## SN54HC161, SN74HC161 4-BIT SYNCHRONOUS BINARY COUNTERS

- Wide Operating Voltage Range of 2 V to 6 V
- Outputs Can Drive Up To 10 LSTTL Loads
- Low Power Consumption, 80- $\mu \mathrm{A}$ Max ICC
- Typical $\mathrm{t}_{\mathrm{pd}}=14 \mathrm{~ns}$
- $\pm 4$-mA Output Drive at 5 V

- Synchronously Programmable

NC - No internal connection

## description/ordering information

These synchronous, presettable counters feature an internal carry look-ahead for application in high-speed counting designs. The 'HC161 devices are 4-bit binary counters. Synchronous operation is provided by having all flip-flops clocked simultaneously so that the outputs change coincident with each other when so instructed by the count-enable (ENP, ENT) inputs and internal gating. This mode of operation eliminates the output counting spikes that are normally associated with synchronous (ripple-clock) counters. A buffered clock (CLK) input triggers the four flip-flops on the rising (positive-going) edge of the clock waveform.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## SN54HC161, SN74HC161 <br> 4-BIT SYNCHRONOUS BINARY COUNTERS

SCLS297D - JANUARY 1996 - REVISED SEPTEMBER 2003

## description/ordering information (continued)

These counters are fully programmable; that is, they can be preset to any number between 0 and 9 or 15. As presetting is synchronous, setting up a low level at the load input disables the counter and causes the outputs to agree with the setup data after the next clock pulse, regardless of the levels of the enable inputs.
The clear function for the 'HC161 devices is asynchronous. A low level at the clear ( $\overline{\mathrm{CLR}})$ input sets all four of the flip-flop outputs low, regardless of the levels of the CLK, load ( $\overline{\mathrm{LOAD}}$ ), or enable inputs.

The carry look-ahead circuitry provides for cascading counters for n-bit synchronous applications without additional gating. Instrumental in accomplishing this function are ENP, ENT, and a ripple-carry output (RCO). Both ENP and ENT must be high to count, and ENT is fed forward to enable RCO. Enabling RCO produces a high-level pulse while the count is maximum ( 9 or 15 with $Q_{A}$ high). This high-level overflow ripple-carry pulse can be used to enable successive cascaded stages. Transitions at ENP or ENT are allowed, regardless of the level of CLK.

These counters feature a fully independent clock circuit. Changes at control inputs (ENP, ENT, or $\overline{\text { LOAD }}$ ) that modify the operating mode have no effect on the contents of the counter until clocking occurs. The function of the counter (whether enabled, disabled, loading, or counting) is dictated solely by the conditions meeting the stable setup and hold times.
logic diagram (positive logic)

$\dagger$ For simplicity, routing of complementary signals $\overline{\mathrm{LD}}$ and $\overline{\mathrm{CK}}$ is not shown on this overall logic diagram. The uses of these signals are shown on the logic diagram of the D/T flip-flops.
Pin numbers shown are for the D, J, N, NS, PW, and W packages.

NOTE 3: All unused inputs of the device must be held at $\mathrm{V}_{\mathrm{CC}}$ or GND to ensure proper device operation. Refer to the TI application report, Implications of Slow or Floating CMOS Inputs, literature number SCBA004.
$\ddagger$ If this device is used in the threshold region (from $\mathrm{V}_{I L} \max =0.5 \mathrm{~V}$ to $\mathrm{V}_{I H} \min =1.5 \mathrm{~V}$ ), there is a potential to go into the wrong state from induced grounding, causing double clocking. Operating with the inputs at $t_{t}=1000 \mathrm{~ns}$ and $\mathrm{V}_{\mathrm{CC}}=2 \mathrm{~V}$ does not damage the device; however, functionally, the CLK inputs are not ensured while in the shift, count, or toggle operating modes.

## PARAMETER MEASUREMENT INFORMATION

Figure 1. Load Circuit and Voltage Waveforms

## SN54HC161, SN74HC161 <br> 4-BIT SYNCHRONOUS BINARY COUNTERS

SCLS297D - JANUARY 1996 - REVISED SEPTEMBER 2003

## APPLICATION INFORMATION

## n-bit synchronous counters

This application demonstrates how the look-ahead carry circuit can be used to implement a high-speed n-bit counter. The 'HC161 devices count in binary. Virtually any count mode (modulo-N, $\mathrm{N}_{1}$-to- $\mathrm{N}_{2}$, $\mathrm{N}_{1}$-to-maximum) can be used with this fast look-ahead circuit.

The application circuit shown in Figure 2 is not valid for clock frequencies above 18 MHz (at $25^{\circ} \mathrm{C}$ and $\left.4.5-\mathrm{V} \mathrm{V}_{\mathrm{CC}}\right)$. The reason for this is that there is a glitch that is produced on the second stage's RCO and every succeeding stage's RCO. This glitch is common to all HC vendors that Texas Instruments has evaluated, in addition to the bipolar equivalents (LS, ALS, AS).

APPLICATION INFORMATION

Figure 2

## APPLICATION INFORMATION

The glitch on RCO is caused because the propagation delay of the rising edge of $Q_{A}$ of the second stage is shorter than the propagation delay of the falling edge of ENT. RCO is the product of ENT, $Q_{A}, Q_{B}, Q_{C}$, and $Q_{D}$ ( $E N T \times Q_{A} \times Q_{B} \times Q_{C} \times Q_{D}$ ). The resulting glitch is about 7-12 ns in duration. Figure 3 shows the condition in which the glitch occurs. For simplicity, only two stages are being considered, but the results can be applied to other stages. $Q_{B}, Q_{C}$, and $Q_{D}$ of the first and second stage are at logic one, and $Q_{A}$ of both stages are at logic zero (1110 1110) after the first clock pulse. On the rising edge of the second clock pulse, $Q_{A}$ and RCO of the first stage go high. On the rising edge of the third clock pulse, $Q_{A}$ and $R C O$ of the first stage return to a low level, and $Q_{A}$ of the second stage goes to a high level. At this time, the glitch on RCO of the second stage appears because of the race condition inside the chip.

Figure 3
The glitch causes a problem in the next stage (stage three) if the glitch is still present when the next rising clock edge appears (clock pulse 4). To ensure that this does not happen, the clock frequency must be less than the inverse of the sum of the clock-to-RCO propagation delay and the glitch duration $\left(\mathrm{t}_{\mathrm{g}}\right)$. In other words, $f_{\max }=1 /\left(\mathrm{t}_{\text {pd }}\right.$ CLK-to-RCO $\left.+\mathrm{t}_{\mathrm{g}}\right)$. For example, at $25^{\circ} \mathrm{C}$ at $4.5-\mathrm{V} \mathrm{V}_{\mathrm{CC}}$, the clock-to-RCO propagation delay is 43 ns and the maximum duration of the glitch is 12 ns . Therefore, the maximum clock frequency that the cascaded counters can use is 18 MHz . The following tables contain the $f_{\text {clock }}, t_{w}$, and $f_{\text {max }}$ specifications for applications that use more than two 'HC161 devices cascaded together.

## APPLICATION INFORMATION

timing requirements over recommended operating free-air temperature range (unless otherwise noted)

switching characteristics over recommended operating free-air temperature range, $\mathrm{C}_{\mathrm{L}}=50 \mathrm{pF}$ (unless otherwise noted) (see Note 4)

| PARAMETER | FROM (INPUT) | TO (OUTPUT) | $V_{C C}$ | $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ |  | SN54HC161 |  | SN74HC161 |  | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | MIN | MAX | MIN | MAX | MIN | MAX |  |
| ${ }^{\prime}$ max |  |  | 2 V | 3.6 |  | 2.5 |  | 2.9 |  | MHz |
|  |  |  | 4.5 V | 18 |  | 12 |  | 14 |  |  |
|  |  |  | 6 V | 21 |  | 14 |  | 17 |  |  |

NOTE 4: These limits apply only to applications that use more than two 'HC161 devices cascaded together.
If the 'HC161 devices are used as a single unit, or only two cascaded together, then the maximum clock frequency that the device can use is not limited because of the glitch. In these situations, the device can be operated at the maximum specifications.
A glitch can appear on RCO of a single 'HC161 device, depending on the relationship of ENT to CLK. Any application that uses RCO to drive any input except an ENT of another cascaded 'HC161 device must take this into consideration.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width

Important Information and Disclaimer:The information provided on this page represents Tl's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and
continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
OTHER QUALIFIED VERSIONS OF SN54HC161, SN54HC161-SP, SN74HC161 :

- Catalog : SN74HC161, SN54HC161
- Military : SN54HC161
- Space : SN54HC161-SP

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product
- Military - QML certified for Military and Defense Applications
- Space - Radiation tolerant, ceramic packaging and qualified for use in Space-based application

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm , per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm , per side.

NOTES: (continued)
5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE BASED ON 0.125 mm THICK STENCIL SCALE:7X

NOTES: (continued)
7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

FK (S-CQCC-N**)
LEADLESS CERAMIC CHIP CARRIER 28 TERMINAL SHOWN

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. This package can be hermetically sealed with a metal lid.
D. Falls within JEDEC MS-004

D (R-PDSO-G16)

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed $0.006(0,15)$ each side.
D Body width does not include interlead flash. Interlead flash shall not exceed $0.017(0,43)$ each side.
E. Reference JEDEC MS-012 variation AC.

D (R-PDSO-G16)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE BASED ON 0.125 mm THICK STENCIL SCALE: 10X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

NS (R-PDSO-G**)
14-PINS SHOWN
