TEXAS INSTRUMENTS
DP83TC812S-Q1, DP83TC812R-Q1
SNLS654A – APRIL 2021 – REVISED DECEMBER 2021

DP83TC812x-Q1 TC-10 Compliant 100BASE-T1 Automotive Ethernet PHY

1 Features

- Open Alliance and IEEE 802.3bw 100BASE-T1 compliant
  - Passes Level IV emissions with Integrated LPF
  - TC-10 compliant with < 20µA sleep current
- SAE J2962-3 EMC compliant
- Configurable I/O voltages: 3.3 V, 2.5 V, and 1.8 V
- MAC interfaces: MII, RMII, RGMII and SGMII
- Optional separate voltage rail for MAC interface pins (3.3 V, 2.5 V, 1.8 V)
- AEC-Q100 qualified for automotive applications:
  - Temperature grade 1: –40°C to +125 °C ambient operating temperature
  - ±8-kV HBM ESD for pins 12 and 13
  - IEC61000-4-2 ESD classification level 4 for pins 12 and 13: ±8-kV contact discharge
- IEEE 1588 SFD support
- TSN compliant with 802.3br frame pre-emption support
- Low active power operation: < 230 mW
- Diagnostic tool kit
  - Signal quality indication (SQI)
  - Time domain reflectometry (TDR)
  - Electrostatic discharge sensor
  - Voltage sensor
  - PRBS Built-in Self-Test
  - Loopbacks
- VQFN, wettable flank packaging

2 Applications

- ADAS
- Gateway and Body Control
- Telematics

3 Description

The DP83TC812-Q1 device is an IEEE 802.3bw-compliant automotive PHYTER™ Ethernet physical layer transceiver which can work with Unshielded Twisted Pair cable. The PHY supports TC10 sleep and wake features. It provides all physical layer functions needed to transmit and receive data over unshielded single twisted-pair cables. The device provides xMII flexibility with support for standard MII, RMII, RGMII, and SGMII MAC interfaces.The PHY also integrates a low pass filter on the MDI side to reduce emissions.

This device includes the Diagnostic Tool Kit, providing an extensive list of real-time monitoring tools, debug tools and test modes. Within the tool kit is the first integrated electrostatic discharge (ESD) monitoring tool. It is capable of counting ESD events on MDI as well as providing real-time monitoring through the use of a programmable interrupt. Additionally, the DP83TC812-Q1 includes a pseudo random binary sequence (PRBS) frame generation tool, which is fully compatible with internal loopbacks, to transmit and receive data without the use of a MAC. The device is housed in a 6.00-mm × 6.00-mm, 36-pin VQFN wettable flank package. This device is pin-2-pin compatible with DP83TG720 (1000BASE-T1). It is also form factor compatible with DP83TC811. This would allow for a single PCB layout to be used for DP83TC811, DP83TC812, DP83TC814, and DP83TG720.

Device Information

PART NUMBER	PACKAGE (1)	BODY SIZE (NOM)
DP83TC812S-Q1	VQFN (36)	6.00 mm × 6.00 mm
DP83TC812R-Q1	VQFN (36)	6.00 mm × 6.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Table 6-1. Pin Functions

PIN		STATE[1]	DESCRIPTION
NAME[2]	NO.		
MAC INTERFACE			
RX_D3 RX_M	23	S, PD, O	**Receive Data:** Symbols received on the cable are decoded and transmitted out of these pins synchronous to the rising edge of RX_CLK. They contain valid data when RX_DV is asserted. A data nibble, RX_D[3:0], is transmitted in MII and RGMII modes. 2 bits; RX_D[1:0], are transmitted in RMII mode. RX_D[3:2] are not used when in RMII mode. If the PHY is bootstrapped to RMII Master mode, a 50-MHz clock reference is automatically outputted on RX_D3. This clock must be fed to the MAC. **RX_M / RX_P:** Differential SGMII Data Output. These pins transmit data from the PHY to the MAC.
RX_D2 RX_P	24		
RX_D1	25		
RX_D0	26		
RX_CLK	27	PD, O	**Receive Clock:** In MII and RGMII modes, the receive clock provides a 25-MHz reference clock. **Unused in RMII and SGMII modes**
RX_ER	14	S, PD, O	**Receive Error:** In MII and RMII modes, this pin indicates a receive error symbol has been detected within a received packet. In MII mode, RX_ER is asserted high synchronously to the rising edge of RX_CLK. In RMII mode, RX_ER is asserted high synchronously to the rising edge of the reference clock. This pin is not required to be used by the MAC in MII or RMII because the PHY will automatically corrupt data on a receive error. **Unused in RGMII and SGMII modes**
RX_DV CRS_DV RX_CTRL	15	S, PD, O	**Receive Data Valid:** This pin indicates when valid data is presented on RX_D[3:0] for MII mode. **Carrier Sense Data Valid:** This pin combines carrier sense and data valid into an asynchronous signal. When CRS_DV is asserted, data is presented on RX_D[1:0] in RMII mode. **RGMII Receive Control:** Receive control combines receive data valid indication and receive error indication into a single signal. RX_DV is presented on the rising edge of RX_CLK and RX_ER is presented on the falling edge of RX_CLK. **Unused in SGMII mode**
TX_CLK	28	PD, I, O	**Transmit Clock:** In MII mode, the transmit clock is a 25-MHz output and has constant phase referenced to the reference clock. In RGMII mode, this clock is sourced from the MAC layer to the PHY. A 25-MHz clock must be provided (not required to have constant phase to the reference clock unless synchronous RGMII is enabled) **Unused in RMII and SGMII modes**
TX_EN TX_CTRL	29	PD, I	**Transmit Enable:** In MII mode, transmit enable is presented prior to the rising edge of the transmit clock. TX_EN indicates the presence of valid data inputs on TX_D[3:0]. In RMII mode, transmit enable is presented prior to the rising edge of the reference clock. TX_EN indicates the presence of valid data inputs on TX_D[1:0]. **RGMII Transmit Control:** Transmit control combines transmit enable and transmit error indication into a single signal. TX_EN is presented prior to the rising edge of TX_CLK; TX_ER is presented prior to the falling edge of TX_CLK. **Unused in SGMII mode**
TX_D3	30	PD, I	**Transmit Data:** In MII and RGMII modes, the transmit data nibble, TX_D[3:0], is received from the MAC prior to the rising edge of TX_CLK. In RMII mode, TX_D[1:0] is received from the MAC prior to the rising edge of the reference clock. TX_D[3:2] are not used in RMII mode. **TX_M / TX_P:** Differential SGMII Data Input. These pins receive data that is transmitted from the MAC to the PHY.
TX_D2	31		
TX_D1 TX_P	32		
TX_D0 TX_M	33		
SERIAL MANAGEMENT INTERFACE			
MDC	1	I	**Management Data Clock:** Synchronous clock to the MDIO serial management input and output data. This clock may be asynchronous to the MAC transmit and receive clocks. The maximum clock rate is 25 MHz. There is no minimum clock rate.
MDIO	36	OD, IO	**Management Data Input/Output:** Bidirectional management data signal that may be sourced by the management station or the PHY. This pin requires a pullup resistor. In systems with multiple PHYs using same MDIO-MDC bus, a single pull-up resistor should be used on MDIO line. Recommended to use a resistor between 2.2 kΩ and 9 kΩ.

Table 6-1. Pin Functions (continued)

PIN		STATE[1]	DESCRIPTION
NAME[2]	NO.		
CONTROL INTERFACE			
$\overline{\text{INT}}$	2	PU, OD, IO	**Interrupt:** Active-LOW output, which will be asserted LOW when an interrupt condition occurs. This pin has a weak internal pullup. Register access is necessary to enable various interrupt triggers. Once an interrupt event flag is set, register access is required to clear the interrupt event. This pin can be configured as an Active-HIGH output using register *0x0011*. This pin can also operate as Power-Down control where asserting this pin low would put the PHY in power down mode and asserting high would put the PHY in normal mode. This feature can also be enabled via register *0x0011*.
$\overline{\text{RESET}}$	3	PU, I	**Reset:** Active-LOW input, which initializes or reinitializes the PHY. Asserting this pin LOW for at least 1 µs will force a reset process to occur. All internal registers will reinitialize to their default states as specified for each bit in the Register Maps section. All bootstrap pins are resampled upon deassertion of reset.
WAKE	8	PD, I/O	**WAKE:** Input/Outputpin which is Active-HIGH input by default. As input this pin wakes the PHY from TC-10 SLEEP. Asserting this pin HIGH at power-up will bring the PHY out of SLEEP. External 10kΩ pull down resistor can be used when implementing TC-10 circuit to prevent accidental wake-up. This pin can be directly tied to VSLEEP or it can be pulled to VSLEEP via a resistor to wake the device. This pin also supports wake forwarding feature where a WAKE pulse will be generated by the PHY which can be used for waking up other PHYs on the same system.
INH	10	O, OD	**INH:** Active-HIGH output. This pin will be Hi-Z when the PHY is in TC-10 SLEEP. This pin is HIGH for all other PHY states. External pull down resistor in th range of 2kΩ - 10kΩ must be used when implementing TC-10 circuit. If multiple devices are sharing INH pin, then a single pull down resistor must be used.
CLOCK INTERFACE			
XI	5	I	**Reference Clock Input (RMII):** Reference clock 50-MHz CMOS-level oscillator in RMII Slave mode. Reference clock 25-MHz crystal or oscillator in RMII Master mode. **Reference Clock Input (Other MAC Interfaces):** Reference clock 25-MHz crystal or oscillator input. The device supports either an external crystal resonator connected across pins XI and XO, or an external CMOS-level oscillator connected to pin XI only and XO left floating. This pin can also accept clock input from other devices like Ethernet MAC or another Ethernet PHY in daisy-chain operations.
XO	4	O	**Reference Clock Output:** XO pin is used for crystal only. This pin must be left floating when a CMOS-level oscillator is connected to XI.
LED/GPIO INTERFACE			
LED_0 / GPIO_0	35	S, PD, IO	**LED_0:** Link Status LED. This pin can also be used as LED or clock output via Register selection.
LED_1 / GPIO_1	6	S, PD, IO	**LED_1:** Link Status and BLINK for TX/RX Activity. This pin can also be used as LED or clock output via Strap/ Register selection.
CLKOUT / GPIO_2	16	IO	**Clock Output:** 25-MHz reference clock. This pin can also be used as LED or GPIO via Strap/Register selection.
MEDIUM DEPENDENT INTERFACE			
TRD_M	13	IO	**Differential Transmit and Receive:** Bidirectional differential signaling configured for 100BASE-T1 operation, IEEE 802.3bw compliant.
TRD_P	12		
GROUND ESCAPE			
GND_ESC	17		**Ground Escape:** Optional ground escape pins. These pins can be connected to ground to optimize PCB layout. These pins are not substitute for power ground connection to DAP. DAP must always be connected to power ground. This pin can be left unconnected if not used.
GND_ESC	18		**Ground Escape:** Optional ground escape pins. These pins can be connected to ground to optimize PCB layout. These pins are not substitute for power ground connection to DAP. DAP must always be connected to power ground. This pin can be left unconnected if not used.
POWER CONNECTIONS			

Table 6-1. Pin Functions (continued)

PIN		STATE[1]	DESCRIPTION
NAME[2]	NO.		
VDDA	11	SUPPLY	**Core Supply:** 3.3 V Recommend using 0.47-µF and 0.01-µF ceramic decoupling capacitors; optional ferrite bead can be used.
VDDIO	34	SUPPLY	**IO Supply:** 1.8 V, 2.5 V, or 3.3 V Recommend using ferrite bead, 0.47-µF and 0.01-µF ceramic decoupling capacitors.
VDDMAC	22	SUPPLY	**Optional MAC Interface Supply:** 1.8 V, 2.5 V, or 3.3 V Optional separate supply for MAC interface pins. This pin supplies power to the MAC interface pins and can be kept at a different voltage level as compared to other IO pins. Recommend using 0.47-µF, and 0.01-µF ceramic decoupling capacitors and ferrite bead. When separate VDDMAC is not required in the system then it must be connected to VDDIO. When connecting to VDDIO, 0.47-µF on the VDDIO can be removed. 0.47-µF must still be connected close to VDDMAC. In this case, one common ferrite bead can be used between VDDIO and VDDMAC.
VSLEEP	7	SUPPLY	**VSLEEP Supply:** 3.3 V Recommend using 0.1-µF ceramic decoupling capacitors.
GROUND	DAP	GROUND	**Ground:** This must always be connected to power ground.
DO NOT CONNECT			
DNC	19		**DNC:** Do not connect (leave floating)
DNC	20		**DNC:** Do not connect (leave floating)
NO CONNECT			
NC	9		**NC:** No connection. Can be left floating. Connecting to any signal will have no effect on PHY performance.
NC	21		**NC:** No connection. Can be left floating. Connecting to any signal will have no effect on PHY performance.

1. Pin Type:
   I = Input
   O = Output
   IO = Input/Output
   OD = Open Drain
   PD = Internal pulldown
   PU = Internal pullup
   S = Bootstrap configuration pin (all configuration pins have weak internal pullups or pulldowns)
2. When pins are unused, follow the recommended connection requirements provided in the table above. If pins do not have required termination, they may be left floating.

Table 6-2. Pin Domain

PIN NO	PIN NAME	VOLTAGE DOMAIN
1	MDC	VDDIO

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

		MIN	TYP	MAX	UNIT
Input Voltage	VDDA	–0.3		4	V
Input Voltage	VDDIO/VDDMAC (3.3V)	–0.3		4	V
Input Voltage	VDDIO/VDDMAC (2.5V)	–0.3		4	V
Input Voltage	VDDIO/VDDMAC (1.8V)	–0.3		4	V
Input Voltage	VSLEEP	-0.3		4	V
Pins	MDI	–0.3		4	V
Pins	MAC interface	–0.3		VDDMAC + 0.3	V
Pins	MDIO, MDC, GPIO, XI, XO, INT, RESET, CLKOUT	–0.3		VDDIO + 0.3	V
Pins	WAKE, INH	–0.3		VSLEEP + 0.3	V
DC Output Voltage	All Pins	–0.3		4	V
T_J	Junction Temperature			150	°C
T_{stg}	Storage temperature	–65		150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002(1)	All pins	±2000	V
			TRD_N, TRD_P pins	±8000	
		Charged device model (CDM), per AEC Q100-011	Corner pins	±750	
			Other pins	±750	
		IEC 61000-4-2 contact discharge	TRD_N, TRD_P pins	±8000	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDDIO / VDDMAC	IO Supply Voltage, 1.8V operation	1.62	1.8	1.98	V
	IO Supply Voltage, 2.5V operation	2.25	2.5	2.75	
	IO Supply Voltage, 3.3V operation	2.97	3.3	3.63	
VDDA	Core Supply Voltage, 3.3V	2.97	3.3	3.63	V
VSLEEP	Sleep Supply Voltage, 3.3V	2.97	3.3	3.63	V
T_A	Ambient temperature	–40		125	°C

7.4 Thermal Information

THERMAL METRIC(1)		DP83TC812 RHA (VQFN) 36 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	36.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	27.0	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	17.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.7	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	17.5	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	6.7	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

7.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
100BASE-T1 PMA CONFORMANCE						
V_{OD-MDI}	Output Differential Voltage	$R_{L(diff)}$ = 100Ω			2.2	V
$R_{MDI-Diff}$	Integrated Differential Output Termination	TRD_P and TRD_M		100		Ω
BOOTSTRAP DC CHARACTERISTICS (2 Level)						
V_{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 3.3V ±10%, 2-level strap	0		0.8	V
V_{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 3.3V ±10%, 2-level strap	2		VDDIO	V
V_{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 2.5V ±10%, 2-level strap	0		0.7	V
V_{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 2.5V ±10%, 2-level strap	1.5		VDDIO	V
V_{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 1.8V ±10%, 2-level strap	0		0.35 x VDDIO	V
V_{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 1.8V ±10%, 2-level strap	0.65 x VDDIO		VDDIO	V
BOOTSTRAP DC CHARACTERISTICS (3 Level)						
V_{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 3.3V ±10%, 3-level strap	0		0.18 x VDDIO	V
V_{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 3.3V ±10%, 3-level strap	0.22 x VDDIO		0.42 x VDDIO	V
V_{MODE3}	Mode 3 Strap Voltage Range	VDDIO = 3.3V ±10%, 3-level strap	0.46 x VDDIO		VDDIO	V
V_{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 2.5V ±10%, 3-level strap	0		0.19 x VDDIO	V
V_{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 2.5V ±10%, 3-level strap	0.27 x VDDIO		0.41 x VDDIO	V
V_{MODE3}	Mode 3 Strap Voltage Range	VDDIO = 2.5V ±10%, 3-level strap	0.58 x VDDIO		VDDIO	V
V_{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 1.8V ±10%, 3-level strap	0		0.35 x VDDIO	V
V_{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 1.8V ±10%, 3-level strap	0.40 x VDDIO		0.75 x VDDIO	V

7.5 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{MODE3}	Mode 3 Strap Voltage Range	VDDIO = 1.8V ±10%, 3-level strap	0.84 x VDDIO		VDDIO	V
IO CHARACTERISTICS						
V_{IH}	High Level Input Voltage	VDDIO = 3.3V ±10%	2			V
V_{IL}	Low Level Input Voltage	VDDIO = 3.3V ±10%			0.8	V
V_{OH}	High Level Output Voltage	I_{OH} = -2mA, VDDIO = 3.3V ±10%	2.4			V
V_{OL}	Low Level Output Voltage	I_{OL} = 2mA, VDDIO = 3.3V ±10%			0.4	V
V_{IH}	High Level Input Voltage	VDDIO = 2.5V ±10%	1.7			V
V_{IL}	Low Level Input Voltage	VDDIO = 2.5V ±10%			0.7	V
V_{OH}	High Level Output Voltage	I_{OH} = -2mA, VDDIO = 2.5V ±10%	2			V
V_{OL}	Low Level Output Voltage	I_{OL} = 2mA, VDDIO = 2.5V ±10%			0.4	V
V_{IH}	High Level Input Voltage	VDDIO = 1.8V ±10%	0.65*VDDIO			V
V_{IL}	Low Level Input Voltage	VDDIO = 1.8V ±10%			0.35*VDDIO	V
V_{OH}	High Level Output Voltage	I_{OH} = -2mA, VDDIO = 1.8V ±10%	VDDIO-0.45			V
V_{OL}	Low Level Output Voltage	I_{OL} = 2mA, VDDIO = 1.8V ±10%			0.45	V
I_{IH}	Input High Current(1)	T_A = -40°C to 125°C, VIN=VDDIO, All pins except XI and WAKE	-10		10	µA
I_{IH-XI}	Input High Current(1)	T_A = -40°C to 125°C, VIN=VDDIO, XI pin	-15		15	µA
I_{IL-XI}	Input Low Current(1)	T_A = -40°C to 125°C, VIN=GND, XI pin	-15		15	µA
I_{IL}	Input Low Current(1)	T_A = -40°C to 125°C, VIN=GND, All pins except XI pin	-10		10	µA
Iozh	Tri-state Output High Current(2)	T_A = -40°C to 125°C, VIN=VDDIO, All pins except RX_CTRL and RX_ER	-10		10	µA
Iozh	Tri-state Output High Current(2)	T_A = -40°C to 125°C, VIN=VDDIO, RX_CTRL and RX_ER	-52		52	µA
Iozl	Tri-state Output Low Current(2)	T_A = -40°C to 125°C, VOUT=GND	-10		10	µA
R_{pulldn}	Internal Pull Down Resistor	RX_D[3:0], RX_CLK, LED_0, LED_1	6.2	8.4	10.7	kΩ
R_{pulldn}	Internal Pull Down Resistor	RX_CTRL, RX_ER	4.725	5.8	7.2	kΩ
R_{pulldn}	Internal Pull Down Resistor	WAKE		455		kΩ
R_{pullup}	Internal Pull Up Resistor	INT, RESET	6.3	9	11.2	kΩ
XI V_{IH}	High Level Input Voltage		1.3		VDDIO	V
XI V_{IL}	Low Level Input Voltage				0.5	V
C_{IN}	Input Capacitance XI			1		pF

7.5 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
C_{IN}	Input Capacitance INPUT PINS			5		pF
C_{OUT}	Output Capacitance XO			1		pF
C_{OUT}	Output Capacitance OUTPUT PINS			5		pF
R_{series}	Integrated MAC Series Termination Resistor	RX_D[3:0], RX_ER, RX_DV, RX_CLK	35	50	65	Ω
POWER CONSUMPTION						
I(3V3)	MII	-40°C to 125°C		57	63	mA
I(3V3)	RMII	-40°C to 125°C		57	63	mA
I(3V3)	RGMII	-40°C to 125°C		57	63	mA
I(3V3)	SGMII	-40°C to 125°C		81	95	mA

I(VDDIO=1.8V)	Standby	-40°C to 125°C, SGMII, VDDIO=VDDMAC		6	11	mA
I(VSLEEP)	TC-10 Sleep	-40°C to 125°C, All interfaces, All other supplies are off		7	18	µA
SGMII Input						
V_{IDTH}	Input differential voltage tolerance	SI_P and SI_N, AC coupled	0.1			V
$R_{IN-DIFF}$	Receiver differential input impedance (DC)		80		120	ohm
SGMII Output						
	Clock signal duty cycle	SO_P and SO_N, AC coupled, 0101010101 pattern	48		52	%
	Output Differential Voltage	SO_P and SO_N, AC coupled	150		400	mV
Voltage Sensor						
VDDA	VDDA Sensor Range	-40°C to +125°C	2.7	3.3	4	V
	VDDA Sensor Resolution (LSB)	-40°C to +125°C		8.8		mV
	VDDA Sensor Accuracy (voltage and temperature variation on single part)	-40°C to +125°C	-120		120	mV
	VDDA Sensor Accuracy (part-part variation)	-40°C to +125°C	-50		50	mV

7.5 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
VDDIO / VDDMAC	VDDIO / VDDMAC Sensor Range	-40℃ to +125℃	1.44		3.9	V
	VDDIO / VDDMAC Sensor Resolution (LSB)	-40℃ to +125℃		16		mV
	VDDIO / VDDMAC Sensor Accuracy (voltage and temperature variation on single part)	-40℃ to +125℃	-144		144	mV
	VDDIO / VDDMAC Sensor Accuracy (part-part variation)	-40℃ to +125℃	-85		85	mV
VSLEEP	VSLEEP Sensor Range	-40℃ to +125℃	2.7	3.3	4	V
	VSLEEP Sensor Resolution (LSB)	-40℃ to +125℃		8.8		mV
	VSLEEP Sensor Accuracy (voltage and temperature variation on single part)	-40℃ to +125℃	-120		120	mV
	VSLEEP Sensor Accuracy (part-part variation)	-40℃ to +125℃	-50		50	mV

(1) For pins: MDC, TX_CLK, TX_CTRL, TX_D[3:0], and RESET_N
(2) For pins: RX_D[3:0], RX_CLK, RX_CTRL, MDIO, INT_N, and XO.

7.6 Timing Requirements

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
MII TIMING						
T1.1	TX_CLK High / Low Time		16	20	24	ns
T1.2	TX_D[3:0], TX_ER, TX_EN Setup to TX_CLK		10			ns
T1.3	TX_D[3:0], TX_ER, TX_EN Hold from TX_CLK		0			ns
T2.1	RX_CLK High / Low Time		16	20	24	ns
T2.2	RX_D[3:0], RX_ER, RX_DV Delay from RX_CLK rising		10		30	ns
RMII MASTER TIMING						
T3.1	RMII Master Clock Period			20		ns
	RMII Master Clock Duty Cycle		35		65	%
T3.2	TX_D[1:0], TX_ER, TX_EN Setup to RMII Master Clock		4			ns
T3.3	TX_D[1:0], TX_ER, TX_EN Hold from RMII Master Clock		2			ns
T3.4	RX_D[1:0], RX_ER, CRS_DV Delay from RMII Master Clock rising edge		4	10	14	ns
RMII SLAVE TIMING						
T3.1	Input Reference Clock Period			20		ns
	Reference Clock Duty Cycle		35		65	%
T3.2	TX_D[1:0], TX_ER, TX_EN Setup to XI Clock rising		4			ns
T3.3	TX_D[1:0], TX_ER, TX_EN Hold from XI Clock rising		2			ns
T3.4	RX_D[1:0], RX_ER, CRS_DV Delay from XI Clock rising		4		14	ns
RGMII INPUT TIMING						
T_{cyc}	Clock Cycle Duration	TX_CLK	36	40	44	ns
$T_{setup(align)}$	TX_D[3:0], TX_CTRL Setup to TX_CLK (Align Mode)		1	2		ns
$T_{hold(align)}$	TX_D[3:0], TX_CTRL Hold from TX_CLK (Align Mode)		1	2		ns
RGMII OUTPUT TIMING						
$T_{skew(align)}$	RX_D[3:0], RX_CTRL Delay from RX_CLK (Align Mode Enabled)	On PHY Pins	-750		750	ps
$T_{setup(shift)}$	RX_D[3:0], RX_CTRL Delay from RX_CLK (Shift Mode Enabled, default)	On PHY Pins	2			ns
T_{cyc}	Clock Cycle Duration	RX_CLK	36	40	44	ns
Duty_G	Duty Cycle	RX_CLK	45	50	55	%
Tr/Tf	Rise / Fall Time (20% to 80%)	C_{LOAD} = 5pF			1.2	ns
SMI TIMING						
T4.1	MDC to MDIO (Output) Delay Time	25pF load capacitance	0		40	ns
T4.2	MDIO (Input) to MDC Setup Time		10			ns
T4.3	MDIO (Input) to MDC Hold Time		10			ns
	MDC Frequency			2.5	20	MHz
POWER-UP TIMING						
T5.1	Supply ramp time: For all supplies (1)		0.2		8	ms
T5.2	Supply ramp delay offset: For all supplies				10	ms
T5.3	XTAL Startup / Settling: Powerup to XI good/stabilized			0.35		ms
T5.4	Oscillator stabilization time from power up				10	ms
	Last Supply power up To Reset Release				10	ms
T5.5	Post power-up to SMI ready: Post Power-up wait time required before MDC preamble can be sent for register access		10			ms

7.6 Timing Requirements (continued)

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
T5.6	Power-up to Strap latch-in				10	ms
T5.7	CLKOUT Startup/Settling: Powerup to CLKOUT good/stabilized				10	ms
T5.8	Power-up to idle stream				10	ms
RESET TIMING (RESET_N)						
T6.1	Reset Pulse Width: Miminum Reset pulse width to be able to reset		720			ns
T6.2	Reset to SMI ready: Post reset wait time required before MDC preamble can be sent for register access		1			ms
T6.3	Reset to Strap latch-in: Hardware configuration pins transition to output drivers			40		µs
T6.4	Reset to idle stream				1800	µs
WAKE REQUEST AND WAKE PULSE TIMING						
T7.1	Local Wake-Up Pulse Duration		40			µs
T7.2	Local Wake-Up to INH Transition				40	µs
T7.3	Energy-detect-based Wake-Up Pulse Duration				0.7	ms
T7.4	Energy-detect-based Wake-Up to INH Transition				0.7	ms
T7.5	Energy-detect-based Wake-Up to WAKE forwarding pulse				1.4	ms
TRANSMIT LATENCY TIMING						
	MII Rising edge TX_CLK with assertion TX_EN to SSD symbol on MD		205		233	ns
	Slave RMII Rising edge XI clock with assertion TX_EN to SSD symbol on MDI		374		409	ns
	Master RMII Rising edge clock with assertion TX_EN to SSD symbol on MDI		382		408	ns
	RGMII Rising edge TX_CLK with assertion TX_CTRL to SSD symbol on MDI		370		390	ns
	First symbol of SGMII to SSD symbol on MDI		420		456	ns
RECEIVE LATENCY TIMING						
	SSD symbol on MDI to MII Rising edge of RX_CLK with assertion of RX_DV		467		491	ns
	SSD symbol on MDI to Slave RMII Rising edge of XI clock with assertion of CRS_DV		527		574	ns
	SSD symbol on MDI to Master RMII Rising edge of Master clock with assertion of CRS_DV		521		557	ns
	SSD symbol on MDI to Rising edge of RGMII RX_CLK with assertion of RX_CTRL		484		511	ns
	SSD symbol on MDI to first symbol of SGMII		708		788	ns
25 MHz OSCILLATOR REQUIREMENTS						
	Frequency Tolerance		-100		+100	ppm
	Rise / Fall Time (10%-90%)				8	ns
	Jitter Tolerance (RMS)				25	ps
	XI Duty Cycle in external clock mode		40		60	%
50 MHz OSCILLATOR REQUIREMENTS						
	Frequency			50		MHz
	Frequency Tolerance and Stability Over temperature and aging		–100		100	ppm
	Rise / Fall Time (10% - 90%)				4	ns
	Duty Cycle		35		65	%
25 MHz CRYSTAL REQUIREMENTS						

7.6 Timing Requirements (continued)

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
	Frequency			25		MHz
	Frequency Tolerance and Stability Over temperature and aging		–100		100	ppm
	Equivalent Series Resistance				100	Ω
OUTPUT CLOCK TIMING (25 MHz)						
	Frequency (PPM)		-100		100	-
	Duty Cycle		40		60	%
	Rise Time				5000	ps
	Fall Time				5000	ps
	Jitter (Short Term)				1000	ps
	Frequency			25		MHz

(1) For supplies with ramp rate longer than 8ms, a RESET pulse will be required after the last supply becomes stable.

8 Detailed Description

8.1 Overview

The DP83TC812S-Q1 is a 100BASE-T1 automotive Ethernet Physical Layer transceiver. It is IEEE 802.3bw compliant and AEC-Q100 qualified for automotive applications. The DP83TC812S-Q1 is interoperable with both BroadR-Reach PHYs and 100BASE-T1 PHYs.

The DP83TC812S-Q1 also supports Open Alliance TC-10 low power mode for additional power savings. The PHY supports WAKE and INH pins for implementing TC-10 functionality in the system.

This device is specifically designed to operate at 100-Mbps speed while meeting stringent automotive EMC limits. TheDP83TC812S-Q1 transmits PAM3 ternary symbols at 66.667 MHz over unshielded single twisted-pair cable. It is application flexible; supporting MII, RMII, RGMII, and SGMII in a single 36-pin VQFN wettable flank package.

There is an extensive Diagnostic Tool Kit within the DP83TC812S-Q1 for both in-system use as well as debug, compliance and system prototyping for bring-up. The DP83TC812S-Q1 can meet IEC61000-4-2 Level 4 electrostatic discharge limits and it also includes an on-chip ESD sensor for detecting ESD events in real-time.

8.2 Functional Block Diagram

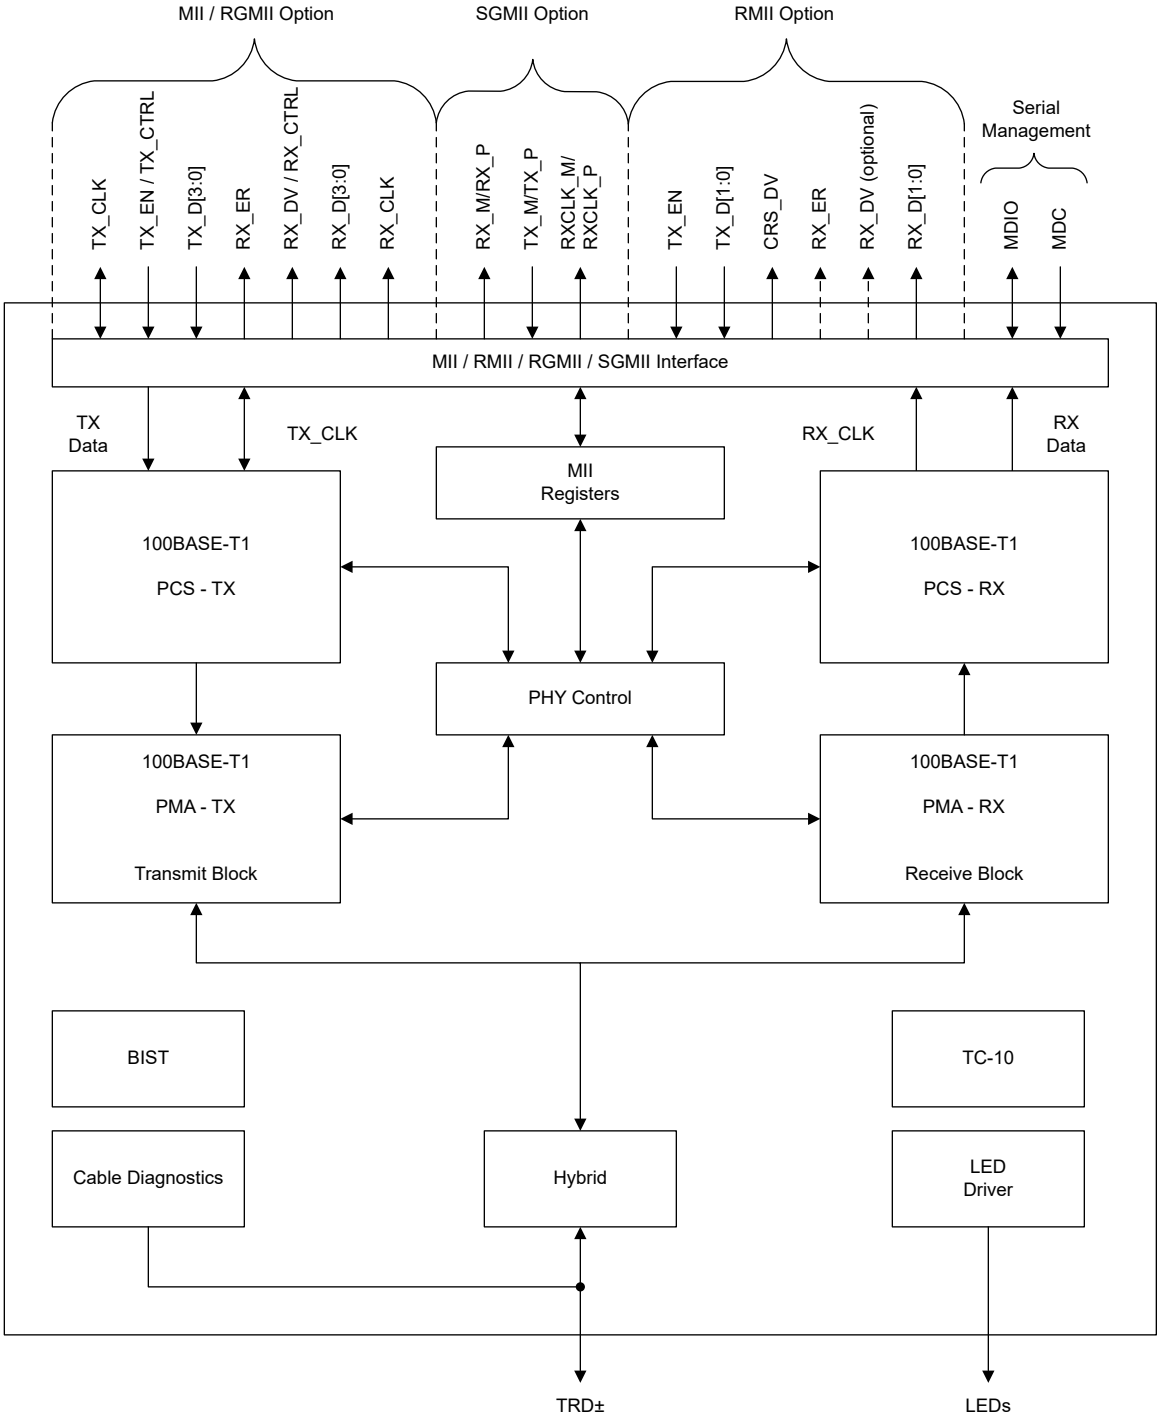

Figure 8-1. DP83TC812S-Q1

8.3 Feature Description

Note

Refer to SNLA389 Application Note for more information about the register settings used for compliance testing. It is necessary to use these register settings in order to achieve the same performance as observed during compliance testing.

8.3.1 Diagnostic Tool Kit

The DP83TC812 diagnostic tool kit provides mechanisms for monitoring normal operation, device-level debugging, system-level debugging, fault detection, and compliance testing. This tool kit includes a built-in self-test with PRBS data, various loopback modes, Signal Quality Indicator (SQI), Time Domain Reflectometry (TDR), undervoltage monitor, electrostatic discharge monitor, and IEEE 802.3bw test modes.

8.3.1.1 Signal Quality Indicator

When the DP83TC812-Q1 is active, the Signal Quality Indicator may be used to determine the quality of link based on SNR readings made by the device. SQI is presented as a 8-level indication. Signal quality indication is accessible through register 0x871. SQI is continuously monitored by the PHY to allow for real-time link signal quality status.

Bits[3:1] in register 0x871 provide SQI value while bits [7:5] provide the worst SQI value since the last read. The SQI value reported in register 0x871[3:1] map directly to the SQI levels required by Open Alliance.

In order to get the most accurate SQI reporting, use the initialization routine explained in SNLA389 application note.

Table 8-1. Signal Quality Indicator

REG 0x871[3:1]	OPEN ALLIANCE SQI LEVEL	LINK QUALITY
0x0	0 (Worst)	Poor/ No Link
0x1	1	
0x2	2	
0x3	3	
0x4	4	Good / Excellent Link
0x5	5	
0x6	6	
0x7	7 (Best)	

8.3.1.2 Electrostatic Discharge Sensing

Electrostatic discharge is a serious issue for electronic circuits and if not properly mitigated can create short-term issues (signal integrity, link drops, packet loss) as well as long-term reliability faults. The DP83TC812 has robust integrated ESD circuitry and offers an ESD sensing architecture. ESD events can be detected on MDI pins independently for further analysis and debug.

Additionally, the DP83TC812 provides an interrupt status flag; *Register 0x12[11]* is set when an ESD event is logged. This interrupt can be routed to the INT_N pin using bit[3] of the same register. *Register 0x442[14:9]* store the number of ESD events that have occurred since power-up. Hardware and software resets are ignored by the ESDS register to prevent unwarranted clearing.

8.3.1.3 Time Domain Reflectometry

Time domain reflectometry helps determine the quality of the cable, connectors and terminations in addition to estimating OPEN and SHORT faults along a cable. The DP83TC812-Q1 transmits a test pulse down the attached twisted-pair cable. Transmitted pulses continue down the cable and reflect from each imperfection and fault, allowing the device to measure the time to return and strength (amplitude) of all reflections. This technique enables the DP83TC812-Q1 to identify cable OPENs and SHORTs.

TDR is activated by setting bit[15] in register 0x1E. The procedure is as follows.

- Configure the DP83TC812-Q1 as per the initilization settings from SNLA389 Application Note
- Ensure that the Link Partner connected to the PHY is slient. Link will be down during TDR execution.
- Run the Pre-TDR configuration settings as listed in SNLA389.
- Start TDR by setting register 0x1E[15] to '1'.
- Wait 100ms, read register 0x1E[1:0]
  - If it reads 0b10 then TDR has executed successfully.
- If TDR executed successfully then read register 0x310 to get TDR results.
  - 0x310[8]: 0 = Half Wire Open not detected or 1 = Half Wire Open detected
  - 0x310[7]: 0 = Cable fault not detected or 1 = Cable fault detected
  - 0x310[6]: 0 = Cable fault is OPEN or 1 = Cable fault is SHORT
  - If valid cable fault is detected then 0x310[5:0] will store the location value in meters.

8.3.1.4 Voltage Sensing

The DP83TC812 offers sensors for monitoringvoltage at the supply pins. Undervoltage monitoring are always active in the DP83TC812 by default. If an undervoltage condition is detected, interrupt status flag is set in register 0x0013. These interrupts can also be optionally routed to the INT pin using the same register.

The following method should be used to read each sensor.

- Step 1: Program register 0x0467 = 0x6004 ; Initial configuration of monitors
- Step 2: Program register 0x046A = 0x00A3; Enable Monitors
- Step 3: Configure register 0x0468 with the corresponding setting to select the required sensor.
  - VDDA Sensor: Use 0x0468 = 0x0920
  - VSLEEP Sensor: Use 0x0468 = 0x1920
  - VDDMAC Sensor: Use 0x0468 = 0x2920
  - VDDIO Sensor: Use 0x0468 = 0x3920
- Step 4: Read register 0x047B[14:7] and convert this output code to decimal.
- Step 5: Use the output code in the following equations to get the sensor's absolute value. Refer to Table 8-2 table for constant values for corresponding sensors.
  - vdda_value = 3.3 + (vdda_output_code - vdda_output_mean_code)*slope_vdda_sensor
  - vsleep_value = 3.3 + (vsleep_output_code - vsleep_output_mean_code)*slope_vsleep_sensor
  - vddmac_value = 3.3 + (vddmac_output_code - vddmac_output_mean_code)*slope_vddmac_sensor
  - vddio_value = 3.3 + (vddio_output_code - vddio_output_mean_code)*slope_vddio_sensor

Table 8-2. Sensors Constant Values

Sensor	Constant	Value
VDDA	vdda_output_mean_code	126
	slope_vdda_sensor	0.0088
VSLEEP	vsleep_output_mean_code	134
	slope_vsleep_sensor	0.0088
VDDMAC	vddmac_output_mean_code	205
	slope_vddmac_sensor	0.016
VDDIO	vddio_output_mean_code	205
	slope_vddio_sensor	0.016

8.3.1.5 BIST and Loopback Modes

DP83TC812 incorporates a data-path's Built-In-Self-Test (BIST) to check the PHY level and system level data-paths. BIST has following integrated features which make the system level data transfer tests (through-put etc) and diagnostics possible without relying on MAC or external data generator hardware/software.

The following features are available in the DP83TC812 which can be used for easy evaluation.

1. Loopback modes
2. Data Generator
   a. Customizable MAC packets generator
   b. Transmitted packet counter
   c. PRBS stream generator
3. Data Checker
   a. Received MAC packets error checker
   b. Received packet counter: Counts total packets received and packets received with errors
   c. PRBS lock and PRBS error checker

8.3.1.5.1 Data Generator and Checker

DP83TC812 supports inbuilt Pseudo-random data generator and checker which can be used in conjuction with Loopback modes to check the data path. Data generator can be programmed to generate either user defined MAC packets or PRBS stream.

Following parameters of generated MAC packets can be configured (refer to registers<0x061B>,register<0x061A> and register<0x0624> for required configuration):

- Packet Length
- Inter-packet gap
- Defined number of packets to be sent or continuous transmission
- Packet data-type: Incremental/Fixed/PRBS
- Number of valid bytes per packet

8.3.1.5.2 xMII Loopback

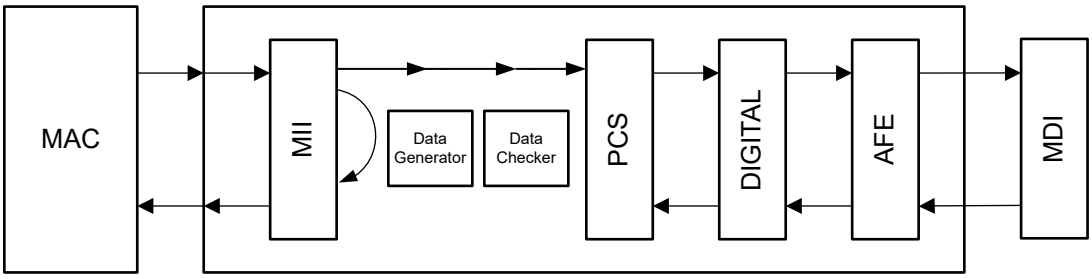

Figure 8-2. xMII Loopback Without Data Generator

xMII Loopback is the shallowest loop through the PHY. It is a useful test mode to validate communications between the MAC and the PHY. When in xMII Loopback, data transmitted from a connected MAC on the TX path is internally looped back in the DP83TC812 to the RX pins where it can be checked by the MAC. There is no link indication when in xMII loopback.

Enable Loopback

Write register 0x0000 = 0x6100

Enable data generator/checker for MAC side

Data will be generated externally on the MAC TX pins.

Use the following register settings to enable checker depending on the MAC interface mode.

- For RGMII, write register 0x0619 = 0x1004
- For SGMII, write register 0x0619 = 0x1114
- For RMII, write register 0x0619 = 0x1224
- For MII, write register 0x0619 = 0x1334

Check incoming data from MAC side

Data can be verified at MAC interface RX pins.

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E

Enable data generator/checker for Cable side

Not applicable as data will be generated externally on the MAC interface TX pins.

Check data for Cable side

Not applicable as PRBS stream checker works with only internal PRBS generator.

Other system requirements

Generated data will be going to cable side.

8.3.1.5.3 PCS Loopback

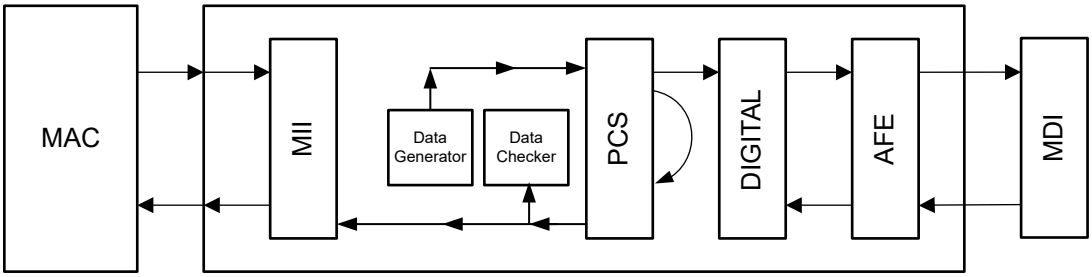

Figure 8-3. PCS Loopback with data generator

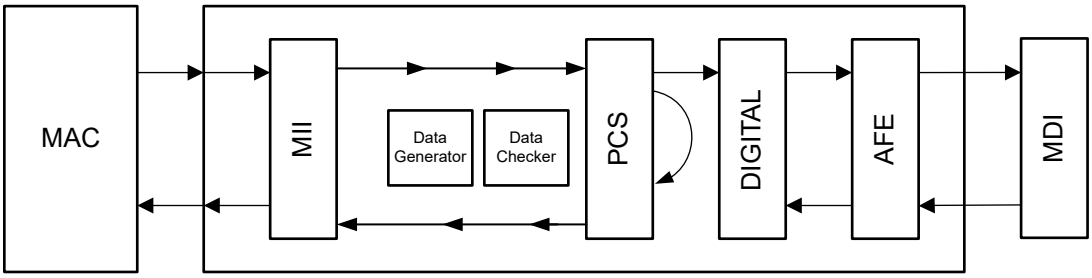

Figure 8-4. PCS Loopback without data generator

PCS Loopback will loop back data prior to it exiting the PCS and entering the PMA. Data received from the MAC on the transmit path is brought through the digital block within the PHY where it is then routed back to the MAC through the receive path. The DP83TC812 receive PMA circuitry is configured for isolation to prevent contention.

Enable Loopback

Write register 0x0016 = 0x0102

Enable data generator/checker for MAC side

Write register 0x0619 = 0x1555

Write register 0x0624 = 0x55BF

Check incoming data from MAC side

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E

Enable data generator/checker for Cable side

Write register 0x0619 = 0x0557

Write register 0x0624 = 0x55BF

Check data for Cable side

1. Write register 0x0620[1] = 1'b1
2. Read register 0x620
   a. Bit [7:0] = Number of errors bytes received
   b. Bit [8] = PRBS checker lock status on incoming data (1'b1 indicates lock)

Repeat steps 1 and 2 to continously check error status of incoming data stream.

Other system requirements

Data generate by the internal PRBS will be transmitted over the MDI and the MAC interface.

8.3.1.5.4 Digital Loopback

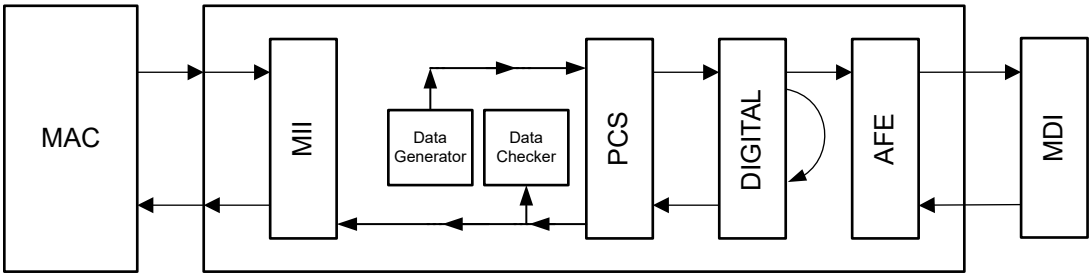

Figure 8-5. Digital loopback with data generator

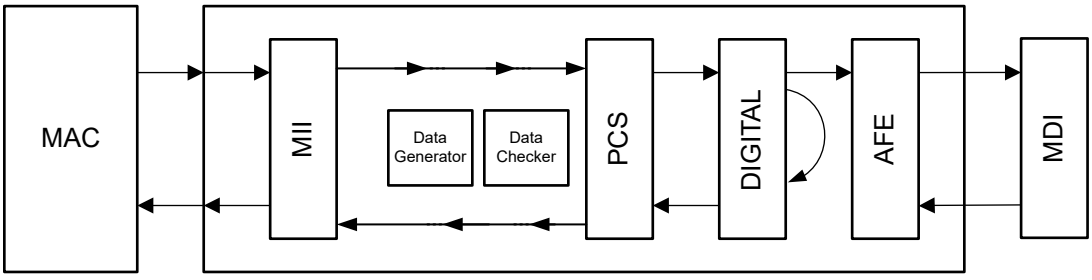

Figure 8-6. Digital loopback without data generator

Digital Loopback will loop back data prior to it exiting the Digital and entering the AFE. Data received from the MAC on the transmit path is brought through the digital block within the PHY where it is then routed back to the MAC through the receive path. The DP83TC812 receive Analog circuitry is configured for isolation to prevent contention.

Enable Loopback

Write register 0x0016 = 0x0104

Enable data generator/checker for MAC side

Write register 0x0619 = 0x1555

Write register 0x0624 = 0x55BF

Check incoming data from MAC side

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E

Enable data generator/checker for Cable side

Write register 0x0619 = 0x0557

Write register 0x0624 = 0x55BF

Check data for Cable side

1. Write register 0x0620[1] = 1'b1
2. Read register 0x620
   a. Bit [7:0] = Number of errors bytes received
   b. Bit [8] = PRBS checker lock status on incoming data (1'b1 indicates lock)

Repeat steps 1 and 2 to continously check error status of incoming data stream.

Other system requirements

Data generate by the internal PRBS will be transmitted over the MDI and the MAC interface.

8.3.1.5.5 Analog Loopback

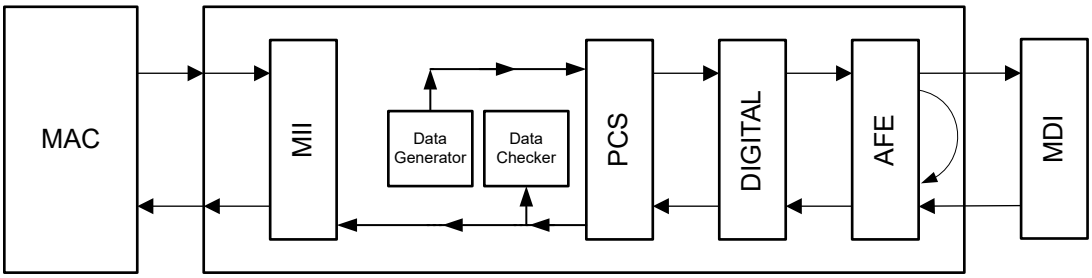

Figure 8-7. Analog loopback with data generator

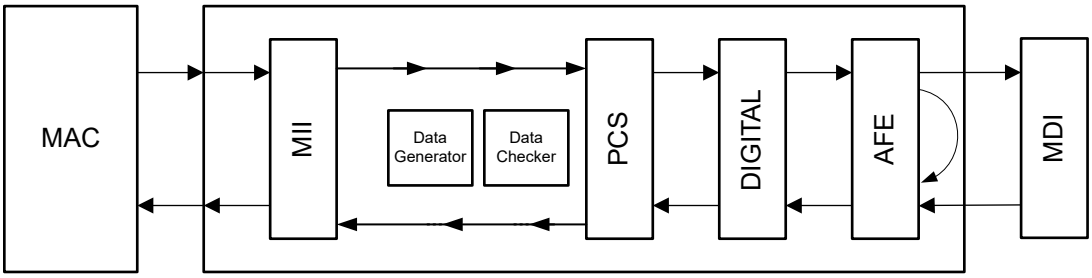

Figure 8-8. Analog loopback with data generator

Analog Loopback uses the echoed signals from the unterminated MDI and decodes these signals in the Hybrid to return the data to the MAC.

Enable Loopback

Write register 0x0016 = 0x0108

Enable data generator/checker for MAC side

Write register 0x0619 = 0x1555

Write register 0x0624 = 0x55BF

Check incoming data from MAC side

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E

Enable data generator/checker for Cable side

Write register 0x0619 = 0x0557

Write register 0x0624 = 0x55BF

Check data for Cable side

1. Write register 0x0620[1] = 1'b1
2. Read register 0x620
   a. Bit [7:0] = Number of errors bytes received
   b. Bit [8] = PRBS checker lock status on incoming data (1'b1 indicates lock)

Repeat steps 1 and 2 to continously check error status of incoming data stream.

Other system requirements

Data generate by the internal PRBS will be transmitted over the MDI and the MAC interface.

8.3.1.5.6 Reverse Loopback

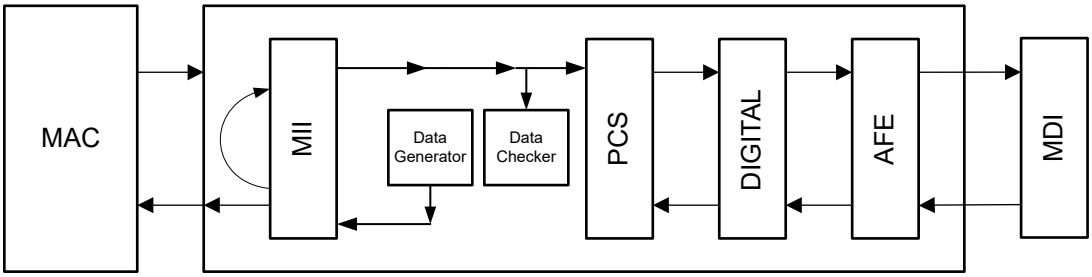

Figure 8-9. Reverse Loopback With Data Generator

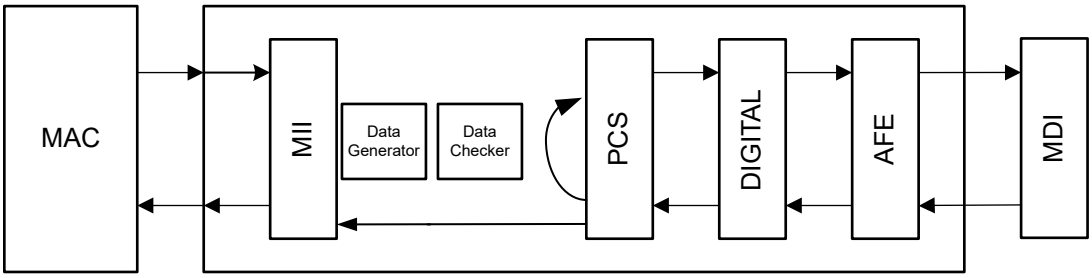

Figure 8-10. Reverse Loopback Without Data Generator

Reverse Loopback receives data on the MDI and passes it through the entire receive block where it is then looped back within the PCS layer to the transmit block. The data is transmitted back out on the MDI to the attached Link Partner. To avoid contention, MAC transmit path is isolated.

Enable Loopback

Write register 0x0016 = 0x0110

Enable data generator/checker for MAC side

Use the following register settings to enable checker depending on the MAC interface mode.

- For RGMII, write register 0x0619 = 0x1004
- For SGMII, write register 0x0619 = 0x1114
- For RMII, write register 0x0619 = 0x1224
- For MII, write register 0x0619 = 0x1334

Write register 0x0624 = 0x55BF

Check incoming data from MAC side

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E

Enable data generator/checker for Cable side

Write register 0x0619 = 0x0557

Write register 0x0624 = 0x55BF

Check data for Cable side

1. Write register 0x0620[1] = 1'b1
2. Read register 0x620
   a. Bit [7:0] = Number of errors bytes received
   b. Bit [8] = PRBS checker lock status on incoming data (1'b1 indicates lock)

Repeat steps 1 and 2 to continously check error status of incoming data stream.

Other system requirements

Data generate by the internal PRBS will be transmitted over the MDI and the MAC interface.

8.3.2 Compliance Test Modes

Note

Refer to SNLA389 Application Note for more information about the register settings used for compliance testing. It is necessary to use these register settings in order to achieve the same performance as observed during compliance testing.

There are four PMA compliance test modes required in IEEE 802.3bw, sub-clause 96.5.2, which are all supported by the DP83TC812-Q1 . These compliance test modes include: transmitter waveform Power Spectral Density (PSD) mask, amplitude, distortion, 100BASE-T1 Master jitter, 100BASE-T1 Slave jitter, droop, transmitter frequency, frequency tolerance, return loss, and mode conversion.

Any of the three GPIOs can be used to output TX_TCLK for the 100BASE-T1 Slave jitter measurement. For routing TX_TCLK to CLKOUT pin for 100BASE-T1 Slave Jitter measurement, write to register 0x045F = 0x000D. The device should be configured in Slave mode.

8.3.2.1 Test Mode 1

Test mode 1 evaluates transmitter droop. In test mode 1, the DP83TC812-Q1 transmits '+1' symbols for a minimum of 600 ns followed by '–1' symbols for a minimum of 600 ns. This pattern is repeated continuously until the test mode is disabled.

Test mode 1 is enabled by setting bits[15:13] = 0b001 in the MMD1_PMA_TEST_MODE_CTRL Register (0x1836).

8.3.2.2 Test Mode 2

Test mode 2 evaluates the transmitter 100BASE-T1 Master mode jitter. In test mode 2, the DP83TC812-Q1 transmits a {+1,-1} data symbol sequence. The transmitter synchronizes the transmitted symbols from the local reference clock.

Test mode 2 is enabled by setting bits[15:13] = 0b010 in MMD1_PMA_TEST_MODE_CTRL Register (0x1836).

8.3.2.3 Test Mode 4

Test mode 4 evaluates the transmitter distortion. In test mode 4, the DP83TC812-Q1 transmits the sequence of symbols generated by Equation 1:

$$g(x) = 1 + x^9 + x^{11} \quad (1)$$

The bit sequences, x0n and x1n, are generated from combinations of the scrambler in accordance to Equation 2 and Equation 3:

$'x0_n = Scr_n[0]$ (2)

$x1_n = Scr_n[1] \wedge Scr_n[4]$ (3)

Example streams of the 3-bit nibbles are shown in Table 8-3.

Table 8-3. Transmitter Test Mode 4 Symbol Mapping

x1n	x0n	PAM3 SYMBOL
0	0	0
0	1	+1
1	0	0
1	1	–1

Test mode 4 is enabled by setting bits[15:13] = 0b100 in MMD1_PMA_TEST_MODE_CTRL Register (0x1836).

8.3.2.4 Test Mode 5

Test mode 5 evaluates the transmitter PSD mask. In test mode 5, the DP83TC812-Q1 transmits a pseudo-random sequence of PAM3 symbols.

Test mode 5 is enabled by setting bits[15:13] = 0b101 in MMD1_PMA_TEST_MODE_CTRL Register (0x1836).

8.4 Device Functional Modes

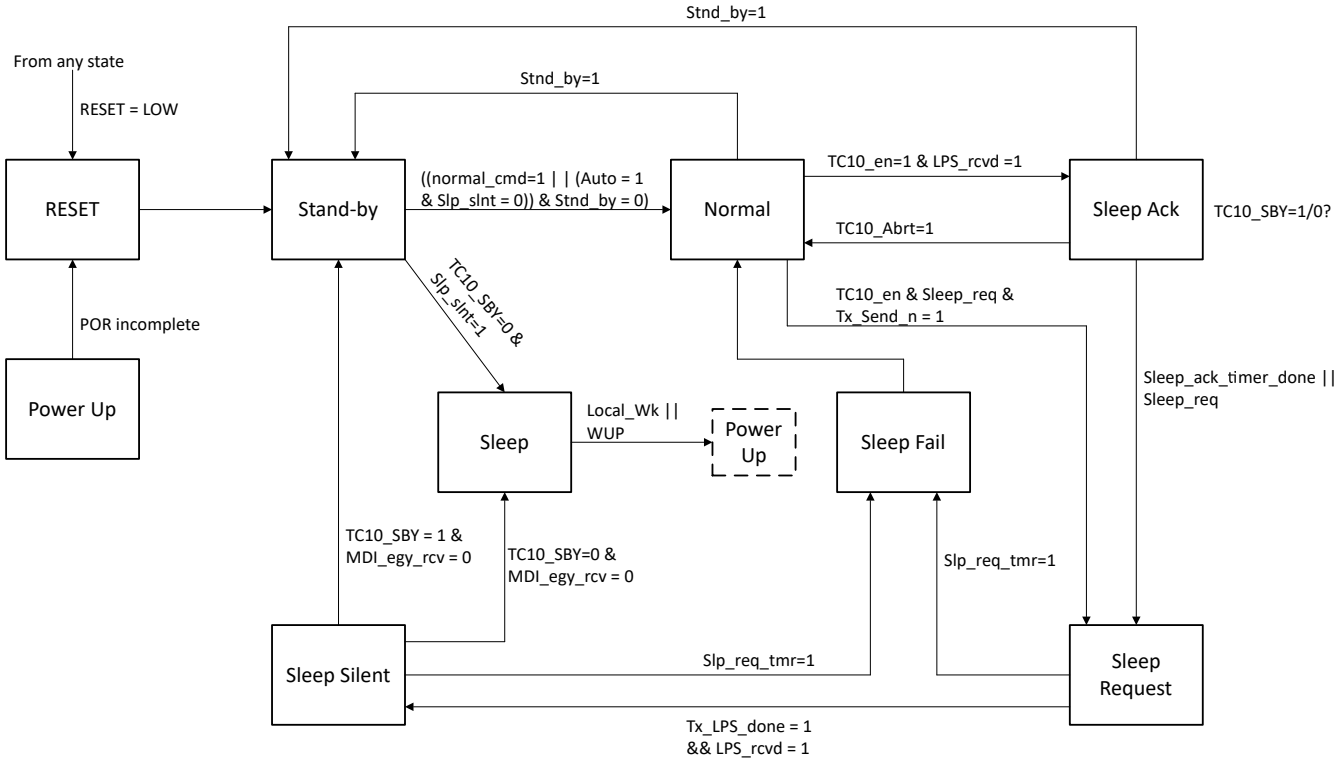

Figure 8-11. PHY Operation State Diagram

8.4.1 Power Down

When any of the supply rails are below the POR threshold (~0.6V), the PHY is in a power-down state. All digital IOs will remain in high impedance states and analog blocks are disabled. PMA termination is not present when powered down.

8.4.2 Reset

Reset is activated upon power-up, when $\overline{\text{RESET}}$ is pulled LOW (for the minimum reset pulse time) or if hardware reset is initiated by setting bit[15] in register 0x1F. All digital circuitry is cleared along with register settings during reset. Once reset completes, device bootstraps are re-sampled and associated bootstrap registers are set accordingly. PMA termination is not present in reset.

8.4.3 Standby

The device (100BASE-T1 Master mode only) automatically enters into standby post power-up and reset so long that all supplies including VSLEEP are available and the device is bootstrapped for managed operation.

In standby, all PHY functions are operational except for PCS and PMA blocks. The PMA termination is also not present. Link establishment is not possible in standby and data cannot be transmitted or received. SMI functions are operational and register configurations are maintained.

If the device is configured for autonomous operation through bootstrap setting, the PHY automatically switches to normal operation once POR is complete.

8.4.4 Normal

Normal mode can be entered from either autonomous or managed operation. When in autonomous operation, the PHY will automatically try to establish a link with a valid Link Partner once POR is complete.

In managed operation, SMI access is required to allow the device to exit standby (100BASE-T1 Master mode only); commands issued through the SMI allow the device to exit standby and enables both the PCS and PMA blocks. All device features are operational in normal mode.

Autonomous operation can be enabled through SMI access by setting bit[6] in the register 0x18B.

8.4.5 Sleep Ack

When the PHY receives low power sleep requests from the link partner, it enter Sleep Ack mode. In this mode, the PHY allows 8ms for the MAC to decide if TC-10 sleep mode must be enabled or not. If the MAC decides to allow TC-10, the PHY proceeds to the next step in TC-10 state machine. However, the MAC can decide to abort TC-10 and the PHY returns to Normal mode. TC10 can be aborted via register setting by disabling TC10 or via GPIO. If TC10 is aborted by disabling TC10 feature, then it is recommended to re-enable TC10 feature once the sleep request has been aborted.

8.4.6 Sleep Request

Sleep request is entered when switching from normal mode to sleep mode. This is an intermediate state and is used to for a smooth transition into sleep mode. In sleep request mode, the PHY transmits LPS code-groups, informing the Link Partner that sleep is requested.

PHY sleep_rqst_timer (default = 16ms) begins once the PHY enters into sleep request mode. LPS decoding at the Link Partner will trigger the LPS RECEIVED interrupt. In sleep request state device waits for Link Partner to send LPS symbols. Once LPS symbols are received by the device, it transitions to SLEEP_SILENT state. If the sleep_rqst_timer expires before device receives LPS codes, the device enters SLEEP FAIL state. .

8.4.7 Sleep Fail

The PHY enters sleep fail mode if the Sleep_rqst_timer expires when in sleep_request state or sleep_silent state.. This indicates that the link partner has not entered sleep mode. After entering sleep fail mode, the PHY transitions to Normal mode.

8.4.8 Sleep

If sleep enable is set, the PHY transitions to sleep mode after the MDI line goes silent when in sleep_silent state; however, if sleep enable is not set, the device transitions to standby after the MDI line goes silent. By default, sleep enable is set. Once in sleep mode, all PHY blocks are disabled except for energy detection on the MDI. All register configurations are lost in sleep mode. No link can be established, data cannot be transmitted or received and SMI access is not available when in sleep mode.

Note

When the PHY is in Sleep mode, the MAC interface should not be driven by the Ethernet MAC.

8.4.9 Wake-Up

The user can wake up the DP83TC812S-Q1 remotely through energy detection on the MDI or locally using the WAKE pin. For local wake, the WAKE pin must be pulled HIGH. If the WAKE pin is tied LOW, the PHY will only exit sleep if energy is detected on the MDI.

8.4.10 TC10 System Example

The following block diagrams explains how TC10 sleep and wake function works in a system.

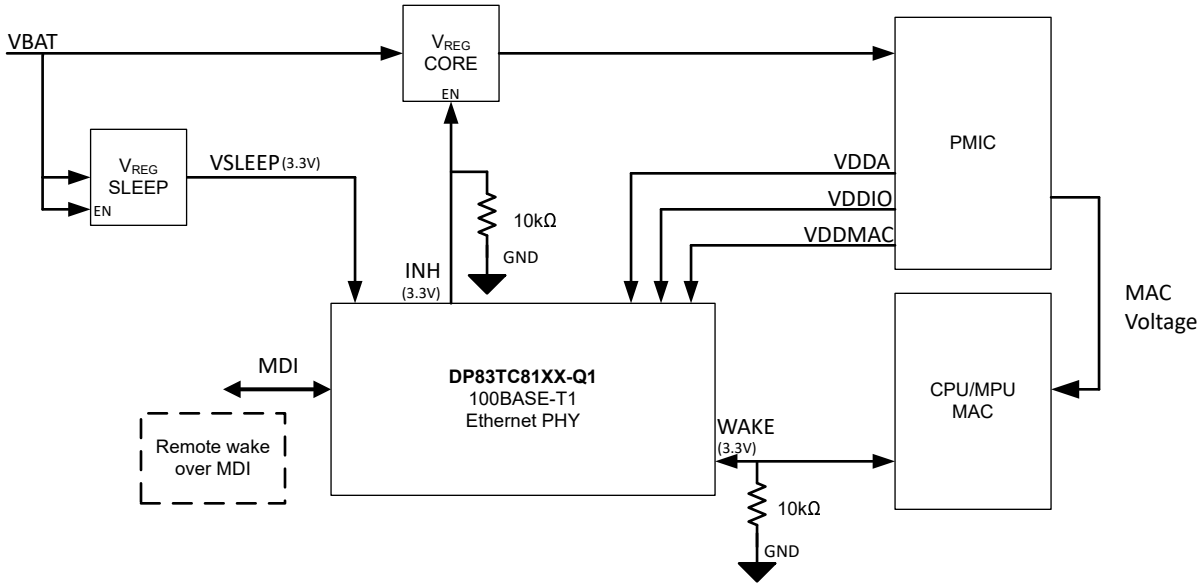

Figure 8-12. TC10 System Example - Remote Wake

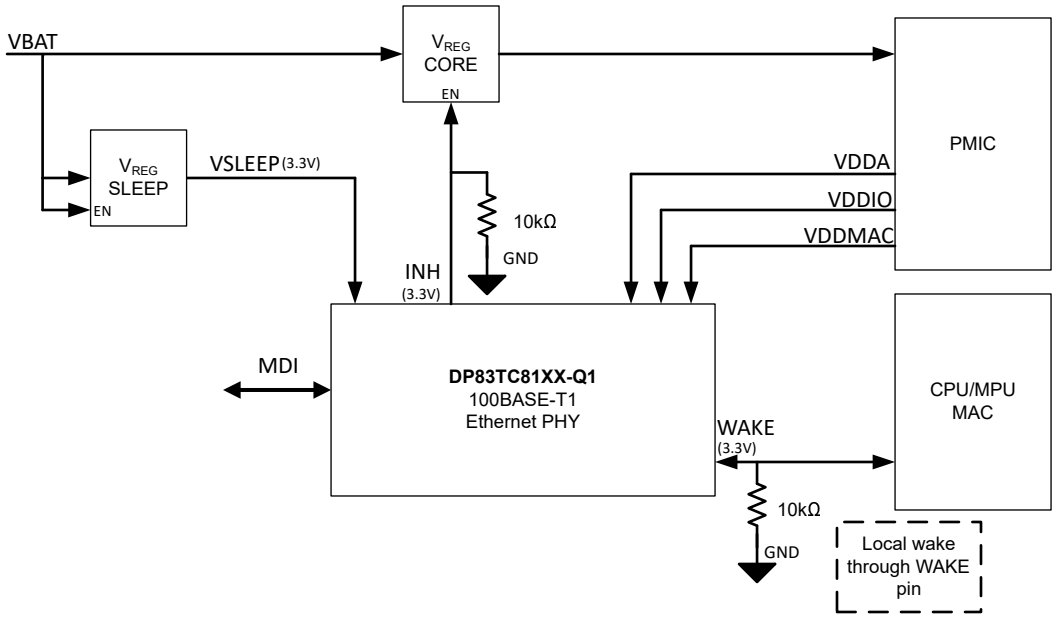

Figure 8-13. TC10 System Example - Local Wake

Remote Wake Up

For remote wake up, the initial state of the system is TC10 sleep. Core voltages to the PHY and MAC are turned off but the VSLEEP of the PHY is present. At some time, wake-up pulses (WUP) are received on the MDI lines. The PHY recevies the message and if its a valid sequence then the PHY wakes up and drives INH pin HIGH. INH pin is used as enable input to voltage regulator (e.g. LDO). Voltage regulators turns on and supplies power to a power management device. The power management device then supplies power to the PHY, MAC, and any other devices on the system. The whole system powers up and becomes operational.

Wake Forwarding

DP83TC812-Q1

support wake forwarding feature. When the device received Wake-Up Requests (WUR) or Wake-Up Pulses (MDI) on the MDI then the PHY will transmit an 40µs high pulse on the WAKE pin. This can be used to wake-up any other PHYs on the system that are in TC-10 sleep.

Local Wake Up

For local wake, it is assumed that some portion of the system is already active and the PHY is in TC10 sleep. As a example, the system might have micro-controller in active mode to control the WAKE pin of the PHY. When the MCU wants to wake up the PHY from TC10 sleep, it raises the WAKE pin to 3.3V to send a wake pulse (min. 40µs). The PHY wakes up and drives INH pin HIGH. INH pin is used as enable input to voltage regulator (e.g. LDO). Voltage regulators turns on and supplies power to a power management device. The power management device then supplies power to the PHY. Any other device on the system that depends on the PHY wake up can now be powered up and the system becomes operational.

Local Sleep

When the PHY is in normal operational mode and the MAC needs to put it in TC10 sleep, it initiates the TC10 sleep process via SMI on the PHY. DP83TC812-Q1 then sends LPS signals on MDI to the link partner. If the link partner also agrees to enter TC10 sleep, the host PHY enters TC10 sleep. It then releases the INH pin and it gets pulled low through the external pull down resistor. Voltage regulator that uses INH pin as enable input will be turned off. PHY, MAC, and any other devices that are dependent on the voltage regulator will be turned off. The PHY will still have VSLEEP voltage present and continue to stay in TC10 sleep.

8.4.11 Media Dependent Interface

8.4.11.1 100BASE-T1 Master and 100BASE-T1 Slave Configuration

100BASE-T1 Master and 100BASE-T1 Slave are configured using either hardware bootstraps or through register access.

LED_0 controls the 100BASE-T1 Master and 100BASE-T1 Slave bootstrap configuration. By default, 100BASE-T1 Slave mode is configured because there is an internal pulldown resistor on LED_0 pin. If 100BASE-T1 Master mode configuration through hardware bootstrap is preferred, an external pullup resistor is required.

Additionally, bit[14] in the **MMD1_PMA_CTRL_2 Register (Address 0x1834)** controls the 100BASE-T1 Master and 100BASE-T1 Slave configuration. When this bit is set, 100BASE-T1 Master mode is enabled.

8.4.11.2 Auto-Polarity Detection and Correction

During the link training process, the DP83TC812-Q1 100BASE-T1 Slave device is able to detect polarity reversal and automatically corrects the error. If polarity reversal is detected, the 100BASE-T1 Slave will invert its own transmitted signals to account for the error and ensure compatibility with the 100BASE-T1 Master. Polarity at the 100BASE-T1 Master is always observed as correct because polarity detection and correction is handled entirely by the 100BASE-T1 Slave.

Auto-polarity correction may be disabled in cases where it is not required. Disabling of auto-polarity correction is achieved via register 0x0553.

8.4.11.3 Jabber Detection

The jabber function prevents the PCS Receive state machine from locking up into a DATA state if the End-of-Stream Delimiters, ESD1 and ESD2, are never detected or received within the rcv_max_timer. When the maximum receive DATA state timer expires, the PCS Receive state machine is reset and transitions into IDLE state. IEEE 802.3bw specifies that jabber timeout be set to 1.08 ms ± 54 µs. By default, jabber timeout in the DP83TC812 is set to 1.1 ms. This timer is configurable in *Register 0x496[10:0]*.

8.4.11.4 Interleave Detection

The interleave function allows for the DP83TC812-Q1 to detect and de-interleave the serial stream from a connected link partner. The two possible interleave sequences of ternary symbols include: (TA_n, TB_n) or (TB_n, TA_n).

8.4.12 MAC Interfaces

8.4.12.1 Media Independent Interface

The Media Independent Interface (MII) is a synchronous 4-bit wide nibble data interface that connects the PHY to the MAC. The MII is fully compliant with IEEE 802.3-2015 clause 22. The PHY has internal series termination resistors on MII output pins including TX_CLK output when the PHY is operating in MII mode. In this mode, it is recommended to not leave the MII-TX pins floating or High-Z.

The MII signals are summarized in Table 8-4:

Table 8-4. MII Signals

FUNCTION	PINS
Data Signals	TX_D[3:0]
	RX_D[3:0]
Control Signals	TX_EN, TX_ER
	RX_DV, RX_ER
Clock Signals	TX_CLK
	RX_CLK

0	1	1110	False Carrier Indication
0	1	1111	Reserved
1	0	0000 through 1111	Normal Data Reception
1	1	0000 through 1111	Data Reception with Errors

8.4.12.2 Reduced Media Independent Interface

The DP83TC812-Q1 incorporates the Reduced Media Independent Interface (RMII) as defined in the RMII Revision 1.2 and 1.0 from the RMII consortium. The purpose of this interface is to provide a reduced pin count alternative to the IEEE 802.3u MII as specified in Clause 22. Architecturally, the RMII specification provides an additional reconciliation layer on either side of the MII, but can be implemented in the absence of an MII.

The DP83TC812-Q1 offers two types of RMII operations: RMII Slave and RMII Master. In RMII Slave Mode, the DP83TC812-Q1 operates off a 50-MHz CMOS-level oscillator, which is either provided by the MAC or synchronous to the MAC's reference clock. In RMII Master operation, the DP83TC812-Q1 operates off of either a 25-MHz CMOS-level oscillator connected to XI pin or a 25-MHz crystal connected across XI and XO pins. When bootstrapping to RMII Master Mode, a 50-MHz output clock will automatically be enabled on RX_D3. This 50-MHz output clock should be routed to the MAC.

The RMII specification has the following characteristics:

- Single clock reference shared between MAC and PHY
- Provides independent 2-bit wide transmit and receive data paths

In this mode, data transfers are two bits for every clock cycle using the 50-MHz reference clock for both transmit and receive paths.

The RMII signals are summarized in Table 8-7:

Table 8-7. RMII Signals

FUNCTION	PINS
Data Signals	TX_D[1:0]
	RX_D[1:0]
Control Signals	TX_EN
	CRS_DV

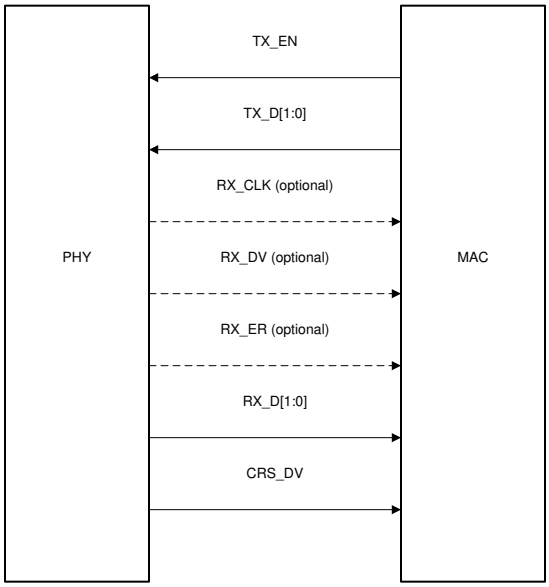

Figure 8-15. RMII Signaling

Table 8-8. RMII Transmit Encoding

TX_EN	TX_D[1:0]	DESCRIPTION
0	00 through 11	Normal Inter-Frame
1	00 through 11	Normal Data Transmission

Table 8-9. RMII Receive Encoding

CRS_DV	RX_ER	RX_D[1:0]	DESCRIPTION
0	0	00 through 11	Normal Inter-Frame
0	1	00	Normal Inter-Frame
0	1	01 through 11	Reserved
1	0	00 through 11	Normal Data Reception
1	1	00 through 11	Data Reception with Errors

RMII Slave: Data on TX_D[1:0] are latched at the PHY with reference to the rising edge of the reference clock at the XI pin. Data is presented on RX_D[1:0] with reference to the same rising clock edges at the XI pin.

RMII Master: Data on TX_D[1:0] are latched at the PHY with reference to the rising edge of the reference clock at the RX_D3 pin. Data is presented on RX_D[1:0] with reference to the same rising clock edges at the RX_D3 pin.

The DP83TC812-Q1 RMII supplies an RX_DV signal, which provides a simpler method to recover receive data without the need to separate RX_DV from the CRS_DV indication. RX_ER is also supported even though it is not required by the RMII specification.

RMII includes a programmable FIFO to adjust for the frequency differences between the reference clock and the recovered clock. The programmable FIFO, located in the register 0x0011[9:8] and register 0x0648[9:7], minimizes internal propagation delay based on expected maximum packet size and clock accuracy.

8.4.12.3 Reduced Gigabit Media Independent Interface

The DP83TC812-Q1 also supports Reduced Gigabit Media Independent Interface (RGMII) as specified by RGMII version 2.0 with LVCMOS. RGMII is designed to reduce the number of pins required to connect MAC and PHY. To accomplish this goal, the control signals are multiplexed. Both rising and falling edges of the clock are used to sample the control signal pin on transmit and receive paths. Data is samples on just the rising edge of the clock. For 100-Mbps operation, RX_CLK and TX_CLK operate at 25 MHz.

The RGMII signals are summarized in Table 8-10:

Table 8-10. RGMII Signals

FUNCTION	PINS
Data Signals	TX_D[3:0]
	RX_D[3:0]
Control Signals	TX_CTRL
	RX_CTRL
Clock Signals	TX_CLK
	RX_CLK

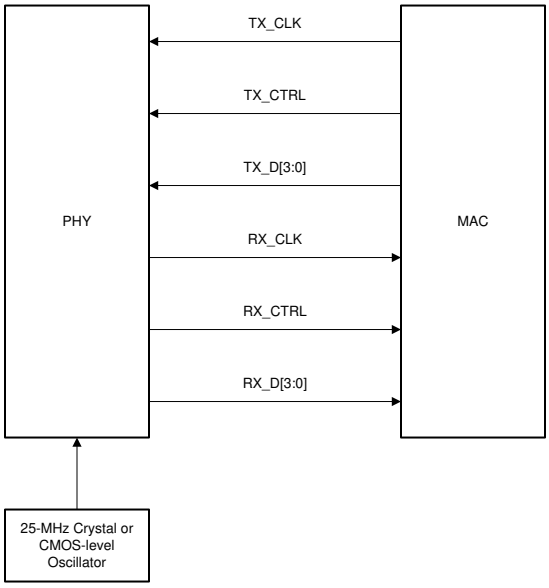

Figure 8-16. RGMII Connections

Table 8-11. RGMII Transmit Encoding

TX_CTRL (POSITIVE EDGE)	TX_CTRL (NEGATIVE EDGE)	TX_D[3:0]	DESCRIPTION
0	0	0000 through 1111	Normal Inter-Frame
0	1	0000 through 1111	Reserved
1	0	0000 through 1111	Normal Data Transmission
1	1	0000 through 1111	Transmit Error Propagation

Table 8-12. RGMII Receive Encoding

RX_CTRL (POSITIVE EDGE)	RX_CTRL (NEGATIVE EDGE)	RX_D[3:0]	DESCRIPTION
0	0	0000 through 1111	Normal Inter-Frame
0	1	0000 through 1101	Reserved
0	1	1110	False Carrier Indication
0	1	1111	Reserved
1	0	0000 through 1111	Normal Data Reception
1	1	0000 through 1111	Data Reception with Errors

During packet reception, RX_CLK may be stretched on either the positive or negative pulse to accommodate the transition from the internal free running clock to a recovered clock (data synchronous). Data may be duplicated

on the falling edge of the clock because double data rate (DDR) is only required for 1-Gbps operation, which is not supported by the DP83TC812-Q1.

The DP83TC812-Q1 supports in-band status indication to help simplify link status detection. Inter-frame signals on RX_D[3:0] pins as specified in Table 8-13.

Table 8-13. RGMII In-Band Status

RX_CTRL	RX_D3	RX_D[2:1]	RX_D0
00 **Note:** In-band status is only valid when RX_CTRL is low	**Duplex Status:** 0 = Half-Duplex 1 = Full-Duplex	**RX_CLK Clock Speed:** 00 = 2.5 MHz 01 = 25 MHz 10 = 125 MHz 11 = Reserved	**Link Status:** 0 = Link not established 1 = Valid link established

8.4.12.4 Serial Gigabit Media Independent Interface

The Serial Gigabit Media Independent Interface (SGMII) provides a means for data transfer between MAC and PHY with significantly less signal pins (4 pins) compared to MII (14 pins), RMII (7 pins) or RGMII (12 pins). SGMII uses low-voltage differential signaling (LVDS) to reduce emissions and improve signal quality.

The DP83TC812 SGMII is capable of operating in 4-wire. SGMII is configurable through hardware bootstraps. In 4-wire operation, two differential pairs are used to transmit and receive data. Clock and data recovery are performed in the MAC and in the PHY.

Because the DP83TC812 operates at 100-Mbps, the 1.25-Gbps rate of the SGMII is excessive. The SGMII specification allows for 100-Mbps operation by replicating each byte within a frame 10 times. Frame elongation takes place above the IEEE 802.3 PCS layer, which prevents the start-of-frame delimiter from appearing more than once.

Because the DP83TC812 only supports 100-Mbps speed, SGMII Auto-Negotitation can be disabled by setting bit[0] = 0b0 in the *Register 0x608*.

The SGMII signals are summarized in Table 8-14.

Table 8-14. SGMII Signals

FUNCTION	PINS
Data Signals	TX_M, TX_P
	RX_M, RX_P

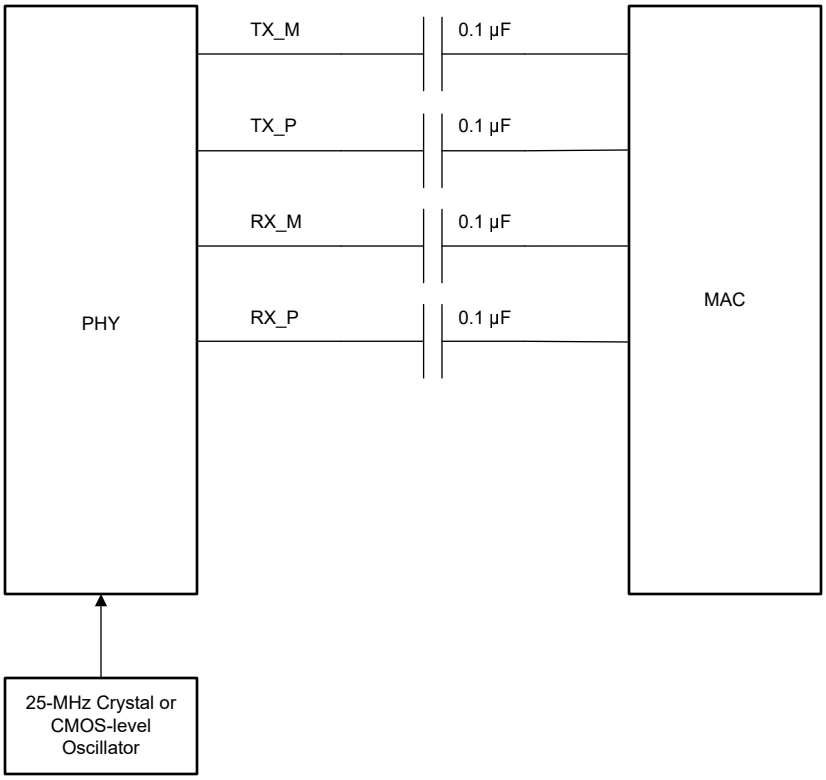

Figure 8-17. SGMII Connections

8.4.13 Serial Management Interface

The Serial Management Interface (SMI) provides access to the DP83TC812S-Q1 internal register space for status information and configuration. The SMI frames and base registers are compatible with IEEE 802.3 clause 22. The implemented register set consists of the registers required by the IEEE 802.3 plus several others to provide additional visibility and controllability of the DP83TC812S-Q1 . Additionally, the DP83TC812S-Q1 includes control and status registers added to clause 45 as defined by IEEE 802.3bw. Access to clause 45 register field is achieved using clause 22 access.

The SMI includes the management clock (MDC) and the management input and output data pin (MDIO). MDC is sourced by the external management entity, also called Station (STA), and can run at a maximum clock rate of 24 MHz. MDC is not expected to be continuous, and can be turned off by the external management entity when the bus is idle.

MDIO is sourced by the external management entity and by the PHY. The data on the MDIO pin is latched on the rising edge of the MDC. MDIO pin requires a pullup resistor (2.2 KΩ), which pulls MDIO high during IDLE and turnaround.

Up to 9 DP83TC812S-Q1 PHYs can share a common SMI bus. To distinguish between the PHYs, a 4-bit address is used. During power-up-reset, the DP83TC812S-Q1 latches the PHYAD[3:0] configuration pins to determine its address.

The management entity must not start an SMI transaction in the first cycle after power-up-reset. To maintain valid operation, the SMI bus must remain inactive at least one MDC cycle after hard reset is deasserted. In normal MDIO transactions, the register address is taken directly from the management-frame reg_addr field, thus allowing direct access to 32 16-bit registers (including those defined in IEEE 802.3 and vendor specific). The data field is used for both reading and writing. The Start code is indicated by a <01> pattern. This pattern makes sure that the MDIO line transitions from the default idle line state. Turnaround is defined as an idle bit time inserted between the Register Address field and the Data field. To avoid contention during a read transaction, no device may actively drive the MDIO signal during the first bit of turnaround. The addressed

DP83TC812S-Q1 drives the MDIO with a zero for the second bit of turnaround and follows this with the required data.

For write transactions, the station-management entity writes data to the addressed DP83TC812S-Q1 , thus eliminating the requirement for MDIO Turnaround. The turnaround time is filled by the management entity by inserting <10>.

Table 8-15. SMI Protocol Structure

SMI PROTOCOL	<idle> <start> <op code> <device address> <reg address> <turnaround> <data> <idle>
Read Operation	<idle><01><10><AAAAA><RRRRR><Z0><XXXX XXXX XXXX XXXX><idle>
Write Operation	<idle><01><01><AAAAA><RRRRR><10><XXXX XXXX XXXX XXXX><idle>

8.4.14 Direct Register Access

Direct register access can be used for the first 31 registers (0x0 through 0x1F).

8.4.15 Extended Register Space Access

The DP83TC812S-Q1 SMI function supports read and write access to the extended register set using registers REGCR (0xD) and ADDAR (0xE) and the MDIO Manageable Device (MMD) indirect method defined in IEEE 802.3ah Draft for Clause 22 for accessing the Clause 45 extended register set.

REGCR (0xD) is the MDIO Manageable MMD access control. In general, register REGCR[4:0] is the device address DEVAD that directs any accesses of ADDAR (0xE) register to the appropriate MMD.

The DP83TC812S-Q1 supports 3 MMD device addresses:

1. DEVAD[4:0] = 11111 is used for general MMD register accesses for IEEE defined registers as well as vendor defined registers.
2. DEVAD[4:0] = 00001 is used for 100BASE-T1 PMA MMD register accesses. Register names for registers accessible at this device address are preceded by MMD1.
3. DEVAD[4:0] = 00011 is used for vendor specific registers. This registers space is called MMD3.

All accesses through register REGCR and ADDAR must use the correct DEVAD. Transactions with other DEVADs are ignored. REGCR[15:14] holds the access function: address (00), data with no post increment (01), data with post increment on read and writes (10) and data with post increment on writes only (11).

- ADDAR is the address and data MMD register. ADDAR is used in conjunction with REGCR to provide the access to the extended register set. If register REGCR[15:14] is (00), then ADDAR holds the address of the extended address space register. Otherwise, ADDAR holds the data as indicated by the contents of its address register. When REGCR[15:14] is set to (00), accesses to register ADDAR modify the extended register set address register. This address register must always be initialized to access any of the registers within the extended register set.
- When REGCR[15:14] is set to (01), accesses to register ADDAR access the register within the extended register set selected by the value in the address register.
- When REGCR[15:14] is set to (10), access to register ADDAR access the register within the extended register set selected by the value in the address register. After that access is complete, for both reads and writes, the value in the address register is incremented.
- When REGCR[15:14] is set to (11), access to register ADDAR access the register within the extended register set selected by the value in the address register. After that access is complete, for write access only, the value in the address register is incremented. For read accesses, the value of the address register remains unchanged.

The following sections describe how to perform operations on the extended register set using register REGCR and ADDAR.

8.4.16 Write Address Operation

To set the address register:

1. Write the value 0x1F (address function field = 00, DEVAD = '11111') to register REGCR.
2. Write the register address to register ADDAR.

Subsequent writes to register ADDAR (step 2) continue to write the address register.

8.4.16.1 MMD1 - Write Address Operation

For writing register addresses within MMD1 field:
1. Write the value 0x1 (address function field = 00, DEVAD = '00001') to register REGCR.
2. Write the register address to register ADDAR.

8.4.17 Read Address Operation

To read the address register:
1. Write the value 0x1F (address function field = 00, DEVAD = '11111') to register REGCR.
2. Read the register address from register ADDAR.

Subsequent reads to register ADDAR (step 2) continue to read the address register.

8.4.17.1 MMD1 - Read Address Operation

For reading register addresses within MMD1 field:
1. Write the value 0x1 (address function field = 00, DEVAD = '00001') to register REGCR.
2. Read the register address from register ADDAR.

8.4.18 Write Operation (No Post Increment)

To write a register in the extended register set:
1. Write the value 0x1F (address function field = 00, DEVAD = '11111') to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x401F (data, no post increment function field = 01, DEVAD = '11111') to register REGCR.
4. Write the content of the desired extended register set to register ADDAR.

Subsequent writes to register ADDAR (step 4) continue to rewrite the register selected by the value in the address register.

Note

Steps (1) and (2) can be skipped if the address register was previously configured.

8.4.18.1 MMD1 - Write Operation (No Post Increment)

To write a register in the MMD1 extended register set:
1. Write the value 0x1 (address function field = 00, DEVAD = '00001') to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x4001 (data, no post increment function field = 01, DEVAD = '00001') to register REGCR.
4. Write the content of the desired extended register set to register ADDAR.

8.4.19 Read Operation (No Post Increment)

To read a register in the extended register set:
1. Write the value 0x1F (address function field = 00, DEVAD = '11111') to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x401F (data, no post increment function field = 01, DEVAD = '11111') to register REGCR.
4. Read the content of the desired extended register set in register ADDAR.

Subsequent reads to register ADDAR (step 4) continue to reading the register selected by the value in the address register.

Note

Steps (1) and (2) can be skipped if the address register was previously configured.

8.4.19.1 MMD1 - Read Operation (No Post Increment)

To read a register in the MMD1 extended register set:

1. Write the value 0x1 (address function field = 00, DEVAD = '00001') to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x4001 (data, no post increment function field = 01, DEVAD = '00001') to register REGCR.
4. Read the content of the desired extended register set in register ADDAR.

8.4.20 Write Operation (Post Increment)

To write a register in the extended register set with post increment:

1. Write the value 0x1F (address function field = 00, DEVAD = '11111') to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x801F (data, post increment function field = 10, DEVAD = '11111') or the value 0xC01F (data, post increment on writes function field = 11, DEVAD = '11111') to register REGCR.
4. Write the content of the desired extended register set to register ADDAR.

Subsequent writes to register ADDAR (step 4) write the next higher addressed data register selected by the value of the address register; the address register is incremented after each access.

8.4.20.1 MMD1 - Write Operation (Post Increment)

To write a register in the MMD1 extended register set with post increment:

1. Write the value 0x1 (address function field = 00, DEVAD = '00001') to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x8001 (data, post increment function field = 10, DEVAD = '00001') or the value 0xC001 (data, post increment on writes function field = 11, DEVAD = '00001') to register REGCR.
4. Write the content of the desired extended register set to register ADDAR.

8.4.21 Read Operation (Post Increment)

To read a register in the extended register set and automatically increment the address register to the next higher value following the write operation:

1. Write the value 0x1F (address function field = 00, DEVAD = '11111') to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x801F (data, post increment function field = 10, DEVAD = '11111') to register REGCR.
4. Read the content of the desired extended register set in register ADDAR.

Subsequent reads to register ADDAR (step 4) read the next higher addressed data register selected by the value of the address register; the address register is incremented after each access.

8.4.21.1 MMD1 - Read Operation (Post Increment)

To read a register in the MMD1 extended register set and automatically increment the address register to the next higher value following the write operation:

1. Write the value 0x1 (address function field = 00, DEVAD = '00001') to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x8001 (data, post increment function field = 10, DEVAD = '00001') to register REGCR.
4. Read the content of the desired extended register set in register ADDAR.

8.5 Programming

8.5.1 Strap Configuration

The DP83TC812S-Q1 uses functional pins as strap options to place the device into specific modes of operation. The values of these pins are sampled at power up and hardware reset (through either the $\overline{\text{RESET}}$ pin or register access). Some strap pins support 3 levels and some strap pins support 2 levels, which are described in greater detail below. PHY address straps, RX_DV/RX_CTRL and RX_ER, are 3-level straps while all other straps are two levels. Configuration of the device may be done through strapping or through serial management interface.

Note

Because strap pins are functional pins after reset is deasserted, they must not be connected directly to VDDIO or VDDMAC or GND. Either pullup resistors, pulldown resistors, or both are required for proper operation.

Note

When using VDDMAC and VDDIO separately, it is important to connect strap resistors to the correct voltage rail. Each pin's voltage domain is listed in the Table 8-18 table below.

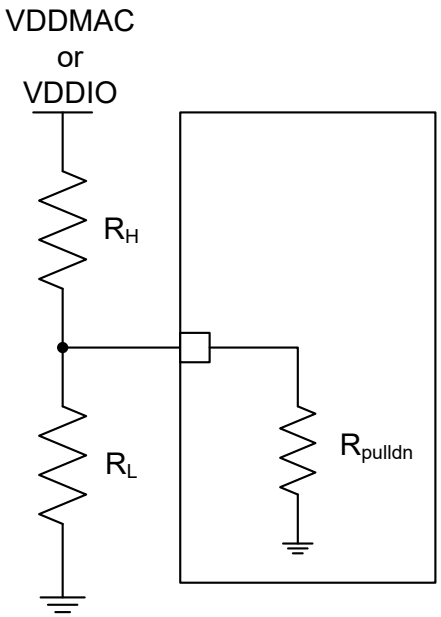

Figure 8-18. Strap Circuit

R_{pulldn} value is included in the Electrical Characteristics table of the datasheet.

Table 8-16. Recommended 3-Level Strap Resistor Ratios for PHY Address

MODE[3]	IDEAL RH (kΩ) (VDDIO = 3.3V)[1]	IDEAL RH (kΩ) (VDDIO = 2.5V)[2]	IDEAL RH (kΩ) (VDDIO = 1.8V)[1]
1	OPEN	OPEN	OPEN
2	13	12	4
3	4.5	2	0.8

1. Strap resistors with 10% tolerance.
2. Strap resistors with 1% tolerance.
3. RL is optional and can be added if voltage on bootstrap pins needs to be adjusted.

Table 8-17. Recommended 2-Level Strap Resistors

MODE	IDEAL RH (kΩ) [1, 2]
1	OPEN
2	2.49

1. Strap resistors with upto 10% tolerance can be used.
2. To gain more margin in customer application for 1.8V VDDIO, either 2.1kΩ +/-10% pull-up can be used or resistor accuracy of 2.49kΩ resistor can be limited to 1%.

The following table describes the PHY configuration bootstraps:

Table 8-18. Bootstraps

PIN NAME	PIN NO.	DOMAIN	DEFAULT MODE	STRAP FUNCTION			DESCRIPTION
RX_DV/ RX_CTRL	15	VDDMAC	1	**MODE**	**PHY_AD[0]**	**PHY_AD[2]**	PHY_AD: PHY Address ID
				1	0	0	
				2	0	1	
				3	1	1

				1	0		
				2	1		

Note

Refer to SNLA389 Application Note for more information about the register settings used for compliance testing. It is necessary to use these register settings in order to achieve the same performance as observed during compliance testing. Managed mode strap option is recommended to prevent the link up process from initiating while the software configuration from SNLA389 is being executed. Once the software configuration is completed, the PHY can be removed from Managed mode by setting bit 0x018B[6] to '0'

RX_D3 strap pin has a special functionality of controlling the output status of CLKOUT (pin 16) and LED_1 (pin 6). The Table 8-19 table below shows how pin 16 and pin 6 will be affected by RX_D3 strap status. Note that RX_D3 option only changes the pin functionality but not their voltage domains. Pin 16 will always be in VDDMAC domain and Pin 6 will always be in VDDIO domain. If VDDIO and VDDMAC are at separate voltage levels, it must be ensured that pin 16 and pin 6 are strapped to their respective voltage domains.

In clock output daisy chain applications, if VDDMAC and VDDIO are at different voltages then clock output should be routed to pin 6. Internal oscillator of the DP83TC812 operates in the VDDIO domain, so clock ouput should also be used on the pin in VDDIO domain i.e. pin 6. In clock output daisy chain applications where VDDMAC and VDDIO are same, this requirement can be ignored. This requirement can also be ignored in applications where clock output is not being used.

Table 8-19. Clock Output Pin Selection

CLKOUT_PIN	DESCRIPTION
0	Pin 16 is Clock output, Pin 6 is LED_1 pin. $\overline{\text{AUTO}}$ will be controlled by straps on pin 6.
1	Pin 6 is Clock output, Pin 16 is LED_1 pin. $\overline{\text{AUTO}}$ will be controlled by straps on pin 16.

1000	1	2	PHY Address: 0b01000 (0x8)
1001	-	-	NA
1010	1	3	PHY Address: 0b01010 (0xA)
1011	-	-	NA
1100	2	2	PHY Address: 0b01010 (0xC)
1101	3	2	PHY Address: 0b01011 (0xD)
1110	2	3	PHY Address: 0b01110 (0xE)
1111	3	3	PHY Address: 0b01111 (0xF)

8.5.2 LED Configuration

The DP83TC812S-Q1 supports up to three configurable Light Emitting Diode (LED) pins: LED_0, LED_1, and LED_2 (CLKOUT). Several functions can be multiplexed onto the LEDs for different modes of operation. LED operations are selected using registers 0x0450.

Because the LED output pins are also used as strap pins, external components required for strapping and the user must consider the LED usage to avoid contention. Specifically, when the LED outputs are used to drive LEDs directly, the active state of each output driver is dependent on the logic level sampled by the corresponding input upon power up or hardware reset.

Figure 8-19 shows the two proper ways of connecting LEDs directly to the DP83TC812S-Q1 .

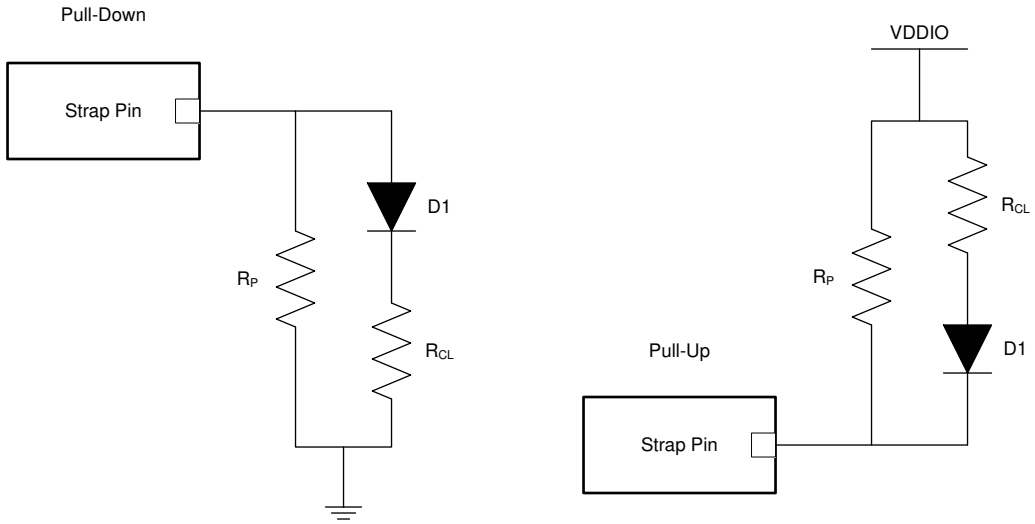

Figure 8-19. Example Strap Connections

8.5.3 PHY Address Configuration

The DP83TC812S-Q1 can be set to respond to any of 9 possible PHY addresses through bootstrap pins. The PHY address is latched into the device upon power-up or hardware reset. Each PHY on the serial management bus in the system must have a unique PHY address.

By default, DP83TC812S-Q1 will latch to a PHY address of 0 (<0b00000>). This address can be changed by adding pullup resistors to bootstrap pins found in Section 8.5.3.

8.6 Register Maps

8.6.1 Register Access Summary

There are two different methods for accessing registers within the field. Direct register access method is only allowed for the first 31 registers (0x0 through 0x1F). Registers beyond 0x1F must be accessed by use of the Indirect Method (Extended Register Space) described in *Section 8.4.15*.

Table 8-24. MMD Register Space Division

MMD REGISTER SPACE	REGISTER ADDRESS RANGE
MMD1F	0x0000 - 0x0EFD
MMD1	0x1000 - 0x1836
MMD3	0x3000 - 0x3001

Note

For MMD1 and MMD3, the most significant nibble of the register address is used to denote the respective MMD space. This nibble must be ignored during actual register access operation. For example, to access register 0x1836, use 0x1 as the MMD indicator and 0x0836 as the register address.

Table 8-25. Register Access Summary

REGISTER FIELD	REGISTER ACCESS METHODS
0x0 through 0x1F	Direct Access
	Indirect Access, MMD1F = '11111' **Example:** to read register 0x17 in MMD1F field with no post increment Step 1) write 0x1F to register 0xD Step 2) write 0x17 to register 0xE Step 3) write 0x401F to register 0xD Step 4) read register 0xE
MMD1F Field 0x20 - 0xFFF	Indirect Access, MMD1F = '11111' **Example:** to read register 0x462 in MMD1F field with no post increment Step 1) write 0x1F to register 0xD Step 2) write 0x462 to register 0xE Step 3) write 0x401F to register 0xD Step 4) read register 0xE
MMD1 Field 0x0 - 0xFFF	Indirect Access, MMD1 = '00001' **Example:** to read register 0x7 in MMD1 field (register 0x1007) with no post increment Step 1) write 0x1 to register 0xD Step 2) write 0x7 to register 0xE Step 3) write 0x4001 to register 0xD Step 4) read register 0xE

8.6.2 DP83TC812 Registers

DP83TC812 Registers lists the memory-mapped registers for the DP83TC812 registers. All register offset addresses not listed in DP83TC812 Registers should be considered as reserved locations and the register contents should not be modified.

Table 8-103. PRBS_STATUS_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-13	RESERVED	R	0b	Reserved
12	pkt_done	R	0b	Set when all MAC packets w CRC are transmitted
11	pkt_gen_busy	R	0b	status of packet generator
10	prbs_pkt_ov	R	0b	If set, packet counter reached overflow Overflow is cleared when PRBS counters are cleared - done by setting bit[15] of 0x001B
9	prbs_byte_ov	R	0b	If set, bytes counter reached overflow Overflow is cleared when PRBS counters are cleared - done by setting bit[15] of 0x001B
8	prbs_lock	R	0b	prbs lock status
7-0	prbs_err_cnt	R	0b	Holds number of errored bytes that received by the PRBS checker Value in this register is locked when write is done to bit[0] or bit[1] When PRBS Count Mode set to zero, count stops on 0xFF Notes: Writing bit 0 generates a lock signal for the PRBS counters. Writing bit 1 generates a lock and clear signal for the PRBS counters

8.6.2.77 PRBS_STATUS_6 Register (Address = 622h) [Reset = 0000h]

PRBS_STATUS_6 is shown in PRBS_STATUS_6 Register and described in PRBS_STATUS_6 Register Field Descriptions.

Return to the DP83TC812 Registers.

9 Application and Implementation

Application Information Disclaimer

9.1 Application Information Disclaimer

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.2 Application Information

The DP83TC812 is a single-port 100-Mbps Automotive Ethernet PHY. It supports IEEE 802.3bw and allows for connections to an Ethernet MAC through MII, RMII, RGMII, or SGMII. When using the device for Ethernet applications, it is necessary to meet certain requirements for normal operation. The following subsections are intended to assist in appropriate component selection and required connections.

Note

Refer to SNLA389 Application Note for more information about the register settings used for compliance testing. It is necessary to use these register settings in order to achieve the same performance as observed during compliance testing.

9.3 Typical Applications

Figure 9-1 through Figure 9-5 show some the typical applications for the DP83TC812x-Q1.

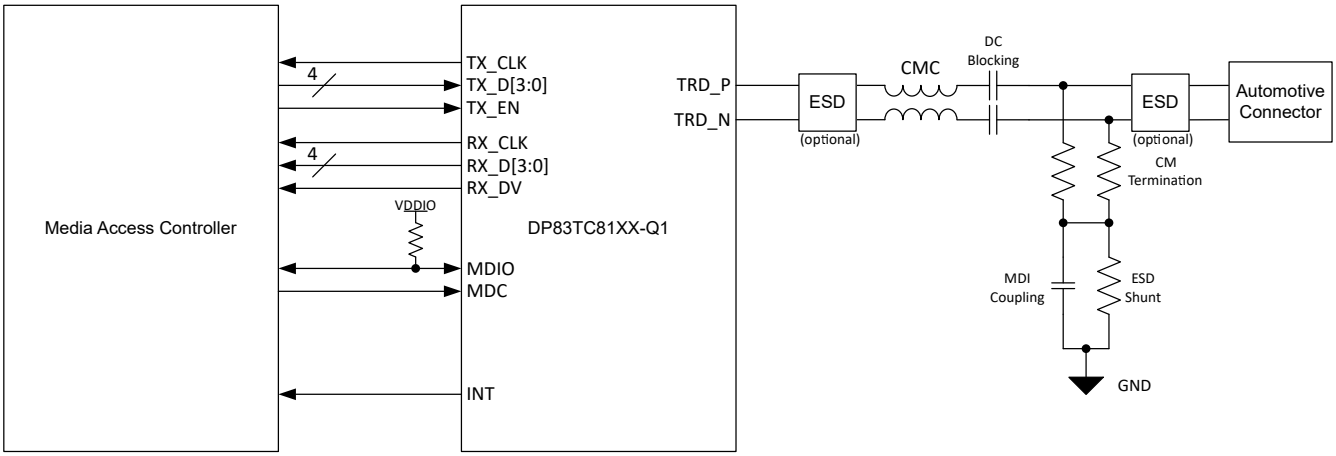

Figure 9-1. Typical Application (MII)

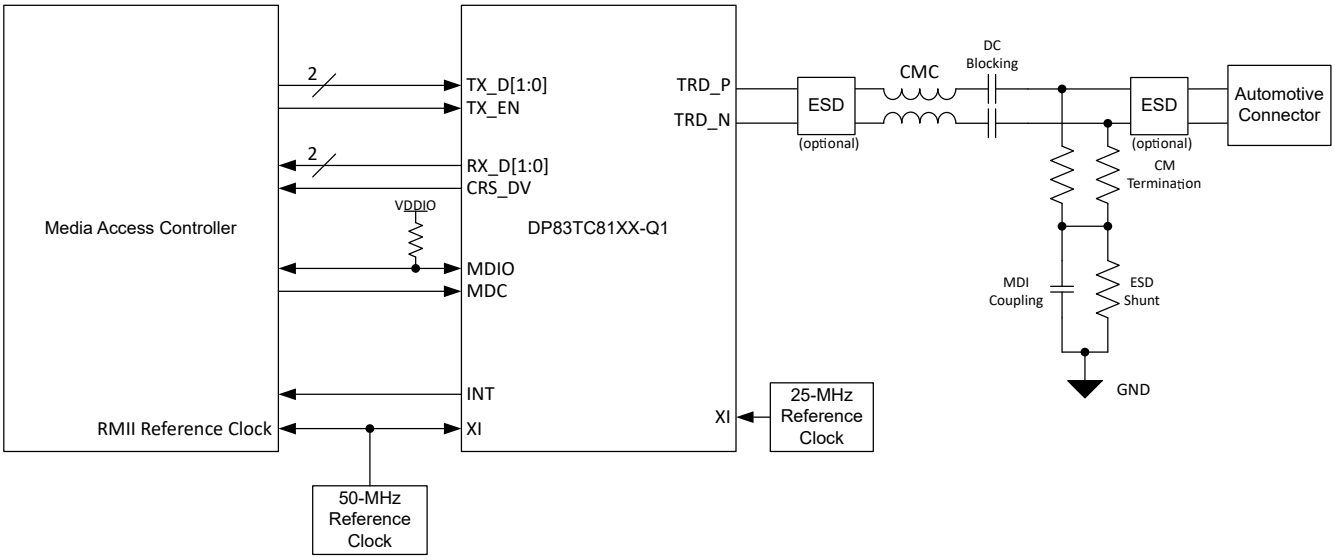

Figure 9-2. Typical Application (RMII Slave)

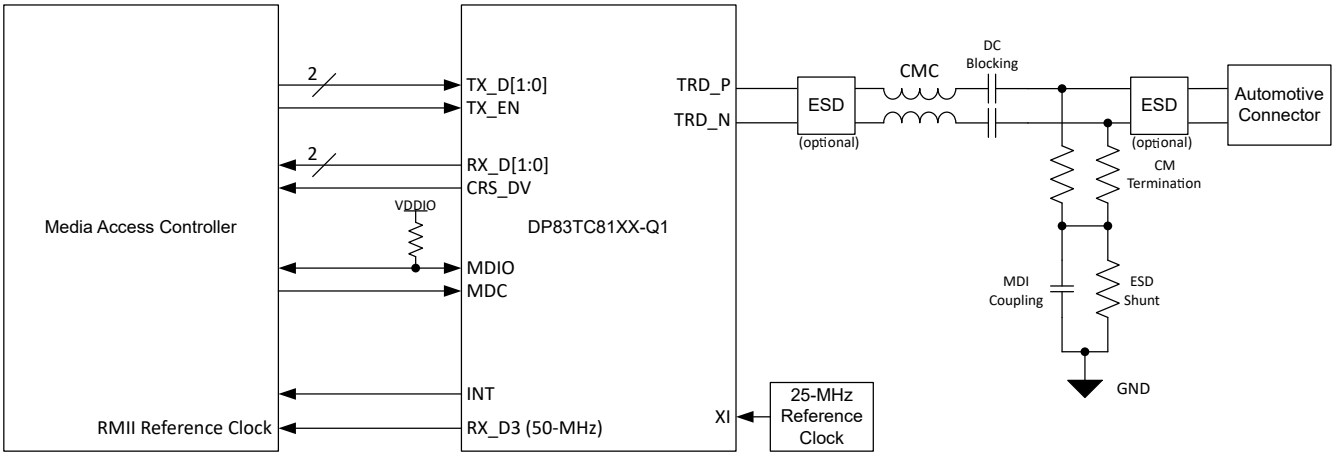

Figure 9-3. Typical Application (RMII Master)

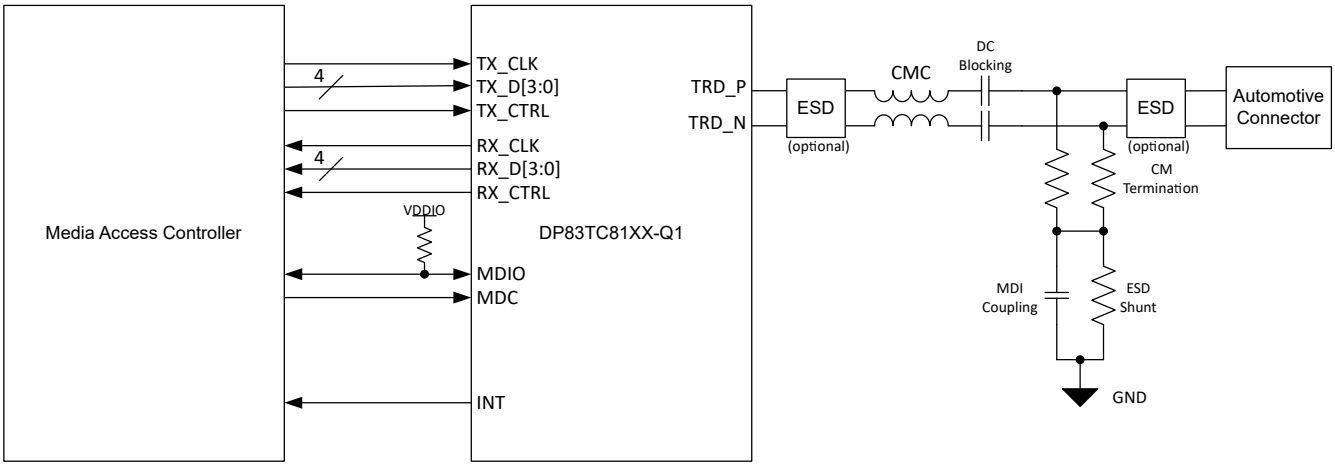

Figure 9-4. Typical Application (RGMII)

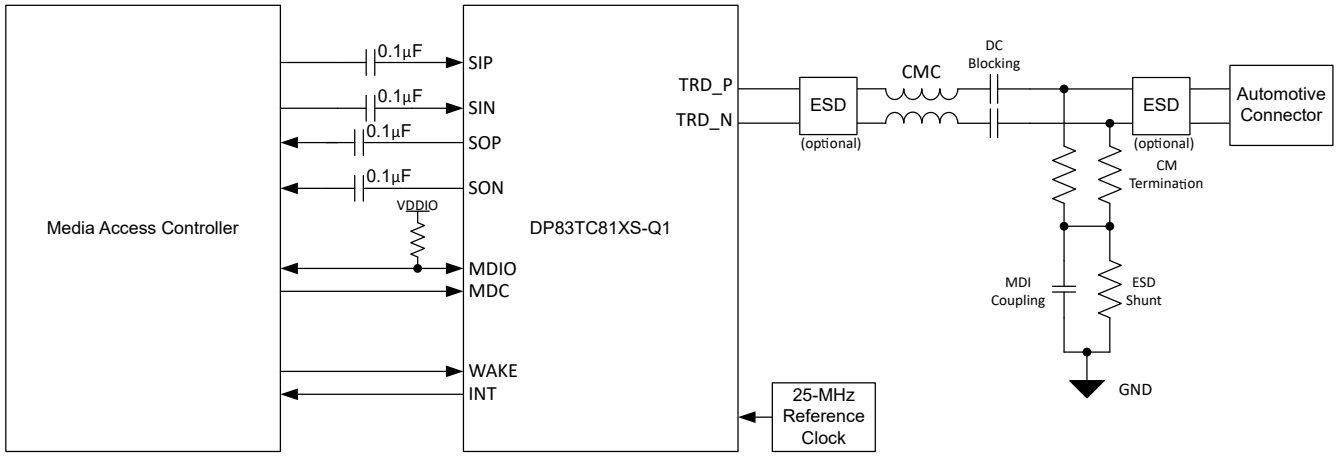

Figure 9-5. Typical Application (SGMII)

9.3.1 Design Requirements

For these typical applications, use the following as design parameters from the table below. Refer to *Power Supply Recommendations* section for detailed connection diagram.

Table 9-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{DDIO}	1.8 V, 2.5 V, or 3.3 V
V_{DDMAC}	1.8 V, 2.5 V, or 3.3 V
V_{DDA}	3.3 V
V_{SLEEP}	3.3 V
Decoupling capacitors V_{DDIO} (2) (3)	0.01 µF
(Optional) ferrite bead for V_{DDIO} (3)	1 kΩ at 100 MHz (BLM18KG601SH1D)
Decoupling capacitors V_{DDMAC} (2)	0.01 µF, 0.47 µF
Ferrite bead for V_{DDMAC}	1 kΩ at 100 MHz (BLM18KG601SH1D)
Decoupling capacitors V_{DDA} (2)	0.01 µF, 0.47 µF
(Optional) ferrite bead for V_{DDA}	1 kΩ at 100 MHz (BLM18KG601SH1D)
Decoupling capacitors V_{SLEEP}	0.1 µF
DC Blocking Capacitors (2)	0.1 µF
Common-Mode Choke	200 µH
Common Mode Termination Resistors(1)	1 kΩ
MDI Coupling Capacitor (2)	4.7 nF
ESD Shunt(2)	100 kΩ
Reference Clock	25 MHz

(1) 1% tolerance components are recommended.
(2) 10% tolerance components are recommended.
(3) If VDDIO is separate from VDDMAC then additional ferrite bead and 0.47µF capacitor will be required on VDDIO.

9.3.1.1 Physical Medium Attachment

There must be no metal running beneath the common-mode choke. CMCs can inject noise into metal beneath them, which can affect the emissions and immunity performance of the system. Because the DP83TC812S-Q1 is a voltage mode line driver, no external termination resistors are required. The ESD shunt and MDI coupling capacitor must be connected to ground. Ensure that the common mode termination resistors are 1% tolerance or better to improve differential coupling.

9.3.1.1.1 Common-Mode Choke Recommendations

The following CMCs are recommended for use with the DP83TC812S-Q1 :

Table 9-2. Recommended CMCs

MANUFACTURER	PART NUMBER
Pulse Electronics	AE2002
Murata	DLW43MH201XK2L
Murata	DLW32MH201XK2
TDK	ACT1210L-201

Table 9-3. CMC Electrical Specifications

PARAMETER	TYP	UNITS	CONDITIONS
Insertion Loss	–0.5	dB	1 – 30 MHz
	–1.0	dB	30 – 60 MHz
Return Loss	–26	dB	1 – 30 MHz
	–20	dB	30 – 60 MHz
Common-Mode Rejection	–24	dB	1 MHz
	–42	dB	10 – 100 MHz
	–25	dB	400 MHz
Differential Common-Mode Rejection	–70	dB	1 – 10 MHz
	–50	dB	100 MHz
	–24	dB	1000 MHz

9.3.2 Detailed Design Procedure

When creating a new system design with an Ethernet PHY, follow this schematic capture procedure:

1. Select desired PHY hardware configurations in table Table 8-18.
2. Use the Electrical Characteristics table, the Table 8-16 table and the Table 8-17 table to select the correct external bootstrap resistors.
3. If using LEDs, ensure the correct external circuit is applied as shown in Figure 8-19.
4. Select an appropriate clock source that adheres to either the CMOS-level oscillator or crystal resonator requirements within the Electrical Characteristics table.
5. Select a CMC, a list of recommended CMCs are located in Table 9-2.
6. Add common-mode termination, DC-blocking capacitors, an MDI-coupling capacitor, and an ESD shunt found in Table 9-1.
7. Ensure that there is sufficient supply decoupling on VDDIO and VDDA supply pins.
8. Add an external pullup resistor (tie to VDDIO) on MDIO line.
9. If operating with SGMII, place 0.1-µF, DC-blocking capacitors between the MAC and PHY SGMII pins.
10. If sleep modes are not desired, WAKE and EN pins must be tied to VSLEEP directly or through an external pullup resistor.

The following layout procedure must be followed:

1. Locate the PHY near the edge of the board so that short MDI traces can be routed to the desired connector.
2. Place the MDI external components: CMC, DC-blocking capacitors, CM termination, MDI-coupling capacitor, and ESD shunt.
3. Create a top-layer metal pour keepout under the CMC.
4. Ensure that the MDI TRD_M and TRD_P traces are routed such that they are 100-Ω differential.
5. Place the clock source near the XI and XO pins.
6. Ensure that when configured for MII, RMII, or RGMII operation, the xMII pins are routed 50-Ω and are single-ended with reference to ground.
7. Ensure that transmit path xMII pins are routed such that setup and hold timing does not violate the PHY requirements.
8. Ensure that receive path xMII pins are routed such that setup and hold timing does not violate the MAC requirements.
9. Ensure that when configured for SGMII operation, the xMII RX_P, RX_M, TX_P, and TX_M pins are routed 100-Ω differential.
10. Place the MDIO pullup close to the PHY.

9.3.3 Application Curves

The following curves were obtained using the PHY evaluation module under nominal conditions.

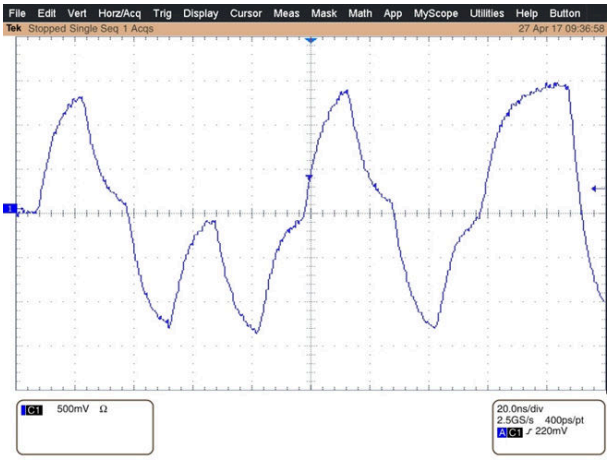

Figure 9-6. MDI IDLE Stream

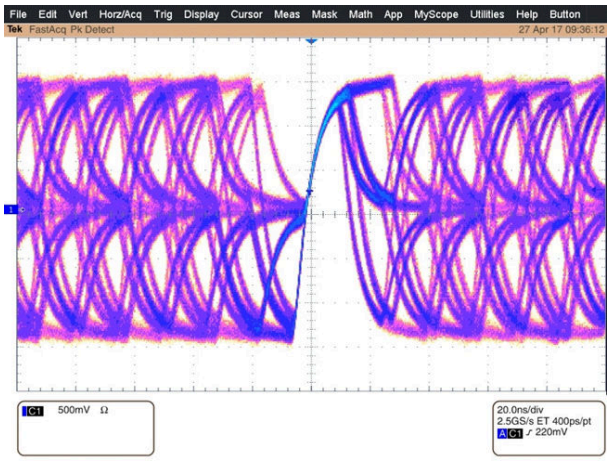

Figure 9-7. MDI IDLE Stream (Variable Persistence)

10 Power Supply Recommendations

The DP83TC812S-Q1 is capable of operating with a wide range of IO supply voltages (3.3 V, 2.5 V, or 1.8 V). No power supply sequencing is required. The recommended power supply de-coupling network is shown in the figure below. For improved conducted emissions, an optional ferrite bead may be placed between the supply and the PHY de-coupling network.

Typical TC-10 application block diagram along with supply and peripherals is shown below. TPS7B81-Q1 is the recommended part number to be used as 3.3V LDO for the VSLEEP rail. The low quiescent current of this LDO makes it ideal for TC-10 applications.

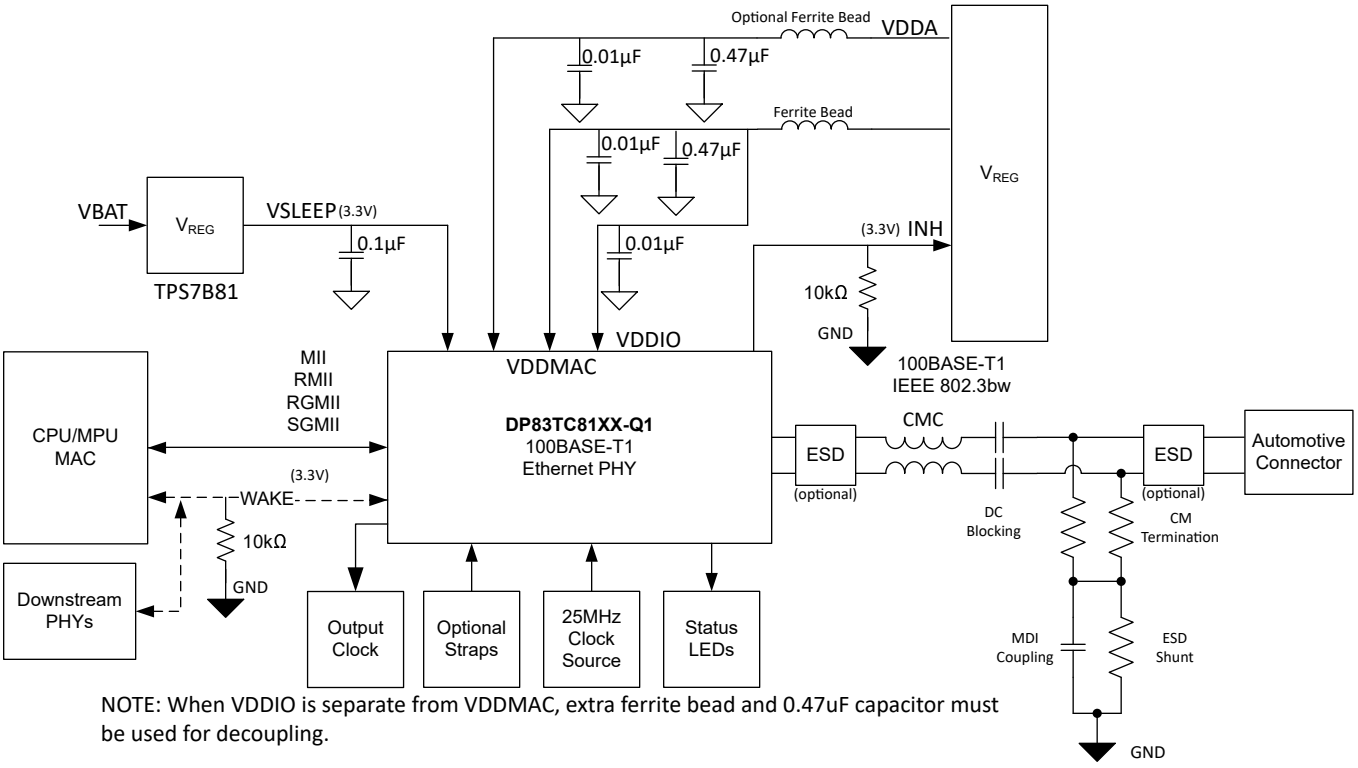

Figure 10-1. Typical TC-10 Application With Peripherals

When VDDIO and VDDMAC are separate, both voltage rails should have a dedicated network of ferrite bead, 0.47uF, and 0.01uF capacitors. VSLEEP can also be connected to VDDA, 0.1uF capacitor should be retained in this configuration.

Current Consumption Break-Down

The following table highlights the break down of power consumption in active mode for each supply rail, specifically highlighting the split between VDDMAC and VDDIO.

Table 10-1. Active Mode Current Consumption

VOLTAGE RAIL	VOLTAGE (V)	MAX CURRENT (mA)[1]
MII		
VDDA	3.3	63
VDDIO	3.3	4
	2.5	3
	1.8	2
VDDMAC	3.3	20
	2.5	15
	1.8	11
VSLEEP	3.3	2
RMII		
VDDA	3.3	63
VDDIO	3.3	6

VDDMAC	3.3	8
	2.5	6
	1.8	4
VSLEEP	3.3	2

1. Current consumption measured across voltage, temperature, and process with active data communication.

11 Layout

11.1 Layout Guidelines

11.1.1 Signal Traces

PCB traces are lossy and long traces can degrade signal quality. Traces must be kept short as possible. Unless mentioned otherwise, all signal traces must be 50-Ω, single-ended impedance. Differential traces must be 50-Ω single-ended and 100-Ω differential. Take care to ensure impedance is controlled throughout. Impedance discontinuities will cause reflections leading to emissions and signal integrity issues. Stubs must be avoided on all signal traces, especially differential signal pairs.

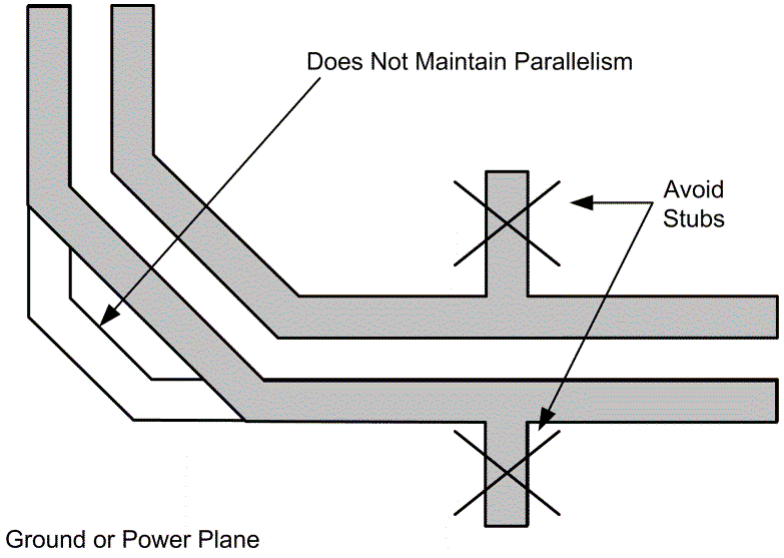

Figure 11-1. Differential Signal Trace Routing

Within the differential pairs, trace lengths must be run parallel to each other and matched in length. Matched lengths minimize delay differences, avoiding an increase in common mode noise and emissions. Length matching is also important for MAC interface connections. All transmit signal traces must be length matched to each other and all receive signal traces must be length matched to each other. For SGMII differential traces, it is recommended to keep the skew mismatch below 20ps.

Ideally, there must be no crossover on signal path traces. High speed signal traces must be routed on internal layers to improved EMC performance. However, vias present impedance discontinuities and must be minimized when possible. Route trace pairs on the same layer. Signals on different layers must not cross each other without at least one return path plane between them. Differential pairs must always have a constant coupling distance between them. For convenience and efficiency, TI recommends routing critical signals first (that is, MDI differential pairs, reference clock, and MAC IF traces).

11.1.2 Return Path

A general best practice is to have a solid return path beneath all signal traces. This return path can be a continuous ground or DC power plane. Reducing the width of the return path can potentially affect the impedance of the signal trace. This effect is more prominent when the width of the return path is comparable to the width of the signal trace. Breaks in return path between the signal traces should be avoided at all cost. A signal crossing a split plane may cause unpredictable return path currents and could impact signal quality and result in emissions issues.

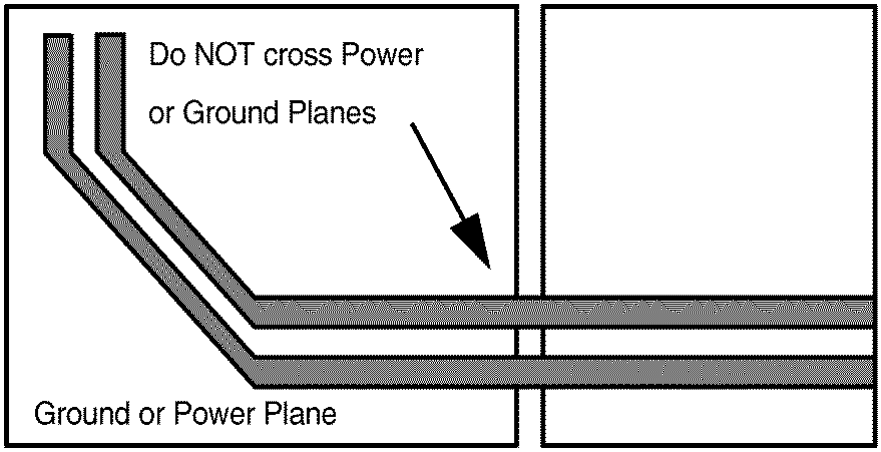

Figure 11-2. Power and Ground Plane Breaks

11.1.3 Metal Pour

All metal pours that are not signals or power must be tied to ground. There must be no floating metal in the system, and there must be no metal between differential traces.

11.1.4 PCB Layer Stacking

To meet signal integrity and performance requirements, minimum four-layer PCB is recommended. However, a six-layer PCB and above must be used when possible.

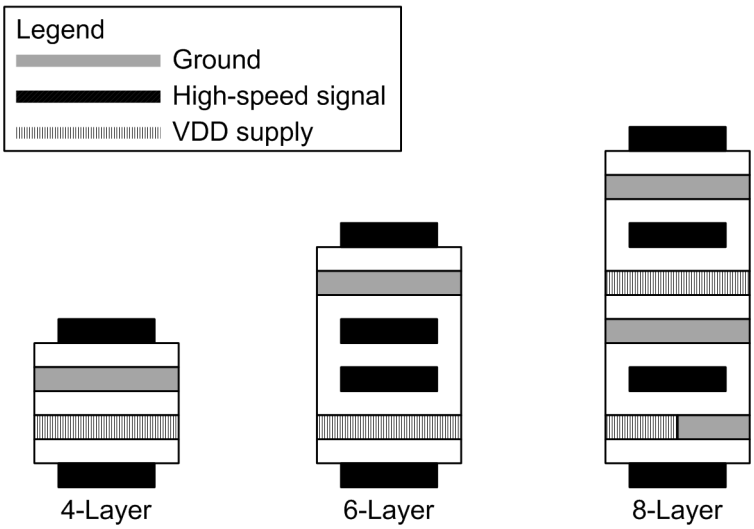

Figure 11-3. Recommended PCB Layer Stack-Up

11.2 Layout Example

There is an evaluation board references for the DP83TC812-Q1 . The DP83TC812EVM-MC is a media converter board which can be used for interoperability and bit error rate testing.

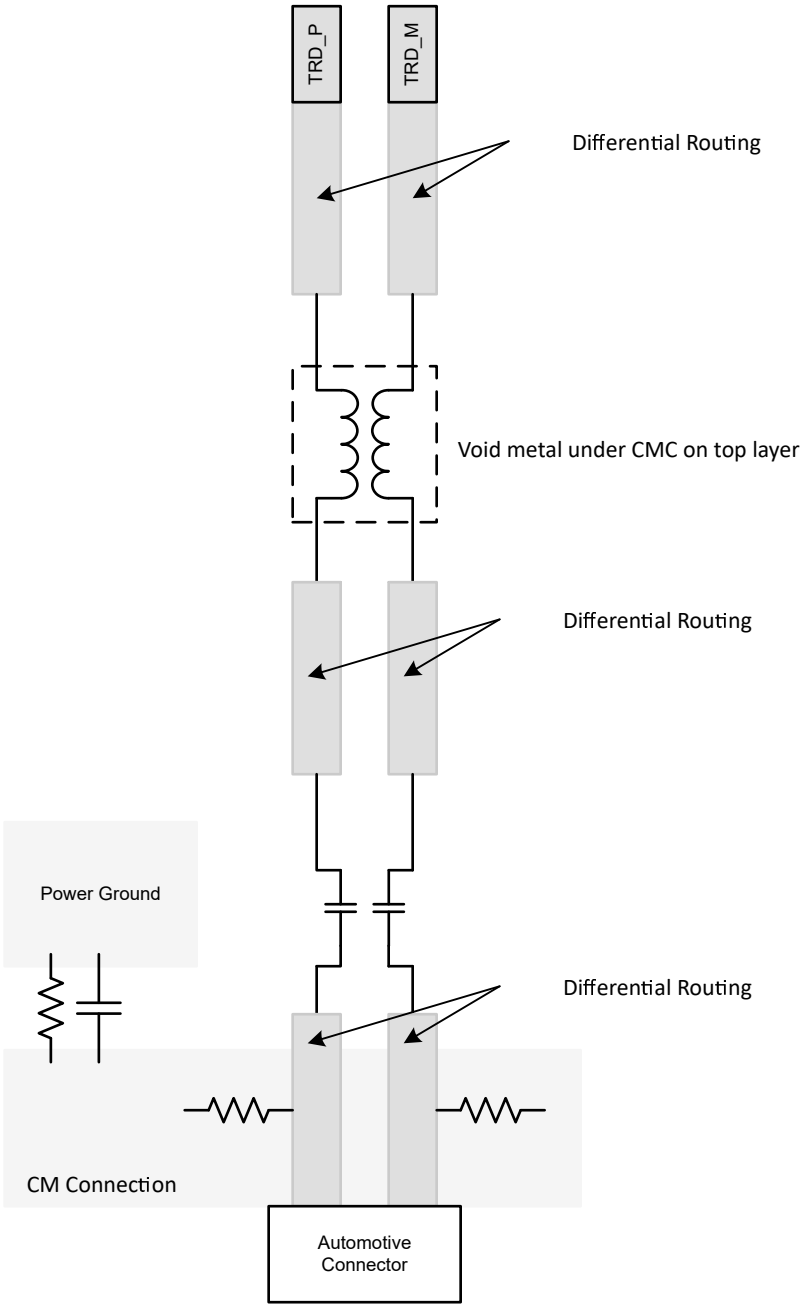

Figure 11-4. MDI Low-Pass Filter Layout Recommendation

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

12.3 Community Resources

12.4 Trademarks

PHYTER™ and TI E2E™ are trademarks of Texas Instruments.
All trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.6 Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals.
TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

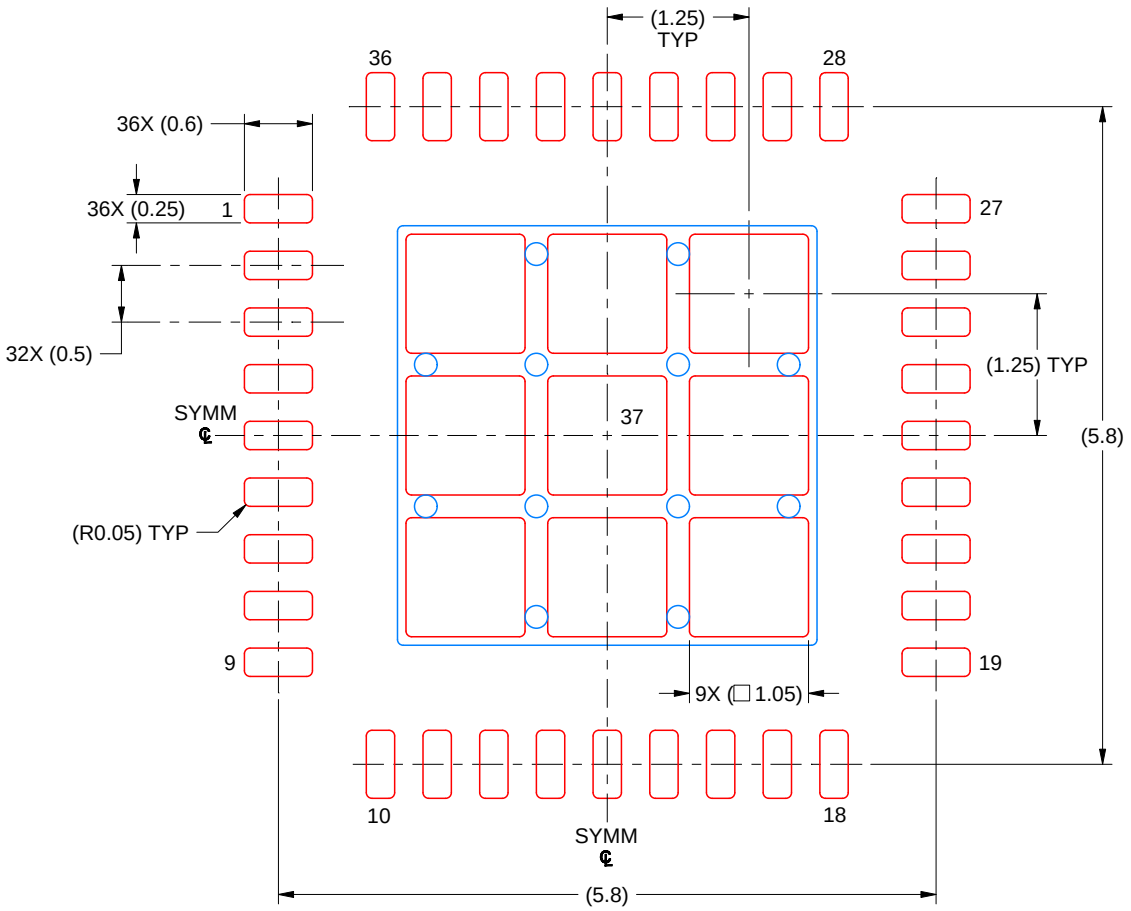
NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.



SOLDER PASTE EXAMPLE
BASED ON 0.125 MM THICK STENCIL
SCALE: 15X

EXPOSED PAD 37
72% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE

4225089/A 06/2019

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI’s products are provided subject to TI’s Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI’s provision of these resources does not expand or otherwise alter TI’s applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
