUFCFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RESERVED	R/W	X	
16	ADCBUFPIPOSEL	R	1h	TI Internal Feature Ping-pong select value from ADC Buffer Packing logic. Even in SW override mode, this register will indicate the ping-pong select signal generated from the ADC Buffer Packing logic and not the override value.
15	ADCBUFCONTSTOPPL	R/W	0h	Stop Pulse for Continuous mode. The data capture will stop once this register is set. Continous mode is expected to be only used for CZ and ADC Buffer Testpattern mode : Its a wspecial access type, write to this field will generate a pulse
14	ADCBUFCONTSTRTPL	R/W	0h	Start Pulse for Continuous mode. The data capture will start from Address 0 once this register is set. All the other configurations like Enable, Sample Count are expected to be programmed before this pulse. Continous mode is expected to be only used for CZ and ADC Buffer Testpattern mode : Its a wspecial access type, write to this field will generate a pulse
13	ADCBUFCONTMODEEN	R/W	0h	Continuous mode enable for ADC Buffer. This is set when a fixed number of samples have to be stored in Ping/Pong and not depend on Chirp time-lines (Eg: Analog Lab characterization to stream out continuous data from DFE). Continous mode is expected to be only used for CZ and ADC Buffer Testpattern mode
12	ADCBUFWRITEMODE	R/W	0h	This needs to be programmed to 0x1 in AR16xx 0 --> Interleaved, 1 --> Non-interleaved
11	ADCBUFPIPOOVRVAL	R/W	0h	TI Internal Feature SW override value for ADC Buffer Ping Pong select
10	ADCBUFPIPOOVRCNT	R/W	0h	TI Internal Feature Override control for ADC Buffer Ping Pong select
9	RX3EN	R/W	0h	Enable for Rx3 write
8	RX2EN	R/W	0h	Enable for Rx2 write
7	RX1EN	R/W	0h	Enable for Rx1 write
6	RX0EN	R/W	0h	Enable for Rx0 write
5	ADCBUFIQSWAP	R/W	0h	0 --> I is stored in LSB and Q is stored in MSB 1 --> Q is stored in LSB and I is stored in MSB
4	ADCBUFRL2CHINTRL	R/W	0h	TI reserved field. Do not touch
3	ADCBUFRLMODECHSEL	R/W	0h	TI Internal Feature 0 -->I channel, 1 --> Q channel
2	ADCBUFREALONLYMODE	R/W	1h	0-->Complex Data mode, 1-->Real data mode
1	ADCBUFPIPOSELINV	R/W	0h	TI Internal Feature Inversion control for ADC Buffer Ping-pong select. By default ADC Buffer write starts with Pong write. By setting this bit to 1, it will start from Ping write after reset.
0	ADCBUFWRSOURCE	R/W	0h	TI Internal Feature Write source for ADC Buffer. 0 --> DFE, 1 --> VIN

5.2.7.166 ADCBUFCFG1_EXTD Register (Offset = 828h) [Reset = 00000000h]

ADCBUFCFG1_EXTD is shown in ADCBUFCFG1_EXTD Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1531. ADCBUFCFG1_EXTD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADCBUFINTGENDLY	R/W	0h	TI Intenal Feature. No of clocks to delay the ping-pong switch and interrupt generation w.r.t ADC Valid fall pulse. This will enable dithering the DSP activity for successive ping-pong switch cycles. This will not delay the ping pong toggle which will happen immediately after ADC Valid fall.

5.2.7.167 ADCBUFCFG2 Register (Offset = 82Ch) [Reset = X]

ADCBUFCFG2 is shown in ADCBUFCFG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1532. ADCBUFCFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	X	
26-16	ADCBUFADDRX1	R/W	100h	128 bit Address offset to be added to the internal address pointer for Rx1 writes in Non-interleaved mode.
15-11	RESERVED	R/W	X	
10-0	ADCBUFADDRX0	R/W	0h	128 bit Address offset to be added to the internal address pointer for Rx0 writes in Non-interleaved mode.

5.2.7.168 ADCBUFCFG3 Register (Offset = 830h) [Reset = X]

ADCBUFCFG3 is shown in ADCBUFCFG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1533. ADCBUFCFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	X	
26-16	ADCBUFADDRX3	R/W	300h	128 bit Address offset to be added to the internal address pointer for Rx3 writes in Non-interleaved mode.
15-11	RESERVED	R/W	X	
10-0	ADCBUFADDRX2	R/W	200h	128 bit Address offset to be added to the internal address pointer for Rx2 writes in Non-interleaved mode.

5.2.7.169 ADCBUFCFG4 Register (Offset = 834h) [Reset = X]

ADCBUFCFG4 is shown in ADCBUFCFG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1534. ADCBUFCFG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30	ADCBUFPNGSELTGLDIS	R/W	0h	TI Internal Feature 0 --> Delay Interrupt Gen and Ping/Pong toggle together based on cfg_interrupt_gen_delay, 1 --> Delay only Interrupt Gen based on cfg_interrupt_gen_delay. But toggle Ping/Pong select signal as soon as the write is complete.
29-26	RESERVED	R/W	X	
25-21	ADCBUFNUMCHRPPONG	R/W	0h	Number of chirps to be stored in Pong buffer. This register should be programmed with one less than the actual number needed. This is used when data is written to Pong Memory. The value written to this field should be the same as that configured for Ping
20-16	ADCBUFNUMCHRPPING	R/W	0h	Number of chirps to be stored in Ping buffer. This register should be programmed with one less than the actual number needed. This is used when data is written to Pong Memory. The value written to this field should be the same as that configured for Pong
15-0	ADCBUFSAMPCNT	R/W	400h	No of samples to store in each Ping and Pong register in continuous mode of ADC Buffer. In real only mode this refers to the number of real samples and in complex mode, this refers to number of complex samples. This refers to the number of samples per channel. This counter increments once for every new sample from DFE (as long as 1 or more channels are enabled). The max allowed value varies depending on other configurations (No of channels enabled and real/complex data). Continous mode is expected to be only used for CZ and ADC Buffer Testpattern mode

5.2.7.170 ADCBUFINTGENDITHERDLY Register (Offset = 838h) [Reset = 00000000h]

ADCBUFINTGENDITHERDLY is shown in ADCBUFINTGENDITHERDLY Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1535. ADCBUFINTGENDITHERDLY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADCBUFINTGENDITHERDLY	R/W	0h	TI Internal Feature. Additional dithering delay added on the Chirp Avilable interrupt

5.2.7.171 CBUFF_FRAME_START_SEL Register (Offset = 83Ch) [Reset = X]

CBUFF_FRAME_START_SEL is shown in CBUFF_FRAME_START_SEL Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1536. CBUFF_FRAME_START_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	sel	R/W	0h	writing: 1'b0: selects frame_start from DFE 1'b1: Selects frame_start from chirp_avail (adc capture complete)

5.2.7.172 CQCFG1 Register (Offset = C00h) [Reset = X]

CQCFG1 is shown in CQCFG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1537. CQCFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-22	CQ2BASEADDR	R/W	100h	128-bit Address offset which inidcates the start address for storing CQ0 (ADC/RxIF Saturation Detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
21-13	CQ1BASEADDR	R/W	80h	128-bit Address offset which inidcates the start address for storing CQ0 (Signal Image Band Energy detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
12-4	CQ0BASEADDR	R/W	0h	128-bit Address offset which inidcates the start address for storing CQ0 (Wide Band Energy detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
3	CQ96BITPACKEN	R/W	0h	This is used to pack the CQ data into only the LSB 96 bits of each row of the CQ memory. This can be used in 3 channel mode of LVDS where the ADC data and Chirp Params occupy only LSB 96 bits of each memory row.
2	RESERVED	R/W	X	
1-0	CQDATAWIDTH	R/W	0h	This is used to appropriately pack the valid CQ data bits in appropriate bits in the CQ memory. 00, 01->Raw 16, 10-->Raw 12, 11-->Raw14

5.2.7.173 CQCFG2 Register (Offset = C04h) [Reset = X]

CQCFG2 is shown in CQCFG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1538. CQCFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R/W	X	
17	CQ_CLK_GATE	R/W	0h	writing: 1'b0: ungates the clk to CQ logic 1'b1: Gates the clk to CQ logic
16	CQPIPOSELVAL	R/W	0h	Ping pong select override value for CQ Memory. 1 --> Read access from Chirp Info Slave of DSS Interconnect will be routed to ping memory and write access from CQ_W/DFE write will be routed to pong memory. 0 --> Read access from Chirp Info Slave of DSS Interconnect will be routed to pong memory and write access from CQ_W/DFE write will be routed to ping memory.
15-13	RESERVED	R/W	X	
12	CQPIPOSELCNT	R/W	0h	Ping pong select override control for CQ Memory. 0 --> Ping-pong select comes from HW FSM (same as the ping-pong select for ADC Buffer)/DMMCQPINPONSEL 1 --> Ping pong select for CQ memory is taken from SW register (CQPIPOSELVAL)
11-9	RESERVED	R/W	X	
8	CQ2TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ2 (ADC/RxIF Saturation). Once enabled, each 8 bit data is same as Addr+1.
7-5	RESERVED	R/W	X	
4	CQ1TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ1 (SI). Once enabled, each 16 bit data is same as [2*Addr+1 for the MSB 8 bits and Addr+1 for the LSB 8 bits.
3-1	RESERVED	R/W	X	
0	CQ0TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ0 (WBE). Once enabled, each 16 bit data is same as [2*Addr+1 for the MSB 8 bits and Addr+1 for the LSB 8 bits.

5.2.7.174 CPREG0 Register (Offset = C08h) [Reset = 00000000h]

CPREG0 is shown in CPREG0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1539. CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG0	R	0h	Chirp Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.175 CPREG1 Register (Offset = C0Ch) [Reset = 00000000h]

CPREG1 is shown in CPREG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1540. CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG1	R	0h	Chirp Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.176 CPREG2 Register (Offset = C10h) [Reset = 00000000h]

CPREG2 is shown in CPREG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1541. CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG2	R	0h	Chirp Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.177 CPREG3 Register (Offset = C14h) [Reset = 00000000h]

CPREG3 is shown in CPREG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1542. CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG3	R	0h	Chirp Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.178 CPREG4 Register (Offset = C18h) [Reset = 00000000h]

CPREG4 is shown in CPREG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1543. CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG4	R	0h	Chirp Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.179 CPREG5 Register (Offset = C1Ch) [Reset = 00000000h]

CPREG5 is shown in CPREG5 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1544. CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG5	R	0h	Chirp Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.180 CPREG6 Register (Offset = C20h) [Reset = 00000000h]

CPREG6 is shown in CPREG6 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1545. CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG6	R	0h	Chirp Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.181 CPREG7 Register (Offset = C24h) [Reset = 00000000h]

CPREG7 is shown in CPREG7 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1546. CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG7	R	0h	Chirp Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.182 CPREG8 Register (Offset = C28h) [Reset = 00000000h]

CPREG8 is shown in CPREG8 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1547. CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG8	R	0h	Chirp Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.183 CPREG9 Register (Offset = C2Ch) [Reset = 00000000h]

CPREG9 is shown in CPREG9 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1548. CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG9	R	0h	Chirp Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.184 CPREG10 Register (Offset = C30h) [Reset = 00000000h]

CPREG10 is shown in CPREG10 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1549. CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG10	R	0h	Chirp Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.185 CPREG11 Register (Offset = C34h) [Reset = 00000000h]

CPREG11 is shown in CPREG11 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1550. CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG11	R	0h	Chirp Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.186 CPREG12 Register (Offset = C38h) [Reset = 00000000h]

CPREG12 is shown in CPREG12 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1551. CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG12	R	0h	Chirp Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.187 CPREG13 Register (Offset = C3Ch) [Reset = 00000000h]

CPREG13 is shown in CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1552. CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG13	R	0h	Chirp Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.188 CPREG14 Register (Offset = C40h) [Reset = 00000000h]

CPREG14 is shown in CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1553. CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG14	R	0h	Chirp Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.189 CPREG15 Register (Offset = C44h) [Reset = 00000000h]

CPREG15 is shown in CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1554. CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG15	R	0h	Chirp Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.190 CH0CPREG0 Register (Offset = C48h) [Reset = 00000000h]

CH0CPREG0 is shown in CH0CPREG0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1555. CH0CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG0	R	0h	Multi Chirp 0 Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.191 CH0CPREG1 Register (Offset = C4Ch) [Reset = 00000000h]

CH0CPREG1 is shown in CH0CPREG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1556. CH0CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG1	R	0h	Multi Chirp 0 Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.192 CH0CPREG2 Register (Offset = C50h) [Reset = 00000000h]

CH0CPREG2 is shown in CH0CPREG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1557. CH0CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG2	R	0h	Multi Chirp 0 Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.193 CH0CPREG3 Register (Offset = C54h) [Reset = 00000000h]

CH0CPREG3 is shown in CH0CPREG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1558. CH0CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG3	R	0h	Multi Chirp 0 Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.194 CH0CPREG4 Register (Offset = C58h) [Reset = 00000000h]

CH0CPREG4 is shown in CH0CPREG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1559. CH0CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG4	R	0h	Multi Chirp 0 Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.195 CH0CPREG5 Register (Offset = C5Ch) [Reset = 00000000h]

CH0CPREG5 is shown in CH0CPREG5 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1560. CH0CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG5	R	0h	Multi Chirp 0 Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.196 CH0CPREG6 Register (Offset = C60h) [Reset = 00000000h]

CH0CPREG6 is shown in CH0CPREG6 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1561. CH0CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG6	R	0h	Multi Chirp 0 Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.197 CH0CPREG7 Register (Offset = C64h) [Reset = 00000000h]

CH0CPREG7 is shown in CH0CPREG7 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1562. CH0CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG7	R	0h	Multi Chirp 0 Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.198 CH0CPREG8 Register (Offset = C68h) [Reset = 00000000h]

CH0CPREG8 is shown in CH0CPREG8 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1563. CH0CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG8	R	0h	Multi Chirp 0 Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.199 CH0CPREG9 Register (Offset = C6Ch) [Reset = 00000000h]

CH0CPREG9 is shown in CH0CPREG9 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1564. CH0CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG9	R	0h	Multi Chirp 0 Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.200 CH0CPREG10 Register (Offset = C70h) [Reset = 00000000h]

CH0CPREG10 is shown in CH0CPREG10 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1565. CH0CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG10	R	0h	Multi Chirp 0 Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.201 CH0CPREG11 Register (Offset = C74h) [Reset = 00000000h]

CH0CPREG11 is shown in CH0CPREG11 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1566. CH0CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG11	R	0h	Multi Chirp 0 Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.202 CH0CPREG12 Register (Offset = C78h) [Reset = 00000000h]

CH0CPREG12 is shown in CH0CPREG12 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1567. CH0CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG12	R	0h	Multi Chirp 0 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.203 CH0CPREG13 Register (Offset = C7Ch) [Reset = 00000000h]

CH0CPREG13 is shown in CH0CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1568. CH0CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG13	R	0h	Multi Chirp 0 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.204 CH0CPREG14 Register (Offset = C80h) [Reset = 00000000h]

CH0CPREG14 is shown in CH0CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1569. CH0CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG14	R	0h	Multi Chirp 0 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.205 CH0CPREG15 Register (Offset = C84h) [Reset = 00000000h]

CH0CPREG15 is shown in CH0CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1570. CH0CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH0CPREG15	R	0h	Multi Chirp 0 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.206 CH1CPREG0 Register (Offset = C88h) [Reset = 00000000h]

CH1CPREG0 is shown in CH1CPREG0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1571. CH1CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG0	R	0h	Multi Chirp 1 Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.207 CH1CPREG1 Register (Offset = C8Ch) [Reset = 00000000h]

CH1CPREG1 is shown in CH1CPREG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1572. CH1CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG1	R	0h	Multi Chirp 1 Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.208 CH1CPREG2 Register (Offset = C90h) [Reset = 00000000h]

CH1CPREG2 is shown in CH1CPREG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1573. CH1CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG2	R	0h	Multi Chirp 1 Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.209 CH1CPREG3 Register (Offset = C94h) [Reset = 00000000h]

CH1CPREG3 is shown in CH1CPREG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1574. CH1CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG3	R	0h	Multi Chirp 1 Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.210 CH1CPREG4 Register (Offset = C98h) [Reset = 00000000h]

CH1CPREG4 is shown in CH1CPREG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1575. CH1CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG4	R	0h	Multi Chirp 1 Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.211 CH1CPREG5 Register (Offset = C9Ch) [Reset = 00000000h]

CH1CPREG5 is shown in CH1CPREG5 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1576. CH1CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG5	R	0h	Multi Chirp 1 Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.212 CH1CPREG6 Register (Offset = CA0h) [Reset = 00000000h]

CH1CPREG6 is shown in CH1CPREG6 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1577. CH1CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG6	R	0h	Multi Chirp 1 Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.213 CH1CPREG7 Register (Offset = CA4h) [Reset = 00000000h]

CH1CPREG7 is shown in CH1CPREG7 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1578. CH1CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG7	R	0h	Multi Chirp 1 Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.214 CH1CPREG8 Register (Offset = CA8h) [Reset = 00000000h]

CH1CPREG8 is shown in CH1CPREG8 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1579. CH1CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG8	R	0h	Multi Chirp 1 Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.215 CH1CPREG9 Register (Offset = CACh) [Reset = 00000000h]

CH1CPREG9 is shown in CH1CPREG9 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1580. CH1CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG9	R	0h	Multi Chirp 1 Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.216 CH1CPREG10 Register (Offset = CB0h) [Reset = 00000000h]

CH1CPREG10 is shown in CH1CPREG10 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1581. CH1CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG10	R	0h	Multi Chirp 1 Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.217 CH1CPREG11 Register (Offset = CB4h) [Reset = 00000000h]

CH1CPREG11 is shown in CH1CPREG11 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1582. CH1CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG11	R	0h	Multi Chirp 1 Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.218 CH1CPREG12 Register (Offset = CB8h) [Reset = 00000000h]

CH1CPREG12 is shown in CH1CPREG12 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1583. CH1CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG12	R	0h	Multi Chirp 1 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.219 CH1CPREG13 Register (Offset = CBCh) [Reset = 00000000h]

CH1CPREG13 is shown in CH1CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1584. CH1CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG13	R	0h	Multi Chirp 1 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.220 CH1CPREG14 Register (Offset = CC0h) [Reset = 00000000h]

CH1CPREG14 is shown in CH1CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1585. CH1CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG14	R	0h	Multi Chirp 1 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.221 CH1CPREG15 Register (Offset = CC4h) [Reset = 00000000h]

CH1CPREG15 is shown in CH1CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1586. CH1CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH1CPREG15	R	0h	Multi Chirp 1 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.222 CH2CPREG0 Register (Offset = CC8h) [Reset = 00000000h]

CH2CPREG0 is shown in CH2CPREG0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1587. CH2CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG0	R	0h	Multi Chirp 2 Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.223 CH2CPREG1 Register (Offset = CCCh) [Reset = 00000000h]

CH2CPREG1 is shown in CH2CPREG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1588. CH2CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG1	R	0h	Multi Chirp 2 Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.224 CH2CPREG2 Register (Offset = CD0h) [Reset = 00000000h]

CH2CPREG2 is shown in CH2CPREG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1589. CH2CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG2	R	0h	Multi Chirp 2 Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.225 CH2CPREG3 Register (Offset = CD4h) [Reset = 00000000h]

CH2CPREG3 is shown in CH2CPREG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1590. CH2CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG3	R	0h	Multi Chirp 2 Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.226 CH2CPREG4 Register (Offset = CD8h) [Reset = 00000000h]

CH2CPREG4 is shown in CH2CPREG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1591. CH2CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG4	R	0h	Multi Chirp 2 Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.227 CH2CPREG5 Register (Offset = CDCh) [Reset = 00000000h]

CH2CPREG5 is shown in CH2CPREG5 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1592. CH2CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG5	R	0h	Multi Chirp 2 Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.228 CH2CPREG6 Register (Offset = CE0h) [Reset = 00000000h]

CH2CPREG6 is shown in CH2CPREG6 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1593. CH2CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG6	R	0h	Multi Chirp 2 Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.229 CH2CPREG7 Register (Offset = CE4h) [Reset = 00000000h]

CH2CPREG7 is shown in CH2CPREG7 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1594. CH2CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG7	R	0h	Multi Chirp 2 Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.230 CH2CPREG8 Register (Offset = CE8h) [Reset = 00000000h]

CH2CPREG8 is shown in CH2CPREG8 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1595. CH2CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG8	R	0h	Multi Chirp 2 Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.231 CH2CPREG9 Register (Offset = CECh) [Reset = 00000000h]

CH2CPREG9 is shown in CH2CPREG9 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1596. CH2CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG9	R	0h	Multi Chirp 2 Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.232 CH2CPREG10 Register (Offset = CF0h) [Reset = 00000000h]

CH2CPREG10 is shown in CH2CPREG10 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1597. CH2CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG10	R	0h	Multi Chirp 2 Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.233 CH2CPREG11 Register (Offset = CF4h) [Reset = 00000000h]

CH2CPREG11 is shown in CH2CPREG11 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1598. CH2CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG11	R	0h	Multi Chirp 2 Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.234 CH2CPREG12 Register (Offset = CF8h) [Reset = 00000000h]

CH2CPREG12 is shown in CH2CPREG12 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1599. CH2CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG12	R	0h	Multi Chirp 2 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.235 CH2CPREG13 Register (Offset = CFCh) [Reset = 00000000h]

CH2CPREG13 is shown in CH2CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1600. CH2CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG13	R	0h	Multi Chirp 2 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.236 CH2CPREG14 Register (Offset = D00h) [Reset = 00000000h]

CH2CPREG14 is shown in CH2CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1601. CH2CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG14	R	0h	Multi Chirp 2 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.237 CH2CPREG15 Register (Offset = D04h) [Reset = 00000000h]

CH2CPREG15 is shown in CH2CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1602. CH2CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH2CPREG15	R	0h	Multi Chirp 2 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.238 CH3CPREG0 Register (Offset = D08h) [Reset = 00000000h]

CH3CPREG0 is shown in CH3CPREG0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1603. CH3CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG0	R	0h	Multi Chirp 3 Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.239 CH3CPREG1 Register (Offset = D0Ch) [Reset = 00000000h]

CH3CPREG1 is shown in CH3CPREG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1604. CH3CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG1	R	0h	Multi Chirp 3 Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.240 CH3CPREG2 Register (Offset = D10h) [Reset = 00000000h]

CH3CPREG2 is shown in CH3CPREG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1605. CH3CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG2	R	0h	Multi Chirp 3 Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.241 CH3CPREG3 Register (Offset = D14h) [Reset = 00000000h]

CH3CPREG3 is shown in CH3CPREG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1606. CH3CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG3	R	0h	Multi Chirp 3 Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.242 CH3CPREG4 Register (Offset = D18h) [Reset = 00000000h]

CH3CPREG4 is shown in CH3CPREG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1607. CH3CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG4	R	0h	Multi Chirp 3 Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.243 CH3CPREG5 Register (Offset = D1Ch) [Reset = 00000000h]

CH3CPREG5 is shown in CH3CPREG5 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1608. CH3CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG5	R	0h	Multi Chirp 3 Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.244 CH3CPREG6 Register (Offset = D20h) [Reset = 00000000h]

CH3CPREG6 is shown in CH3CPREG6 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1609. CH3CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG6	R	0h	Multi Chirp 3 Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.245 CH3CPREG7 Register (Offset = D24h) [Reset = 00000000h]

CH3CPREG7 is shown in CH3CPREG7 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1610. CH3CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG7	R	0h	Multi Chirp 3 Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.246 CH3CPREG8 Register (Offset = D28h) [Reset = 00000000h]

CH3CPREG8 is shown in CH3CPREG8 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1611. CH3CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG8	R	0h	Multi Chirp 3 Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.247 CH3CPREG9 Register (Offset = D2Ch) [Reset = 00000000h]

CH3CPREG9 is shown in CH3CPREG9 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1612. CH3CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG9	R	0h	Multi Chirp 3 Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.248 CH3CPREG10 Register (Offset = D30h) [Reset = 00000000h]

CH3CPREG10 is shown in CH3CPREG10 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1613. CH3CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG10	R	0h	Multi Chirp 3 Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.249 CH3CPREG11 Register (Offset = D34h) [Reset = 00000000h]

CH3CPREG11 is shown in CH3CPREG11 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1614. CH3CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG11	R	0h	Multi Chirp 3 Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.250 CH3CPREG12 Register (Offset = D38h) [Reset = 00000000h]

CH3CPREG12 is shown in CH3CPREG12 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1615. CH3CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG12	R	0h	Multi Chirp 3 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.251 CH3CPREG13 Register (Offset = D3Ch) [Reset = 00000000h]

CH3CPREG13 is shown in CH3CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1616. CH3CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG13	R	0h	Multi Chirp 3 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.252 CH3CPREG14 Register (Offset = D40h) [Reset = 00000000h]

CH3CPREG14 is shown in CH3CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1617. CH3CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG14	R	0h	Multi Chirp 3 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.253 CH3CPREG15 Register (Offset = D44h) [Reset = 00000000h]

CH3CPREG15 is shown in CH3CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1618. CH3CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH3CPREG15	R	0h	Multi Chirp 3 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.254 CH4CPREG0 Register (Offset = D48h) [Reset = 00000000h]

CH4CPREG0 is shown in CH4CPREG0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1619. CH4CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG0	R	0h	Multi Chirp 4 Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.255 CH4CPREG1 Register (Offset = D4Ch) [Reset = 00000000h]

CH4CPREG1 is shown in CH4CPREG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1620. CH4CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG1	R	0h	Multi Chirp 4 Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.256 CH4CPREG2 Register (Offset = D50h) [Reset = 00000000h]

CH4CPREG2 is shown in CH4CPREG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1621. CH4CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG2	R	0h	Multi Chirp 4 Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.257 CH4CPREG3 Register (Offset = D54h) [Reset = 00000000h]

CH4CPREG3 is shown in CH4CPREG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1622. CH4CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG3	R	0h	Multi Chirp 4 Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.258 CH4CPREG4 Register (Offset = D58h) [Reset = 00000000h]

CH4CPREG4 is shown in CH4CPREG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1623. CH4CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG4	R	0h	Multi Chirp 4 Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.259 CH4CPREG5 Register (Offset = D5Ch) [Reset = 00000000h]

CH4CPREG5 is shown in CH4CPREG5 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1624. CH4CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG5	R	0h	Multi Chirp 4 Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.260 CH4CPREG6 Register (Offset = D60h) [Reset = 00000000h]

CH4CPREG6 is shown in CH4CPREG6 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1625. CH4CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG6	R	0h	Multi Chirp 4 Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.261 CH4CPREG7 Register (Offset = D64h) [Reset = 00000000h]

CH4CPREG7 is shown in CH4CPREG7 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1626. CH4CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG7	R	0h	Multi Chirp 4 Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.262 CH4CPREG8 Register (Offset = D68h) [Reset = 00000000h]

CH4CPREG8 is shown in CH4CPREG8 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1627. CH4CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG8	R	0h	Multi Chirp 4 Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.263 CH4CPREG9 Register (Offset = D6Ch) [Reset = 00000000h]

CH4CPREG9 is shown in CH4CPREG9 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1628. CH4CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG9	R	0h	Multi Chirp 4 Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.264 CH4CPREG10 Register (Offset = D70h) [Reset = 00000000h]

CH4CPREG10 is shown in CH4CPREG10 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1629. CH4CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG10	R	0h	Multi Chirp 4 Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.265 CH4CPREG11 Register (Offset = D74h) [Reset = 00000000h]

CH4CPREG11 is shown in CH4CPREG11 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1630. CH4CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG11	R	0h	Multi Chirp 4 Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.266 CH4CPREG12 Register (Offset = D78h) [Reset = 00000000h]

CH4CPREG12 is shown in CH4CPREG12 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1631. CH4CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG12	R	0h	Multi Chirp 4 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.267 CH4CPREG13 Register (Offset = D7Ch) [Reset = 00000000h]

CH4CPREG13 is shown in CH4CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1632. CH4CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG13	R	0h	Multi Chirp 4 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.268 CH4CPREG14 Register (Offset = D80h) [Reset = 00000000h]

CH4CPREG14 is shown in CH4CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1633. CH4CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG14	R	0h	Multi Chirp 4 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.269 CH4CPREG15 Register (Offset = D84h) [Reset = 00000000h]

CH4CPREG15 is shown in CH4CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Bit	Field	Type	Reset	Description
31-0	CH5CPREG12	R	0h	Multi Chirp 5 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.283 CH5CPREG13 Register (Offset = DBCh) [Reset = 00000000h]

CH5CPREG13 is shown in CH5CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1648. CH5CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH5CPREG13	R	0h	Multi Chirp 5 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.284 CH5CPREG14 Register (Offset = DC0h) [Reset = 00000000h]

CH5CPREG14 is shown in CH5CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1649. CH5CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH5CPREG14	R	0h	Multi Chirp 5 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.285 CH5CPREG15 Register (Offset = DC4h) [Reset = 00000000h]

CH5CPREG15 is shown in CH5CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1650. CH5CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH5CPREG15	R	0h	Multi Chirp 5 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.286 CH6CPREG0 Register (Offset = DC8h) [Reset = 00000000h]

CH6CPREG0 is shown in CH6CPREG0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1651. CH6CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG0	R	0h	Multi Chirp 6 Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.287 CH6CPREG1 Register (Offset = DCCh) [Reset = 00000000h]

CH6CPREG1 is shown in CH6CPREG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1652. CH6CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG1	R	0h	Multi Chirp 6 Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.288 CH6CPREG2 Register (Offset = DD0h) [Reset = 00000000h]

CH6CPREG2 is shown in CH6CPREG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1653. CH6CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG2	R	0h	Multi Chirp 6 Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.289 CH6CPREG3 Register (Offset = DD4h) [Reset = 00000000h]

CH6CPREG3 is shown in CH6CPREG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1654. CH6CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG3	R	0h	Multi Chirp 6 Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.290 CH6CPREG4 Register (Offset = DD8h) [Reset = 00000000h]

CH6CPREG4 is shown in CH6CPREG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1655. CH6CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG4	R	0h	Multi Chirp 6 Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.291 CH6CPREG5 Register (Offset = DDCh) [Reset = 00000000h]

CH6CPREG5 is shown in CH6CPREG5 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1656. CH6CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG5	R	0h	Multi Chirp 6 Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.292 CH6CPREG6 Register (Offset = DE0h) [Reset = 00000000h]

CH6CPREG6 is shown in CH6CPREG6 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1657. CH6CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG6	R	0h	Multi Chirp 6 Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.293 CH6CPREG7 Register (Offset = DE4h) [Reset = 00000000h]

CH6CPREG7 is shown in CH6CPREG7 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1658. CH6CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG7	R	0h	Multi Chirp 6 Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.294 CH6CPREG8 Register (Offset = DE8h) [Reset = 00000000h]

CH6CPREG8 is shown in CH6CPREG8 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1659. CH6CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG8	R	0h	Multi Chirp 6 Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.295 CH6CPREG9 Register (Offset = DECh) [Reset = 00000000h]

CH6CPREG9 is shown in CH6CPREG9 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1660. CH6CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG9	R	0h	Multi Chirp 6 Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.296 CH6CPREG10 Register (Offset = DF0h) [Reset = 00000000h]

CH6CPREG10 is shown in CH6CPREG10 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1661. CH6CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG10	R	0h	Multi Chirp 6 Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.297 CH6CPREG11 Register (Offset = DF4h) [Reset = 00000000h]

CH6CPREG11 is shown in CH6CPREG11 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1662. CH6CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG11	R	0h	Multi Chirp 6 Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.298 CH6CPREG12 Register (Offset = DF8h) [Reset = 00000000h]

CH6CPREG12 is shown in CH6CPREG12 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1663. CH6CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG12	R	0h	Multi Chirp 6 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.299 CH6CPREG13 Register (Offset = DFCh) [Reset = 00000000h]

CH6CPREG13 is shown in CH6CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1664. CH6CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG13	R	0h	Multi Chirp 6 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.300 CH6CPREG14 Register (Offset = E00h) [Reset = 00000000h]

CH6CPREG14 is shown in CH6CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1665. CH6CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG14	R	0h	Multi Chirp 6 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.301 CH6CPREG15 Register (Offset = E04h) [Reset = 00000000h]

CH6CPREG15 is shown in CH6CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1666. CH6CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH6CPREG15	R	0h	Multi Chirp 6 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.302 CH7CPREG0 Register (Offset = E08h) [Reset = 00000000h]

CH7CPREG0 is shown in CH7CPREG0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1667. CH7CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG0	R	0h	Multi Chirp 7 Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.303 CH7CPREG1 Register (Offset = E0Ch) [Reset = 00000000h]

CH7CPREG1 is shown in CH7CPREG1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1668. CH7CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG1	R	0h	Multi Chirp 7 Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.304 CH7CPREG2 Register (Offset = E10h) [Reset = 00000000h]

CH7CPREG2 is shown in CH7CPREG2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1669. CH7CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG2	R	0h	Multi Chirp 7 Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.305 CH7CPREG3 Register (Offset = E14h) [Reset = 00000000h]

CH7CPREG3 is shown in CH7CPREG3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1670. CH7CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG3	R	0h	Multi Chirp 7 Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.306 CH7CPREG4 Register (Offset = E18h) [Reset = 00000000h]

CH7CPREG4 is shown in CH7CPREG4 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1671. CH7CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG4	R	0h	Multi Chirp 7 Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.307 CH7CPREG5 Register (Offset = E1Ch) [Reset = 00000000h]

CH7CPREG5 is shown in CH7CPREG5 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1672. CH7CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG5	R	0h	Multi Chirp 7 Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.308 CH7CPREG6 Register (Offset = E20h) [Reset = 00000000h]

CH7CPREG6 is shown in CH7CPREG6 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1673. CH7CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG6	R	0h	Multi Chirp 7 Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.309 CH7CPREG7 Register (Offset = E24h) [Reset = 00000000h]

CH7CPREG7 is shown in CH7CPREG7 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1674. CH7CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG7	R	0h	Multi Chirp 7 Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.310 CH7CPREG8 Register (Offset = E28h) [Reset = 00000000h]

CH7CPREG8 is shown in CH7CPREG8 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1675. CH7CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG8	R	0h	Multi Chirp 7 Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.311 CH7CPREG9 Register (Offset = E2Ch) [Reset = 00000000h]

CH7CPREG9 is shown in CH7CPREG9 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1676. CH7CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG9	R	0h	Multi Chirp 7 Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.312 CH7CPREG10 Register (Offset = E30h) [Reset = 00000000h]

CH7CPREG10 is shown in CH7CPREG10 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1677. CH7CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG10	R	0h	Multi Chirp 7 Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.313 CH7CPREG11 Register (Offset = E34h) [Reset = 00000000h]

CH7CPREG11 is shown in CH7CPREG11 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1678. CH7CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG11	R	0h	Multi Chirp 7 Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.314 CH7CPREG12 Register (Offset = E38h) [Reset = 00000000h]

CH7CPREG12 is shown in CH7CPREG12 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1679. CH7CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG12	R	0h	Multi Chirp 7 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.315 CH7CPREG13 Register (Offset = E3Ch) [Reset = 00000000h]

CH7CPREG13 is shown in CH7CPREG13 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1680. CH7CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG13	R	0h	Multi Chirp 7 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.316 CH7CPREG14 Register (Offset = E40h) [Reset = 00000000h]

CH7CPREG14 is shown in CH7CPREG14 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1681. CH7CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG14	R	0h	Multi Chirp 7 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.317 CH7CPREG15 Register (Offset = E44h) [Reset = 00000000h]

CH7CPREG15 is shown in CH7CPREG15 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1682. CH7CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH7CPREG15	R	0h	Multi Chirp 7 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.318 CH01_HIL_CP_OVERRIDE Register (Offset = E48h) [Reset = 00000000h]

CH01_HIL_CP_OVERRIDE is shown in CH01_HIL_CP_OVERRIDE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1683. CH01_HIL_CP_OVERRIDE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	chirp1	R/W	0h	Override data used for Chirp1. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index
15-0	chirp0	R/W	0h	Override data used for Chirp0. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index

5.2.7.319 CH23_HIL_CP_OVERRIDE Register (Offset = E4Ch) [Reset = 00000000h]

CH23_HIL_CP_OVERRIDE is shown in CH23_HIL_CP_OVERRIDE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1684. CH23_HIL_CP_OVERRIDE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	chirp3	R/W	0h	Override data used for Chirp3. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index
15-0	chirp2	R/W	0h	Override data used for Chirp2. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index

5.2.7.320 CH45_HIL_CP_OVERRIDE Register (Offset = E50h) [Reset = 00000000h]

CH45_HIL_CP_OVERRIDE is shown in CH45_HIL_CP_OVERRIDE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1685. CH45_HIL_CP_OVERRIDE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	chirp5	R/W	0h	Override data used for Chirp5. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index
15-0	chirp4	R/W	0h	Override data used for Chirp4. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index

5.2.7.321 CH67_HIL_CP_OVERRIDE Register (Offset = E54h) [Reset = 00000000h]

CH67_HIL_CP_OVERRIDE is shown in CH67_HIL_CP_OVERRIDE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1686. CH67_HIL_CP_OVERRIDE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	chirp7	R/W	0h	Override data used for Chirp7. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index
15-0	chirp6	R/W	0h	Override data used for Chirp6. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index

5.2.7.322 CH_HIL_CP_OVERRIDE Register (Offset = E58h) [Reset = X]

CH_HIL_CP_OVERRIDE is shown in CH_HIL_CP_OVERRIDE Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1687. CH_HIL_CP_OVERRIDE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	X	
15-0	chirp	R/W	0h	Override data used for Chirp. data[11:0] is used for overriding chirp number data[15:12] is used for overriding chirp profile index

5.2.7.323 HW_SPARE_RW0 Register (Offset = FD0h) [Reset = 00000000h]

HW_SPARE_RW0 is shown in HW_SPARE_RW0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1688. HW_SPARE_RW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw0	R/W	0h	Reserved for HW R&D

5.2.7.324 HW_SPARE_RW1 Register (Offset = FD4h) [Reset = 00000000h]

HW_SPARE_RW1 is shown in HW_SPARE_RW1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1689. HW_SPARE_RW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw1	R/W	0h	Reserved for HW R&D

5.2.7.325 HW_SPARE_RW2 Register (Offset = FD8h) [Reset = 00000000h]

HW_SPARE_RW2 is shown in HW_SPARE_RW2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1690. HW_SPARE_RW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw2	R/W	0h	Reserved for HW R&D

5.2.7.326 HW_SPARE_RW3 Register (Offset = FDCh) [Reset = 00000000h]

HW_SPARE_RW3 is shown in HW_SPARE_RW3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1691. HW_SPARE_RW3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw3	R/W	0h	Reserved for HW R&D

5.2.7.327 HW_SPARE_RO0 Register (Offset = FE0h) [Reset = 00000000h]

HW_SPARE_RO0 is shown in HW_SPARE_RO0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1692. HW_SPARE_RO0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro0	R	0h	Reserved for HW R&D

5.2.7.328 HW_SPARE_RO1 Register (Offset = FE4h) [Reset = 00000000h]

HW_SPARE_RO1 is shown in HW_SPARE_RO1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1693. HW_SPARE_RO1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro1	R	0h	Reserved for HW R&D

5.2.7.329 HW_SPARE_RO2 Register (Offset = FE8h) [Reset = 00000000h]

HW_SPARE_RO2 is shown in HW_SPARE_RO2 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1694. HW_SPARE_RO2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro2	R	0h	Reserved for HW R&D

5.2.7.330 HW_SPARE_RO3 Register (Offset = FECh) [Reset = 00000000h]

HW_SPARE_RO3 is shown in HW_SPARE_RO3 Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1695. HW_SPARE_RO3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro3	R	0h	Reserved for HW R&D

5.2.7.331 HW_SPARE_WPH Register (Offset = FF0h) [Reset = 00000000h]

HW_SPARE_WPH is shown in HW_SPARE_WPH Register Field Descriptions.

Return to the RSS_CTRL Registers.

Table 5-1696. HW_SPARE_WPH Register Field Descriptions

0	hw_spare_rec0	R/W	0h	Reserved for HW R&D

5.2.7.333 LOCK0_KICK0 Register (Offset = 1008h) [Reset = 00000000h]

LOCK0_KICK0 is shown in LOCK0_KICK0 Register Field Descriptions.

Return to the RSS_CTRL Registers.

- KICK0 component

Table 5-1698. LOCK0_KICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick0	R/W	0h	- KICK0 component

5.2.7.334 LOCK0_KICK1 Register (Offset = 100Ch) [Reset = 00000000h]

LOCK0_KICK1 is shown in LOCK0_KICK1 Register Field Descriptions.

Return to the RSS_CTRL Registers.

- KICK1 component

Table 5-1699. LOCK0_KICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick1	R/W	0h	- KICK1 component

5.2.7.335 intr_raw_status Register (Offset = 1010h) [Reset = X]

intr_raw_status is shown in intr_raw_status Register Field Descriptions.

Return to the RSS_CTRL Registers.

Interrupt Raw Status/Set Register

Table 5-1700. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.2.7.336 intr_enabled_status_clear Register (Offset = 1014h) [Reset = X]

intr_enabled_status_clear is shown in intr_enabled_status_clear Register Field Descriptions.

Return to the RSS_CTRL Registers.

Interrupt Enabled Status/Clear register

Table 5-1701. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.2.7.337 intr_enable Register (Offset = 1018h) [Reset = X]

intr_enable is shown in intr_enable Register Field Descriptions.

Return to the RSS_CTRL Registers.

Interrupt Enable register

Table 5-1702. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.7.338 intr_enable_clear Register (Offset = 101Ch) [Reset = X]

intr_enable_clear is shown in intr_enable_clear Register Field Descriptions.

Return to the RSS_CTRL Registers.

Interrupt Enable Clear register

Table 5-1703. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.7.339 eoi Register (Offset = 1020h) [Reset = X]

eoi is shown in eoi Register Field Descriptions.

Return to the RSS_CTRL Registers.

EOI register

Table 5-1704. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.7.340 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in fault_address Register Field Descriptions.

Return to the RSS_CTRL Registers.

Fault Address register

Table 5-1705. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.7.341 fault_type_status Register (Offset = 1028h) [Reset = X]

fault_type_status is shown in fault_type_status Register Field Descriptions.

Return to the RSS_CTRL Registers.

Fault Type Status register

Table 5-1706. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	X	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_0000 = Supervisor read fault - priv = 1 dir = 1 dtype != 1 01_0000 = Supervisor write fault - priv = 1 dir = 0 00_1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_0010 = User write fault - priv = 0 dir = 0 00_0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_0000 = No fault

5.2.7.342 fault_attr_status Register (Offset = 102Ch) [Reset = 00000000h]

fault_attr_status is shown in fault_attr_status Register Field Descriptions.

Return to the RSS_CTRL Registers.

Fault Attribute Status register

Table 5-1707. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.7.343 fault_clear Register (Offset = 1030h) [Reset = X]

fault_clear is shown in fault_clear Register Field Descriptions.

Return to the RSS_CTRL Registers.

Fault Clear register

Table 5-1708. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	X	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.3 Device Clock Architecture

5.3.1 Clock Overview

Figure 5-1358 shows a high-level overview of the device clock architecture. The figure captures the key clock sources and the configuration options available to select the appropriate clock source. The detailed structure is captured under each PLL clocking section.

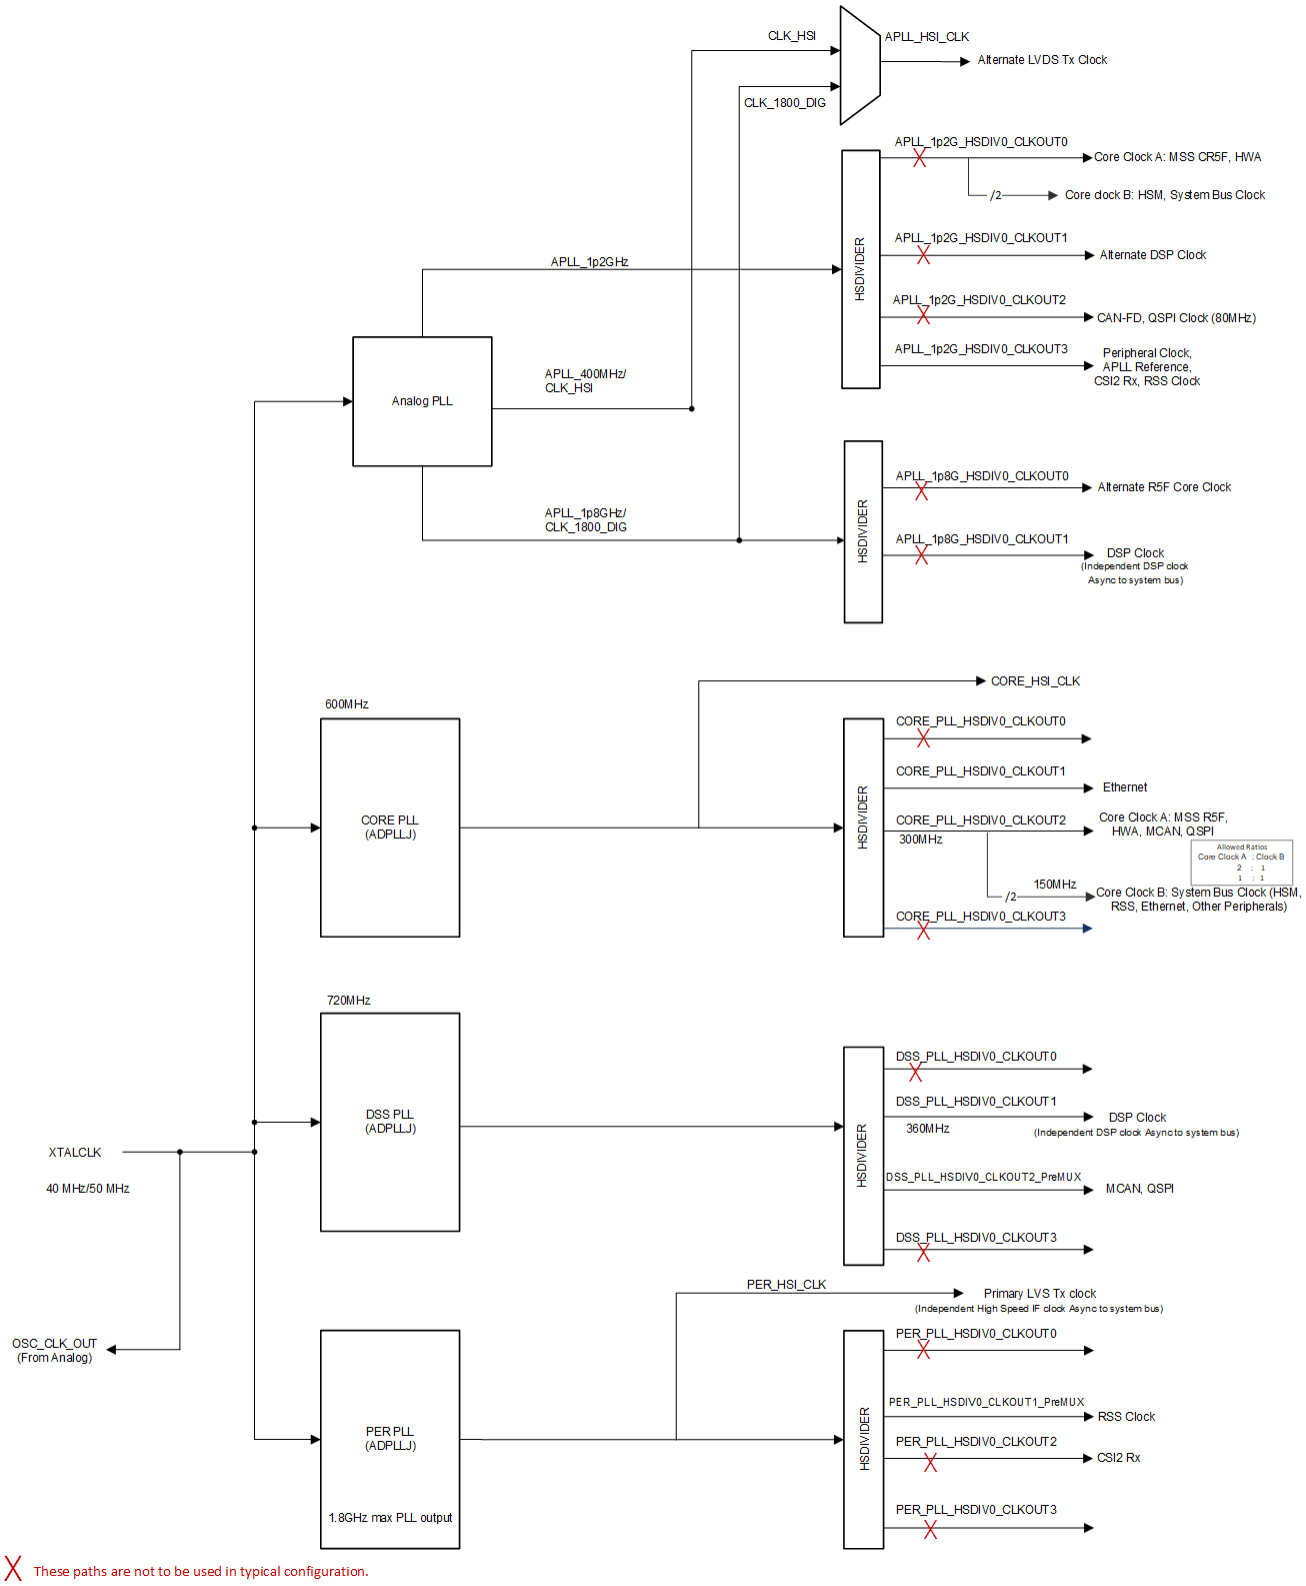

Figure 5-1358. Clock Tree Configuration

5.3.2 External Clocks

The clocks in the AWR294x device to the supported peripherals are as depicted in Figure 5-1359.

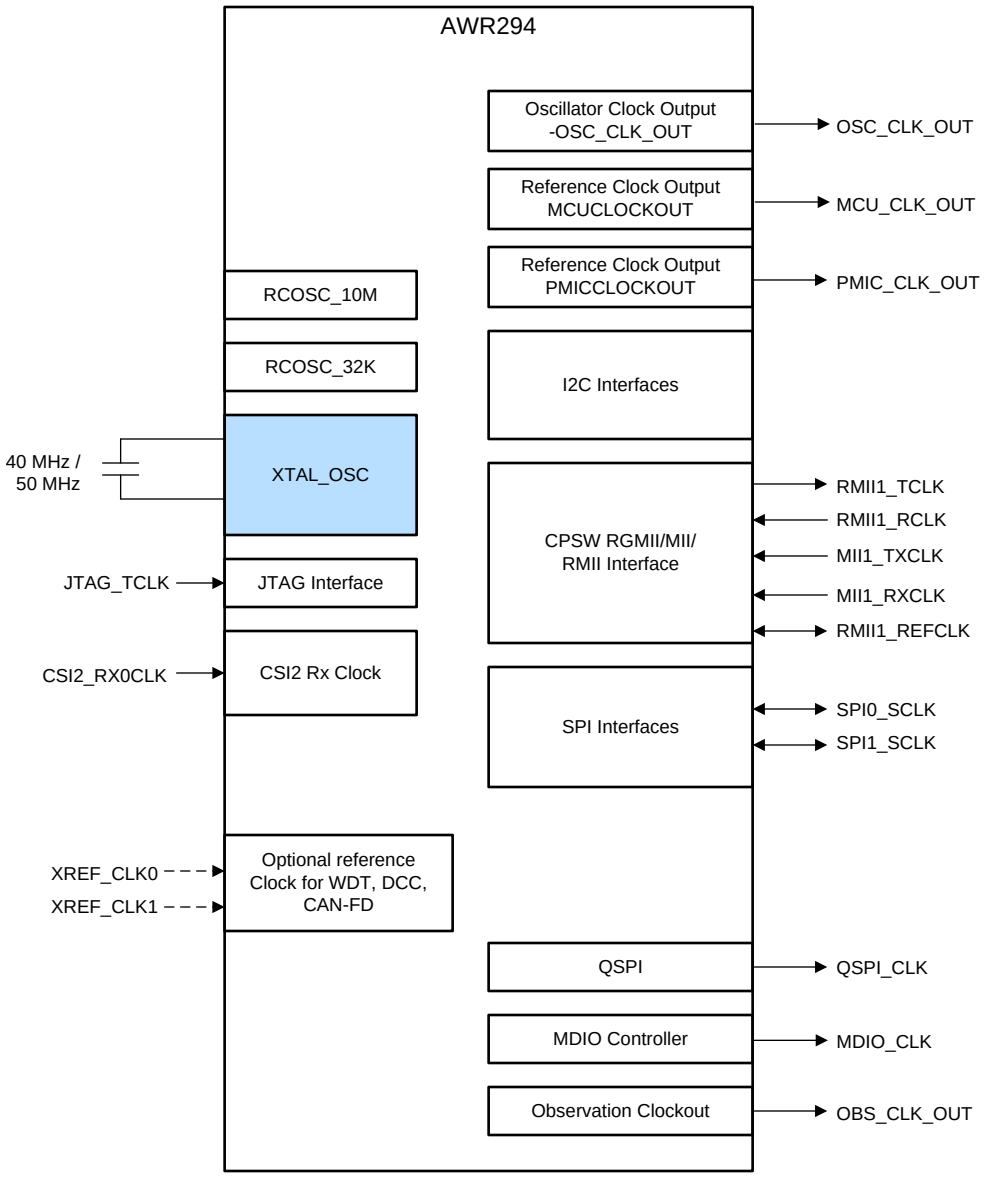

Figure 5-1359. External Clocks

5.3.3 Clock Selection

Table 5-1709 lists the configuration options for the clock source, divider, and gating selections for different peripheral clocks.

Table 5-1709. Configuration Options

Clock Mux	Clock Sources		CLKSRCSEL MMR Control	CLKDIV MMR Control	CLKGATE.MMR Control
MSS_CR5F_CLK_GCM_CLKSRC_SEL	0	WUCPUCLK	MSS_CR5_CLK_SRC_SEL [MSS_CR5_CLK_SRC_SEL_CLKSRCSEL]

5.3.4 Analog Modules

5.3.4.1 ADPLLJ (Low-Jitter DPLL)

General features of the ADPLLJ module are:

- Low Jitter Phase-Locked Loop
- RHEA, OCP, and Direct Access interface
- Programmable 8-bit input divider: N
- Programmable 12-bit integer, 18-bit fractional loop multiplier: M
- Programmable 7-bit post divider: M2
- Digital control and loop filter
- User-selectable multiple in-built oscillators for power-jitter optimization
- Primary output clock on digital core domain: CLKOUT = (M / (N+1))*CLKINP*(1/M2)
- Additional output clock on internal LDO domain: CLKOUTLDO = (M / (N+1))*CLKINP*(1/M2)
- Internal oscillator clock on internal LDO domain: CLKDCOLDO = (M / (N+1))*CLKINP
- Output clock gating control: CLKOUTEN / CLKOUTLDOEN / CLKOUTDCOLDOEN
- Digital LOCK indicators for frequency and phase lock
- Fast re-lock
- Input to output bypass on CLKOUT
- Bypass programmable 4-bit divider: N2: CLKOUT = CLKINP / (N2 + 1)
- Optional low frequency bypass clock control: ULOWCLKEN CLKOUT = CLKINPULOW
- Power management modes:
- Power down
- Idle bypass
- Stop Clock-input Bypass
- Retention
- Output clock Spread spectrum clocking supported

5.3.4.2 ADPLLJ Programming Model

5.3.4.2.1 ADPLLJ Programming Sequence

The following sequence is for PLL_PER. Similar registers exist for PLL_CORE and PLL_DSP.

1. Program the values M and N2 in TOP_RCM: PLL_PER_MN2DIV.
2. Program the values of N and M2 in TOP_RCM:PLL_PER_M2NDIV.
3. Program the Fractional M in TOP_RCM:PLL_PER_FRACDIV_FRACTIONALM.
4. Program the Sigma Delta Divider (SD) in TOP_RCM:PLL_PER_FRACDIV_REGSD.
5. Copy the NWELL TRIM from EFUSE to TOP_RCM:PLL_PER_CLKCTRL_NWELLTRIM.

6. Write 0x0 to TOP_RCM:PLL_PER_CLKCTRL_IDLE.
7. Write 0x1 to TOP_RCM:PLL_PER_TENABLE.
8. Write 0x1 to TOP_RCM:PLL_PER_CLKCTRL_TINTZ.
9. Write 0x0 to TOP_RCM:PLL_PER_TENABLE.
10. Write 0x1 to TOP_RCM: PLL_PER_TENABLEDIV.
11. Write 0x0 to TOP_RCM: PLL_PER_TENABLEDIV.
12. Poll Lock Status by reading TOP_RCM:PLL_PER_STATUS_PHASELOCK until it is 0x1.

5.3.4.2.2 HS Divider Programming Sequence

1. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT0_DIV.
2. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT1_DIV.
3. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT2_DIV.
4. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT3_DIV.
5. Write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_TENABLEDIV.
6. Write 0x0 to TOP_RCM:PLL_PER_HSDIVIDER_TENABLEDIV.
7. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT0_GATE_CTRL.
8. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT1_GATE_CTRL.
9. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT2_GATE_CTRL.
10. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT3_GATE_CTRL.

5.3.4.2.3 ADPLLLJ (Low Jitter DPLL)

The ADPLLLJ is a low jitter PLL with a 2-GHz maximum output. ADPLLLJ has a predivide feature which allows user to divide, for instance, a 24-MHz or 26-MHz reference clock to 1 MHz and then multiply up to 2 GHz maximum.

All PLLs will come-up in bypass mode at reset. SW needs to program all the PLL settings appropriately and then wait for PLL to be locked. For more details, see the configuration procedure for each PLL.

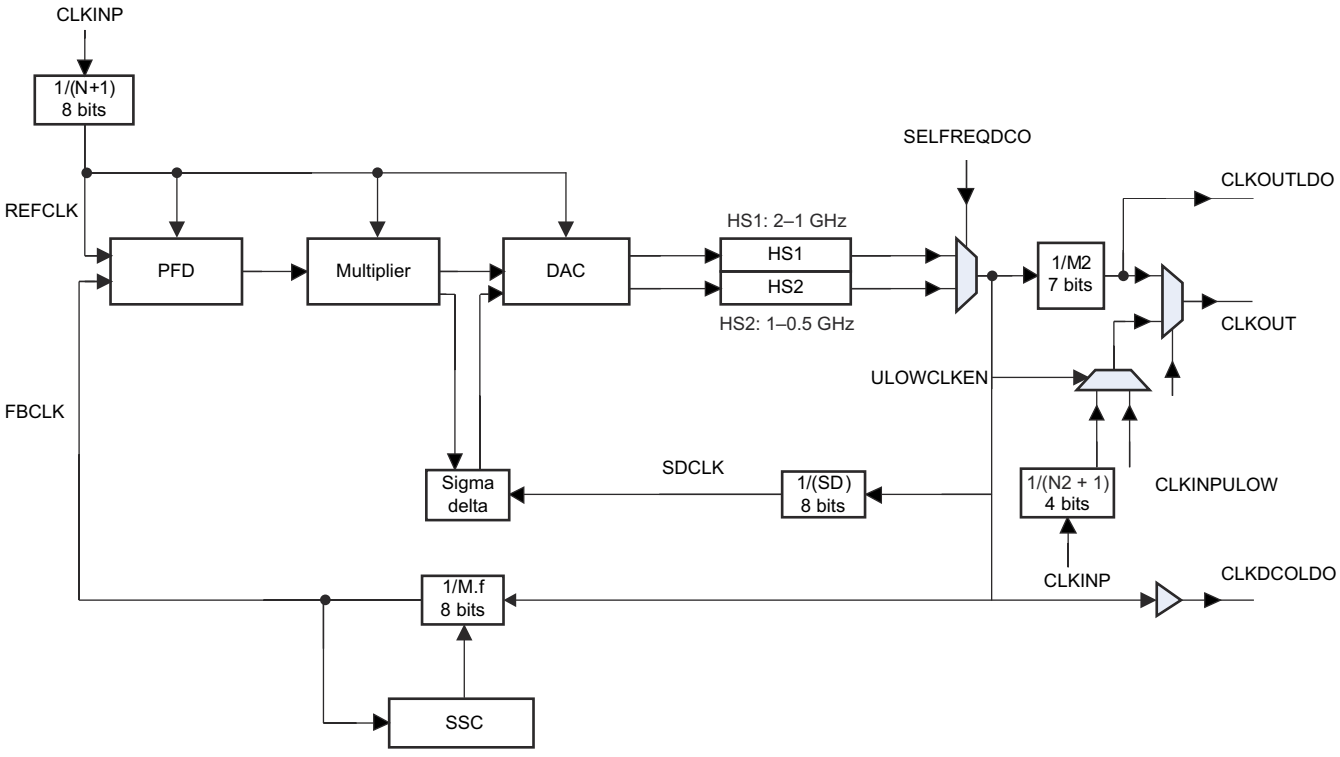

Figure 5-1360. Basic Structure of the ADPLLLJ

The peripheral PLL and EXTDEV PLL belong to type ADPLLLJ:

The DPLL has two input clocks:

- CLKINP: Reference input clock
- CLKINPULOW: Bypass input clock.

The DPLL has two internal clocks:

- REFCLK (Internal reference clock): This is generated by dividing the input clock CLKINP by the programmed value N+1. The entire loop of the PLL runs on the REFCLK.

  Here, REFCLK = CLKINP/(N+1).
- CLKDCO (Internal Oscillator clock.):This is the raw clock directly out of the digitally controlled oscillator (DCO) before the post-divider. The PLL output clock is synthesized by an internal oscillator which is phase locked to the refclk. There are two oscillators built within ADPLLLJ. The oscillators are user selectable based on the synthesized output clock frequency requirement. In locked condition, CLKDCO = CLKINP *[M/(N+1)].

The ADPLLLJ lock frequency is defined as follows: f_{DPLL} = CLKDCOOUT

The DPLL has three external output clocks:

- CLKOUTLDO: Primary output clock in VDDLDOOUT domain. Bypass option not available on this output.

  CLKOUTLDO = (M / (N+1))*CLKINP*(1/M2)
- CLKOUT:

  Primary output clock on digital core domain

  CLKOUT = (M / (N+1))*CLKINP*(1/M2)
- CLKDCOLDO:

  Oscillator (DCO) output clock before post-division in VDDLDOOUT domain. Bypass option is not available on this output.

  CLKDCOLDO = (M / (N+1))*CLKINP.

All clock outputs of the DPLL can be gated. The Control module provides the DPLL with a clock gating control signal to enable or disable the clock, and the DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. Output clock gating control for various clockouts: CLKOUTEN/CLKOUTLDOEN/CLKDCOLDOEN.

5.3.4.2.3.1 Clock Functions

Table 5-1710. Output Clocks in Locked Condition

Pin Name	Frequency
CLKOUT	[M /(N+1)] * CLKINP * [1/M2]
CLKOUTLDO	[M /(N+1)] * CLKINP * [1/M2]
CLKDCOOUT	[M /(N+1)] * CLKINP

Table 5-1711. Output Clocks Before Lock and During Relock Modes

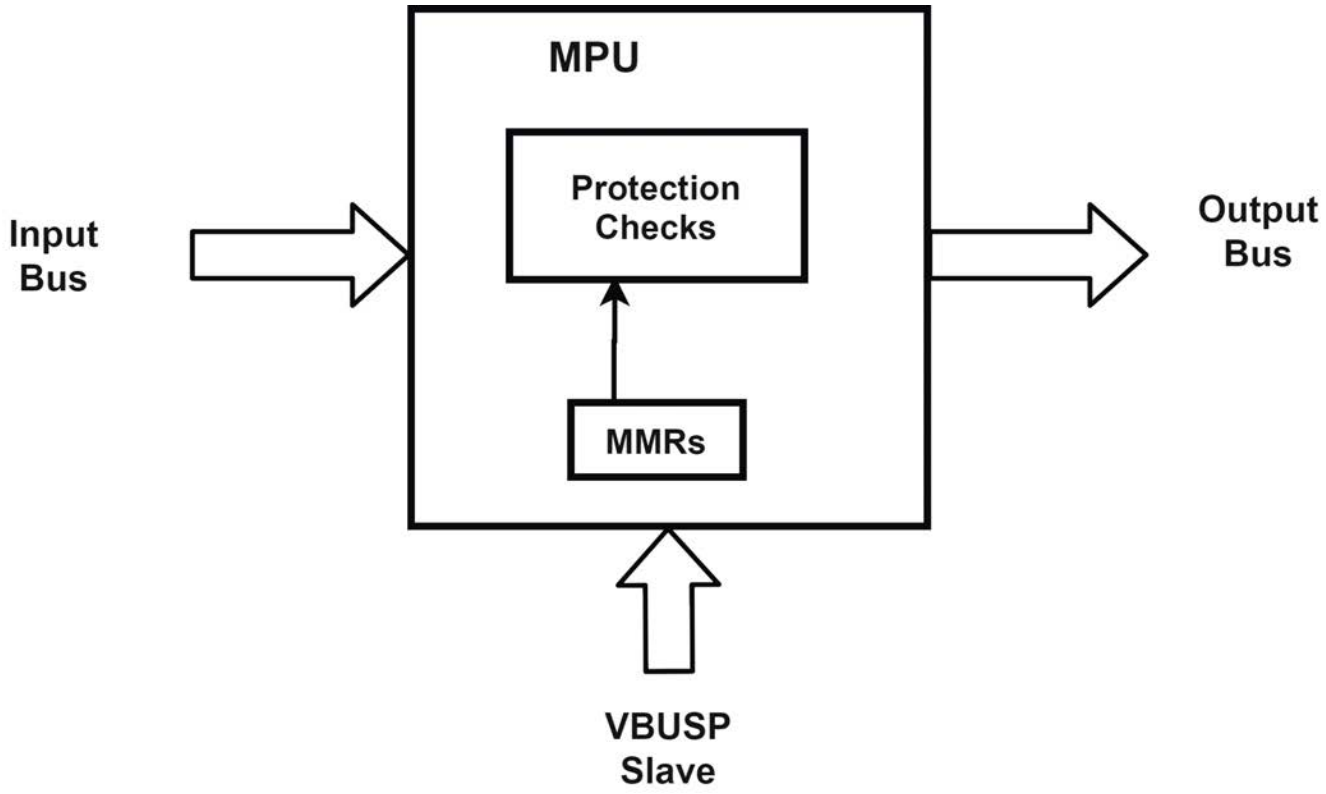
Pin Name	Frequency	Comments
CLKOUT	CLKINP/(N2+1)	ULOWCLKEN='0'
	CLKINPLOW	ULOWCLKEN='1'
CLKDCOLDO	LOW	
CLKOUTLDO	LOW	

5.3.4.2.4 M2 and N2 Change On-the-Fly

The dividers M2 and N2 are designed to change on the fly and provide a glitch-free frequency switch from the old to new frequencies. In other words, they can be changed while the PLL is in a locked condition, without having to switch to bypass mode. A status toggle bit will give an indication if the new divisor was accepted. These dividers can also be changed in bypass mode, and the new divisor value will be reflected on output after the PLL relocks. For more details, see the PLL configuration procedures for each PLL.

5.4 Memory Protection Unit (MPU)

The MPU performs memory protection checking for a CBA bus. It inputs a VBUSM or VBUSP bus, then checks the address against the fixed and programmable regions to see if the access is allowed. If allowed, the transfer is passed unmodified to the output VBUSM or VBUSP bus. If the transfer is illegal (fails the protection check), then the MPU does not pass the transfer to the output bus but rather services the transfer internally back to the input bus (to prevent a hang) returning the fault status to the requestor as well as generating an interrupt about the fault.



The first check is the transfer's privID against the AID settings. There is an AID register bit for each possible privID (0 to 15) and an AIDX that covers privIDs not configured. The privID is used to lookup the associated AID bit. If the AID bit is 0, then the range does not cover that privilege level and the range is not checked (although other ranges with different AID setting will) for this transfer. If the AID bit is 1, then the range does cover that privilege level and the permissions are checked. The transfer secure and debug parameters are checked against the MPPA values to detect an allowed access. The two bits (NS and EMU) provide 3 permission levels. If the NS is set, the range is non-secure and any security or debug level may access the range. If the NS is not set, the range is secure only and only secure level accesses are allowed. In secure mode, if the EMU is set, debug accesses are allowed. If the EMU is not set, debug accesses are not allowed. For non-debug accesses, the read, write, and execute permissions are also checked. There is a set of permissions for supervisor mode and another for user mode. The "priv" attribute of the transfer determines which is checked. If priv = 1, the supervisor rwx bits are checked against the "dir" and "dtype" attributes of the transfer (read is dir = 1 and dtype not instruction, write is dir = 0, execute is dir = 1 and dtype = instruction). If priv = 0, the user rwx bits are checked against the same attributes. If the associated rwx bit for the type of transfer is 1, the transfer is allowed, but if the rwx bit is 0, the transfer is not allowed.

The function outputs whether the transfer is allowed or not. If the transfer address range (start to end address, or those with AID bits = 0) does not match any range, the transfer is either allowed or disallowed based on the configuration mode of the MPU to "assumed allowed" or "assumed disallowed" mode. If any of the overlapped ranges does not allow the access, the access is not allowed. Only when all the overlapped ranges allow the

access is the access allowed. The final permissions are the lowest of each type of permission from any hit range (so if a transfer hits 2 ranges, one that is rw and one that is rx, then the final permission is just r).

Figure 5-1361. MPU Top Level Diagram

Memory Map (MPU)

The default registers are listed in . There can also be configured MMRs.

Table 5-1712. Memory Map Registers

Address Offset	Register
0x000	Section 5.4.1
0x004	Section 5.4.2
0x010	Section 5.4.3
0x014	Section 5.4.4

5.4.1 Revision Register (Base Address + 0x000)

The Revision Register contains the ID and revision information.

Table 5-1713. Revision Register

Bits	Field	Type	Reset	Description
31:30	scheme	r/o	1	Scheme.
29:28	reserved	r/o	0	Always read as 0. Writes have no affect.
27:16	modID	r/o	0xe81	Module ID field.
15:11	revrtl	r/o	Any	RTL revision. Will vary depending on release.
10:8	revmaj	r/o	1	Major revision.
7:6	revcustom	r/o	0	Custom revision.
5:0	revmin	r/o	2	Minor revision.

5.4.2 Configuration Register (Base Address + 0x004)

The Configuration register contains the configured values of the module.

Table 5-1714. Configuration Register

Bits	Field	Type	Reset	Description
31:24	address_align	r/o	conf	Address alignment for range checking. 0 = 1k 1 = 2k 2 = 4k …
23:20	num_fixed	r/o	0 or 1	Number of fixed address ranges. Configurable as 0 or 1.
19:16	num_prog	r/o	config	Number of programmable address ranges. Value is determined by configuration
15:12	num_fixed_aids	r/o	config	Number of supported AIDs. 0 = no specific AIDs supported (all treated equally) N = PrivIDs from 0 to N-1 supported, others use AIDX Value is determined by configuration
11:1	reserved	r/o	0	Always read as 0.
0	assumed_allowed	r/o	1	Assumed allowed mode. 0 = assumed disallowed 1 = assumed allowed

5.4.3 Interrupt Raw Status/Set Register (Base Address + 0x010)

The Interrupt Raw Status/Set register shows the interrupt status (before enabling) and allows setting of the interrupt status.

Table 5-1715. Interrupt Raw Status/Set Register

Bits	Field	Type	Reset	Description
31:02:00	reserved	r/o	0	Always read as 0.
1	addr_err	w1ts	0	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	w1ts	0	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.4.4 Interrupt Enabled Status/Clear Register (Base Address + 0x014)

The Interrupt Enabled Status/Clear register shows the interrupt enabled status and allows clearing of the interrupt status.

Table 5-1716. Interrupt Enabled Status/Clear Register

Bits	Field	Type	Reset	Description
31:2	reserved	r/o	0	Always read as 0.
1	enabled_ addr_err	w1tc	0	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_ prot_err	w1tc	0	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.4.5 Interrupt Enable Register (Base Address + 0x018)

The Interrupt Enable register shows the interrupt enable value and allows setting the enable.

Table 5-1717. Interrupt Enable Register

Bits	Field	Type	Reset	Description
31:02	reserved	r/o	0	Always read as 0.

Table 5-1717. Interrupt Enable Register (continued)

Bits	Field	Type	Reset	Description
1	addr_err_en	w1ts	0	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	w1ts	0	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.4.6 Interrupt Enable Clear Register (Base Address + 0x01C)

The Interrupt Enable Clear register shows the interrupt enable and allows clearing of the interrupt enable. Reads return the Interrupt Enable register value, but writes can clear the interrupt enables.

Table 5-1718. Interrupt Enable Clear Register

Bits	Field	Type	Reset	Description
31:02	reserved	r/o	0	Always read as 0.
1	addr_err_en_clr	w1tc	0	Addressing violation error enable. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_ en_clr	w1tc	0	Protection violation error enable. Write a 1 to clear the enable. Writing a 0 has no effect.

5.4.7 EOI Register (Base Address + 0x020)

The EOI register allows software to indicate when the end of interrupt service is complete. The eoi vector value is dependent on the interrupt handling.

Table 5-1719. EOI Register

Bits	Field	Type	Reset	Description
31:8	reserved	r/o	0	Always read as 0.
7:0	eoi_vector	r/w	0	EOI vector value. Write this with the interrupt distribution value in the chip. This drives the mpu_eoi_vector output signal.

5.4.8 Interrupt Vector Register (Base Address + 0x024)

The Interrupt Vector register displays the interrupt vector returned from interrupt distribution.

Table 5-1720. Interrupt Vector Register

Bits	Field	Type	Reset	Description
31:0	intr_vec	r/o	0	Interrupt vector. Reads mpu_intr_vector input signal.

5.4.9 Fixed Address Start Register (Base Address + 0x100)

The Fixed Address Start register holds the start address for the fixed range. The register is read only and may be invalid if the region mode is used to not perform an address compare. The size of the field is determined by the comp_width parameter.

5.4.10 Fixed Address End Register (Base Address + 0x104)

The Fixed Address End register holds the end address for the fixed range. The register is read only and may be invalid if the region mode is used to not perform an address compare. The width of the field is determined by the comp_width parameter.

5.4.11 Fixed MPPA Register (Base Address + 0x108)

The Fixed Address MPPA register holds the permissions for the fixed region. This register is writeable by a non-debug supervisor entity (priv = 1) only. If the NS bit is in secure mode (= 0), the register is also only writeable by a non-debug secure entity (secure = 1). The NS bit is only writeable by a secure entity. For debug accesses, the register is writeable only when NS = 1 or EMU = 1.

Table 5-1721. Fixed MPPA Register

Bits	Field	Type	Reset	Description
31:26	reserved	r/o	0	Always read as 0.
25:10	AID15-0	r/w	input	AIDs checked for this region. Defaults to input value. 0 = AID is not checked for these permissions. 1 = AID is checked for these permissions.
9	AIDX	r/w	input	Additional AIDs checked. Defaults to input value.
8	reserved	r/o	0	Always read as 0.
7	ns	r/w	input	Non-secure permission. Defaults to input value.
6	emu	r/w	input	Debug permission. Defaults to input value.
5	sr	r/w	input	Supervisor read permission. Defaults to input value.
4	sw	r/w	input	Supervisor write permission. Defaults to input value.
3	sx	r/w	input	Supervisor executable permission. Defaults to input value.
2	ur	r/w	input	User read permission. Defaults to input value.
1	uw	r/w	input	User write permission. Defaults to input value.
0	ux	r/w	input	User executable permission. Defaults to input value.

5.4.12 Programmable Address Start Register N (Base Address + 0x200, 0x210, 0x220, …)

The Programmable Address Start register holds the start address for the range. This register is writeable by a supervisor entity (priv = 1) only. If the NS bit is in non-secure mode (= 0) in the associated MPPA register, the register is also only writeable by a secure entity (secure = 1). The width of the field is determined by the comp_width parameter.

Table 5-1722. Programmable Address Start Register

Bits	Field	Type	Reset	Description
31:N	start_addrN	r/w	input	Start address for range N. Defaults to input signal value.
N-1:0	reserved	r/o	0	Always read as 0.

5.4.13 Programmable Address End Register N (Base Address + 0x204, 0x214, 0x224, …)

The Programmable Address End register holds the end address for the range. This register is writeable by a supervisor entity (priv = 1) only. If the NS bit is in non-secure mode (= 0) in the associated MPPA register, the register is also only writeable by a secure entity (secure = 1). The field width is determined by the comp_width parameter.

Table 5-1723. Programmable Address End Register

Bits	Field	Type	Reset	Description
31:N	end_addrN	r/w	input	End address for range N. Defaults to input signal value.
N-1:0	reserved	r/o	1s	Always read as all bits 1.

5.4.14 Programmable MPPA Register N (Base Address + 0x208, 0x218, 0x228, …)

The Programmable Address MPPA register holds the permissions for the region. This register is writeable by a non-debug supervisor entity (priv = 1) only. If the NS bit is in secure mode (= 0), the register is also only writeable by a non-debug secure entity (secure = 1). The NS bit is only writeable by a non-debug secure entity. For debug accesses, the register is writeable only when NS = 1 or EMU = 1.

Table 5-1724. Programmable MPPA Register

Bits	Field	Type	Reset	Description
31:26	reserved	r/o	0	Always read as 0.
25:10	AID15-0	r/w	input	AIDs checked for this region. Defaults to input value. 0 = AID is not checked for these permissions. 1 = AID is checked for these permissions.
9	AIDX	r/w	input	Additional AIDs checked. Defaults to input value.
8	reserved	r/o	0	Always read as 0.
7	ns	r/w	input	Non-secure permission. Defaults to input value.
6	emu	r/w	input	Debug permission. Defaults to input value.
5	sr	r/w	input	Supervisor read permission. Defaults to input value.
4	sw	r/w	input	Supervisor write permission. Defaults to input value.
3	sx	r/w	input	Supervisor executable permission. Defaults to input value.
2	ur	r/w	input	User read permission. Defaults to input value.
1	uw	r/w	input	User write permission. Defaults to input value.
0	ux	r/w	input	User executable permission. Defaults to input value.

5.4.15 Fault Address Register (Base Address + 0x300)

The Fault Address register holds the address of the first protection fault transfer.

Table 5-1725. Fault Address Register

Bits	Field	Type	Reset	Description
31:0	fault_addr	r/o	0	Fault address.

5.4.16 Fault Status Register (Base Address + 0x304)

The Fault Status register holds the status and attributes of the first protection fault transfer.

Table 5-1726. Fault Status Register

Bits	Field	Type	Reset	Description
31:24	id	r/o	0	Transfer ID.
23:16	mstid	r/o	0	Master ID.

Table 5-1726. Fault Status Register (continued)

Bits	Field	Type	Reset	Description
15:13	reserved	r/o	0	Always read as 0.
12:09	privid	r/o	0	Privilege ID.
8	reserved	r/o	0	Always read as 0.
7	ns	r/o	0	Non-secure access.
6	reserved	r/o	0	Always read as 0.
5:00	fault_type	r/o	0	Fault type. 100000 = supervisor read fault 010000 = supervisor write fault 001000 = supervisor execute fault 000100 = user read fault 000010 = user write fault 000001 = user execute fault 111111 = relaxed cache linefill fault 010010 = relaxed cache writeback fault 000000 = no fault

5.4.17 Fault Clear Register (Base Address + 0x308)

The Fault Clear register allows the software to clear the current fault, so that another can be captured when this register is written.

Table 5-1727. Fault Clear Register

Bits	Field	Type	Reset	Description
31:1	reserved	r/o	0	Always read as 0.
0	fault_clr	w/o	0	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.5 Power Domains

The device has two power domains:

- Always-on power domain: This power domain supplies power to entire device except for the DSP core. It cannot be switched off dynamically within the device.
- DSP power domain: The DSP core inside the DSP subsystem is placed on switchable power domain, and can be switched on or off as needed. This feature can be used to reduce power consumption of the device when the DSP core is not in use. By default, the state of this power domain is OFF.

5.5.1 DSP Power Domain

The C66x DSP is off by default on bootup. The DSS_RCM controls the power cycling of the DSP. Software can trigger a power on/off sequence by writing to the DSP_PD registers in DSS_RCM space.

5.5.1.1 Software Sequence To Power On DSP

1. Unmask the wakeup trigger related to DSS_DSP_WAKEUP. This is DSP interrupt number 16. Thus, unmask the 16th bit in the register DSS_RCM.DSP_PD_WAKEUP_MASK0 by writing 0xFFFEFFFF
2. Trigger DSP wakeup by writing 0x1 to register DSS_RCM.DSP_PD_TRIGGER_WAKU.
3. Poll DSS_RCM.DSP_PD_STATUS.STATE for the value 13. This indicates that the L2 memory can now be written to or preloaded with code.
4. Download the DSP code into L2.
5. Write 0x0 to DSS_RCM.DSP_PD_CTRL.PROC_HALT to unhalt the processor and begin execution.

5.5.1.2 Software Sequence To Power OFF DSP

1. Ensure that all previous registered events during the previous power down are cleared.
2. Set up the DSP interrupt routine for DSS_DSP_PDC_INT (Gem event number : 118) as below:

a. Set the bit DSP_ICFG.PDCCMD.GEMPD.
b. Execute the idle instruction
3. If DSP powers up in autonomous mode without the program download, set the DSS_REG.GEMPWRSMCFG4.PWRSMLRSTHALT bit to 0x0.
4. Unmask the events to use as wakeup events in DSS_RCM:DSP_PD_WAKEUP_MASK[0-2].
5. Unmask the events to receive as hardware event pulses after the next power up in DSS_RCM:DSP_PD_MISSED_EVENT_MASK [0-2].
6. Mask all interrupts from DSP by setting the DSS_RCM:DSP_PD_CTRL:DSP_PD_CTRL_INTERRUPT_MASK field to 0x1.
7. Trigger a power down by setting the DSS_RCM:DSP_PD_TRIGGER_SLEEPfield to 0x1, and wait in a while loop. This triggers the interrupt DSS_DSP_PDC_INT, followed by the power-down of the DSP core by the control module.
8. The state of the DSP power domain can be polled by other main subsystem R5F cores to ensure the DSP power down. DSS_RCM:DSP_PD_STATUS_PD_STATUS field

5.5.2 DSP Subsystem L3 Power Domain

The DSS L3 memory can be controlled from DSS_RCM registers by the software.

By default, all the L3 memory is Power ON.

When partially switching off banks, it is the software's responsibility to ensure that the banks are disabled from the last 256 KB bank, that is, DSS L3 BANK D1. A bank should not be powered off if all its higher banks are not powered off. For example, if DSS L3 BANK C1 is powered down, BANK D0 and D1 are also powered down.

5.5.2.1 L3 Memory Bank Power Sequence

Below is the sequence to Power off a bank:
1. Write 0x7 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_ISO field.
2. Write 0x0 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_AONIN field.
3. Wait until DSS_RCM:DSS_L3_BANK*_PD_STATUS_AONOUT field is 0x0.
4. Write 0x0 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_AGOODIN field.
5. Wait until DSS_RCM:DSS_L3_BANK*_PD_STATUS_AGOODOUT field is 0x0.

Below is the sequence to Power on a bank:
1. Write 0x7 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_AONIN field.
2. Wait until DSS_RCM:DSS_L3_BANK*_PD_STATUS_AONOUT field is 0x1.
3. Write 0x7 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_AGOODIN field.
4. Wait until DSS_RCM:DSS_L3_BANK*_PD_STATUS_AGOODOUT field is 0x1.
5. Write 0x0 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_ISO field.

Table 5-1728. Title TBD

Bank 256 KB	Bank Name	Control Registers
0	DSS L3 BANK A0	DSS_L3_BANKA0_PD_CTRL_AGOODIN DSS_L3_BANKA0_PD_CTRL_AONIN DSS_L3_BANKA0_PD_CTRL_ISO
1	DSS L3 BANK A1	DSS_L3_BANKA1_PD_CTRL_AGOODIN DSS_L3_BANKA1_PD_CTRL_AONIN DSS_L3_BANKA1_PD_CTRL_ISO
2	DSS L3 BANK A2	DSS_L3_BANKA2_PD_CTRL_AGOODIN DSS_L3_BANKA2_PD_CTRL_AONIN DSS_L3_BANKA2_PD_CTRL_ISO
4	DSS L3 BANK B0	DSS_L3_BANKB0_PD_CTRL_AGOODIN DSS_L3_BANKB0_PD_CTRL_AONIN DSS_L3_BANKB0_PD_CTRL_ISO

Table 5-1728. Title TBD (continued)

Bank 256 KB	Bank Name	Control Registers
5	DSS L3 BANK B1	DSS_L3_BANKB1_PD_CTRL_AGOODIN DSS_L3_BANKB1_PD_CTRL_AONIN DSS_L3_BANKB1_PD_CTRL_ISO
6	DSS L3 BANK B2	DSS_L3_BANKB2_PD_CTRL_AGOODIN DSS_L3_BANKB2_PD_CTRL_AONIN DSS_L3_BANKB2_PD_CTRL_ISO
8	DSS L3 BANK C0	DSS_L3_BANKC0_PD_CTRL_AGOODIN DSS_L3_BANKC0_PD_CTRL_AONIN DSS_L3_BANKC0_PD_CTRL_ISO
9	DSS L3 BANK C1	DSS_L3_BANKC1_PD_CTRL_AGOODIN DSS_L3_BANKC1_PD_CTRL_AONIN DSS_L3_BANKC1_PD_CTRL_ISO
12	DSS L3 BANK D0	DSS_L3_BANKD0_PD_CTRL_AGOODIN DSS_L3_BANKD0_PD_CTRL_AONIN DSS_L3_BANKD0_PD_CTRL_ISO
13	DSS L3 BANK D1	DSS_L3_BANKD1_PD_CTRL_AGOODIN DSS_L3_BANKD1_PD_CTRL_AONIN DSS_L3_BANKD1_PD_CTRL_ISO

5.5.3 MSS L2 Power Domain

The MSS L2 memory can be controlled from the MSS_RCM registers by the software. By default, all the MSS_L2 memory is Power ON.

5.5.3.1 Power Sequence

Below is the sequence to Power off a bank:

1. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_ISO field.
2. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AONIN field.
3. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AONOUT field is 0x0.
4. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AGOODIN field.
5. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AGOODOUT field is 0x0.

Below is the sequence to Power on a bank:

1. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AONIN field.
2. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AONOUT field is 0x1.
3. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AGOODIN field.
4. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AGOODOUT field is 0x1.
5. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_ISO field.

When a block is powered off, a bus error is generated on access. It is always safe to have decent delay between each step because memory might take some time before reaching to total power-on state.

Table 5-1729. Title - TBD

Bank 512KB	Bank Name	Control Registers
0	MSS L2 BANK A	MSS_L2_BANKA_PD_CTRL_AGOODIN MSS_L2_BANKA_PD_CTRL_AONIN MSS_L2_BANKA_PD_CTRL_ISO
1	MSS L2 BANK B	MSS_L2_BANKB_PD_CTRL_AGOODIN MSS_L2_BANKB_PD_CTRL_AONIN MSS_L2_BANKB_PD_CTRL_ISO

5.6 Resets

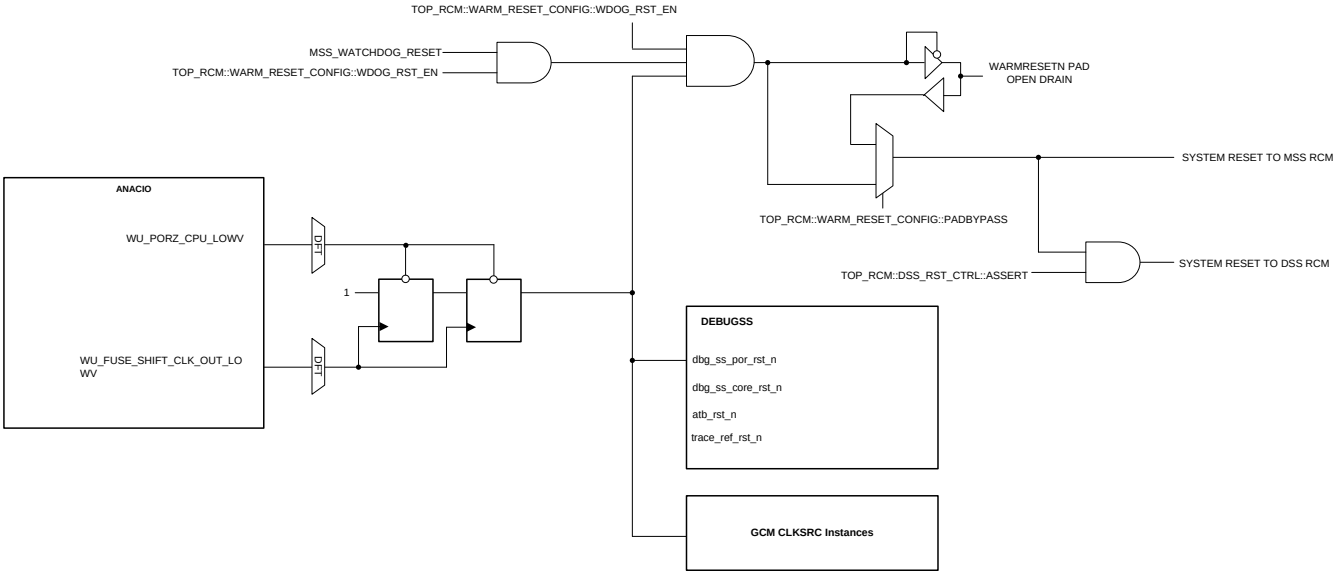

Figure 5-1362. Resets

Two device resets are available that can be controlled from the device pins: the power-on reset pin NRESET and the bidirectional WARM_RESET signal. The warm reset signal is implemented as an I/O, so that an external monitor can be used to detect changes to the state of the internal warm reset control signal.

Reset Types and Sources

Table 5-1730. Reset Types and Sources

Reset Type	Reset Source	Description
Power On Reset	Device Pin NRESET	Reset triggered by the device reset pin NREST. This resets the entire device, including all subsystems and interfaces. This is an active low asynchronous Power ON reset signal, and must be asserted for minimum 20 usec to reset the device.

Table 5-1730. Reset Types and Sources (continued)

Reset Type	Reset Source	Description
Warm Reset	Soft Reset, Watch Dog Reset, Device Pin WARM_RESET pin	This is an active low warm reset internally generated by the device, or triggered by device pin WARM_RESET. A write to the TOP_RCM.WARM_RESET_CONFIG[10:8] register or watch dog module can generate this reset; additionally, the external pin WARM_RESET can also be used to trigger this reset. Selection is controlled through the TOP_RCM.WARM_RESET_CONFIG register. The WARM_RESET pin is an open-drain failsafe IO which can be used to reset the device from the external world or to report the reset to the external world if it is generated by an internal source such as watchdog. A write to the TOP_RCM.WARM_RESET_CONFIG, as explained in register description, can create this reset. The watch dog module in the main subsystem can be configured to trigger this reset. Check the watch dog module description for details. This feature is enabled by the TOP_RCM.WARM_RESET_CONFIG register.

As listed in above table, various reset sources can generate the different resets used inside the device to reset various components and submodules. A Warm_rest excludes certain modules and spaces listed in this table from reset. These can only be reset by power-on reset.

Reset Domains

The device can be divided into various reset domains. The top reset domains cover the entire device and all of the subsystems. Additional subsystem-level reset domains are available, and can be reset independently based on resets mentioned in below table.

Table 5-1731. Reset Domains

Reset Domains	Description	Resets
Top reset domain	This top device-level reset domain resets entire device and all subsystems. All other reset domains are subdomains of this domain, and resetting this domain issues a reset to these subdomains. Only power-on reset can reset this domain, and it is immune to any other system reset type. Sub reset domain can be independently reset, as mentioned in the respective rows.	Power-on reset
Main subsystem reset domain	This reset subdomain controls the reset to the main susbsystem and the modules inside it. Resetting the top reset domain also resets this domain.	Power-on reset Warm reset

Table 5-1731. Reset Domains (continued)

Reset Domains	Description	Resets
Radar subsystem reset domain	This reset subdomain controls the reset to the radar susbsystem and all components inside it. Resetting the top reset domain also resets this domain.	Power-on reset Warm reset
DSP subsystem reset domain	This reset subdomain controls the reset to the DSP subsystem and all components inside it. Resetting the top reset domain also resets this domain.	Power-on reset Warm reset

Reset Cause Registers

Various reset cause registers are available that show the last reset issued to the device or subsystem, as shown b

Table 5-1732. Reset Cause Registers

Register	Description
MSS_RCM:MSS_RST_STATUS.MSS_RST_STATUS_CAUSE	Records the cause for the main SS reset domain reset
MSS_TOPRCM:SYS_RST_CAUSE.SYS_RST_CAUSE_CAUSE	Records the cause for the top reset domain reset
DSS_RCM:DSP_RST_CAUSE.DSP_RST_CAUSE_LRST_CAUSE	Records the cause of the local reset of the DSP reset domain
DSS_RCM:DSP_RST_CAUSE.DSP_RST_CAUSE_GRST_CAUSE	Records the cause of the global reset of the DSP reset domain
DSS_RCM:DSP_RST_CAUSE.DSP_RST_CAUSE_POR_CAUSE	Records the cause of the POR reset of the DSP reset domain

5.7 AWR294x Temperature Sensor

The AWR294x device has multiple on-chip temperature sensors (TS) which are distributed in and around different components of silicon. The RF front-end of the device contains multiple TS, which RadarSS can access to measure the temperature for RX and TX components. The application can read these TS through RadarSS using the mmWaveLink API (AWR_RF_TEMPERATURE_GET_SB, rlRfGetTemperatureReport). There are three digital temperature sensors available on the die which the application can access through GPADC. Figure 5-1363 and Table 5-1733 show the locations of these digital temperature sensors.

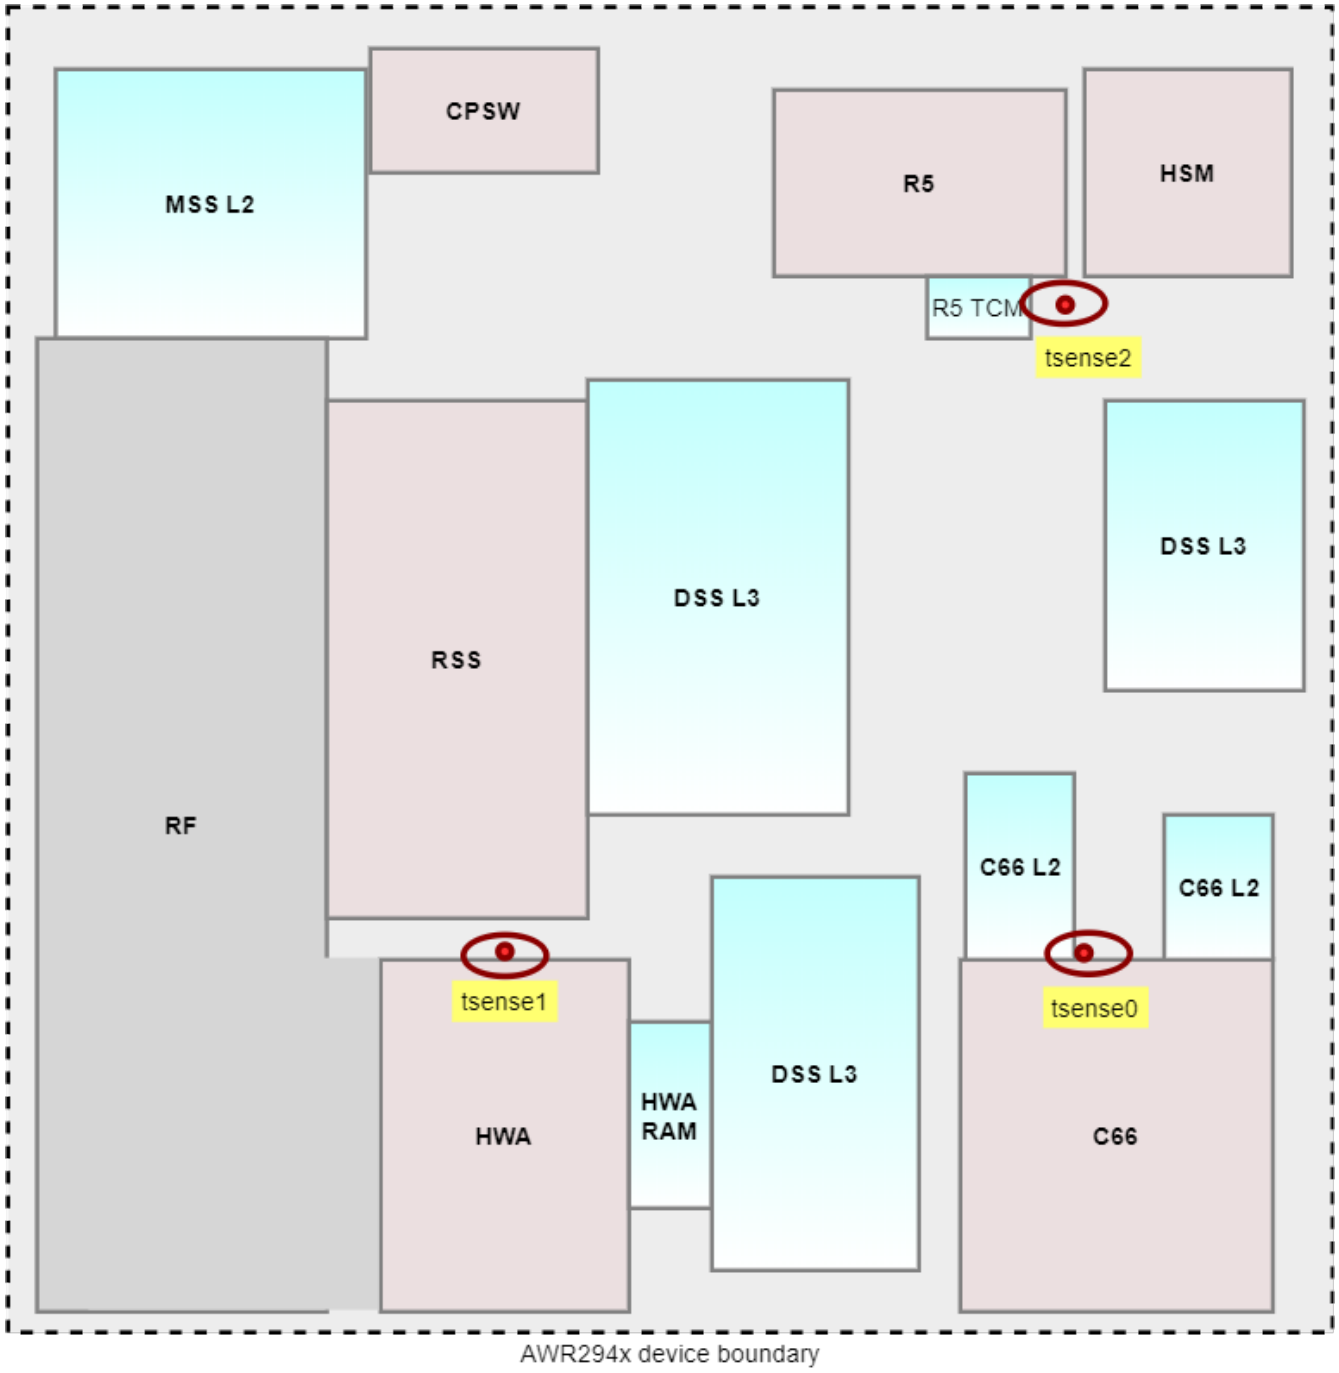

Figure 5-1363. AWR294x Temperature Sensors

Table 5-1733. Digital Temperature Sensor Location

	X	Y
tsense0	7041.775	1898.780
tsense1	3311.320	2070.465
tsense2	6522.780	6117.565

Note

Refer to the GPADC driver and unit-test application from MMWAVE-MCUPLUS-SDK to read these temperature sensors.

This page intentionally left blank.

AWR294x includes the following processor core and accelerators:

- MCU Subsystem ARM Cortex dual core lockstep R5F
- DSP Subsystem TI C66x DSP
- Radar Processing Hardware Accelerators
- Radar Subsystem ARM Cortex lockstep R4F

6.1 Main Subsystem Cortex R5F

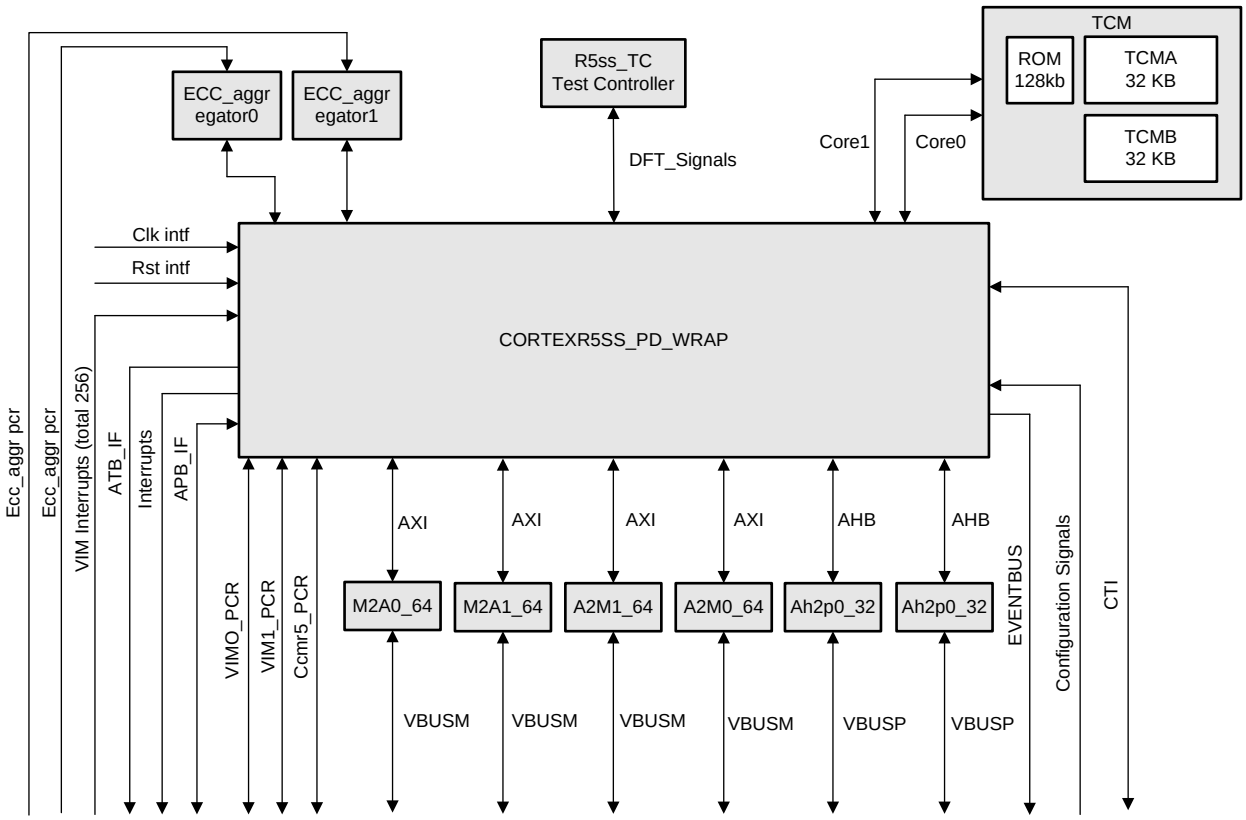

Figure 6-1. Main Subsystem

The Main SubSystem is a dual-core implementation of the Arm Cortex-R5F processor configured for split/lock operation. It also includes accompanying memories (L1 caches and tightly-coupled memories), standard Arm® CoreSight™ debug and trace architecture, integrated Vectored Interrupt Manager (VIM), ECC Aggregators, and various other modules for protocol conversion and address translation for easy integration into the SoC.

6.1.1 Main ARM SubSystem Features

The MSS supports the following features:

- ARMv7-R architecture with the following extensions:

  - Advanced SIMD extension for integer and floating-point vector operations
  - Vector Floating Point Version 3 (VFPv3) with Single/Double Precision
  - Dynamic branch prediction with a global history buffer, and a 4-entry return stack
- Lock step and dual core modes are supported:
  - Switching to dual core mode is possible by the application (if switching to performance mode is enabled by EFUSE), even if the boot has happened in lock step mode – using a CPU reset triggered by application software.
- L1 memory architecture (per each CPU in split mode, or single lock-step CPU):
  - 16KByte I-Cache with 64-bit ECC
  - 16Kbyte D-cache with 32-bit ECC
  - 128KBKB TCM with 32-bit ECC
    - 64KB TCMA and 64KB TCMB in lock-step mode
    - 32KB TCMA and 32KB TCMB for each core in split-mode
- L2 Interface
  - 64-bit Controller interface for peripheral access
  - 64-bit Target interface for cache and TCM access
  - 32-bit Controller interface for MCU peripherals
  - ECC on data. Redudancy on Control bus
- Vectored Interrupt Manager with ECC protection on Vector Table RAM
  - VIM1 and VIM2 in lockstep pair when CPU cores are in lock step mode
  - VIM1 and VIM2 supports interrupt generation for its corresponding cores in dual core/split mode.
- Static (boot time) configuration for either lockstep mode or dual-CPU mode
- Mechanism to clock gate the CPU and comparator logic in a non-Lockstep mode.
- CPU Self-Test Controller for CPU core, VIM, and Comparator modules
- PBIST controller for test of all the RAMs
- Support to test ECC functionality in safety-critical applications
- Built in debug features
  - Up to 8 hardware breakpoints per CPU
  - Up to 8 watch points per CPU
- 32-bit Target Debug interface to access Debug components (CTI, ETM, ATB)
- Trace interface to a Core Sight ETM-R5
- Performance Monitoring Unit (PMU)
- Little Endian mode of operation

6.1.2 TCM Initialization

Auto-init module has been implemented for initializing the TCMs. Paths from TCMA and TCMB are timing-critical, so the initialization of these memories occur through the test path. Initialization of TCMA and TCMB occurs in parallel.

Below are the registers used for the TCM initialization

- Writing 1 to MSS_CTRL:MSS_<A/B>TCM_MEM_INIT:MSS_<A/B>TCM_MEM_INIT_MEM_INIT starts the mem-init for MSS_TCM<A/B>_CR5A/B.
- Reading 1 from MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_DONE: MSS_<A/B>TCM_MEM_INIT_DONE_MEM_INIT_DONE confirms the end of initialization for MSS_TCM<A/B>_CR5A/B.
- Writing 1 to MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_DONE: MSS_<A/B>TCM_MEM_INIT_DONE_MEM_INIT_DONE clears the field.
- Reading 1 from MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_STATUS: MSS_<A/B>TCM_MEM_INIT_STATUS_MEM_STATUS confirms progress of initialization for MSS_TCM<A/B>_CR5A/B.

6.1.3 Lock-Step to Dual Core Switching

1. Write 3'b111 to MSS_CTRL: R5_CONTROL: R5_CONTROL_LOCK_STEP_SWITCH_WAIT. This ensures switching happens only on CR5A/B reset.
2. Write 3'b000 to MSS_CTRL: R5_CONTROL: R5_CONTROL_LOCK_STEP. This decides whether to switch or not.
3. Write 0xFFFFFFFF to MSS_RCM:RST_WFICHECK to ensure the Reset-Sequencer looks for WFI state of CR5A/B before asserting the reset.
4. Write 3'b111 to MSS_CTRL: R5_CONTROL: R5_CONTROL_RESET_FSM_TRIGGER. This triggers the reset sequencer, which is waiting for WFI from CR5A/B as it ensures step-3 is done. Go to WFI with arm-command asm(wfi).
5. R5F goes through a reset-cycle and starts booting.
6. Read bit9 of MSS_RCM: MSS_RST_STATUS:MSS_RST_STATUS_CAUSE. That being '1' ensures the reset has happened because of the Reset-Sequencer.
7. Write 3'b111 to MSS_RCM: MSS_RST_CAUSE_CLR:MSS_RST_CAUSE_CLR_CLR to clear the MSS_RCM: MSS_RST_STATUS:MSS_RST_STATUS_CAUSE register.

Note

The switch can only be performed from Lock Step mode to Dual core mode and not vice versa. This switch cannot be done multiple times; it is allowed only once.

6.1.4 Vectored Interrupt Manager (VIM) Module

This chapter describes the behavior of the vectored interrupt manager (VIM) module of the device family.

6.1.4.1 VIM Overview

The VIM aggregates device interrupts and sends them to the R5F CPU(s). It can be used in either split or lockstep configuration. In split, it has two independent interrupt cores, one per CPU. In lockstep, CPU1 acts as a diagnostic on CPU0; only CPU0's outputs are used but all outputs are compared to CPU1 to provide diagnostic coverage.

The VIM module supports the following features:

- 256 interrupt inputs per R5F core
- Each interrupt has its own 4-bit programmable priority
  - Defined via the INTPRIORITY_j register
  - The VIM provides support for priority interruption of interrupts
- Each interrupt has its own enable mask
  - Interrupt enable is done via the INTR_EN_SET_j register
  - Interrupt disable is done via the INTR_EN_CLR_j register
- Each interrupt can be programmed as either an IRQ or FIQ
  - Defined via the INTMAP_j register
- Each interrupt has its own programmable 32-bit vector address associated with it
  - Defined via the INTVECTOR_j register
  - Protected with SECDED
- One IRQn and one FIQn output per core
- Vectored interrupt interface
  - Compatible with R5F VIC port
- Default vector provided when a double-bit error is detected
- Split or lockstep capable
  - In lockstep mode, only interrupts connected to VIM interrupt core 0 are available
- Software interrupt generation

6.1.4.2 VIM Interrupt Inputs

The VIM supports 256 interrupt inputs per core. Each interrupt can be either a level or a pulse (both active-high). The interrupt mapping for the two R5F cores can be found in Chapter , *Interrupts*.

6.1.4.3 VIM Interrupt Outputs

The VIM has two interrupt outputs per core:

- *CoreN_IRQn*: This is a normal interrupt for core *N* (active-low level). It can be serviced via the VIC interface or through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an IRQ (via the INTMAP_j register) and is enabled (via the INTR_EN_SET_j register), then it will cause an IRQ to assert
- *CoreN_FIQn*: This is a fast (or non-maskable) interrupt for core *N* (active-low level). FIQs always have priority over IRQs. An FIQ can be serviced through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an FIQ and is enabled, then it will cause an FIQ to assert

6.1.4.4 VIM Interrupt Vector Table (VIM RAM)

For each VIM interrupt core, there is an associated interrupt vector table (VIM RAM) that is used to store the address of ISRs. During register vectored interrupt and hardware vectored interrupt, VIM accesses the interrupt vector table using the vector value to fetch the address of the corresponding ISR. Note that both interrupt vector tables are identical in their memory organization.

The VIM RAM is basically comprised of a set of interrupt vector registers (INTVECTOR_j). Hence, the interrupt vector table is organized in 256 words of 30 bits, with a base address corresponding to the physical address of the first register in the group.

Note

The lower two bits of the 32-bit interrupt vector are always 0s.

Figure 6-2 shows the VIM RAM interrupt vector map.

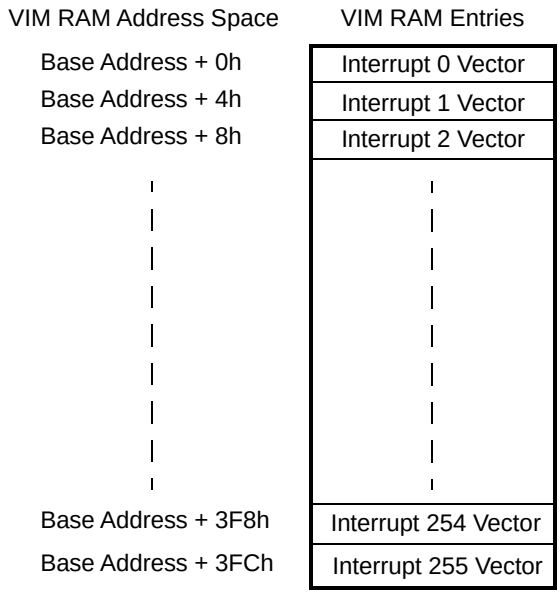

Figure 6-2. VIM RAM Interrupt Vector Map

The interrupt vector table has protection by ECC to indicate corruption due to soft errors. The ECC logic inside VIM supports SECDED. Refer to the ECC aggregator map for the VIM RAM ID.

6.1.4.5 VIM Interrupt Prioritization

The VIM supports the interruption of the currently active interrupt by one with a higher priority. FIQs and IRQs are completely separate but both use the same mechanism.

When an interrupt goes from pending to active (FIQ: reading the FIQVEC register; IRQ: reading the IRQVEC register, then the interrupt is loaded into the corresponding active register (ACTFIQ / ACTIRQ), and all interrupts of an equal or lesser priority are masked (discarded). If prior to this interrupt being cleared (by writing to theFIQVEC register, or IRQVEC register) another interrupt of higher priority arrives, then the FIQn/IRQn will be asserted and that interrupt made pending as normal. If the CPU switches this interrupt to active (by reading the FIQVEC / IRQVEC register), then the currently active interrupt will be pushed onto a stack. When an interrupt is cleared by reading the FIQVEC / IRQVEC register, if there are any interrupts on the stack, the first entry is popped off and put back into the ACTFIQ / ACTIRQ register, so that software may continue where it left off.

6.1.4.6 VIM ECC Support

The memory that holds the interrupt vector for each interrupt is protected by SECDED ECC. Single-bit errors are corrected and written back. Double-bit errors are not corrected. If a double-bit error occurs while trying to load a vector, then the DEDVEC register is used to provide the default vector for the *coreN_IRQADDRV* signal, the IRQVEC register, and the FIQVEC register. The DEDVEC should point to an ISR that handles the fact that there was an uncorrectable error in the interrupt handling.

Some possible remediating actions would be to:

1. Reconstruct the vector table and re-start the application
   a. Potentially switch to a completely software interrupt handler in the mean time
2. Restart the application from scratch
3. Reset the device
4. Sit in a loop (or WFI) while something external (for example, the ESM) responds to the DED interrupt that will be generated

It is up to the user and the application to determine the appropriate action.

Note

An interrupt that has an uncorrectable vector error (and thus uses the DED vector) will still have the priority of the original interrupt . This makes it possible for a higher priority interrupt to supercede the handling of the error.

Control and reporting are done by the ECC aggregator.

6.1.4.7 VIM Lockstep Mode

In lockstep mode, CPU1 is used as a diagnostic for CPU0. In this mode, only the interrupt inputs for CPU0 are used. Besides to CPU0, these interrupt inputs are also internally routed to CPU1 (through the level-sync / edge-detect logic dedicated to CPU1, and additionally through some delay circuits). The outputs from both VIM interrupt cores are then sent to the MSS CCMR5 module through dedicated compare buses (with CPU0's outputs delayed). The CCMR5 module is responsible for comparing the two sets of output signals and for reporting any mismatches by generating an interrupt (MSS_CCMR5_ERR).

Note

In lockstep mode, only the RAM dedicated to CPU0 is used, so software *must not* do anything with the ECC interface on the RAM dedicated to CPU1.

6.1.4.8 VIM IDLE State

The VIM will indicate IDLE when there are no pending unmasked interrupts or MMR accesses. The VIM does not have a clock stop interface.

6.1.4.9 VIM Interrupt Handling

There are multiple ways to service an interrupt depending on how much of the hardware assistance offered by the VIM the software wants to take advantage of.

For IRQs, it is recommended to use the procedure in Section 6.1.4.9.1, but the procedures in Section 6.1.4.9.2 or Section 6.1.4.9.3 (if a user wants to implement a fully software prioritization scheme) may be used as alternatives.

For FIQs, it is recommended to use the procedure in Section 6.1.4.9.4, but the procedure in Section 6.1.4.9.5 may be used as an alternative.

Note

These descriptions do not include steps such as stack pushes and state retention that software must take in order to return from the ISR. It is assumed that the programmer is aware of these steps.

6.1.4.9.1 Servicing IRQ Through Vector Interface

If the associated CPU has the vector (VIC) interface enabled, then the following method is used for servicing IRQs:

1. Hardware handshake
   a. CPU asserts *coreN_IRQACK* high
   b. VIM asserts *coreN_IRQADDRV* to indicate that the *coreN_IRQADDR* bus is stable with the correct vector address
   c. CPU reads *coreN_IRQADDR*, jumps to that address, and de-asserts *coreN_IRQACK* low
   d. VIM de-asserts *coreN_IRQn* and *coreN_IRQADDRV*, VIM masks (discards) all IRQs with the same or lower priority
   e. VIM loads the value from the PRIIRQ[9:0] NUM bit field (which corresponds to the vector address) into the ACTIRQ[9:0] NUM bit field, which causes the ACTIRQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTIRQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE_j register to determine type)
   a. Pulse
      i. Clear the status by writing a '1' to the appropriate bit in the IRQSTS_j register, or STS_j register
      ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
   b. Level
      i. Clear the interrupt at the source
      ii. Clear the status by writing a '1' to the appropriate bit in the IRQSTS_j register, or STS_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the IRQVEC register
   a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
   b. This will also clear the ACTIRQ[31] VALID bit

6.1.4.9.2 Servicing IRQ Through MMR Interface

When an IRQ interrupt is received, the CPU should follow these steps if not using the vector interface:

1. Read the IRQVEC register and jump to that address to service the ISR
   a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN_IRQn* output. If another interrupt of a higher priority becomes available, the *coreN_IRQn* will re-assert, allowing priority interruption of an interrupt

   b. Reading this register will cause the value from the PRIIRQ[9:0] NUM bit field to be loaded into the ACTIRQ[9:0] NUM bit field, and the ACTIRQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
   a. Pulse
      i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
      ii. Clear the interrupt at the source
   b. Level
      i. Clear the interrupt at the source
      ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
4. Write any value to the IRQVEC register
   a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
   b. This will also clear the ACTIRQ[31] VALID bit

6.1.4.9.3 Servicing IRQ Through MMR Interface (Alternative)

If a user does not want to use the IRQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the IRQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
   a. Read the PRIIRQ register to determine which interrupt is the highest priority IRQ currently asserted, OR
   b. Optionally read the IRQGSTS register to determine which groups have IRQs pending, then read the IRQSTS_j register and use a software prioritization scheme to determine which IRQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
   a. Pulse
      i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
      ii. Clear the interrupt at the source.
   b. Level
      i. Clear the interrupt at the source
      ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register

6.1.4.9.4 Servicing FIQ

When an FIQ interrupt is received, the CPU should follow these steps:

1. Read the FIQVEC register and jump to that address to service the ISR
   a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN_FIQn* output. If another interrupt of a higher priority becomes available, the *coreN_FIQn* will re-assert, allowing priority interruption of an interrupt.
   b. Reading this register will cause the value from the PRIFIQ[9:0] NUM bit field to be loaded into the ACTFIQ[9:0] NUM bit field, and the ACTFIQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTFIQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE_j register to determine type)
   a. Pulse
      i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register
      ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
   b. Level
      i. Clear the interrupt at the source

ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt

4. Write any value to the FIQVEC register
   a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
   b. This will also clear the ACTFIQ[31] VALID bit

6.1.4.9.5 Servicing FIQ (Alternative)

If a user does not want to use the FIQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the FIQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
   a. Read the PRIFIQ register to determine which interrupt is the highest priority FIQ currently asserted, OR
   b. Optionally read the FIQGSTS register to determine which groups have IRQs pending, then read the FIQSTS_j register and use a software prioritization scheme to determine which FIQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
   a. Pulse
      i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register
      ii. Clear the interrupt at the source.
   b. Level
      i. Clear the interrupt at the source
      ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register.

6.1.4.10 MSS_VIM Registers

Table 6-2 lists the memory-mapped registers for the MSS_VIM registers. All register offset addresses not listed in Table 6-2 should be considered as reserved locations and the register contents should not be modified.

Table 6-1. VIM Instances

Instance	Base Address
MSS_VIM_R5A	0x02080000

6.1.4.10.1 PID Register (Offset = 0h) [Reset = 60900001h]

PID is shown in Figure 6-3 and described in Table 6-3.

Return to the Table 6-2.

The Revision Register contains the major and minor revisions for the module.

Figure 6-3. PID Register

Table 6-6. PRIFIQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid.
30-20	RES4	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending FIQ. valid only if the valid flag is set.
15-10	RES5	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the highest priority pending FIQ. valid only if the valid flag is set.

6.1.4.10.5 IRQGSTS Register (Offset = 10h) [Reset = 0h]

IRQGSTS is shown in Figure 6-7 and described in Table 6-7.

Return to the Table 6-2.

The IRQ Group Status Register indicates which groups have pending IRQ interrupts.

Figure 6-7. IRQGSTS Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STS																															
R-0h																															

Table 6-7. IRQGSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R	0h	Indicates that the num field is valid.

6.1.4.10.6 FIQGSTS Register (Offset = 14h) [Reset = 0h]

FIQGSTS is shown in Figure 6-8 and described in Table 6-8.

Return to the Table 6-2.

The FIQ Group Status Register indicates which groups have pending FIQ interrupts.

Figure 6-8. FIQGSTS Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 6-11. ACTIRQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid. Set when the IRQ Vector Address Register is read and cleared whenever the IRQ Vector Address Register is written.
30-20	RES6	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES7	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the currently active IRQ. Loaded from teh Prioritized IRQ Register whenever the IRQ Vector Address is read. Valid only if the valid flag is set.

6.1.4.10.10 ACTFIQ Register (Offset = 24h) [Reset = 0h]

ACTFIQ is shown in Figure 6-12 and described in Table 6-12.

Return to the Table 6-2.

The Active FIQ Register shows the number of the currently active FIQ.

Figure 6-12. ACTFIQ Register

31	30	29	28	27	26	25	24

Table 6-61. INTTYPE_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

6.1.4.10.60 RAW_6 Register (Offset = 4C0h) [Reset = 0h]

RAW_6 is shown in Figure 6-62 and described in Table 6-62.

Return to the Table 6-2.
