# OPA3S2859 Dual-Channel, $900-\mathrm{MHz}, 2.2-\mathrm{nV} / \sqrt{ } \mathrm{Hz}$, Programmable Gain Transimpedance Amplifier 

## 1 Features

- Gain bandwidth product: 900 MHz
- Internal switches for programmable gain
- High impedance FET inputs
- Input voltage noise: $2.2 \mathrm{nV} / \mathrm{JHz}$
- Slew rate: $350 \mathrm{~V} / \mu \mathrm{s}$
- Supply voltage range: 3.3 V to 5.25 V
- Quiescent current: $22 \mathrm{~mA} /$ channel
- Power down mode $\mathrm{I}_{\mathrm{Q}}: 75 \mu \mathrm{~A}$
- Temperature range: $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$

## 2 Applications

- Switchable transimpedance amplifier
- Smart munitions
- Laser distance measurement
- Optical time domain reflectometry (OTDR)
- Silicon photomultiplier (SiPM) buffer
- Photomultiplier tube post amplifier
- High speed programmable gain amplifier

Block Diagram

## 3 Description

The OPA3S2859 is a wideband, low-noise programmable gain amplifier with CMOS inputs for wideband transimpedance and voltage amplifier applications. When the device is configured as a transimpedance amplifier (TIA), the $0.9-\mathrm{GHz}$ gain bandwidth product (GBWP) enables high closedloop bandwidths in low-capacitance photodiode (PD) applications.
The three internal switched feedback paths along with an optional parallel non-switched feedback path allows for up to four selectable gain configurations. The internal switches minimize parasitic contributions to increase performance compared to systems that use discrete external switches. Each switch is optimized for feedback resistor values ranging from $<1 \mathrm{k} \Omega$ to $>100 \mathrm{k} \Omega$ for wide dynamic range applications. The selected switch path is controlled for both channels using a 2 -wire parallel interface. For each channel selected, the gain path can also be held constant by exerting the latch pin, which subsequently disables switch control for the selected channel and prevents the channel from changing gain.

Package Information ${ }^{(1)}$

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
| :--- | :--- | :---: |
| OPA3S2859 | WQFN $(24)$ | $4.00 \mathrm{~mm} \times 4.00 \mathrm{~mm}$ |

## 5 Pin Configuration and Functions

Figure 5-1. RTW Package, 24-Pin WQFN With Exposed Thermal Pad (Top View)

Table 5-1. Pin Functions

| PIN |  | TYPE ${ }^{(1)}$ | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| COM_A | 23 | I | Photodiode input - Channel A |
| COM_B | 8 | I | Photodiode input - Channel B |
| FB_A0 | 20 | 1 | Feedback connection to Channel A - TIA Gain Resistor (Low gain, optimized for gain in < $10 \mathrm{k} \Omega$ range) |
| FB_A1 | 21 | 1 | Feedback connection to Channel A - TIA Gain Resistor (Mid gain, optimized for gain in $10 \mathrm{k} \Omega-100 \mathrm{k} \Omega$ range) |
| FB_A2 | 22 | I | Feedback connection to Channel A - TIA Gain Resistor (High gain, optimized for gain in > $100 \mathrm{k} \Omega$ range) |
| FB_B0 | 11 | I | Feedback connection to Channel B - TIA Gain Resistor (Low gain, optimized for gain in < $10 \mathrm{k} \Omega$ range) |
| FB_B1 | 10 | 1 | Feedback connection to Channel B - TIA Gain Resistor (Mid gain, optimized for gain in $10 \mathrm{k} \Omega-100 \mathrm{k} \Omega$ range) |
| FB_B2 | 9 | 1 | Feedback connection to Channel B - TIA Gain Resistor (High gain, optimized for gain in > $100 \mathrm{k} \Omega$ range) |
| INA- | 24 | 1 | Negative (inverting) input for amplifier A |
| INA+ | 1 | I | Positive (noninverting) input for amplifier A |
| INB- | 7 | 1 | Negative (inverting) input for amplifier B |
| INB+ | 6 | I | Positive (noninverting) input for amplifier B |

Table 5-1. Pin Functions (continued)

| PIN |  | TYPE ${ }^{(1)}$ | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| LTCH_A | 3 | 1 | Latch control input for Channel A. $\overline{\text { LTCH_A }}=$ logic high (default) $=$ transparent mode, gain setting changes based on SEL0 and SEL1 pins are reflected at the output. <br> $\overline{\text { LTCH_A }}=$ logic low $=$ latch mode $=$ changing SEL0 and SEL1 pins does not affect the gain configuration of amplifier. |
| LTCH_B | 4 | 1 | Latch control input for Channel B. $\overline{\text { LTCH_B }}=$ logic high (default) $=$ transparent mode, gain setting changes based on SELO and SEL1 pins are reflected at the output. <br> $\overline{\text { LTCH_B }}=$ logic low $=$ latch mode $=$ changing SELO and SEL1 pins does not affect the gain configuration of amplifier. |
| PD | 15 | 1 | Power down pin. $\overline{\mathrm{PD}}=$ logic high (default) = normal operation, $\overline{\mathrm{PD}}=$ logic low $=$ power down mode. |
| SELO | 5 | I | TIA gain selection. SEL0 = logic high (default). See Table 5-2 for details. |
| SEL1 | 2 | 1 | TIA gain selection. SEL1 = logic high (default). See Table 5-2 for details. |
| VOUT_A | 19 | 0 | Output of amplifier A |
| VOUT_B | 12 | 0 | Output of amplifier B |
| VS- | 13, 18 | I | Negative (lowest) power supply |
| VS+ | 14, 16, 17 | 1 | Positive (highest) power supply |
| Thermal pad |  | - | Connect the thermal pad to the most negative power supply (pin 13 and 18) of the device under test (DUT). |

(1) I = input, O = output

Table 5-2. Select Pin Decoder

| SEL1 | SELO | Gain |
| :--- | :--- | :--- |
| LOW | HIGH | Low Gain, optimized for gain in < $10 \mathrm{k} \Omega$ range |
| LOW | LOW | Mid Gain, optimized for gain in $10 \mathrm{k} \Omega-100 \mathrm{k} \Omega$ <br> range |
| HIGH | LOW | High Gain, optimized for gain in $>100 \mathrm{k} \Omega$ range |
| HIGH (Default) | HIGH (Default) | External Gain. All internal switches open |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {S }}$ | Total supply voltage ( $\mathrm{V}_{\mathrm{S}_{+}}-\mathrm{V}_{\mathrm{S}_{-}}$) |  | 5.5 | V |
| $\mathrm{V}_{\text {IN }+}, \mathrm{V}_{\text {IN }-}$ | Input voltage | $\left(\mathrm{V}_{\text {S- }}\right)-0.5$ | $\left(\mathrm{V}_{\text {S }}\right)+0.5$ | V |
| $V_{\text {ID }}$ | Differential input voltage |  | 1 | V |
| $\mathrm{V}_{\text {OUT }}$ | Output voltage | $\left(\mathrm{V}_{\text {S- }}\right)-0.5$ | $\left(\mathrm{V}_{\text {S }}\right)+0.5$ | V |
| $\mathrm{I}_{\mathrm{N}}$ | Continuous input current |  | $\pm 4$ | mA |
| lout | Continuous output current ${ }^{(2)}$ |  | 25 | mA |
| $\mathrm{T}_{J}$ | Junction temperature |  | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{A}}$ | Operating free-air temperature | -40 | 125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage temperature | -65 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute maximum ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If briefly operating outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not sustain damage, but it may not be fully functional. Operating the device in this manner may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) Long-term continuous output current for electromigration limits

### 6.2 ESD Ratings

| $\mathrm{V}_{(\text {(ESD })}$Electrostatic <br> discharge |  | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ${ }^{(1)}$ | VALUE | UNIT |
| :--- | :--- | :--- | :---: | :---: |
|  | Charged device model (CDM), per JEDEC specification JEDEC JS-002, all pins ${ }^{(2)}$ | $\pm 1500$ |  |  |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|  |  | MIN | NOM | MAX |
| :--- | :--- | ---: | ---: | :---: |
| $V_{S}$ | Uotal supply voltage $\left(\mathrm{V}_{\mathrm{S}+}-\mathrm{V}_{\mathrm{S}-}\right)$ | 3.3 | 5 | 5.25 |
| $\mathrm{~T}_{\mathrm{A}}$ | Umbient temperature | -40 | V |  |

### 6.4 Thermal Information

| THERMAL METRIC ${ }^{(1)}$ |  | OPA3S2859 | UNIT |
| :---: | :---: | :---: | :---: |
|  |  | RTW |  |
|  |  | 24 PINS |  |
| $\mathrm{R}_{\text {өJA }}$ | Junction-to-ambient thermal resistance | 52 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(top) }}$ | Junction-to-case (top) thermal resistance | 39.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJB }}$ | Junction-to-board thermal resistance | 28.2 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JT }}$ | Junction-to-top characterization parameter | 1.8 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JB }}$ | Junction-to-board characterization parameter | 28.2 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(bot) }}$ | Junction-to-case (bottom) thermal resistance | 13.3 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

[^0]OPA3S2859

### 6.5 Electrical Characteristics

$\mathrm{V}_{\mathrm{S}_{+}}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{S}_{-}}=0 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=200 \Omega$, output load is referenced to midsupply, input common-mode biased at midsupply, and $\mathrm{T}_{\mathrm{A}} \approx$ $+25^{\circ} \mathrm{C}$ (unless otherwise noted)

| PARAMETER |  | TEST CONDITIONS | MIN TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| AC PERFORMANCE |  |  |  |  |  |
| SSBW | Small-signal transimpedance bandwidth ${ }^{(1)}$ | $\mathrm{V}_{\text {OUT }}=100 \mathrm{~m} \mathrm{~V}_{\text {PP }}$, Gain $=1 \mathrm{k} \Omega, \mathrm{C}_{\text {IN }}=4 \mathrm{pF}$ | 130 |  | MHz |
|  |  | $\mathrm{V}_{\text {OUT }}=100 \mathrm{mV} \mathrm{VP}_{\text {Pr }}$, Gain $=10 \mathrm{k} \Omega, \mathrm{C}_{\text {IN }}=4 \mathrm{pF}$ | 40 |  | MHz |
|  |  | $V_{\text {OUT }}=100 \mathrm{mV} \mathrm{VP}$, Gain $=100 \mathrm{k} \Omega$, Cin $=4 \mathrm{pF}$ | 14 |  | MHz |
| GBWP | Gain-bandwidth product |  | 900 |  | MHz |
|  | Slew rate (10\% - 90\%) | $\mathrm{V}_{\text {OUT }}=2-\mathrm{V}$ step | 350 |  | V/us |
| $\mathrm{e}_{\mathrm{n}}$ | Input-referred voltage noise | $\mathrm{f}=1 \mathrm{MHz}$ | 2.2 |  | $\mathrm{nV} / \mathrm{V} \mathrm{Hz}$ |
| $\mathrm{Z}_{\text {OUT }}$ | Closed-loop output impedance | $\mathrm{f}=1 \mathrm{MHz}$ | 0.02 |  | $\Omega$ |

DC PERFORMANCE

| $\mathrm{A}_{\mathrm{OL}}$ | Open-loop voltage gain | $\mathrm{f}=\mathrm{DC}$ | 70 | 76 | dB |
| :--- | :--- | :--- | ---: | ---: | :---: |
| $\mathrm{~V}_{\mathrm{OS}}$ | Input offset voltage | $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ | -8 | $\pm 0.9$ | 8 |
| $\Delta \mathrm{~V}_{\mathrm{OS}} / \Delta \mathrm{T}$ | Input offset voltage drift | $\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | mV |  |  |
| $\mathrm{I}_{\mathrm{BN}}, \mathrm{I}_{\mathrm{BI}}$ | Input bias current ${ }^{(2)}$ |  | -2 |  | $\mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ |
| $\mathrm{I}_{\mathrm{BOS}}$ | Input offset current ${ }^{(2)}$ |  | -50 | 50 | pA |
| CMRR | Common-mode rejection ratio | $\mathrm{V}_{\mathrm{CM}}= \pm 0.5 \mathrm{~V}$ (from midsupply) | -50 | 50 | pA |

INPUTS

| $\mathrm{C}_{\mathrm{IN}_{+}}$ | Non-inverting input capacitance |  | 1.4 | pF |
| :--- | :--- | :--- | ---: | :---: |
| $\mathrm{C}_{\mathrm{IN}-}$ | Inverting input capacitance ${ }^{(3)}$ |  | 3 | pF |
| $\mathrm{V}_{\mathrm{IH}}$ | Common-mode input range (high) | CMRR $>64 \mathrm{~dB}$ | 3.4 | 3.6 |
| $\mathrm{~V}_{\mathrm{IH}}$ | Common-mode input range (high) | $\mathrm{CMRR}>64 \mathrm{~dB}, \mathrm{~V}_{\mathrm{S}_{+}}=3.3 \mathrm{~V}$ | 1.7 | 1.9 |
| $\mathrm{~V}_{\mathrm{IL}}$ | Common-mode input range (low) | CMRR $>64 \mathrm{~dB}$ | 0 | 0.4 |
| $\mathrm{~V}_{\mathrm{IL}}$ | Common-mode input range (low) | $\mathrm{CMRR}>64 \mathrm{~dB}, \mathrm{~V}_{\mathrm{S}_{+}}=3.3 \mathrm{~V}$ | V |  |

## OUTPUTS

| $\mathrm{V}_{\mathrm{OH}}$ | Output voltage (high) | $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ | 3.95 | 4.1 | V |
| :--- | :--- | :--- | ---: | ---: | :---: |
| $\mathrm{~V}_{\mathrm{OH}}$ | Output voltage (high) | $\mathrm{V}_{\mathrm{S}_{+}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ | 2.3 | 2.4 | V |
| $\mathrm{~V}_{\mathrm{OL}}$ | Output voltage(low) | $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ | 1.1 | 1.2 | V |
| $\mathrm{~V}_{\mathrm{OL}}$ | Output voltage(low) | $\mathrm{V}_{\mathrm{S}_{+}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ | 1.05 | 1.15 | V |
| $\mathrm{I}_{\mathrm{O}} \mathrm{CIN}$ | Linear output drive (source and sink) | $\mathrm{R}_{\mathrm{L}}=10 \Omega, \mathrm{~A}_{\mathrm{OL}}>52 \mathrm{~dB}$ | 74 | mA |  |

CHANNEL-TO-CHANNEL MATCHING

|  | Crosstalk (output-referred) | $\mathrm{f}=1 \mathrm{MHz}$, Gain $=100 \mathrm{k} \Omega, \mathrm{V}_{\text {OUT }}=100 \mathrm{mV}$ |  |  |
| :--- | :--- | :--- | :---: | :---: |
|  | Offset voltage mismatch |  | -70 | dB |
|  | Offset current mismatch |  | -20 | mV |

### 6.5 Electrical Characteristics (continued)

$\mathrm{V}_{\mathrm{S}_{+}}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{S}_{-}}=0 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=200 \Omega$, output load is referenced to midsupply, input common-mode biased at midsupply, and $\mathrm{T}_{\mathrm{A}} \approx$ $+25^{\circ} \mathrm{C}$ (unless otherwise noted)

| PARAMETER |  | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| POWER SUPPLY |  |  |  |  |  |  |
| $\mathrm{I}_{\mathrm{Q}}$ | Quiescent current (both channels) | $\mathrm{V}_{\mathrm{S}_{+}}=5 \mathrm{~V}$ |  | 44 | 53 | mA |
|  |  | $\mathrm{V}_{\mathrm{S}_{+}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+125^{\circ} \mathrm{C}$ |  | 51 |  | mA |
|  |  | $\mathrm{V}_{\mathrm{S}_{+}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ |  | 39 |  | mA |
| PSRR+ | Power Supply Rejection Ratio | $\mathrm{f}=\mathrm{DC}$ | 74 | 85 |  | dB |
| PSRR- | Power Supply Rejection Ratio | $f=D C$ | 68 | 72 |  | dB |

POWER DOWN

(1) $\mathrm{C}_{\mathrm{IN}}=$ Photodiode capacitance +PCB capacitance. Photodiode capacitance is 3.3 pF and estimated PCB capacitance is 0.7 pF .
(2) Leakage currents from switches are not included in this measurement.
(3) $\mathrm{C}_{\mathrm{IN}}$ refers to the capacitance at the inverting input of the amplifier. $\mathrm{C}_{\mathrm{IN}-}=\mathrm{C}_{\mathrm{IN}-(\mathrm{CM})}+\mathrm{C}_{\mathrm{DIFF}}+$ Switch capacitance on the amplifier inverting pin (ON capacitance of the closed switch + OFF capacitance for open switches).

### 6.6 Switching Characteristics

$\mathrm{V}_{\mathrm{S}+}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{S}-}=0 \mathrm{~V}$, input common-mode biased at midsupply, $\mathrm{R}_{\mathrm{F} 0}=1 \mathrm{k} \Omega, \mathrm{R}_{\mathrm{F} 1}=10 \mathrm{k} \Omega, \mathrm{R}_{\mathrm{F} 2}=100 \mathrm{k} \Omega, \mathrm{R}_{\mathrm{L}}=200 \Omega$, output load is referenced to midsupply, and $T_{A} \approx+25^{\circ} \mathrm{C}$ (unless otherwise noted), see figure 7-1 for schematic configuration. (1) (2)

| PARAMETER |  | TEST CONDITIONS | MIN TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GAIN SWITCHES |  |  |  |  |  |
|  | Switch transition-time ${ }^{(5)}$ | $\mathrm{SW}_{0}$ OFF to $\mathrm{SW}_{1} \mathrm{ON}$ | 160 |  | ns |
|  |  | $\mathrm{SW}_{0}$ OFF to $\mathrm{SW}_{2} \mathrm{ON}$ | 230 |  |  |
|  |  | $\mathrm{SW}_{1}$ OFF to $\mathrm{SW}_{0} \mathrm{ON}$ | 80 |  |  |
|  |  | $\mathrm{SW}_{1}$ OFF to $\mathrm{SW}_{2} \mathrm{ON}$ | 230 |  |  |
|  |  | $\mathrm{SW}_{2}$ OFF to $\mathrm{SW}_{0} \mathrm{ON}$ | 80 |  |  |
|  |  | $\mathrm{SW}_{2}$ OFF to $\mathrm{SW}_{1} \mathrm{ON}$ | 110 |  |  |
| $\mathrm{C}_{\text {Сомо }}$ | COM capacitance ${ }^{(3)}$ (6) | SW Сомо $^{\text {ON; }}$ SW Сом $1^{\text {and }} \mathrm{SW}_{\text {Сом2 }}$ OFF | 1.3 |  | pF |
| $\mathrm{C}_{\text {COM1 }}$ |  | $\mathrm{SW}_{\text {Сом1 }}$ ON; SW $\mathrm{COM0}^{\text {and }} \mathrm{SW}_{\text {Сом2 }}$ OFF | 1.2 |  |  |
| $\mathrm{C}_{\text {COM2 }}$ |  | $\mathrm{SW}_{\text {Сом2 }} \mathrm{ON} ; \mathrm{SW}_{\text {Сомо }}$ and SW $\mathrm{COM1}^{\text {Com }}$ OFF | 1.2 |  |  |
| CCOM_OPEN |  | $\mathrm{SW}_{\text {Сомо }}, \mathrm{SW}_{\text {Сом1 }}$ and $\mathrm{SW}_{\text {Сом2 }}$ OFF | 1.2 |  |  |
| $\mathrm{C}_{\text {FB0 }}$ | FB capacitance ${ }^{(5)}$ (7) | SW ${ }_{0}$ ON | 1.9 |  |  |
| $\mathrm{C}_{\text {FB1 }}$ |  | $\mathrm{SW}_{1} \mathrm{ON}$ | 1.6 |  |  |
| $\mathrm{C}_{\text {FB2 }}$ |  | $\mathrm{SW}_{2} \mathrm{ON}$ | 1.5 |  |  |
| $\mathrm{C}_{\text {FBO_OPEN }}$ |  | SW ${ }_{0}$ OFF | 1.4 |  |  |
| $\mathrm{C}_{\text {FB1_OPEN }}$ |  | $\mathrm{SW}_{1}$ OFF | 1.2 |  |  |
| $\mathrm{C}_{\text {FB2_OPEN }}$ |  | $\mathrm{SW}_{2}$ OFF | 1.1 |  |  |
| Ron_como | On resistance ${ }^{(8)}$ (9) |  | 80 |  | $\Omega$ |

|  |  | SW FBO for Channel A and B | 0.4 |  |  |
|  |  | SW ${ }_{\text {COM } 1}$ for Channel $A$ and B | 0.45 |  |  |
|  |  | SWW ${ }_{\text {FB1 }}$ for Channel A and B | 0.07 |  |  |
|  |  | $\mathrm{SW}_{\text {COM2 }}$ for Channel $A$ and $B$ | 3 |  |  |
|  |  | $\mathrm{SW}_{\text {FB2 }}$ for Channel A and B | 0.12 |  |  |

### 6.6 Switching Characteristics (continued)

$\mathrm{V}_{\mathrm{S}+}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{S}-}=0 \mathrm{~V}$, input common-mode biased at midsupply, $\mathrm{R}_{\mathrm{F} 0}=1 \mathrm{k} \Omega, \mathrm{R}_{\mathrm{F} 1}=10 \mathrm{k} \Omega, \mathrm{R}_{\mathrm{F} 2}=100 \mathrm{k} \Omega, \mathrm{R}_{\mathrm{L}}=200 \Omega$, output load is referenced to midsupply, and $T_{A} \approx+25^{\circ} \mathrm{C}$ (unless otherwise noted), see figure $7-1$ for schematic configuration. (1) (2)

(1) All the specifications apply for both Channels $A$ and $B$, unless otherwise noted.
(2) When switching from one gain condition to another, the new gain switches are closed before opening the previous gain switches (make-before-break).
(3) $\mathrm{SW}_{\text {СОмо }}, \mathrm{SW}_{\text {СОМ1 }}, \mathrm{SW}_{\text {СОм2 }}$ refer to switch on the common-mode side (COM) for the different gain options.
(4) $\mathrm{SW}_{\mathrm{FB} 0}, \mathrm{SW}_{\mathrm{FB} 1}, \mathrm{SW}_{\mathrm{FB} 2}$ refer to switch on the feedback side ( FB ) for the different gain options.
(5) $\mathrm{SW}_{0}, \mathrm{SW}_{1}, \mathrm{SW}_{2}$ refers to the two switches needed for a given gain condition. For example, SW0 refers to $\mathrm{SW}_{\text {COM0 }}$ and $\mathrm{SW}_{\mathrm{FB} 0}$.
(6) $\mathrm{C}_{\text {COM0 }}, \mathrm{C}_{\text {СоM1 }}, \mathrm{C}_{\text {COM2 }}$ is the capacitance at the COM pin for different gain options. It is equal to ON capacitance of closed switch + OFF capacitance of open switches.
(7) $\mathrm{C}_{\mathrm{FB} 0}, \mathrm{C}_{\mathrm{FB} 1}, \mathrm{C}_{\mathrm{FB} 2}$ is the capacitance at the $\mathrm{FB} \times$ pin. It is equal to ON capacitance of the gain option selected ( $\mathrm{SW}_{\mathrm{COM0}}+\mathrm{SW}_{\mathrm{FB}}$ capacitance).
(8) $\mathrm{R}_{\text {ON_сомо }}, \mathrm{R}_{\mathrm{ON} \text { _сом1 }}, \mathrm{R}_{\mathrm{ON}}$ сом2, refer to ON resistance for the COM side switch.
(9) $R_{\text {ON_FBO }}, R_{\mathrm{ON} \_ \text {FB1 }}, \mathrm{R}_{\mathrm{ON} \_ \text {FB2 }}$, refer to ON resistance for the FB side switch.

### 6.7 Typical Characteristics

$\mathrm{V}_{\mathrm{S}^{+}}=+2.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{S}-}=-2.5 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=200 \Omega, \mathrm{C}_{\mathrm{IN}}=4 \mathrm{pF}$, output load is referenced to mid-supply, input common-mode biased at mid-supply, and $\mathrm{T}_{\mathrm{A}} \cong+25^{\circ} \mathrm{C}$ (unless otherwise noted)

## 7 Parameter Measurement Information

The following figure shows the test setup configuration for OPA3S2859.

Figure 7-1. Switching Characteristics Configuration

## 8 Detailed Description

### 8.1 Overview

The OPA3S2859 features dual channel, high-speed, low noise, wide gain bandwidth amplifier with programmable gain switches to offer a compact, easy-to-use device for wideband transimpedance applications, high-speed data acquisition systems, and applications with weak signal inputs that require low-noise and highgain front ends. Integrated switches allow for multiple gain settings on a single amplifier stage without the need for an additional multiplexer, therefore minimizing board parasitics.
The OPA3S2859 is offered in a 4-mm $\times 4-\mathrm{mm}$, 24-pin WQFN package that features multiple feedback (FB) pins for different gain options to make simple feedback network connection between the amplifier output and inverting input. The three internally switched feedback paths along with an additional parallel non-switched feedback path allows for up to four selectable gain configurations.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

### 8.3.1 Programmable Gain

The OPA3S2859 features integrated switches that can be used for implementing different gain configurations. The closed-loop bandwidth and noise of a TIA are affected by the transimpedance gain and photodiode capacitance. The OPA3S2859 has a higher bandwidth in its low-gain configuration for a given value of photodiode capacitance compared to the high-gain configuration. Increasing the gain of the TIA stage by a factor of $X$ increases the output signal by a factor $X$, but the noise contribution from the resistor only increases by $\sqrt{ }$. The input-referred noise density of the low-gain configuration is therefore higher than the input-referred noise density of the high-gain configuration.

OPA3S2859 provides control for switching among three independently-configured external feedback networks using FB_x0, FB_x1, FB_x2 pins, and allows for up to four selectable gain configurations with an additional parallel non-switched feedback path. The internal switches minimize parasitic contributions to increase performance compared to external methods. Each switch is optimized for increasing feedback resistor values ranging from < $1 \mathrm{k} \Omega$ to $>100 \mathrm{k} \Omega$ for wide dynamic range applications. The selected switch path is controlled for both channels using a 2 -wire parallel interface (SELO and SEL1).
In many systems it is typical that gain will switch sequentially (also known as adjacent gain switching). For example, the gain will switch low to medium to high or high to medium to low. When switching between adjacent gains, the switches feature make-before-break switching. When programmed to a different connection, the previous switch does not change to high impedance state until the new switch is closed (with a typical 80 ns to 230 ns delay when both switches are closed). This feature helps the amplifier from not operating in an open-loop state when the switches are used in a switched-gain transimpedance configuration.

### 8.3.2 Slew Rate

The OPA3S2859 features a high slew rate of $350 \mathrm{~V} / \mu \mathrm{s}$. The slew rate is a critical parameter in high-speed pulse applications such as optical time-domain reflectometry (OTDR). As Figure 6-11 shows, the high slew rate implies that the device accurately reproduces a $2-\mathrm{V}$, sub 100 -ns pulse edge. The wide bandwidth and slew rate of the device make it an excellent amplifier for high-speed signal-chain front ends.

### 8.3.3 Input and ESD Protection

The OPA3S2859 is fabricated on a low-voltage, high-speed, BiCMOS process. The internal, junction breakdown voltages are low for these small geometry devices, and as a result, all device pins are protected with internal ESD protection diodes to the power supplies. There are two antiparallel diodes between the inputs of the amplifier that clamp the inputs during an overrange or fault condition.

### 8.4 Device Functional Modes

### 8.4.1 Split-Supply and Single-Supply Operation

The OPA3S2859 can be configured with single-sided supplies or split-supplies without degrading performance. In either case, the thermal pad should be tied to the same voltage as $\mathrm{V}_{\mathrm{S}}$.

### 8.4.2 Power-Down Mode

The OPA3S2859 features a power-down mode to conserve power. Connecting the $\overline{\mathrm{PD}}$ pin low disables the amplifier thereby reducing the quiescent current and places the output in a high-impedance state.
$\overline{\mathrm{PD}}$ pin has an internal pull up resistor. If the pin is left floating, then the device defaults to an ON state. The $\overline{\mathrm{PD}}$ disable and enable threshold voltages are referenced to the positive supply (for more inforamtion refer to the Electrical Characteristics section). If the amplifier is configured with the positive supply at 5 V and the negative supply at ground, then the disable and enable threshold voltages are 3.5 V and 4.2 V , respectively. If the amplifier is configured with $\pm 2.5 \mathrm{~V}$ supplies, then the threshold voltages are at 1 V and 1.7 V .

### 8.4.3 Gain Select Mode (SEL)

The OPA3S2859 features two pins SEL0 and SEL1 to choose between three different internal switch networks and an external option. The SELx disable and enable threshold voltages are with reference to the positive supply as shown in the Switching Characteristics table. Note: while the SELx logic will select the same switch configuration for channel $A$ and $B$, the external components (feedback network) of channels $A$ and $B$ do not have to be exactly the same.
When switching between different gain settings (feedback networks), the device has a transition time of only 80 ns to 230 ns (typical) as shown in the Switching Characteristics table. In many systems, it is typical that gain will be stepped sequentially (for example, low to medium to high or high to medium to low). As provided in Table 5-2, the SELx logic assignment ensures that switching gains up or down involve only one input-pin transition, reducing the probability of unintended false codes during logic settling.

### 8.4.4 Latch Mode

OPA3S2859 features $\overline{\text { LTCH_A }}$ and $\overline{\text { LTCH_B pins which independently latch the gain configuration for Channel A }}$ and Channel B, respectively. If the latch control inputs are connected to logic high or floating, then the chosen feedback selection (through the SELO and SEL1 pins) applies to A and B analog channels immediately, this is also called transparent mode. If the latch control inputs are logic low, then changing the feedback selection (through the SEL0 and SEL1 pins) does not affect the gain configuration of the respective amplifier channel. Figure 8-1 shows the minimum timing requirements that should be met when using [TCH_x pins to latch gain configuration.
As shown in Figure 8-1, use the latch control input for each channel to separately control the feedback selection from the common SEL1 and SELO pins. The latch control inputs can also provide benefits in some cases where channel $A$ and $B$ need to have the same configuration. For example, any timing skew from SEL1 and SELO may result in unintended switch logic configurations for a short-duration resulting in transient output glitch when switching between different settings in transparent mode. Holding the LTCH_x pin low until the new selection value at the SEL pins have settled can minimize these intermediate glitch states.

This feature is also useful in larger systems with multiple OPA3S2859 devices. The gain path can be set using common SEL0 and SEL1 signals for all the devices, and latch pins can be used to control the gain independently for each amplifier channel.
The steps to update the gain settings in the following example configuration for Channel A only, are as follows:

1. Set $\overline{\text { LTCH_B }}$ to logic low (latch mode), this way changes made on Channel $A$ do not affect Channel $B$ gain configuration.
2. If $\overline{\text { LTCH_A }}$ is high (transparent mode), then use SELO and SEL1 pins to select the feedback network of interest. If $\overline{\text { LTCH_A }}$ is low, then toggle it to logic high and use SELO and SEL1 pins to select the feedback network of interest.
3. To hold the selected gain, set $\overline{\mathrm{LTCH}} \mathrm{A}$ to logic low. Ensure minimum setup time requirements ( 100 ns ) are met between SELx selection to LTCH_A going low. Also, ensure that during the hold time ( 100 ns ), no changes should be made on SELx pins. The minimum timing is based on internal device configuration. If needed, additional time must be added due to board layout parasitics and signal delays.
4. Gain setting for channel $A$ is now latched and any changes on the SELx pins will not change the gain configuration for channel A.

Figure 8-1. Timing Diagram

## 9 Application and Implementation

## Note

Information in the following applications sections is not part of the TI component specification, and Tl does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The OPA3S2859 offers a unique combination of dual channel, wide bandwidth low noise amplifiers with integrated programmable gain switches. This combination makes this amplifier an excellent choice for photodiode transimpedance amplifier applications with variable gain needs.

### 9.2 Typical Application

Figure 9-1 shows the circuit used to measure transimpedance bandwidth of the OPA3S2859 with different feedback network setting options. This configuration imitates the impedance of the photodiode on the input of the TIA.

Figure 9-1. OPA3S2859 Test Circuit

### 9.2.1 Design Requirements

The objective is to design a variable gain, low noise, wideband optical front-end transimpedance amplifier. The design requirements are as follows:

- Amplifier supply voltage: $\pm 2.5 \mathrm{~V}$
- Transimpedance gain: $1 \mathrm{k} \Omega, 10 \mathrm{k} \Omega$, or $100 \mathrm{k} \Omega$
- Photodiode capacitance: $\mathrm{C}_{\text {APD }}=3.3 \mathrm{pF}$ (additional estimated PCB capacitance $=0.7 \mathrm{pF}$ )
- Target bandwidth: $130 \mathrm{MHz}, 40 \mathrm{MHz}$, or 14 MHz

### 9.2.2 Detailed Design Procedure

The OPA3S2859 meets the growing demand for wideband, low-noise photodiode amplifiers. The closed-loop bandwidth of a transimpedance amplifier is a function of the following:

1. The total input capacitance ( $\mathrm{C}_{\mathrm{IN}}$ ). This total includes the photodiode capacitance, the input capacitance of the amplifier (common-mode and differential capacitance) and any stray capacitance from the PCB.
2. The op amp gain bandwidth product (GBWP).
3. The transimpedance gain $\left(R_{F}\right)$.

Figure 9-1 shows the OPA3S2859 configured as programmable gain TIA using different feedback paths through the switch network. The feedback resistance $\left(R_{F}\right)$ and the input capacitance $\left(\mathrm{C}_{\mathrm{IN}}\right)$ form a zero in the noise gain that results in instability if left unchecked. To counteract the effect of the zero, a pole is inserted into the noise gain transfer function by adding the feedback capacitor $\left(\mathrm{C}_{\mathrm{F}}\right)$. The Transimpedance Considerations for High-Speed Amplifiers Application Report application report discusses theories and equations that show how to compensate a transimpedance amplifier for a particular transimpedance gain and input capacitance. The bandwidth and compensation equations from the application report are available in an Excel ${ }^{\circledR}$ calculator. What You Need To Know About Transimpedance Amplifiers - Part 1 provides a link to the calculator.

The equations and calculators in the referenced application report and blog posts are used to model the bandwidth ( $\mathrm{f}_{-3 \mathrm{~dB}}$ ) and noise performance of the OPA3S2859 configured as a TIA. For this setup, to emulate an ideal current source, choose an $R_{\mathbb{I N}}$ value that is 1 to $10 x$ greater than $R_{F}$ so that the resulting low frequency noise gain is closer to $1 \mathrm{~V} / \mathrm{V}$ than to $2 \mathrm{~V} / \mathrm{V}\left(\mathrm{R}_{\mathrm{F}}=1 \mathrm{k} \Omega\right.$, $10 \mathrm{k} \Omega$, or $100 \mathrm{k} \Omega, \mathrm{R}_{\mathrm{IN}}=10 \mathrm{k} \Omega$, $100 \mathrm{k} \Omega$, or 100 $k \Omega$; respectively). Figure $9-2$ shows the resultant performance. To maximize bandwidth, make sure to reduce any stray parasitic capacitance from the PCB. Increasing $R_{F}$ results in lower bandwidth. To maximize the signal-to-noise ratio (SNR) in an optical front-end system, maximize the gain in the TIA stage.

### 9.2.3 Application Curves

Figure 9-2. Bandwidth vs Frequency

## 10 Power Supply Recommendations

The OPA3S2859 operates on supplies from 3.3 V to 5.25 V . The device operates on single-sided supplies, split and balanced bipolar supplies, and unbalanced bipolar supplies. Because the OPA3S2859 does not feature rail-to-rail inputs or outputs, the input common-mode and output swing ranges are limited at $3.3-\mathrm{V}$ supplies.

## 11 Layout

### 11.1 Layout Guidelines

Achieving optimum performance with a high-frequency amplifier, such as the OPA3S2859, requires careful attention to board layout parasitics and external component types. Recommendations that optimize performance include the following:

- Reduce capacitive coupling between feedback traces. Trace-to-trace capacitance between the three feedback connection traces can cause the traces to couple together at high frequency and effect the gain of the device. Particularly for high gain feedback configurations, capacitive coupling to feedback paths with lower gain can significantly reduce the bandwidth if not properly isolated. For example, in a circuit configuration with $100 \mathrm{k}, 10 \mathrm{k}$, and 1 k feedback elements, the 100 k gain path can see over $66 \%$ reduction in bandwidth when using a non-optimized feedback layout. To properly isolate the feedback traces, it is important to space the traces out and pour ground plane between the traces to isolate their capacitance; additional trace length, however, does add further inductance and capacitance to the traces which can also effect performance. Therefore, it is important to balance the feedback area and trace length to best minimize the major parasitic effect. A good starting point is to use a design similar to the evaluation module with a feedback area of approximately $6 \mathrm{~mm} \times 6 \mathrm{~mm}$. This can then be adjusted depending on circuit limitations and needs.
- Minimize parasitic capacitance from the signal I/O pins to ac ground. Parasitic capacitance on the output pins can cause instability, where as parasitic capacitance on the input pin reduces the amplifier bandwidth. To reduce unwanted capacitance, cut out the power and ground traces under the signal input pins, output pins, and exterior feedback trace when possible. A small value isolation resistor between the DUT output and feedback network can also help reduce the parasitic loading caused by the feedback trace on the output. Otherwise, ground and power planes must be unbroken elsewhere on the board.
- Minimize the distance from the power-supply pins to the high-frequency bypass capacitors. Use high-quality, $100-\mathrm{pF}$ to $0.1-\mu \mathrm{F}, \mathrm{C} 0 \mathrm{G}$ and NPO-type decoupling capacitors with voltage ratings at least three times greater than the amplifiers maximum power supplies. Place the smallest value capacitors on the same side as the DUT. If space constraints force the larger value bypass capacitors to be placed on the opposite side of the PCB, use multiple vias on the supply and ground side of the capacitors. This configuration makes sure that there is a low-impedance path to the amplifiers power-supply pins across the amplifiers gain bandwidth specification. Avoid narrow power and ground traces to minimize inductance between the pins and the decoupling capacitors. Larger ( $2.2-\mu \mathrm{F}$ to $6.8-\mu \mathrm{F}$ ) decoupling capacitors that are effective at lower frequency must be used on the supply pins. Place these decoupling capacitors further from the device. Share the decoupling capacitors among several devices in the same area of the printed circuit board (PCB).

### 11.2 Layout Examples

Figure 11-1 shows a typical layout around the OPA3S2859 based on the evaluation module. The smallest decoupling capacitors were placed as close as possible to the DUT with wide metal area to minimize inductance. Special attention was placed on the feedback network layout to optimize the design for a typical application using $1 \mathrm{k} \Omega, 10 \mathrm{k} \Omega$, and $100 \mathrm{k} \Omega$ feedback resistors. Figure 11-2 shows more details. The black colored areas under the input and feedback traces show the voids cut in the ground plane underneath the traces to minimize capacitance to ground as much as possible.

Figure 11-1. General Layout Example
Figure 11-2 shows an example of a feedback network from the evaluation module optimized to reduce the capacitive coupling between the feedback and output traces. Ground plane is poured between each of the feedback traces and component footprints as much as possible for the best isolation. A small isoation resistor (RISO) is connected between the output and feedback trace to help isolate the trace capacitance from being directly connected to the DUT output. Additionally, the ground plane is removed from under the feedback trace to further reduce the parasitic capacitance to ground created by the additional trace length required for the feedback network.

Figure 11-2. Feedback Network Layout Recommendations

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free"
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000 \mathrm{ppm}$ threshold requirement
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
