8.4.8 VIP Video Port Direct Memory Access (VPDMA)

8.4.8.1 VPDMA Introduction

The VPDMA primary function is to move data between external memory and internal processing modules that source or sink data. VPDMA is capable buffering this data and then delivering the data as demanded to the modules as programmed. The modules that source or sink data are referred to as clients. A channel is setup inside the VPDMA to connect a specific memory buffer to a specific client. The VPDMA centralizes the DMA control functions and buffering required to allow all the clients to minimize the effect of long latency times. The VPDMA also supports a descriptor based mode where lists of descriptors can be setup to configure all the channels as they become available.

Additionally, in a third-party configuration, the VPDMA is capable of performing DMA transfers as requested by the pulsing of an event strobe. The VPDMA is capable of generation of an address which may reach any location in the range for which it is configured. It is capable of moving this data either to or from a Shared Buffer and ultimately to or from a Client Buffer. For the two type of Client Buffers that are used to drive data into a subsystem (Streaming Buffer and Random Access Buffer) data is either pushed into the buffer or pulled out of the buffer dependent upon the direction of the data transfer. For third-party DMA operations the data is transferred into a Client buffer, and then transferred out of the Client Buffer to the transfer destination. These transfers are triggered by an Event pulse to each of the Client Buffers which are Routing Buffer types.

8.4.8.2 VPDMA Basic Definitions

8.4.8.2.1 Client

The modules that source or sink data are referred to as clients. The clients of the VPDMA are the physical between the processing modules (VIP) and external memory. A channel is the mechanism inside the VPDMA that connects a specific memory buffer or transfer to a specific client.

The start event can also be selected by a channel attribute or to be controlled by an internal frame signal controlled by the List Manager.

8.4.8.2.2 Channel

The VPDMA requires a channel to be setup for each group of transfers. All the channels are described through a Data Transfer Descriptor that has a common format. The client that the channel is mapped to interprets the information in the descriptor to perform the requested data transfer.

Each of the channels has a type of data that it can support based upon the client that it services. The VPDMA supports three types of channels:

- **YUV Channel** - Clients taking data YUV data
- **RGB Channel** - Clients taking RGB data
- **Miscellaneous Channel** - The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client.

8.4.8.2.3 List

A list is a group of descriptors that makes up a set of DMA transfers that need to be completed. The VPDMA supports one kind of list only:

- The **Regular List** is a single list that the VPDMA will execute each descriptor once and initiate an interrupt when the list has completed. A regular list can contain any kind of descriptor without limitation and be of any size.

The VPDMA Controller works on lists of descriptors. In this mode the processor writes the lists of descriptors in the order it wants them executed. It then writes the location of the list to the [VIP_LIST_ADDR](#) register, followed by writing the size (bit LIST_SIZE) and type (bit LIST_TYPE) of the list, and list number (bit LIST_NUM) to the [VIP_LIST_ATTR](#) register. The List Manager module then schedules a DMA transfer to pull in the portion of the list that it can store in internal VPDMA memory. The List Manager will sequentially process the active list of descriptors until either the descriptor requires the use of a client that is currently active, or if it is waiting for the next portion of the list to be transferred from a DMA request. If there is no active list to process the list manager will go into an IDLE mode waiting for any client that is blocking a list or a list DMA transfer to complete.

All the DMA transfers are controlled by List Manager module inside VPDMA. List Manager needs to be loaded with FIRMWARE, before any DMA transfer from memory, after the VPDMA reset. The first MMR write to [VIP_LIST_ADDR](#) register after VPDMA reset should be the address of the memory buffer(128-bit aligned, that is, last four bits of the buffer address should be zero) where the firmware is stored. List Manager then schedules a DMA transaction to fetch the firmware and sets the [VIP_LIST_ATTR\[19\]](#) RDY bit after the firmware loading is complete.

8.4.8.2.4 Data Formats Supported

Following list summarizes the data formats supported in the VPDMA. For more information see [Section 8.4.8.9, VPDMA Data Formats](#).

- RGB Data Types:
 - RGB16-565
 - ARGB-1555
 - ARGB-4444
 - RGBA-5551
 - RGBA-4444
 - ARGB24-6666
 - RGB24-888
 - ARGB32-8888
 - RGBA24-6666
 - RGBA32-8888
 - BGR16-565
 - ABGR-1555

- ABGR-4444
- BGRA-5551
- BGRA-4444
- ABGR24-6666
- BGR24-888
- ABGR32-8888
- BGRA24-6666
- BGRA32-8888
- YUV Data Types:
 - Y 4:4:4
 - Y 4:2:2
 - Y 4:2:0
 - C 4:4:4
 - C 4:2:2
 - C 4:2:0
 - CY 4:2:2
 - YCbC 4:4:4
 - YC 4:2:2

NOTE: VPDMA supports swapping formats (RGB/BGR and Cb/Cr)

8.4.8.3 VPDMA Client Buffering and Functionality

Table 8-29 lists for each client:

- The channels used, amount of buffering allocated for it, and the shared buffer used for its memory
- The line sizes it handles for tiled and non-tiled memory spaces, as well as any additional features it supports

Table 8-29. VPDMA Client Buffering and Functionality

Client	Channel(s)	Tiled Memory Max Line Size	Non-Tiled Memory Max Line Size	Additional Features

8.4.8.4 VPDMA Channels Assignment

Table 8-30 lists all of the channels in VPDMA and its base attributes. The Data Type column states what type of data YUV, RGB or OTHER the channel handles and in parentheses are the legal data type values that can be entered into a data transfer descriptor. The Client field states the name of the Client and in parentheses it states the reference number in [Figure 8-4](#), *VIP Block Diagram*.

Table 8-30. VPDMA Channels Assignment

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src0	Video Input 1 Port A Channel 0	38	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src1	Video Input 1 Port A Channel 1	39	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src2	Video Input 1 Port A Channel 2	40	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src3	Video Input 1 Port A Channel 3	41	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src4	Video Input 1 Port A Channel 4	42	YUV (0x7)	vip1_lo_y (2)

Table 8-30. VPDMA Channels Assignment (continued)

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src5	Video Input 1 Port A Channel 5	43	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src6	Video Input 1 Port A Channel 6	44	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src7	Video Input 1 Port A Channel 7	45	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src8	Video Input 1 Port A Channel 8	46	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src9	Video Input 1 Port A Channel 9	47	YUV (0x7)	vip1_lo_y (2)

8.4.8.5 VPDMA MFLAG Mechanism

The device L3_MAIN interconnect accepts MFLAG signals from certain initiators that can influence the internal L3_MAIN arbitration mechanisms. As a result, a higher priority is given to the data traffic initiated by these initiators. The VIP VPDMA can directly drive such MFLAG signals dynamically. The MFLAG generation for VIP VPDMA is enabled by default, and there is no register control over it.

The VPDMA arbitrates between multiple DMA sources within the VIP based on FIFO levels of DMA channels connected to VPDMA. Priority escalation mechanism implemented within VIP subsystem is based on overflow threshold and FIFO margin.

The following is a summary of priority and MFLAG levels provided by the VIP:

- High priority (MFLAG = 3) when FIFO margin is below 25%
- Medium priority (MFLAG = 1) when FIFO margin is between 25% and 50%
- Low priority (MFLAG = 0) when FIFO margin is above 50%

Additionally, the VIP subsystem also generates MReqPriority based upon a programmed descriptor configuration. The MReqPriority configuration influences the arbitration mechanism in the Memory Subsystem only and has no influence on the arbitration that takes place within L3_MAIN interconnect. For more information see [Section 8.4.8.7.1.4, Data Packet Descriptor Word 3](#).

8.4.8.6 VPDMA Interrupts

The VPDMA has 4 interrupt group(s). Each group has an interrupt for all the client interrupts, an interrupt for every 32 channels, a interrupt for each list complete, an interrupt for each list notify and an interrupt for all of the descriptor interrupts. Each of these groups can be individually masked so that only the interrupts specified will trigger the higher level interrupt.

Each interrupt source can be individually masked independently for each separate interrupt group. A status register bit exists for each interrupt source for each interrupt group, that is set whenever the interrupt event occurs even when if the interrupt is masked. The status register bit will remain set until cleared by software by writing a one to the status bit.

[Table 8-31](#) shows all interrupt events from VPDMA that go to VIP top level. The interrupt events are mapped to two interrupt lines, INT0 and INT1, that go to VIP top level.

Table 8-31. VPDMA Interrupt Events

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group0	VIP_INT0_CHANNEL0_INT_STAT VIP_INT1_CHANNEL0_INT_STAT	VIP_INT0_CHANNEL0_INT_MASK VIP_INT1_CHANNEL0_INT_MASK	An unmasked channel interrupt for interrupt group 0 in channel register 0 or 1 has fired.
vpdma_int_channel_group1	VIP_INT0_CHANNEL1_INT_STAT VIP_INT1_CHANNEL1_INT_STAT	VIP_INT0_CHANNEL1_INT_MASK VIP_INT1_CHANNEL1_INT_MASK	An unmasked channel interrupt for interrupt group 1 in channel register 0 or 1 has fired.
vpdma_int_channel_group2	VIP_INT0_CHANNEL2_INT_STAT VIP_INT1_CHANNEL2_INT_STAT	VIP_INT0_CHANNEL2_INT_MASK VIP_INT1_CHANNEL2_INT_MASK	An unmasked channel interrupt for interrupt group 2 in channel register 0 or 1 has fired.
vpdma_int_channel_group3	VIP_INT0_CHANNEL3_INT_STAT VIP_INT1_CHANNEL3_INT_STAT	VIP_INT0_CHANNEL3_INT_MASK VIP_INT1_CHANNEL3_INT_MASK	An unmasked channel interrupt for interrupt group 3 in channel register 0 or 1 has fired.
vpdma_int_channel_group4	VIP_INT0_CHANNEL4_INT_STAT VIP_INT1_CHANNEL4_INT_STAT	VIP_INT0_CHANNEL4_INT_MASK VIP_INT1_CHANNEL4_INT_MASK	An unmasked channel interrupt for interrupt group 4 in channel register 0 or 1 has fired.
vpdma_int_channel_group5	VIP_INT0_CHANNEL5_INT_STAT VIP_INT1_CHANNEL5_INT_STAT	VIP_INT0_CHANNEL5_INT_MASK VIP_INT1_CHANNEL5_INT_MASK	An unmasked channel interrupt for interrupt group 5 in channel register 0 or 1 has fired.
vpdma_int_list0_complete			List 0 has completed
vpdma_int_list0_notify			The data transfer in list 0 with the Notify Field set in the descriptor has completed
vpdma_int_list1_complete			List 1 has completed

Table 8-31. VPDMA Interrupt Events (continued)

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_list1_notify			The data transfer in list 1 with the Notify Field set in the descriptor has completed
vpdma_int_list2_complete			List 2 has completed
vpdma_int_list2_notify			The data transfer in list 2 with the Notify Field set in the descriptor has completed
vpdma_int_list3_complete			List 3 has completed
vpdma_int_list3_notify			The data transfer in list 3 with the Notify Field set in the descriptor has completed
vpdma_int_list4_complete	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_MASK VIP_INT1_LIST0_INT_MASK	List 4 has completed
vpdma_int_list4_notify			The data transfer in list 4 with the Notify Field set in the descriptor has completed
vpdma_int_list5_complete			List 5 has completed
vpdma_int_list5_notify			The data transfer in list 5 with the Notify Field set in the descriptor has completed
vpdma_int_list6_complete			List 6 has completed
vpdma_int_list6_notify			The data transfer in list 6 with the Notify Field set in the descriptor has completed
vpdma_int_list7_complete			List 7 has completed
vpdma_int_list7_notify			The data transfer in list 7 with the Notify Field set in the descriptor has completed
vpdma_int_client	VIP_INT0_CLIENT0_INT_STAT VIP_INT0_CLIENT1_INT_STAT VIP_INT1_CLIENT0_INT_STAT VIP_INT1_CLIENT1_INT_STAT	VIP_INT0_CLIENT0_INT_MASK VIP_INT0_CLIENT1_INT_MASK VIP_INT1_CLIENT0_INT_MASK VIP_INT1_CLIENT1_INT_MASK	Client Interrupt
vpdma_int_descriptor	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	Descriptor Interrupt

In [Table 8-31](#) above, the “channel_group”, “client” and “descriptor” interrupts are actually a set of additional interrupts. When software receives an interrupt from a “channel_group”, “client,” or “descriptor” it must read the appropriate register within the VPDMA (refer to [Table 8-32](#) to determine what the actual interrupt was).

Table 8-32. VIP Interrupt Sources

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_ancb_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src10	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src11	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src12	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src13	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src14	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src15	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_ancb_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_porta_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src10	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src11	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_porta_src12	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src13	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src14	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src15	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_porta_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_luma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point.
channel_vip1_portb_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_luma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip2_mult_anc_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anc_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anc_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anc_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_ancb_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src10	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src11	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src12	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src13	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src14	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src15	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_ancb_src4	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src5	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src6	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src7	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src8	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src9	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_porta_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src10	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src11	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src12	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src13	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_porta_src14	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src15	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src4	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src5	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src6	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src7	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src8	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src9	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_portb_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_porta_chroma	channel_group5	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_porta_luma	channel_group5	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_porta_rgb	channel_group5	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point.
channel_vip2_portb_chroma	channel_group5	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_portb_luma	channel_group5	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_portb_rgb	channel_group5	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
client_vip1_anc_a	client	The client interface vip1_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_anc_b	client	The client interface vip1_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_lo_uv	client	The client interface vip1_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_lo_y	client	The client interface vip1_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
client_vip1_up_uv	client	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_y	client	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_anc_a	client	The client interface vip2_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_anc_b	client	The client interface vip2_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_lo_uv	client	The client interface vip2_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_lo_y	client	The client interface vip2_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_up_uv	client	The client interface vip2_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_up_y	client	The client interface vip2_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vpi_ctl	client	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
control_descriptor_int0	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0.
control_descriptor_int1	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1.
control_descriptor_int10	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10.
control_descriptor_int11	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11.
control_descriptor_int12	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12.
control_descriptor_int13	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13.
control_descriptor_int14	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14.
control_descriptor_int15	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
control_descriptor_int2	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2.
control_descriptor_int3	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3.
control_descriptor_int4	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4.
control_descriptor_int5	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5.
control_descriptor_int6	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6.
control_descriptor_int7	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7.
control_descriptor_int8	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8.
control_descriptor_int9	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9.
list0_complete	list0_complete	List 0 has completed
list0_notify	list0_notify	The data transfer in list 0 with the Notify Field set in the descriptor has completed
list1_complete	list1_complete	List 1 has completed
list1_notify	list1_notify	The data transfer in list 1 with the Notify Field set in the descriptor has completed
list2_complete	list2_complete	List 2 has completed
list2_notify	list2_notify	The data transfer in list 2 with the Notify Field set in the descriptor has completed
list3_complete	list3_complete	List 3 has completed
list3_notify	list3_notify	The data transfer in list 3 with the Notify Field set in the descriptor has completed
list4_complete	list4_complete	List 4 has completed
list4_notify	list4_notify	The data transfer in list 4 with the Notify Field set in the descriptor has completed
list5_complete	list5_complete	List 5 has completed
list5_notify	list5_notify	The data transfer in list 5 with the Notify Field set in the descriptor has completed
list6_complete	list6_complete	List 6 has completed
list6_notify	list6_notify	The data transfer in list 6 with the Notify Field set in the descriptor has completed
list7_complete	list7_complete	List 7 has completed
list7_notify	list7_notify	The data transfer in list 7 with the Notify Field set in the descriptor has completed

8.4.8.7 VPDMA Descriptors

The VPDMA needs to be programmed through descriptors (a pre-defined structure of eight or four 32-bit words depending on type of descriptors) other than VPDMA Memory Mapped Registers (MMR). Descriptors are of three types:

- i. **Data Transfer Descriptors** - A memory structure used to describe a desired memory transaction to or from a client.
- ii. **Control Descriptors** - A memory structure used to perform a control operation inside the DMA controller
- iii. **Configuration Descriptors** - A memory structure used to described a setup that should be applied to an processing modules like MMR write, scalar coefficient write etc.

8.4.8.7.1 Data Transfer Descriptors

In order to set up data transfers from the VPDMA, a data transfer descriptor is added into a list. The fields used for an Inbound and Outbound descriptor vary slightly. An outbound transfer can have two different outbound transfers. The two transfers are the main data transfer and a write of an Inbound Descriptor. The created inbound descriptor is formatted so it can be read back in directly to the next channel specified in the original descriptor.

Figure 8-89. Inbound Data Transfer Descriptor Format

	31:24			23:16				15:8			7:0		
Word 0	Data Type	Notify	Field	1D	Even Line Skip	RSV	Odd Line Skip	Line Stride					
Word 1	Line Length						Transfer Height						
Word 2	Start Address									RSV	RSV		
Word 3	Packet Type	Mode	Dir	Channel				Reserved	Pri	Next Channel			
Word 4	Frame Width						Frame Height						
Word 5	Horizontal Start						Vertical Start						
Word 6	Client Specific Attributes												
Word 7	Client Specific Attributes												

vip-072

Figure 8-90. Outbound Data Transfer Descriptor Format

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word 0	Data Type			Notify	Field	1D	Reserved	Even Line Skip	Reserved	Odd Line Skip	Line Stride																					
Word 1	Reserved																															
Word 2	Start Address																															
Word 3	Packet Type	Mode	Dir	Channel						NoReject	Reserved	Pri	Next Channel																			
Word 4	Descriptor Write Address																								Reserved	write descriptor	Reserved					
Word 5	Reserved																								Max Width	Reserved	Max Height					
Word 6	Reserved																															
Word 7	Reserved																															

The general data transfer Descriptor formats can be seen in the above figures. The descriptor consists of 8 x 32bit words. A Data Transfer Descriptor will be removed from the list when the resource specified by the Channel field is free. If the Channel is not free when the list reaches a data transfer descriptor then the list will stall until the current transfer on the channel has completed.

8.4.8.7.1.1 Data Packet Descriptor Word 0 (Data)
Table 8-33. Data Packet Descriptor Word 0 Field Descriptions

Bit	Field	Value	Description
31:26	Data Type		Miscellaneous Channel Sets the pixel size in bits plus 1
			RGB Channel
		0	RGB16-565
		1h	ARGB-1555
		2h	ARGB-4444
		3h	RGBA-5551
		4h	RGBA-4444
		5h	ARGB24-6666
		6h	RGB24-888
		7h	ARGB32-8888
		8h	RGBA24-6666
		9h	RGBA32-8888
		10h	BGR16-565
		11h	ABGR-1555
		12h	ABGR-4444
		13h	BGRA-5551
		14h	BGRA-4444
		15h	ABGR24-6666
		16h	BGR24-888
		17h	ABGR32-8888
		18h	BGRA24-6666
		19h	BGRA32-8888
			YUV Channel
		0	Y 4:4:4
		1	Y 4:2:2
		2	Y 4:2:0
		4	C 4:4:4
		5	C 4:2:2
		6	C 4:2:0
		7	CY 4:2:2
		8	YCbC 4:4:4
		14h	Cb 4:4:4
15h	Cb 4:2:2		
16h	Cb 4:2:0		
17h	CbY 4:2:2		
27h	YC 4:2:2		
37h	YCb 4:2:2		
25	Notify	0-1	Send List Notification Interrupt upon last transfer of this channel
24	Field	0-1	Field Value
23	1D	0	The transfer is one dimensional. The transfer and frame sizes are combined to make a single 32 bit transfer size. For writes this value is passed to the generated descriptor. This feature is not supported by all clients. Only clients that support the feature will recognize this bit. Note: 1D mode is not supported by VIP modules

Table 8-33. Data Packet Descriptor Word 0 Field Descriptions (continued)

Bit	Field	Value	Description
22:20	Even Line Skip	0 1h 2h-7h	Field Value +1 line +2 lines Reserved
19	Reserved		Reserved for future use
18:16	Odd Line Skip	0 1h 2h-7h	Field Value +1 line +2 lines Reserved
15:0	Line Stride	0- FFFFh	Address stride between lines in bytes

8.4.8.7.1.1.1 Data Type

Bits 31-26 indicate the type of data that is to be transferred. This value is used to compute the number of bytes per pixel so that transactions may be made for the appropriate amount of data. The types of data are dependent on the type of channel. The VPDMA descriptor data types RGB or YUV are defined associated with the VPDMA channel assignment. This helps the engine to distinguish between the overlapping values of the descriptor data types for RGB and YUV data.

- For the Miscellaneous channel, the Data Type selects the size in bits of the data. The range is from 0 to 63 to represent the sizes from 1 to 64 bits.
- For a YUV channel, the Data Type determines, if the data channel is interleaved or color space separate. If color spaced separate, it is still assumed that the two chroma pixels are interleaved.

CAUTION

VPDMA defines the component ordering for its RGB data types in the opposite direction of what commonly used image identifiers expect. To avoid color component swapping in the display and/or in the video/image data written out to the memory, the proper Data Type settings for both RGB and YUV data types must be made. The following paragraphs provide more details on how to set Data Type correctly, in order to match the data stored or expected in the memory.

Setting RGB Data Types

The commonly used RGB format identifiers require the color components to be stored in a little-endian style, where the left most component is the LSB component.

- For an ARGB data type, the A component is the LSB location, as shown in [Table 8-34](#) and [Table 8-35](#);
- For a BGRA data type, the B component would be in the LSB location;

Table 8-34. Common ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
A	R	G	B

Table 8-35. Common ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
B	G	R	A

VPDMA specifies its component ordering in the big-endian style, which requires the data to be stored in the reversed order. Example with ARGB data type is shown in [Table 8-36](#) and [Table 8-37](#). The VPDMA ordering for ARGB data type matches the common BGRA data format.

Table 8-36. VPDMA ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
B	G	R	A

Table 8-37. VPDMA ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
A	R	G	B

In order color components to be mapped correctly and to avoid swapping, the reversal must be taken into consideration when configuring the Data Type in the VPDMA transfer descriptor.

[Table 8-38](#) shows the proper settings required for RGB data types for both storage schemes.

Table 8-38. VPDMA Descriptor RGB Data Type Mapping

Source/Destination Image		VPDMA Data Type Mapping Value	
RGB Component order	Common Image Format Names	Column A Source data stored in the VPDMA defined order	Column B Source data stored in the opposite of VPDMA defined order
RGB	RGB16-565	0x0	0x10
	ARGB-1555	0x1	0x13
	ARGB-4444	0x2	0x14
	RGBA-5551	0x3	0x11
	RGBA-4444	0x4	0x12
	ARGB24-6666	0x5	0x18
	RGB24-888	0x6	0x16
	ARGB32-8888	0x7	0x19
	RGBA24-6666	0x8	0x15
	RGBA32-8888	0x9	0x17
BGR	BGR16-565	0x10	0x0
	ABGR-1555	0x11	0x3
	ABGR-4444	0x12	0x4
	BGRA-5551	0x13	0x1
	BGRA-4444	0x14	0x2
	ABGR24-6666	0x15	0x8
	BGR24-888	0x16	0x6
	ABGR32-8888	0x17	0x7
	BGRA24-6666	0x18	0x5
	BGRA32-8888	0x19	0x9

In [Table 8-38](#), if the application uses the same data type definition as the VPDMA (that is, RGB24 refers to the B in the LSB), the data types in Column A should be used. But, if the application expects the common data type component order for RGB data type names, the VPDMA data types in Column B should be used.

For example:

- To display an ARGB32-8888 source image data with A in the LSB, the data type in the descriptor should be set to 0x19. But, to display an ARGB32-888 source image data with B in the LSB, the data type in the descriptor should be set to 0x7.
- To capture and write out a RGB24-888 image in the memory with R in the LSB, the data type in the

descriptor should be set to 0x16 (this case assumes the VIP VIN d[23:0] data input is mapped to RGB bus with B component in the LSB).

Setting YUV Data Types

There is no component order reversal for YUV data types. The VPDMA uses generic data type names to specify the memory storage format and the application simply needs to follow the VPDMA defined ordering.

[Table 8-39](#) shows how common YUV data types map to the VPDMA YUV data types in order to clarify the YUV data type configuration.

Table 8-39. VPDMA Descriptor YUV Data Type Mapping

Source YUV Image Types			VPDMA Data Type Mapping (Value)		
Chroma Sub-sample	Common YUV Image Format Type Names	Memory Packed Order [MSB - LSB]	Luma/Chroma Interleaved Channel	Luma-only Channel	Chroma-only Channel
444	YUV	V U Y	YC 4:4:4 (0x8)		
	UVY	Y V U	Cb 4:4:4 (0x14)		
422	NV16 (YUV422SP_UV)	V U		Y 4:2:2 (0x1)	C 4:2:2 (0x5)
	NV16 (YUV422SP_VU)	U V		Y 4:2:2 (0x1)	Cb 4:2:2 (0x15)
	YUV2/YUYV/V422 (YUV422I_YUYV)	V Y U Y	YC 4:2:2 (0x7)		
	YUV422I_YVYU	U Y V Y	CbY 4:2:2 (0x17)		
	Y422/UYYV (YUV422I_UYYV)	Y V Y U	YC 4:2:2 (0x27)		
	YUV422I_VYUY	Y U Y V	YCb 4:2:2 (0x37)		
420	NV12 (YUV420SP_UV)	V U		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	C 4:2:0 (0x6) YC 4:2:2 (0x7) (see ⁽¹⁾)
	NV21 (YUV420SP_VU)	U V		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	Cb 4:2:0 (0x16) YC 4:2:2 (0x7) (see ⁽¹⁾)

⁽¹⁾ If 422 source data is used, unused component data fetched (either Luma or Chroma) will be discarded.

For further details on the data formats, refer to [Section 8.4.8.9, VPDMA Data Formats](#).

8.4.8.7.1.1.2 Notify

The Notify bit is used in conjunction with the Notify interrupts and when the channel has completed the DMA transfer the Notify Interrupt for the list that contains the descriptor will fire. The last Notify bit set for a specific list will be used so only a single Notify should be set in a list.

8.4.8.7.1.1.3 Field

The Field bit is the field value of the data that will be passed down to the clients. If the data is interlaced, then this value should be cleared to 0.

8.4.8.7.1.1.4 Even Line Skip

The Even Line skip is used with Line Stride to generate the next line address on an even line. All frames start on line 0. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

8.4.8.7.1.1.5 Odd Line Skip

The Odd Line skip is used with Line Stride to generate the next line address on an odd line. All frames start on line 0, so this will apply starting with the second line. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

8.4.8.7.1.1.6 Line Stride

Bits 15:0 are the stride between lines in bytes at the external address. This value is added or subtracted based upon an adjustment using the current skip value. Operation of the external address pointer shall load the Source Address upon start of the transfer, then at the end of each line increment or decrement by the value computed using the Line Stride and Skip value for the line. The line stride must be aligned to an L3 data bus width. The lower bits of the stride will always be treated as zero to force the alignment.

8.4.8.7.1.2 Data Packet Descriptor Word 1

Table 8-40. Data Packet Descriptor Word 1 Field Description

Bits	Name	Description
31:16	Line Length	Line Length in Pixels
15:0	Transfer Height	Number of rows in transfer.

8.4.8.7.1.2.1 Line Length

Bits 31-16 are the line length in pixels of the current channel. This is ignored for the outbound transfer as the client will provide the line length with the end of line signal on the client interface. The maximum supported line length is currently 4096.

8.4.8.7.1.2.2 Transfer Height

Bits 15-0 are the number of lines to be transferred in the current channel. This is ignored for outbound transfers as the client will provide the line length with the end of frame signal on the client interface. The maximum supported transfer size is currently 2048.

8.4.8.7.1.3 Data Packet Descriptor Word 2

Table 8-41. Data Packet Descriptor Word 2 Field Descriptions

Bit	Field	Value	Description
31:0	Start Address		32-bit data source address [31:0] If Mode is TILED, then TILER specific ADDRESS Map is used: Bits 31-29: 0 0-degree view 1h 180-degree view + mirroring 2h 0-degree view + mirroring 3h 180-degree view 4h 270-degree view + mirroring 5h 270-degree view 6h 90-degree view 7h 90-degree view + mirroring Bits 28-27: 0 8-bit container 1h 16-bit container 2h 32-bit container 3h Page Mode If Mode is NORMAL, then bits 31-26 are the upper bits of the address.

8.4.8.7.1.3.1 Start Address

This is the byte aligned address for the first data transfer. The address on the OCP bus will always be word aligned.

8.4.8.7.1.4 Data Packet Descriptor Word 3

Table 8-42. Data Packet Descriptor Word 3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xa
26	Mode	0= Normal, 1=TILED
25	Direction	Inbound = 0, Outbound = 1
24:16	Channel	Channel for which this descriptor describes
15	Reserved	Reserved for future use
11:9	Priority	Only Bit 9 and Bit 11 are used to set the priority. Bit 10 is ignored. Highest = 0, Lowest = 3 By default, hardware assigns priority = 3. This priority level is used in the arbitration between the masters (for DDR access). See Section 8.4.8.7.1.4.5, Priority , for more details.
8:0	Next Channel	Next Channel to execute on a line or the channel to use in the generated write descriptor.

8.4.8.7.1.4.1 Packet Type

Bits 31:27 are a unique code which indicates that this Descriptor is a VPDMA descriptor.

8.4.8.7.1.4.2 Mode

Bit 26 is used to indicate if the transfer is to regular memory space or to Tiled memory space. The VPDMA will use this to determine if it does standard raster based addressing or if it assumes that the data is stored in TILER format. If data is stored in TILER format then the buffer is turned into 2 or 4 line buffers depending on the container type. For shared clients that use the memory, such as the ancillary data and the VIP port, only one can be active, if the mode field is set. Only clients that support Tiling will properly pack the data for tiling on the output interface. This must only be set for channels going to clients that support the TILING feature in the client configuration.

8.4.8.7.1.4.3 Direction

Bit 25 is used to indicate the direction of transfer. This bit indicates that the data flow is from an external source to an internal buffer (inbound) or data transfers form an internal buffer to an external location (outbound).

8.4.8.7.1.4.4 Channel

Bits 24:16 are the Channels which is supported by the descriptor. This is the identification of the specific Channel which is controlled by the contents of the descriptor. The channel assignments can be found in the channel table.

8.4.8.7.1.4.5 Priority

Bits 11:9 are set to indicate priority of the transfer, these are directly mapped to the OCP reqinfo bits.

8.4.8.7.1.4.6 Next Channel

Bits 8:0 give the next channel to use to create a composite frame. The next channel must be to a free channel. The last channel of a row should point back to the initial channel which must be a channel tied directly to a client. The Descriptor for the Next Channel must be of the same type as the current descriptor.

8.4.8.7.1.5 Data Packet Descriptor Word 4

8.4.8.7.1.5.1 Inbound data

Table 8-43. Data Packet Descriptor Word 4 Inbound Data Field Descriptions

Bits	Name	Description
31:16	Frame Width	Width of the client frame.
15:0	Frame Height	Height of the client frame

8.4.8.7.1.5.1.1 Frame Width

Bits 31:16 indicate the width in pixels of the frame. This is the width of the entire frame and not just the width of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum width is 4096.

8.4.8.7.1.5.1.2 Frame Height

Bits 15:0 indicate the height in pixels of the entire frame. This is the height of the entire frame and not just the height of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum height is 2048.

8.4.8.7.1.5.2 Outbound data

Table 8-44. Data Packet Descriptor Word 4 Outbound Data Field Descriptions

Bits	Name	Description
31:5	Descriptor Write Address	The 32 byte aligned location to write an inbound descriptor
2	Write Descriptor	If set to 1, a descriptor will be generated when the client completes a frame.
1	Drop Data	If set to 1, the data will not be written out. Also, if this is set, the write descriptor bit must be set. This allows for descriptors to only be written out so that software can determine the size of the required buffer before data is written out.
0	Use Descriptor Register	If set to 1, the CURRENT_DESCRIPTOR register will be used for the write address location. If set to 0, the Descriptor Write Address field in this word will be used for the Descriptor Write Address.

8.4.8.7.1.5.2.1 Descriptor Write Address

Bits 31:5 set the 32 byte address to write the generated descriptor. This address is only used if the Write Descriptor bit is set to 1 and the Use Descriptor Register bit is set to 0. If this case is met when the channel is complete a descriptor that meets the inbound descriptor format will be written to the location specified by this field. This allows for software to have a specific channel write its descriptor to a specific address no matter what order the channel completes compared to other outbound channels.

8.4.8.7.1.5.2.2 Write Descriptor

Bit 2 determines if a descriptor should be written out when the client is completed. If this bit is set the descriptor will be written. The format of the descriptor will be of an Inbound Data Transfer descriptor with the LINE LENGTH and TRANSFER HEIGHT fields determined by the counters in the clients. This means that the direction bit will be the opposite of the inbound descriptor. The FRAME WIDTH and FRAME HEIGHT values will match the LINE LENGTH and TRANSFER HEIGHT fields. The CHANNEL and NEXT CHANNEL fields will match the NEXT CHANNEL field of the original descriptor. The FIELD bit will match the source field captured by the client. The NOTIFY bit will always be 0. All other fields will match the original outbound descriptor. If the Outbound descriptor MODE is set to TILED data then the descriptor address used will be in TILED data space and software must ensure that the address is in page mode for the address of the descriptor.

8.4.8.7.1.5.2.3 Drop Data

Bit 1 determines if the data should be written out or not. In some cases software might only want to write the descriptor out to determine the size of the buffer that will be required to store incoming data. By setting this bit, no data will be written out. If this bit is set then the Write Descriptor bit MUST be set. Bit 0 determines where the descriptor should be written.

8.4.8.7.1.6 Data Packet Descriptor Word 5

8.4.8.7.1.6.1 Outbound data

Width and Height are set in the following register bit-fields:

- For Max_Size1: [VIP_MAX_SIZE1](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE1](#)[15:0] MAX_HEIGHT registers
- For Max_Size2: [VIP_MAX_SIZE2](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE2](#)[15:0] MAX_HEIGHT registers
- For Max_Size3: [VIP_MAX_SIZE3](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE3](#)[15:0] MAX_HEIGHT registers

Table 8-45. Data Packet Descriptor Word 5 Outbound Data Field Descriptions

Bits	Name	Description
6:4	Max Width	<p>The maximum allowable pixels per line. 0: Unlimited Line Size</p> <p>1: Use Max_Size1 Max Width field 2: Use Max_Size2 Max Width field 3: Use Max_Size3 Max Width field 4: 352 pixels 5: 768 pixels 6: 1280 pixels 7: 1920 pixels Others: Reserved</p>
2:0	Max Height	<p>The maximum allowable lines per frame. 0: Unlimited Frame Size</p> <p>1: Use Max_Size1 Max Height field 2: Use Max_Size2 Max Height field 3: Use Max_Size3 Max Height field 4: 288 lines 5: 576 lines 6: 720 lines 7: 1080 lines Others: Reserved</p>

8.4.8.7.1.6.1.1 Max Width

Bits 6:4 are encoded to set the maximum transferred line size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed pixels the data will continue to be received from the client but will not be sent to external memory until an end of line is received from the client sending data. The outbound descriptor if created will still have the transmitted size of the last line of the frame which will match the max width. If the frame does not exceed the max width then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0. If Max Width is 0 and the line size is larger than 4096 pixels then the address counters will overflow and the data at the start of the line will be overwritten.

8.4.8.7.1.6.1.2 Max Height

Bits 2:0 are encoded to set the maximum transferred frame size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed lines the data will continue to be received from the client but will not be sent to external memory until an end of frame is received from the client sending data. The outbound descriptor if created will still have the transmitted number of lines received which would match the max height. If the frame does not exceed the max height then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0.

8.4.8.7.2 Configuration Descriptor

The Configuration Descriptor is used in a List to setup a client configuration. The configuration descriptor consists of a header and a payload portion. The payload can either be part of the list that the descriptor is contained in or it can be at a separate location. The VPDMA will pass the payload of the configuration descriptor down to the client over the VPI Control port interface or through the MMR configuration port depending on the destination field. A Configuration Descriptor to any single destination except Destination 0 must be on a single list. Configuration Descriptors to different destinations may be on different lists..

The Configuration Descriptor Header is 4 x 32 bit words. A configuration descriptor is not consumed until the destination specified has received the entire configuration payload. Therefore the list is expected to stall while the configuration takes place. This ensures that all descriptors after a configuration descriptor in the list will occur after the desired configuration.

8.4.8.7.2.1 Configuration Descriptor Header Word0

Table 8-46. Configuration Descriptor Header Word0 Field Descriptions

Bits	Name	Description
31:0	Address Offset of the Destination	This is the address offset location in the destination that the block of data in the payload should be written. This field is only used if the descriptor Class is a block type. Otherwise this field is reserved.

8.4.8.7.2.2 Configuration Descriptor Header Word1

Table 8-47. Configuration Descriptor Header Word1 Field Descriptions

Bits	Name	Description
15:0	Number of Data Words	Length of First Data Packet for Class 1(block).

8.4.8.7.2.2.1 Number of Data Words

Bits 15:0 indicate the length of the first data block if the class is 1 as specified in Configuration Descriptor Header Word3. If the class is not 1 then this field should be set to 0.

8.4.8.7.2.3 Configuration Descriptor Header Word2

Table 8-48. Configuration Descriptor Header Word2 Field Descriptions

Bits	Name	Description
31:0	Payload Location	Pointer to the data payload

8.4.8.7.2.3.1 Payload Location

Bits 31:0 contain the pointer to the data payload if the command packet is an indirect type. This value along with the Payload Length will be combined to issue a DMA transaction that must complete before the List Manager can finish processing this descriptor. The list will be made inactive pending this DMA completion. This address should be on a 16 byte boundary so the lower 4 bits should always be 0.

8.4.8.7.2.4 Configuration Descriptor Header Word3

Table 8-49. Configuration Descriptor Header Word3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xb
26	Direct	Direct Command = 1 Indirect Command = 0
25:24	Class	0 = Address, Data Set 1 = Block 2,3 Reserved for Future Use
23:16	Destination	Destination of the configuration payload
15:0	Payload Length	Length of Payload in Words.

8.4.8.7.2.4.1 Packet Type

Bits 31:27, this field indicates the type of descriptor and should be set 0xB for configuration descriptor.

8.4.8.7.2.4.2 Direct

Bit 26, this field indicates that the descriptor is a direct command or indirect command. A direct command means that the payload is contiguous with the descriptor and will be pulled in by the list manager descriptor control as it processes the list. A direct payload must end on or before a 256 byte boundary in the list. An indirect command is when the Address is located in Word2 is a pointer to the data payload. A DMA transaction will be scheduled to bring the payload into the List Manager to allow for the payload to be sent to the destination.

8.4.8.7.2.4.3 Class

Bits 25:24, this field indicates the type of payload is associated with command descriptor, and thus how to handle the payload.

A 0 indicates that the payload consists of blocks of data with each block having an address and length. The first word after a sub-block contains the next address and length in bytes. This allows for writing to multiple configuration regions in a client. The Configuration Descriptor word1 is the first address and length pair. All addresses used must be larger than the previous address for all destinations except for the MMR destination. If a sub block length is not evenly divisible into 16 then zeroes should be padded in the payload so that the Next Client Address and Length field start on a 16 byte boundary.

8.4.8.7.2.4.3.1 Address Data Block Format

Table 8-50. Address Data Block Format Field Descriptions

Bits	Name	Description
31-0		Next Client Address
31-0		Configuration for Next Client Address
31-0		Configuration for Next Client Address + 4
31-0		Configuration for Next Client Address + 8
31-0		Configuration for Next Client Address + 12
31-0		Configuration for Next Client Address + 16
31-0		Next Client Address 2
15-0		Sub Block Length

A 1 indicates the payload is simply block data. The data is contiguous and starts at the offset of the destination as specified in word1.

8.4.8.7.2.4.4 Destination

The Destination field is used to determine where the configuration payload should be sent. The values for the destination field can be seen in the table below.

Table 8-51. Destination Field Description

Destination Value	Actual Destination	Description
0	mmr_client	Write to MMR registers to setup other modules
7	VIP Slice 0	VIP Slice 0 Scaler Coefficient Tables
8	VIP Slice 1	VIP Slice 1 Scaler Coefficient Tables

8.4.8.7.2.4.5 Descriptor Length

Bits 15:0, this field indicates the size of the payload in words for the command. This is 128 bit words. The maximum number of words is 1023 words in a single payload

8.4.8.7.3 Control Descriptor

8.4.8.7.3.1 Generic Control Descriptor Format

A control descriptor is the mechanism that is used in a list to give commands to the List Manager. These descriptors are not considered consumed until the List Manager has done the instruction required by the descriptor. All control descriptors have a common Header located at Word 3 but the remaining words are based on the specific control descriptor.

8.4.8.7.3.2 Control Descriptor Header Description

Table 8-52. Control Descriptor Header Description

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xc
26:25	Reserved	Reserved
24:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	The type of control descriptor that should be run by the List Manager

8.4.8.7.3.2.1 Packet Type

This field indicates a VPDMA control descriptor.

8.4.8.7.3.2.2 Source

The source is combined with the control field to determine what the control descriptor should use as the source for its synchronization event.

8.4.8.7.3.2.3 Control

The Control field defines the specific function of the descriptor. [Table 8-53](#) lists the different control descriptors.

8.4.8.7.3.3 Control Descriptor Types

Table 8-53. Control Descriptor Types Summary

Control Descriptor	Control Field Value	Description
Sync on Client	0	Wait for the client attached to the channel specified to reach a certain event before proceeding.
Sync on List	1h	Wait for another list(s) to reach its Sync on List Descriptor
Sync on External Event	2h	Wait for a Register write to the LIST_STAT_SYNC bit specified or for an external event.
Sync on Channel	4h	Wait for the channel specified to complete
Change Client Interrupt	5h	Change the interrupt event for a client interrupt but do not wait for the event to occur.
Send Interrupt	6h	Generate an interrupt event on one of the Control Descriptor Interrupts
Reload List	7h	Reload the list from the location and size specified.
Abort Channel	8h	Abort the transfer in the channel specified.

8.4.8.7.3.3.1 Sync on Client

A Sync on Client Control descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. For a client that supports multiple channels then only an event on the portion of the client that supports that client will cause the interrupt to be generation. After configuring the interrupt generation event the list will then stall until that event has occurred.

Table 8-54. Sync on Client Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger

Table 8-55. Sync on Client Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 0

8.4.8.7.3.3.2 Sync on List

The Sync on List Control descriptor is a mechanism to ensure that multiple lists have all reached a common point. The Sync on List descriptor uses the Source field as a mask for each list that should be synchronized which must include the list where the control descriptor resides. Once all lists specified in the source field have reached their Sync on List descriptor all lists will resume with the lowest list number resuming first. All Sync on List Control descriptors in each of the lists must have the same source field so that all lists will synchronize upon reaching that point.

If it is desired to synchronize list 0 and list 1 then the source field would be 0x3. If it is desired to synchronize list 1, list 3, and list 4 then the source field would be 0x1a. Word 0, Word 1 and Word 2 are reserved.

Table 8-56. Sync on List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 1h

8.4.8.7.3.3.3 Sync on External Event

A Sync on External Event descriptor ensures an external event has occurred before proceeding. The external event can be a write to a bit of the LIST_STAT_SYNC register or other external events that are determined at VPDMA elaboration to have occurred. This descriptor can be used to allow for external software to control progression of the list. The descriptor can also be used to select external signals that are brought into the VPDMA. The current implementation just synchronize on the LIST_STAT_SYNC bit for the list number that called the descriptor.

Table 8-57. Sync on External Event Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 2h

8.4.8.7.3.3.4 Sync on Channel

A Sync on Channel descriptor stalls the list until the channel specified is free. If the channel is already free then the descriptor will not cause the list to stall. Word 0, Word 1 and Word 2 are reserved.

Table 8-58. Sync on Channel Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 4h

8.4.8.7.3.3.5 Sync on LM Timer

A Sync on LM Timer descriptor sets a value from the current timer position to wait. The LM timer is a free running counter at the LM processing clock. The Timer Value in the descriptor is added to the value of the timer at the time the descriptor is received and the list will stall for this many cycles before it becomes active again.

8.4.8.7.3.3.6 Change Client Interrupt

A Change Channel Interrupt Source descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. The list will not stall on this descriptor. The format of the fields is identical to the Sync on Client Descriptor. Word 0 is reserved.

Table 8-59. Change Client Interrupt Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger.

Table 8-60. Change Client Interrupt Field Descriptions (Word - 2)

Bits	Name	Description
31:4	Reserved	Reserved
3:0	Event	Specify the event which should trigger the client interrupt.

Table 8-61. Change Client Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 8-61. Change Client Interrupt Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 5h

8.4.8.7.3.3.7 Send Interrupt

A Send Interrupt descriptor will cause the VPDMA to generate an interrupt on the list manager controlled interrupts as specified by the Source Field. The list will not stall on this descriptor. For example, if source is 0 then control_descriptor_int0 will fire. If source is 12, then control_descriptor_int12 will fire. For more information of VPDMA interrupt events, see [Section 8.4.8.6, VPDMA Interrupts](#).

Table 8-62. Send Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 6h

8.4.8.7.3.3.8 Reload List

A Reload List descriptor causes ending descriptors after this descriptor in the original list to be dropped and a new list at the location and of the size specified in the descriptor. This descriptor can be used to allow for linked lists in the VPDMA as the list will continue from this point and fetch the list specified and it does not have to be continuous with the current list.

Table 8-63. Reload List Field Descriptions (Word - 0)

Bits	Name	Description
31:0	LIST_ADDRESS	31 most-significant Bits of the memory address where the descriptors to be loaded are stored. Address must be 16 byte aligned.

Table 8-64. Reload List Field Descriptions (Word - 1)

Bits	Name	Description
31:16	Reserved	Reserved
15:0	LIST_SIZE	Size of the list to load

Table 8-65. Reload List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 7h

8.4.8.7.3.3.9 Abort Channel

An Abort Channel descriptor is used to clear a channel. This clears the channel from issuing any more requests. Any outstanding requests for that channel will complete as originally scheduled. All data inside the client will be flushed. For Tiled Clients such as the noise filter it is required to issue two consecutive abort channel descriptors to ensure the channel is aborted for both the current tile and next tile. Word 0, Word 1 and Word 2 are reserved.

Table 8-66. Abort Channel Field Descriptions (Word - 3)

Bit	Name	Description
31:27	Packet Type	Host Packet Descriptor type = 0xC
26:24	Reserved	Reserved
23:16	Source	VPDMA Channel Number whose transfers are to be aborted
15:4	Reserved	Reserved
3:0	Control	Control type = 9h

8.4.8.8 VPDMA Configuration

The following section describes the different ways of configuring VPDMA for data transfers.

8.4.8.8.1 Regular List

A regular list executes each descriptor in order until the end of the list is reached. When the end of the list is reached an interrupt is sent and the list can be reused by software. A regular list can contain any descriptor types. Software creates the list at some location in external memory. After completing writing the list software then writes the location of the list to the [VIP_LIST_ADDR\[31:0\]](#) [VIP_LIST_ADDR](#) register and then writes the [VIP_LIST_ATTR](#) register. If the NUMBER in the [VIP_LIST_ATTR\[26:24\]](#) LIST_NUM is not an active list then the List will be loaded and begin to execute the next time the List Manager gets to IDLE after processing previous loaded lists. If the NUMBER in the [VIP_LIST_ATTR\[26:24\]](#) LIST_NUM is busy then the [VIP_LIST_ADDR](#) and [VIP_LIST_ATTR](#) registers will be locked until the active list specified by NUMBER completes.

The different ports inside VPDMA requires different list setup, as explained in the following sections.

8.4.8.8.2 Video Input Ports

The Video Input Ports can be used in multiple ways. Depending on how the input ports are configured will determine how the lists to manage them need to be setup. The ways in which the ports can work are multiplexed data stream, single YUV color separate stream, dual YUV interleaved or single RGB stream. Each port also has an ancillary data port that can run either multiplexed or single data stream and shares the buffering with the main data stream. For all cases the descriptor must be loaded into the client before the vertical sync is received on the VIP port or the entire frame will be dropped. As with all write clients the VIP channels can be shadowed so the next frame/field descriptor can be loaded while the previous frame is running without stalling the list.

8.4.8.8.2.1 Multiplexed Data Streams

In the case of a multiplexed data stream input the channels that should be used are [VIP\(X\)_MULT_PORT\(Y\)_SRC\(Z\)](#). Where X is the specific VIP slice of the instance that wants to be used and port Y is the port A or port B that is receiving the data. Finally Z is the channel number. For Split line mux mode the LSB of the channel will determine, if the line is a split line or a complete line. This is required so that the data streams do not get mixed when a channel ends without completing a line. In this mode the data will always be sent out as 422 Interleaved data to the destination specified in the descriptor.

8.4.8.8.2.2 Single YUV Color Separate

If the port is configured to be used as sending out color separated YUV data then the channels that must be used are VIPX_PORTY_LUMA and VIPX_PORTY_CHROMA for the luma and chroma components respectively. The data type can be either 420 or 422 color separate in this case.

8.4.8.8.2.3 Dual YUV Interleaved

If the port is configured to be used to send out 422 interleaved data from a non-multiplexed source then the channels that must be used are VIPX_PORTY_LUMA or VIPX_PORTY_CHROMA depending on if the data stream is connected to the luma or chroma port. The data type must be 422 interleaved in this case.

8.4.8.9 VPDMA Data Formats

Each of the channels has a type of data that it can support based upon the client that it services. Also for each channel, the data type will assume that data is packed in memory a certain way and will be prevented to the client in the same manner to the client no matter what the format of the data in memory.

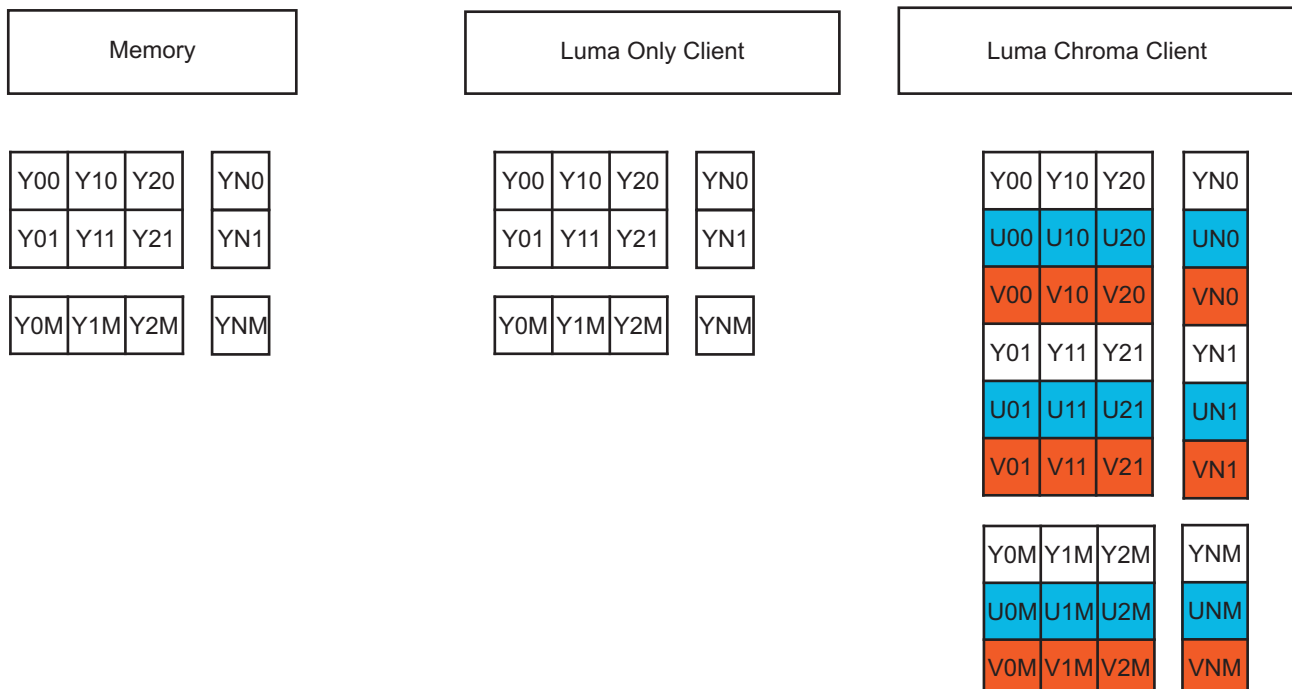

8.4.8.9.1 YUV Data Formats

The YUV formatted channels expect video data that is in YUV color space. The YUV data can be type is for YUV data and it can support both interleaved data where Luma and Chroma are in the same data buffer or it can support co-planar data where the Luma and Chroma are in separate data buffers. The YUV channel also can be given a position to give a different start position for the client instead of the default upper left hand corner of the frame. The storage format for YUV data depends on the data type field. The data type must be set to a data type that the channel can support. All the clients that data are provided too will either accept Luma Only, Chroma Only or Luma and Chroma in a parallel data bus.

8.4.8.9.1.1 Y 4:4:4 (Data Type 0)

The Y 4:4:4 data type is used for a co-planar 4:4:4 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and height set to the desired frame size expected by the receiving client.

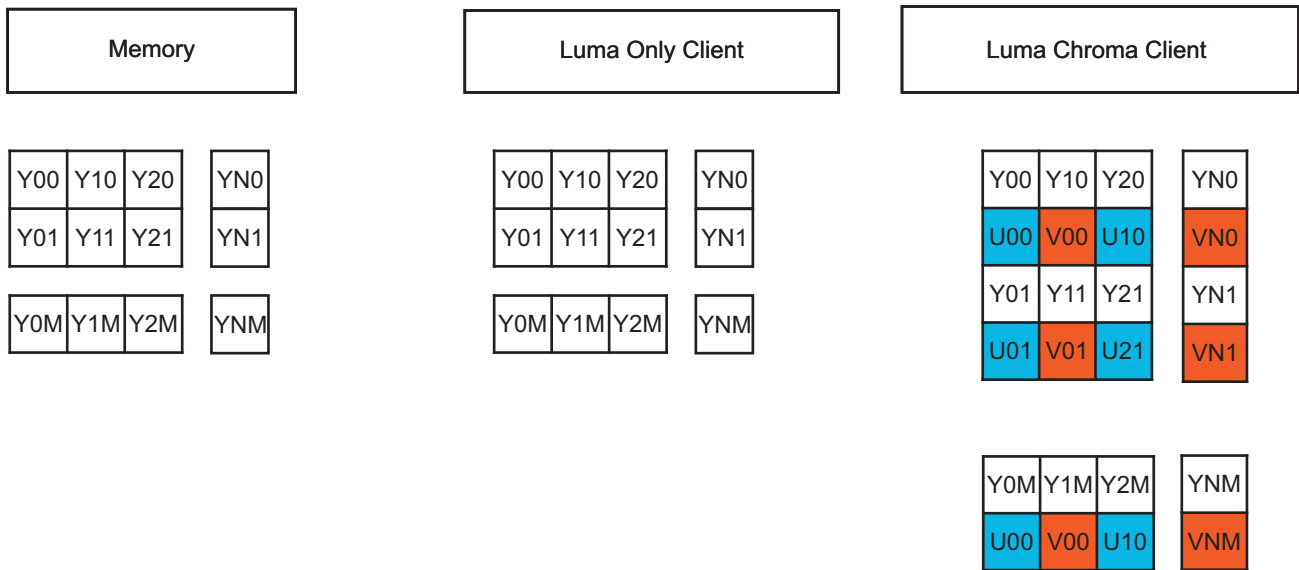

Figure 8-91. Y 4:4:4 (Data Type 0)

8.4.8.9.1.2 Y 4:2:2 (Data Type 1)

The Y 4:2:2 data type is used for a co-planar 4:2:2 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the desired frame sent by the VPDMA to the receive client.

Figure 8-92. Y 4:2:2 (Data Type 1)

8.4.8.9.1.3 Y 4:2:0 (Data Type 2)

The Y 4:2:0 data type is used for a co-planar 4:2:0 data type. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the expected frame for the client.

Figure 8-93. Y 4:2:0 (Data Type 2)

8.4.8.9.1.4 C 4:4:4 (Data Type 4)

The C 4:4:4 data type is used for a co-planar 4:4:4 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and height of the expected client frame.

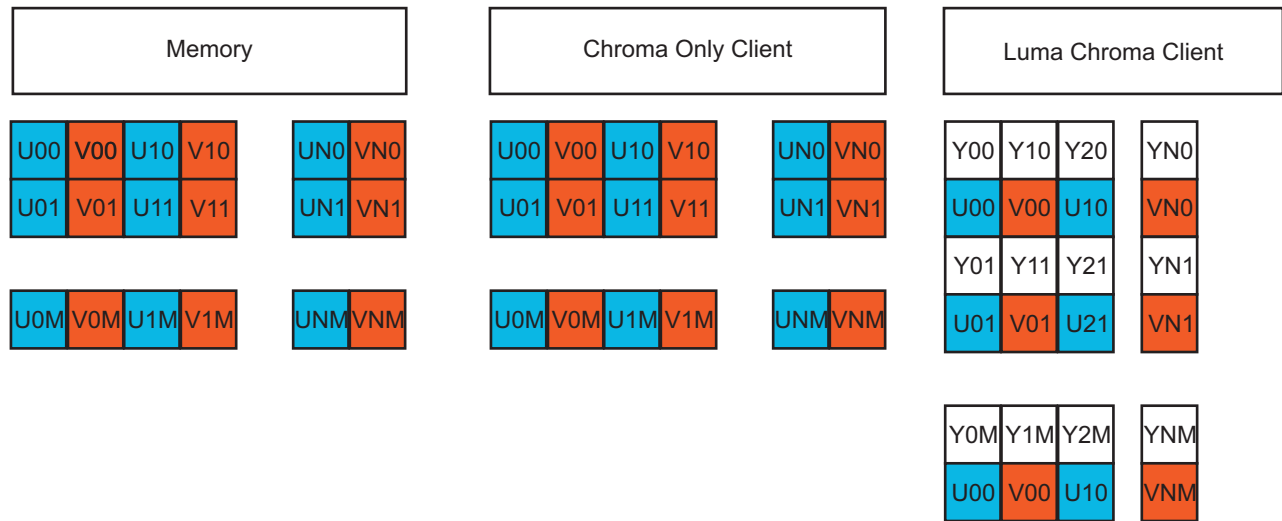

Figure 8-94. C 4:4:4 (Data Type 4)

8.4.8.9.1.5 C 4:2:2 (Data Type 5)

The C 4:2:2 data type is used for co-planar 4:2:2 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and the height of the expected client frame.

Figure 8-95. C 4:2:2 (Data Type 5)

8.4.8.9.1.6 C 4:2:0 (Data Type 6)

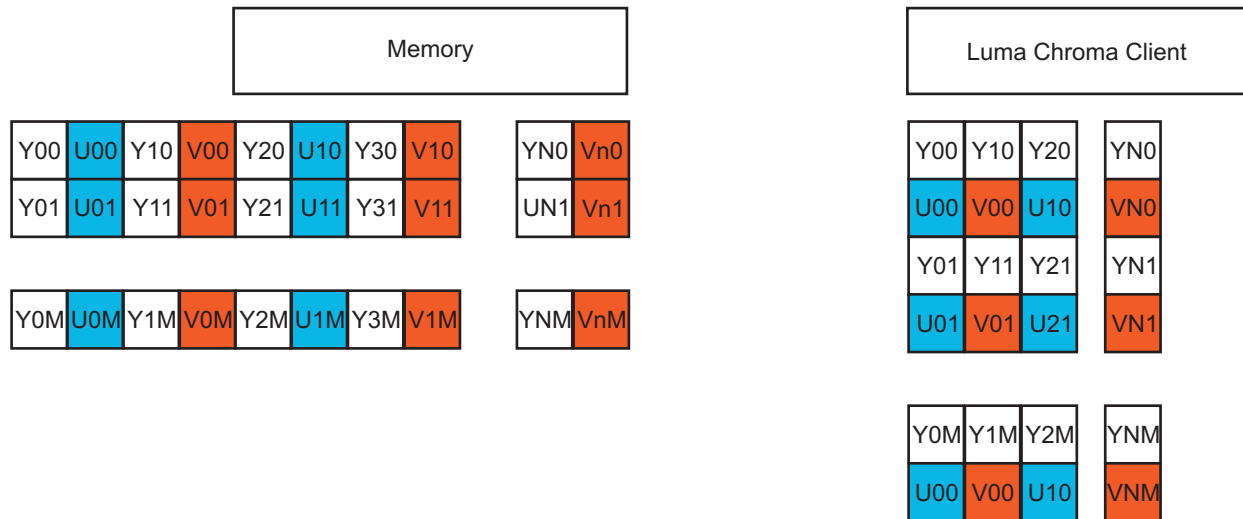

The C 4:2:0 data type is used for a co-planar 4:2:0 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in a 16 bit container. This data block should have the width and half the height of the expected clients frame.

Figure 8-96. C 4:2:0 (Data Type 6)

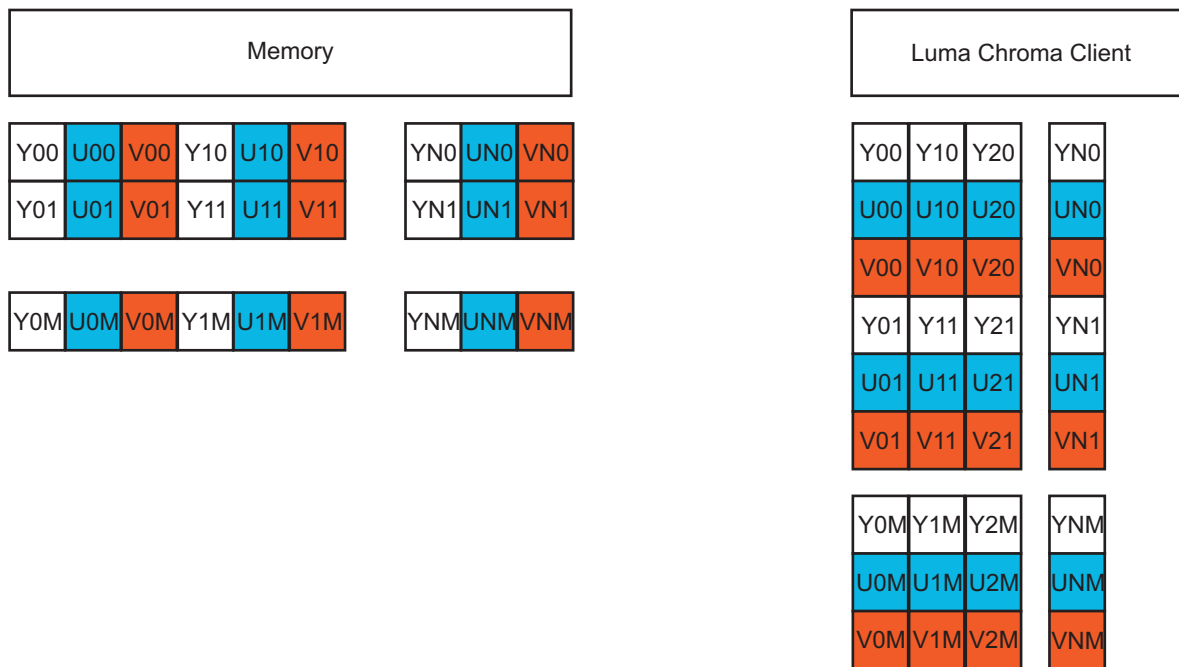

8.4.8.9.1.7 YC 4:2:2 (Data Type 7)

The YC 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Y1 finally Cr in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 8-97. YC 4:2:2 (Data Type 7)

8.4.8.9.1.8 YC 4:4:4 (Data Type 8)

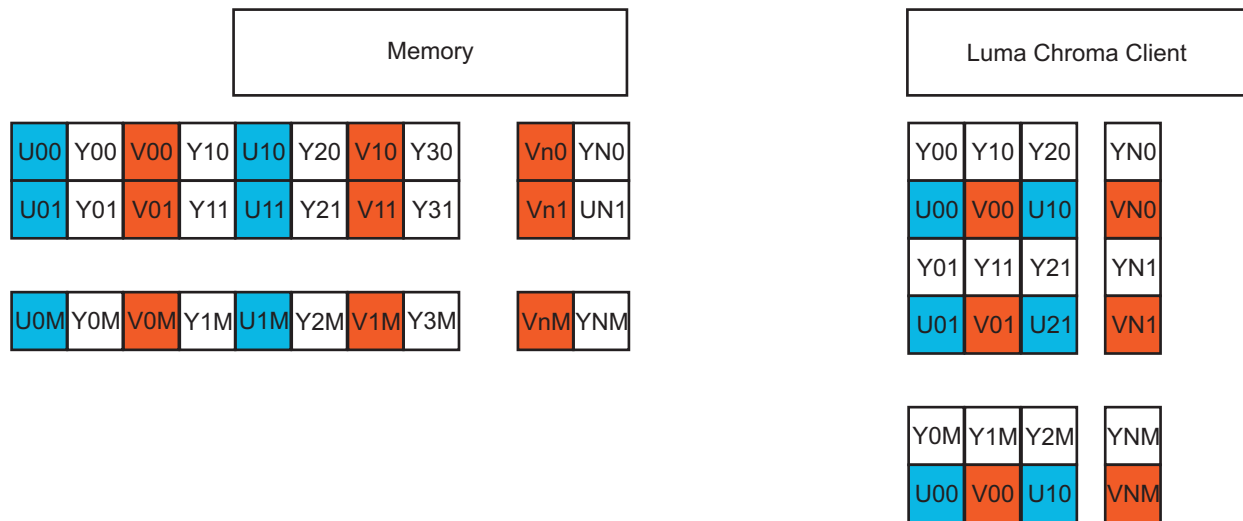

The YC 4:4:4 data type is used for interleaved 4:4:4 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Cr. The transfer counts each YCbCr triplet in a 24 bit word as a pixel. A 2D transfer of the data is NOT supported in the VPDMA. The data block width and height should be set to the number of pixels and lines that are expected by the client.

Figure 8-98. YC 4:4:4 (Data Type 8)

8.4.8.9.1.9 CY 4:2:2 (Data Type 23)

The CY 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Cb in the lowest byte followed by Y0 followed by Cr finally Y1 in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 8-99. CY 4:2:2 (Data Type 23h)

8.4.8.9.2 RGB Data Formats

The RGB channel type is used to provide data for a client that expects to transmit RGB data. In all modes the client is always RGBA 8888 data. The lower bits, if not provided by the data stream, are a replication of the lower bit of the data. For outbound data the input is assumed to be RGB 888 and the Alpha value is taken from the Background Color register to make a full ARGB 8888. The lower bits are dropped from this data, if a data type specifies less than the full 8 bits per color. The client has individual data buses for each component so they have no order dependency in the data bus.

8.4.8.9.2.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Figure 8-100. RGB16-565 (Data Type 0)

8.4.8.9.2.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data, the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

Figure 8-101. ARGB-1555 (Data Type 1)

8.4.8.9.2.3 ARGB-4444 (Data Type 2)

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

Figure 8-102. ARGB-4444 (Data Type 2)

8.4.8.9.2.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

Figure 8-103. RGBA-5551 (Data Type 3)

8.4.8.9.2.5 RGBA-4444 (Data Type 4)

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

Figure 8-104. RGBA-4444 (Data Type 4)

8.4.8.9.2.6 ARGB24-6666 (Data Type 5)

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

Figure 8-105. ARGB24-6666 (Data Type 5)

8.4.8.9.2.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the BG_RGB Blend value for the Blend value.

Figure 8-106. RGB24-888 (Data Type 6)

8.4.8.9.2.8 ARGB32-8888 (Data Type 7)

In ARGB32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the next 8 bits for red data it uses the upper most bits for the blend value.

Figure 8-107. ARGB32-8888 (Data Type 7)

8.4.8.9.2.9 RGBA24-6666 (Data Type 8)

In RGBA24-6666 mode, each pixel is a single RGBA pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper 6 bits for red data.

Figure 8-108. RGBA24-6666 (Data Type 8)

8.4.8.9.2.10 RGBA32-8888 (Data Type 9)

In RGBA32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for the blend value the next 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data.

Figure 8-109. RGBA32-8888 (Data Type 9)

8.4.8.9.3 Miscellaneous Data Type

The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client. The size of the miscellaneous data type is always determined by the Data Type field of the descriptor which specifies the number of bits in the descriptor.

A memory structure used to describe a desired memory transaction to or from a client. The descriptor at a minimum gives an address location for the memory portion of the transfer, the channel to use for this transaction and the size of the transaction. The data descriptor can also contain attributes to be passed down to the client or be linked to another data descriptor to form a larger frame from many smaller frames.

8.5 VIP Register Manual

8.5.1 VIP Instance Summary

Table 8-67. VIP Instance Summary

Module Name	Module Base Address	Size

Description	VIP_SYSCONFIG		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																STANDBYMODE		IDLEMODE		RESERVED											

Bits	Field Name	Description	Type	Reset
31:6	RESERVED		R	0x0
5:4	STANDBYMODE	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state 0x0: Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only 0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only 0x2: Same behavior as bit-field value of 0x1. 0x3: Reserved	RW	0x2
3:2	IDLEMODE	Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state 0x0 : Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only 0x1 : No-idle mode: local target never enters idle state. Backup mode, for debug only 0x2 : Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wakeup events 0x3 : Smart-idle wakeup-capable mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module may generate (IRQ- or DMA-request-related) wakeup events when in idle state. Mode is only relevant if the appropriate IP module 'swakeup' output(s) is (are) implemented	RW	0x2
1:0	RESERVED		R	0x0

Bits	Field Name	Description	Type	Reset
15	VIP1_MULTI_CHANNEL_SELECT	Video Input Port 1 Multi Channel Select 0 : VIP_PARSER A and B channels operate in single channel mode 1 : VIP_PARSER A and B channels directly drive VPDMA (multi-channel case) Multi-Channel means that the A and B sources are from multiple channels and used in a multiplexed stream mode. The VIP Parser extracts the channel ID from each source and outputs this information to VPDMA, and thus to memory. When operating in a multiplexed stream mode, this bit must be set to 1 to enable the channel information to be passed to memory. If this is not set, the channel number (or source number) will be 0 for all streams. If vip1_rgb_out_select = 1, then VIP_PARSER A port is connected to VPDMA	RW	0x0

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_ENABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port A logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0

Bits	Field Name	Description	Type	Reset
13	ACTVID_POLARITY	Discrete Sync Only 0 = ACTVID is active low 1 = ACTVID is active high	RW	0x0
12	VSYNC_POLARITY	Discrete Sync Only 0 = VSYNC is active low 1 = VSYNC is active high	RW	0x0
11	HSYNC_POLARITY	Discrete Sync Only 0 = HSYNC is active low 1 = HSYNC is active high	RW	0x0
10	PIXCLK_EDGE_POLARITY	0 = Rising Edge is active PIXCLK edge 1 = Falling Edge is active PIXCLK edge	RW	0x0
9	FID_POLARITY	0 = Keep FID as found 1 = Invert Determined Value of FID	RW	0x0
8	ENABLE	0 = Disable Port 1 = Enable Port	RW	0x0
7	CLR_ASYNC_FIFO_RD	0 = Normal 1 = Clear Async FIFO Read Logic	RW	0x0
6	CLR_ASYNC_FIFO_WR	0 = Normal 1 = Clear Async FIFO Write Logic	RW	0x0
5:4	CTRL_CHAN_SEL	Embedded Sync Only In 8b mode.. there is only one channel on data[7:0]. In 16b mode.. there are two channels. The Luma Channel is on data[15:8]. The Chroma Channel is on data[7:0]. In 24b mode.. there are three channels. The R channel is on data[23:16].. the G channel is on [15:8]. and the B channel is on data[7:0]. 00 = Use data[7:0] to extract control codes. 01 = Use data[15:8] to extract control codes. 10 = Use data[23:16] to extract control codes. 11 = Undefined In 16b and 24b modes.. this register is also used to select the channel from which Ancillary Data is extracted. The Ancillary Data channel must be the same as the control code channel. For 8b mode.. the anc_chan_sel_8b register is used to select the Luma or Chroma channel from which Ancillary Data is taken.	RW	0x0
3:0	SYNC_TYPE	0000 = embedded sync single 4:2:2 YUV stream 0001 = embedded sync 2x multiplexed 4:2:2 YUV stream 0010 = embedded sync 4x multiplexed 4:2:2 YUV stream 0011 = embedded sync line multiplexed 4:2:2 YUV stream 0100 = discrete sync single 4:2:2 YUV stream 0101 = embedded sync single RGB stream or single 444 YUV stream 0110 = reserved 0111 = reserved 1000 = reserved 1001 = reserved 1010 = discrete sync single 24b RGB stream	RW	0x0

YUV_SRCNUM_STOP_IMMEDIATELY								ANC_SRCNUM_STOP_IMMEDIATELY																							

Bits	Field Name	Description	Type	Reset
31:16	YUV_SRCNUM_STOP_IMMEDIATELY	For the Active Video Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. Each bit in this vector represents a <code>srcnum</code> (remapped <code>srcnum</code> for T1 line mux mode) going to the VPDMA. For example, bit 0 is <code>srcnum 0</code> , bit 1 is <code>srcnum 1</code> , etc. A <code>?0?</code> in a bit position means that the hardware will wait for that <code>srcnum</code> , if it is in the middle of a frame, to continue until the end of the frame before stopping. A <code>?1?</code> in a bit position means that it is ok for a <code>srcnum</code> to stop in the middle of a frame. For example, suppose a source is removed and the input will never complete sending a frame. If the bit position representing that <code>srcnum</code> is set to <code>?0?</code> , the port will never disable.	RW	0x0
15:0	ANC_SRCNUM_STOP_IMMEDIATELY	For the Ancillary Data Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								B0								RESERVED								A0							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED		RW	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. (Same format conversion as A0)	RW	0x0
15:13	RESERVED		RW	0x0
12:0	A0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. Rules for converting a real number coefficient to a 12-bit hex number for this register: - If the real number is positive, then simply multiply it by 1024, and convert the integer part to hex format. For example, 0.673 X 1024 = 689.152, then 0x2B1 should fill in to this register - If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is -1.893, by *1024 to this number, it becomes -1938. The 2'S compliment format of -1938 is 0x186E (in 13-bit width). Then 0x186E should be the number assigned to this register.	RW	0x0

8.5.5.2 VIP SC Register Description

Table 8-248. VIP_CFG_SC0

Address Offset	0x0000 0000	Instance	VIP_Slice0_sc VIP_Slice1_sc
Physical Address	0x4897 5800 0x4897 5D00		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RESERVED																CFG_FID_SELFGEN	CFG_TRIM	CFG_Y_PK_EN	RESERVED				CFG_INTERLACE_I	CFG_HP_BYPASS	CFG_DCM_4X	CFG_DCM_2X	CFG_AUTO_HS	CFG_ENABLE_LEV	CFG_USE_RAV	CFG_INVF_FID	CFG_SC_BYPASS	CFG_LINEAR	CFG_INTERLACE_O

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16	CFG_FID_SELFGEN	FID self generate enable. When input is progressive and this bit is set, the SC generates self-toggling (top/bottom) output FID when performing interlacing.	RW	0x0
15	CFG_TRIM	Trimming enable. When 1, the input image whose size is specified by orgW and orgH registers is trimmed to the size with srcW and srcH from the offset specified by ofW and offH. 0: disable trimming 1: enable trimming	RW	0x0
14	CFG_Y_PK_EN	This parameter is used by peaking block. 0: disable luma peaking 1: enable luma peaking	RW	0x0
13:11	RESERVED		R	0x0
10	CFG_INTERLACE_I	This parameter is used by both horizontal and vertical scaling 0: the input video format is progressive 1: the input video format is interlace	RW	0x0
9	CFG_HP_BYPASS	This parameter is used by horizontal scaling. If cfg_auto_hs is 0, horizontal polyphase filter is always enabled. In this case, this register is DON'T CARE. If cfg_auto_hs is 1, 0: The polyphase scaler is always used regardless of the scaling ratio. 1: The polyphase scaler is bypassed only when (tar_w == src_w) or (tar_w == src_w/2) or (tar_w == src_w/4)	RW	0x0
8	CFG_DCM_4X	This parameter is used by horizontal scaling. 0: the 4X decimation filter is disabled 1: the 4X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (horizontal scale ratio 0.25). (3) This register is DON'T CARE when cfg_auto_hs = 1.	RW	0x0
7	CFG_DCM_2X	This parameter is used by horizontal scaling. 0: the 2X decimation filter is disabled 1: the 2X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (0.25 horizontal scale ratio 0.5). (3) This register is DON'T CARE when cfg_auto_hs = 1.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	CFG_AUTO_HS	This parameter is used by horizontal scaling. 0: the cfg_dcm_2x and cfg_dcm_4x bits will enable appropriate decimation filters 1: HW will decide whether up-scaling or down-scaling is required based on horizontal scaling ratio (SR). SR 0.5 : horizontal polyphase filter is enabled, all decimation filters are disabled SR = 0.5 : dcm_2x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.5 SR 0.25 : dcm_2x and horizontal polyphase filter both are enabled SR = 0.25 : dcm_4x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.25 SR 0.125 : dcm_4x and horizontal polyphase filter are both enabled SR = 0.125 : Functionally supported, but not recommended in auto mode for image quality concerns	RW	0x0
5	CFG_ENABLE_EV	This parameter is used by the edge-detection block. 0: The output of edge-detection block will be force to ?0? 1: The calculation results of edge-detection block will be output normally	RW	0x0
4	CFG_USE_RAV	This parameter is used by vertical scaling. 0: Poly-phase filter will be used for the vertical scaling 1: Running average filter will be used for the vertical scaling (down scaling only)	RW	0x0
3	CFG_INV_T_FID	This parameter is used by vertical scaling. 0: Progressive input 1: Interlaced input Must be set to 1 when CFG_INTERFACE_I = 1.	RW	0x0
2	CFG_SC_BYPASS	This parameter is a general purpose. 0: Scaling module will engaged 1: Scaling module will be bypassed	RW	0x0
1	CFG_LINEAR	This parameter is used by horizontal scaling. 0: Anamorphic scaling 1: Linear scaling	RW	0x0
0	CFG_INTERLACE_O	This parameter is used by vertical scaling. 0: The output format of SC is progressive 1: The output format of SC is interlace	RW	0x0

8.5.6 VIP VPDMA Registers

NOTE: The functionality of the following sets of registers is not supported by VIP VPDMA in this family of devices:

- All VIP_INT2_* registers
- All VIP_INT3_* registers

The following channels are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these channels should be kept at their reset value.

- HQ_*
- GRPX_*
- SCALER_OUT
- SCALER_LUMA
- SCALER_CHROMA
- NF_*
- TRANSCODE1_*
- TRANSCODE2_*
- AUX_IN
- PIP_FRAME
- POST_COMP_WR
- VBI_SD_VENC

The following clients are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these clients should be kept at their reset value.

- DEI_HQ_*
 - TRANS1_LUMA
 - TRANS1_CHROMA
 - TRANS2_LUMA
 - TRANS2_CHROMA
 - HDMI_WRBK
 - VBI_SDVENC
 - NF_420_UV_OUT
 - NF_420_Y_OUT
 - NF_420_UV_IN
 - NF_420_Y_IN
 - NF_422_IN
 - GRPX1_ST
 - GRPX2_ST
 - GRPX3_ST
 - GRPX1_DATA
 - GRPX2_DATA
 - GRPX3_DATA
 - PIP_WRBK
 - SC_IN_*
 - SC_OUT
 - COMP_WRBK

Table 8-293. VIP_LIST_ATTR

Address Offset	0x0000 0008	Instance	VIP_VPDMA
Physical Address	0x4897 D008		
Description	The attributes of a new list. This register should always be written after VIP_LIST_ADDR .		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED						LIST_NUM		RESERVED	STOP	RDY	LIST_TYPE					LIST_SIZE															

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at VIP_LIST_ADDR . If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VIP_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the VIP_LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated.\n0: Normal List\n1: Self-Modifying List\n2: List Doorbell\nOthers Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
26	INT_STAT_VIP1_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP1_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip1_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip1_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
17	INT_STAT_VIP1_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip1_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip1_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip1_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip1_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP1_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip1_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip1_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip1_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip1_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip1_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
8	INT_STAT_VIP1_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip1_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip1_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP1_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP1_MULT_ANCB_SRC9	The interrupt for Video Input 1 Port B Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP1_MULT_ANCB_SRC8	The interrupt for Video Input 1 Port B Ancillary Data Channel 8 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP1_MULT_ANCB_SRC7	The interrupt for Video Input 1 Port B Ancillary Data Channel 7 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP1_MULT_ANCB_SRC6	The interrupt for Video Input 1 Port B Ancillary Data Channel 6 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP1_MULT_ANCB_SRC5	The interrupt for Video Input 1 Port B Ancillary Data Channel 5 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel <code>nf_write_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel <code>vip2_portb_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_lo_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel <code>vip2_porta_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_up_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel <code>vip2_portb_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel <code>vip2_portb_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel <code>vip2_porta_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel <code>vip2_porta_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src15</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src14</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_GRPX1	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27:20	RESERVED	Reserved	R	0x00
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_HQ_VID2_CHROMA	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_HQ_VID2_LUMA	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_HQ_VID1_CHROMA	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_HQ_VID1_LUMA	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrkb will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrkb will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrkb_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel <code>nf_write_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel <code>vip2_portb_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_lo_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel <code>vip2_porta_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_up_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel <code>vip2_portb_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel <code>vip2_portb_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel <code>vip2_porta_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel <code>vip2_porta_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src15</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src14</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
27	INT_STAT_VIP1_ANC_B	The client interface vip1_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
26	INT_STAT_VIP1_ANC_A	The client interface vip1_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
25	INT_STAT_TRANS2_LUMA	The client interface trans2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
24	INT_STAT_TRANS2_CHROMA	The client interface trans2_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
23	INT_STAT_TRANS1_LUMA	The client interface trans1_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
22	INT_STAT_TRANS1_CHROMA	The client interface trans1_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_HDMI_WRBK_OUT	The client interface hdmi_wrbk_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
20	INT_STAT_VPI_CTL	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
19	INT_STAT_VBI_SDVENC	The client interface vbi_sdvenc has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
18	RESERVED	Reserved	R	0
17	INT_STAT_NF_420_UV_OUT	The client interface nf_420_uv_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
16	INT_STAT_NF_420_Y_OUT	The client interface nf_420_y_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
15	INT_STAT_NF_420_UV_IN	The client interface nf_420_uv_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
14	INT_STAT_NF_420_Y_IN	The client interface nf_420_y_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
13	INT_STAT_NF_422_IN	The client interface nf_422_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_GRPX3_ST	The client interface grpx3_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
11	INT_STAT_GRPX2_ST	The client interface grpx2_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
10	INT_STAT_GRPX1_ST	The client interface grpx1_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
9	INT_STAT_VIP2_UP_UV	The client interface vip2_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
8	INT_STAT_VIP2_UP_Y	The client interface vip2_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
7	INT_STAT_VIP2_LO_UV	The client interface vip2_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
6	INT_STAT_VIP2_LO_Y	The client interface vip2_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
5	INT_STAT_VIP1_UP_UV	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_UP_Y	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
3	INT_STAT_VIP1_LO_UV	The client interface vip1_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
2	INT_STAT_VIP1_LO_Y	The client interface vip1_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
1	INT_STAT_GRPX3_DATA	The client interface grpx3_data has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
0	INT_STAT_GRPX2_DATA	The client interface grpx2_data has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Description	The register can be used to capture timing differences between events in the VPDMA.\n		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CAPTURE_MODE				STOP_CLIENT		RESERVED		STOP_COUNT		RESERVED		START_CLIENT		RESERVED		START_COUNT		CURR_COUNT													

Bits	Field Name	Description	Type	Reset
31:30	CAPTURE_MODE	Sets how the counter should be updated. Updating this value will also clear the current counter stored value. 0: Running Average 1: Minimum Value 2: Maximum Value 3: Last Value	RW	0x0
29:28	STOP_CLIENT	Sets the client whose event stops the performance monitor counter. 0: vip2_anc_b 1: vip2_anc_a 2: 3:	RW	0x0
27	RESERVED		R	0x0
26:24	STOP_COUNT	Sets the value that stops the performance monitor counter. 0: command request 1: command accept 2: data request 3: data rcvd 4: data empty 5: data full 6: frame start 7: frame end	RW	0x0
23:22	RESERVED		R	0x0
21:20	START_CLIENT	Sets the client whose event starts the performance monitor counter. 0: vip2_anc_b 1: vip2_anc_a 2: 3:	RW	0x0
19	RESERVED		R	0x0
18:16	START_COUNT	Sets the value that starts the performance monitor counter. 0: command request 1: command accept 2: data request 3: data rcvd 4: data empty 5: data full 6: frame start 7: frame end	RW	0x0
15:0	CURR_COUNT	The current value of the performance monitor counter	R	0x0

REQ_DELAY								REQ_RATE								BUSY	DMA_ACTIVE	FRAME_START	RESERVED												

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles..This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles.This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0
13:10	FRAME_START	The source of the start frame event for the client.\n0 : Change in value of hdmi_field_id\n1 : Change in value of dvo2_field_id\n2 : Change in value of hdcomp_field_id\n3 : Change in value of sd_field_id\n4 : Use List Manager Internal Field0\n5 : Use List Manager Internal Field1\n6 : Use List Manager Internal Field2\n7 : Start on channel active	RW	0x0

Display Subsystem

This chapter describes the display subsystem for the device.

Topic	Page
9.1 Display Subsystem Overview	3629
9.2 Display Controller	3640
9.3 Video Encoder	3809

9.1 Display Subsystem Overview

The Display Subsystem (DSS) provides the logic to interface display peripherals. DSS integrates a DMA engine as part of DISPC module, which allows direct access to the memory frame buffer. Various pixel processing capabilities are supported, such as: color space conversion, filtering, scaling, blending, color keying, etc.

The supported display interfaces are:

- One parallel CMOS output, which can be used for MIPI® DPI 2.0, or BT-656 or BT-1120.
- One TV output, which is connected to the internal Video Encoder module (VENC). The VENC drives a single video digital-to-analog converter (SD_DAC) supporting composite video mode.

The modules integrated in the display subsystem are:

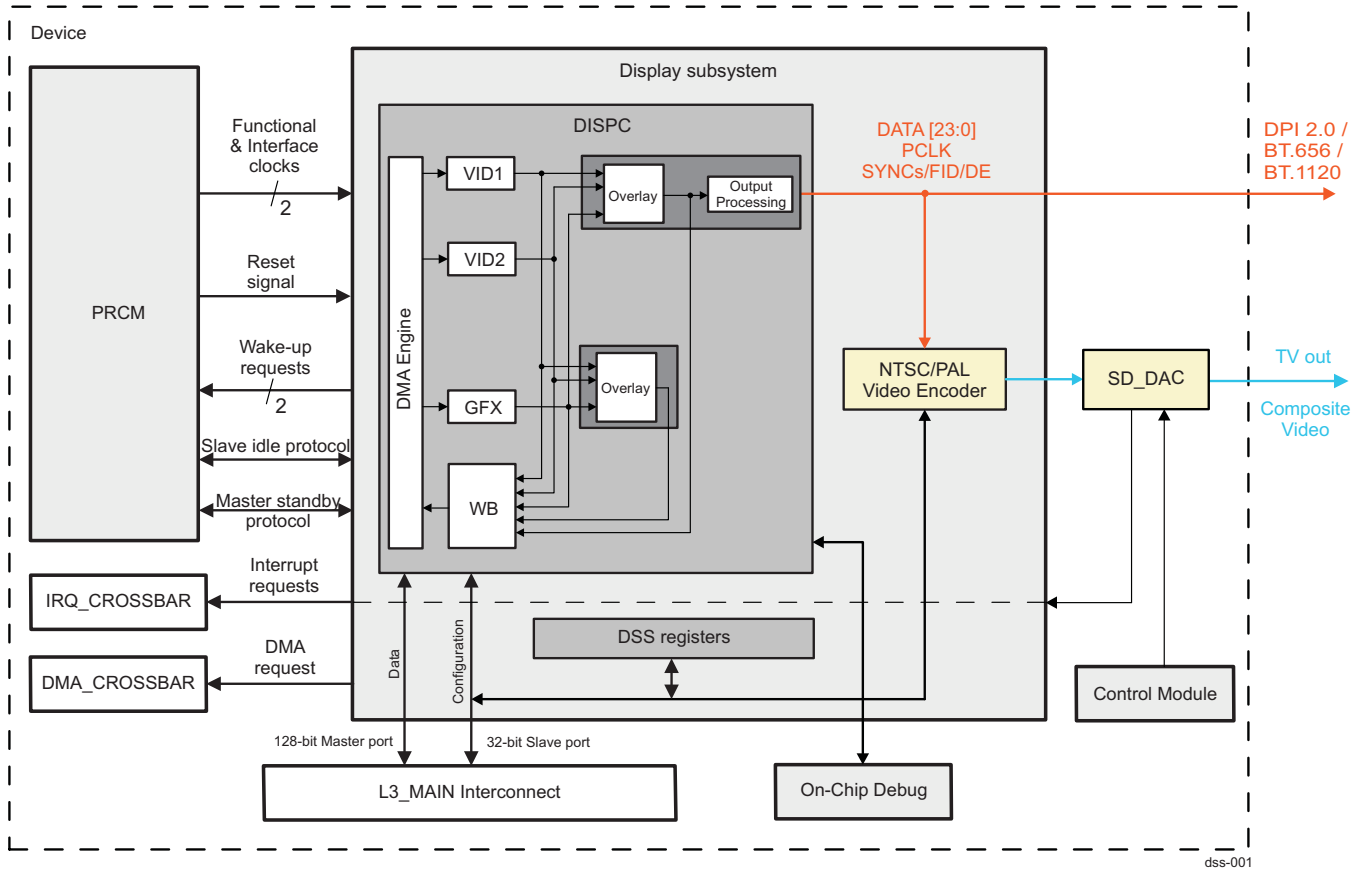

- Display controller (DISPC), with the following main features
 - One direct memory access (DMA) engine
 - One graphics pipeline (GFX), two video pipelines (VID1 and VID2), and one write-back pipeline (WB)
 - Two overlay managers
 - Active Matrix color support for 12/16/18/24-bit (truncated or dithered encoded pixel values)
 - One Video Port (VP) with programmable timing generator to support:
 - DPI: up to 165 MHz pixel clock video formats defined in CEA-861-E and VESA DMT standards
 - VENC: NTSC/PAL standards with 60Hz/50Hz refresh rates
 - Supported maximum FrameBuffer width of 4096 for all pixel formats
 - Configurable output mode: progressive or interlaced
 - Selection between RGB and YUV422 output pixel formats (YUV4:2:2 only available when BT-656 or BT-1120 output mode is enabled)
 - Refer to [Section 9.2, Display Controller](#), for more details
- Video Encoder (VENC) with 10-bit standard definition video DAC (SD_DAC). Refer to [Section 9.3, Video Encoder](#), for more details.

DSS provides two interfaces to L3_MAIN interconnect

- One 128-bit master port (with MFLAG support). The DMA engine in DISPC uses this single master to read/write data from/to device system memory.
- One 32-bit slave port. Used for registers configuration. It is further connected internally to DISPC and VENC modules.

[Figure 9-1](#) is a high-level diagram of the display subsystem.

Figure 9-1. Display Subsystem Overview

dss-001

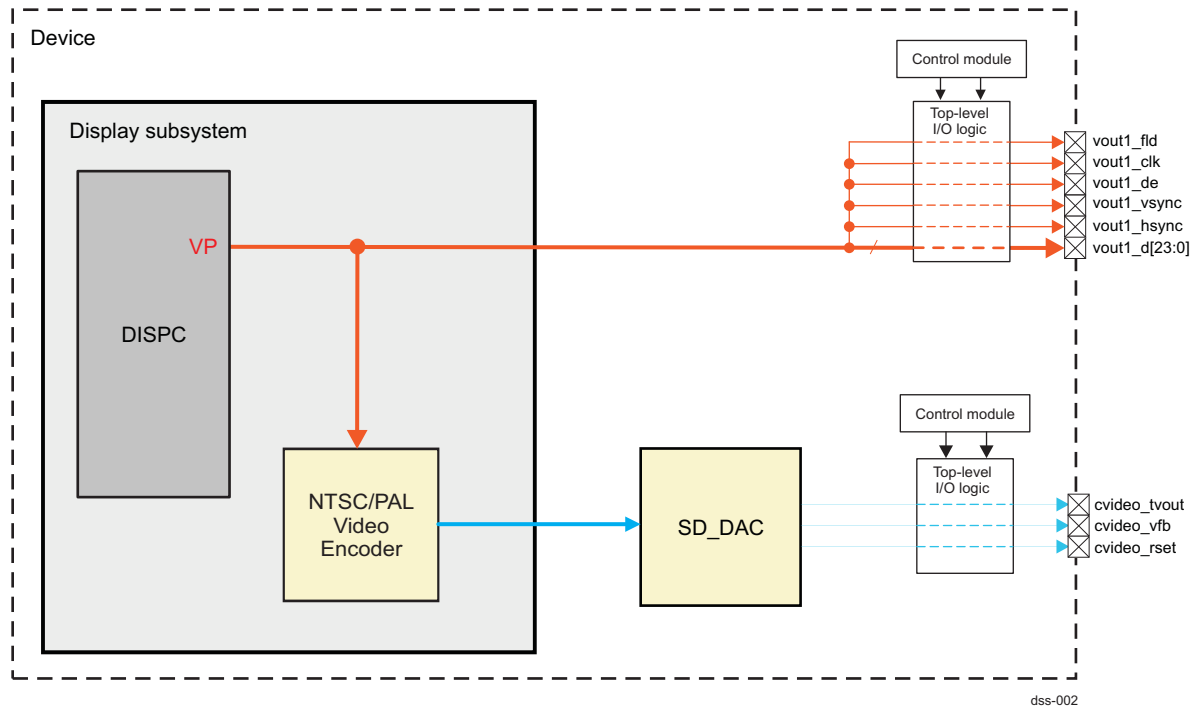

9.1.1 Display Subsystem Environment

This section describes the various outputs handled by the display subsystem:

- Parallel interface (MIPI DPI 2.0, or BT-656 or BT-1120) support
- TV (composite video) output support

Figure 9-2 is a diagram of the display subsystem environment.

Figure 9-2. Display Subsystem Environment

NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see [Section 14.4.6.3 Pad Configuration Registers](#) in [Chapter 14, Control Module](#).

CAUTION

The parallel and TV out interfaces cannot be used simultaneously.

- When the `DSS_DPI_CTRL[0] DPI_ENABLE` is set to 0x1, the parallel DPI output is enabled.
- When the `DSS_DPI_CTRL[0] DPI_ENABLE` is set to 0x0, the parallel DPI output is disabled. The TV composite output through VENC and SD_DAC modules can be used.

9.1.1.1 Display Subsystem Parallel Interface

In a parallel interface configuration, the DISPC outputs the VP data and interface signals on device I/O pads: DATA[23:0] (data bus), HSYNC (horizontal synchronization signal), VSYNC (vertical synchronization signal), DE (data enable), FID (field identification, odd/even) and PCLK (pixel clock). The required data and control signals can be provided directly to an external MIPI DPI-compatible LCD panels.

For more details on the output pixel data formats for the parallel interface, see [Section 9.2.2 DISPC Environment](#), in *Display Controller*.

9.1.1.2 Display Subsystem TV Output

In a TV output configuration, the DISPC, VENC and video SD_DAC modules are used in the data path. The DISPC receives synchronization signals from the VENC and synchronously sends pixel data to the VENC with these signals. The digital output of the DISPC is always a 24-bit RGB value based on a pixel request from the VENC. The VENC converts RGB video signals to conform to the NTSC/PAL standards for analog video.

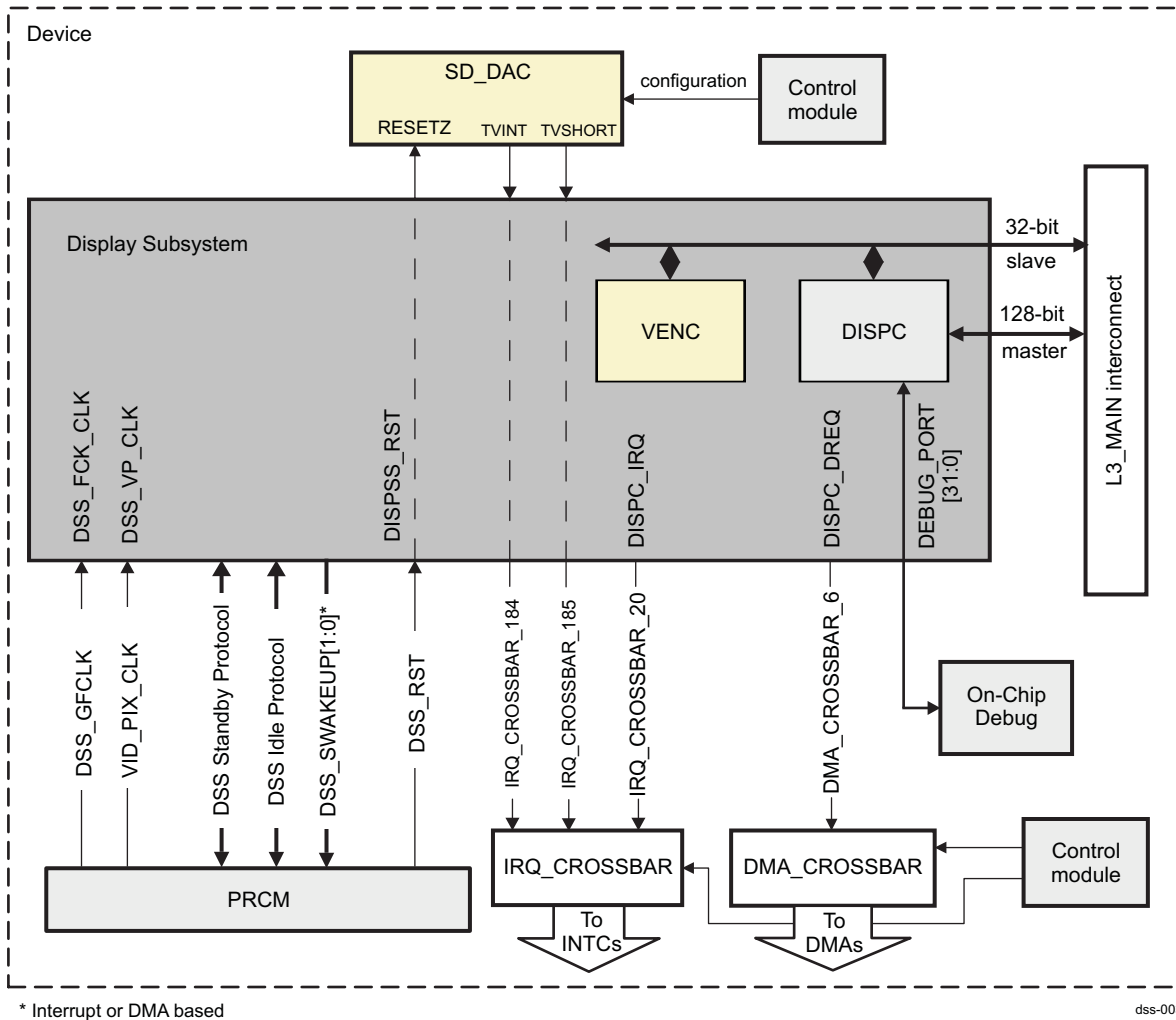

For more details, see [Section 9.3, Video Encoder](#).

9.1.2 Display Subsystem Integration

This section describes the integration of the display subsystem module in the device, including information about clocks, resets, and hardware requests.

Figure 9-3 shows the integration of the display subsystem in the device.

Figure 9-3. Display Subsystem Integration

* Interrupt or DMA based

dss-003

9.1.2.1 Display Subsystem Interrupt and DMA Requests

Table 9-1 shows the interrupt and DMA requests generated by the DISPC and SD_DAC module.

Table 9-1. Display Subsystem Hardware Requests

Module Instance	Source Signal Name	Destination	Interrupt Requests		Description
			IRQ_CROSSBAR Input	Default Mapping	
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20		DSP1_IRQ_51 DSP2_IRQ_51 IPU1_IRQ_23	DISPC interrupt request
SD_DAC	SD_DAC_IRQ_TVINT	IRQ_CROSSBAR_184		-	Interrupt for TV load detection from SD_DAC
	SD_DAC_IRQ_TVSHORT	IRQ_CROSSBAR_185		-	Interrupt for TV short detection from SD_DAC

Table 9-1. Display Subsystem Hardware Requests (continued)

DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5	The line trigger signal used for synchronization of a logical channel in the device-level EDMA for memory-to-memory transfer, generated by the DISPC module. There is no data received by the DISPC based on the DMA request.

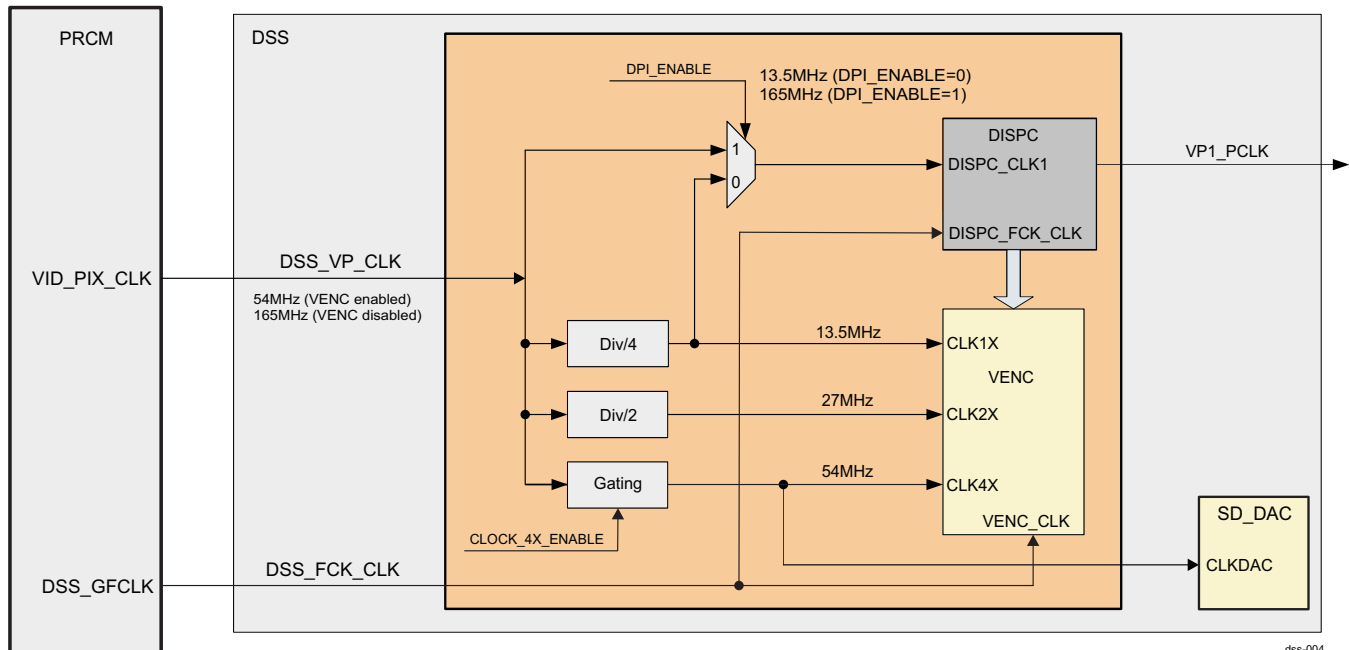

NOTE: The “Default Mapping” column in [Table 9-1 Display Subsystem Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively. For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the DMA_CROSSBAR module, see [Section 14.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#). For more information about the device EDMA module, see [Chapter 12, Enhanced DMA](#).

9.1.2.2 Display Subsystem Clocks

The power, reset, and clock management (PRCM) module provides the clock signals, and status for their activity, to the display subsystem.

[Figure 9-4](#) shows the details of the display subsystem clock tree.

Figure 9-4. Display Subsystem Clock Tree

[Table 9-2](#) lists the main DSS clocks and their sources.

Table 9-2. Display Subsystem Clocks

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DSS	DSS_VP_CLK	VID_PIX_CLK	PRCM module	Functional clock used for the VP pixel clock, Sync buffer and Timing generator modules within DISPC, and VENC/SD_DAC modules
	DSS_FCK_CLK	DSS_GFCLK	PRCM module	DISPC functional and interface clock; VENC interface clock

The DPI_ENABLE signal in [Figure 9-4](#) is driven by [DSS_DPI_CTRL\[0\]](#) DPI_ENABLE register bit.

The gating of VENC clock CLK4X is controlled via [DSS_VENC_CTRL\[0\]](#) VENC_CLOCK_4X_ENABLE bit.

9.1.2.3 Display Subsystem Reset

The PRCM module provides one HW reset signal (DSS_RST) to the display subsystem, which is propagated to the DISPC, VENC and SD_DAC modules.

The DSS submodules can also be reset by a corresponding SW reset on submodule level.

The [DSS_SYSSTATUS\[0\]](#) DSS_RESETDONE register bit indicates the completion of the DISPC reset, following a HW or SW reset.

In order VENC reset status to be indicated in the [DSS_SYSSTATUS\[6\]](#) VENC_RESETDONE bit, the VENC functional clock (VENC_CLK) must be running.

9.1.2.4 Display Subsystem Power Management

The display subsystem and submodules are in the PD_DSS power domain.

The DSS supports no-idle mode, force-idle mode, and smart-idle modes. The mode can be selected by programming the appropriate value in the [DSS_SYSCONFIG\[1:0\]](#) SIDLEMODE register bitfield.

9.1.2.4.1 Display Subsystem Standby Mode

As part of the system-wide power-management scheme, the display subsystem supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

- MStandby/MWait
 - DISPC
- SIdleReq/SIdleAck
 - DISPC

The PRCM module asserts the MWait and receives MStandby directly from DISPC. When the display subsystem initiates a standby procedure, it also initiates a master standby/wait protocols with the PRCM module that lets the PRCM cut the display subsystem clocks. For information about the conditions that allow the subsystem to exit standby mode, see [Section 9.2.4.3.2 DISPC StandBy Mode](#), in [Section 9.2 Display Controller](#).

The PRCM also asserts the SIdleReq. Then, it is split at the display subsystem level and send to the appropriate modules. Consequently, all SIdleAck are merged into one and sent back to PRCM.

9.1.2.4.2 Display Subsystem Wake-Up Mode

The DISPC module supports the wake-up protocol. DSS_SWAKEUP[1:0] signals are associated with DISPC_DREQ and DISPC_IRQ. For the events that generate an Swakeup and the description and configuration of the registers, see [Section 9.2.4.3.3 DISPC StandBy Mode](#), in [Section 9.2 Display Controller](#).

9.2 Display Controller

9.2.1 DISPC Overview

Figure 9-5 shows a block diagram of the display controller (DISPC) within the display subsystem.

Figure 9-5. DISPC Overview

The DISPC includes the following main features:

- Pipelines for processing:
 - One Graphics (GFX) pipeline:
 - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, BITMAP1, BITMAP2, BITMAP4, BITMAP8. (A component can be ignored by not selecting Alpha pixel)
 - Premultiplied ARGB and RGBA formats
 - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the most significant bits [MSBs])

- Support for color look-up table (CLUT): 256 × 24-bit entries palette in RGB
- Support for anti-aliasing on RGB pixel formats using 3-tap filter
- Up to 4K-by-4K frame buffer size
- Two Video pipelines (VID1 and VID2):
 - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, RGB565-A8, BITMAP1, BITMAP2, BITMAP4, BITMAP8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12, YUV420-NV21 and in addition RGBx, xRGB, xBGR, and BGRx pixel formats defined considering that A component of RGBA, ARGB, ABGR, BGRA pixel formats is ignored by HW (e.g. ARGB->xRGB)
 - Premultiplied ARGB and RGBA formats
 - Support for color look-up table (CLUT): 256 × 24-bit entries palette in RGB
 - Programmable poly-phase filter:
 - Independent horizontal and vertical resampling. Upsampling up to x16, and downsampling down to 1/4
 - Maximum input width of 1280 pixels (2560 in 3-tap mode)
 - No limitation on the input height
 - Supported input formats are all above listed formats, except BITMAP formats. The alpha blending factor is rescaled like the R, G and B color components. 16 phases with symmetrical coefficients are implemented.
 - Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB48-12121212.
 - Programmable VC-1 range mapping
 - Up to 4K-by-4K frame buffer size
- One Write-back (WB) pipeline: Allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame
 - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, RGB565-A8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12, YUV420-NV21 and in addition RGBx, xRGB, xBGR, and BGRx pixel formats defined considering that A component of RGBA, ARGB, ABGR, BGRA pixel formats is ignored by HW (e.g. ARGB->xRGB)
 - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21
 - Programmable poly-phase filter:
 - Independent horizontal and vertical resampling. Upsampling up to x16, and downsampling down to 1/4. When the output format of WB pipeline includes a format change from RGB or YUV4:2:2 to YUV4:2:0, the maximum downscaling provided by the WB scaler is 1/2.
 - Maximum input width of 1280 pixels using 32-bit pixels and 5-tap, and 2560 pixels using 32-bit pixels and 3-tap
 - No limitation on the input height
 - The supported formats are RGB888/RGBA-8888/ARGB32-8888, ARGB48-12121212, RGB565-A8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12 and YUV420-NV21
 - Alpha blending factor is rescaled like the R, G, and B color components
 - 16 phases with symmetrical coefficients are implemented
 - Selection of the source of the data:
 - One of the overlay manager outputs
 - One of the pipeline outputs

- One Video Port (VP1) output:
 - Up to 24-bit per pixel on the output interface, with selection between 12, 16, 18 or 24-bit
 - Independent programmable timing generator to support up to 165 MHz pixel clock video formats defined in CEA-861-E and VESA-DMT standards
 - Independent programmable multiple cycles output format on 8/9/12/16-bit interface (TDM)
 - Configurable output mode: progressive or interlaced mode
 - Selection between RGB and YUV422 output pixel format (YUV4:2:2 only available when BT output is enabled)
- Two Overlay Managers (OVR1 and OVR2):
 - Input Pixel format: ARGB48-12121212
 - Output Pixel format: ARGB48-12121212 (A component is only used for Write-back)
 - Overlay of the graphics and video pipelines
 - Transparency color keys (source and destination)
 - Global and pixel alpha blending
 - Programmable Z-order (full flexibility)
- Common:
 - Programmable 8-bit gamma curve support on VP1 output
 - Programmable color phase rotation (CPR)
 - Alpha blending support:
 - Embedded pixel factor (ARGB and RGBA)
 - Global pixel
 - Combination of global pixel and pixel factor
- DMA (internal to the DISPC):
 - No support for rotation, flip-flop, mirroring and memory fragmentation
 - Integrated shared buffers between DMA engine and pipelines
 - Programmable buffer thresholds
 - Bandwidth limiter on write request (insertion on idle cycles between requests)
- Advanced:
 - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
 - Arbitration between normal and low priority pipelines (GFX, VID1, VID2 and WB pipelines)
- Power modes:
 - Low-power saving modes
 - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
 - Merge capability of the DMA buffers to support greater OFF period on the L3_MAIN interconnect
 - All buffers associated to a single pipeline
 - Reallocation of the buffers of the nonactive pipelines to the active pipelines

NOTE: The display resolution is programmable and can be any width in the range [1:4096] pixels. The following limitations, related to the type of display or the processing done, apply:

- Active Matrix screen + dithering forces a width multiple of 2 pixels
- Active Matrix + TDM may force a width multiple of 2 pixels

The display buffers in the system memory consist of contiguous pixels.

9.2.2 DISPC Environment

The DISPC VP1 provides the required data and control signals to interface:

- Directly to device CMOS pads for MIPI DPI 2.0, or BT.656 or BT.1120 interface support
- Video Encoder (VENC) module with dedicated standard definition video DAC (SD_DAC) for composite TV out support

Figure 9-6 shows the supported interfaces.

NOTE: The parallel and TV out interfaces cannot be used simultaneously. The selection can be done at DSS top level. For more information, see Section 9.1.1, *Display Subsystem Environment*.

Figure 9-6. DISPC VP1 Output Interfaces

NOTE: The path from a module pin to device pad (or pads) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see Section 14.4.6.1, Pad Configuration Registers, in Chapter 14 *Control Module*.

Table 9-17 describes the VP1 interface signals.

Table 9-17. DISPC VP1 Interface Signals

Signal Name	Type ⁽¹⁾	Description
vout1_d[23:0]	O	Pixel data
vout1_pclk	O	Pixel clock
vout1_vsync	O	Vertical synchronization. The frame synchronization pulse (vsync) toggles after all the lines in a frame are transmitted and a programmable number of line clock cycles has elapsed at the beginning and the end of each frame.

⁽¹⁾ I = Input, O = Output, I/O = Input/Output

Table 9-17. DISPC VP1 Interface Signals (continued)

Signal Name	Type ⁽¹⁾	Description
vout1_hsync	O	Horizontal synchronization. The line synchronization pulse (hsync) toggles after all pixels in a line are transmitted and a programmable number of pixel clock wait-states has elapsed at the beginning and the end of each line.
vout1_de	O	Pixel data output-enable signal to indicate when data must be latched using the pixel clock.
vout1_fid	O	The FID signal indicates the output field identifier: <ul style="list-style-type: none"> • 0 means even • 1 means odd The FID signal is 0 when the progressive mode is selected for the VP output.

9.2.2.1 DISPC VP1 Output and Data Formats

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

In the Active matrix display type, one pixel per pixel clock is displayed. The diagrams represent the configuration of assertion of the data on the rising edge of the pixel clock. It is possible to program the interface timing to output the data on the falling edge of the pixel clock.

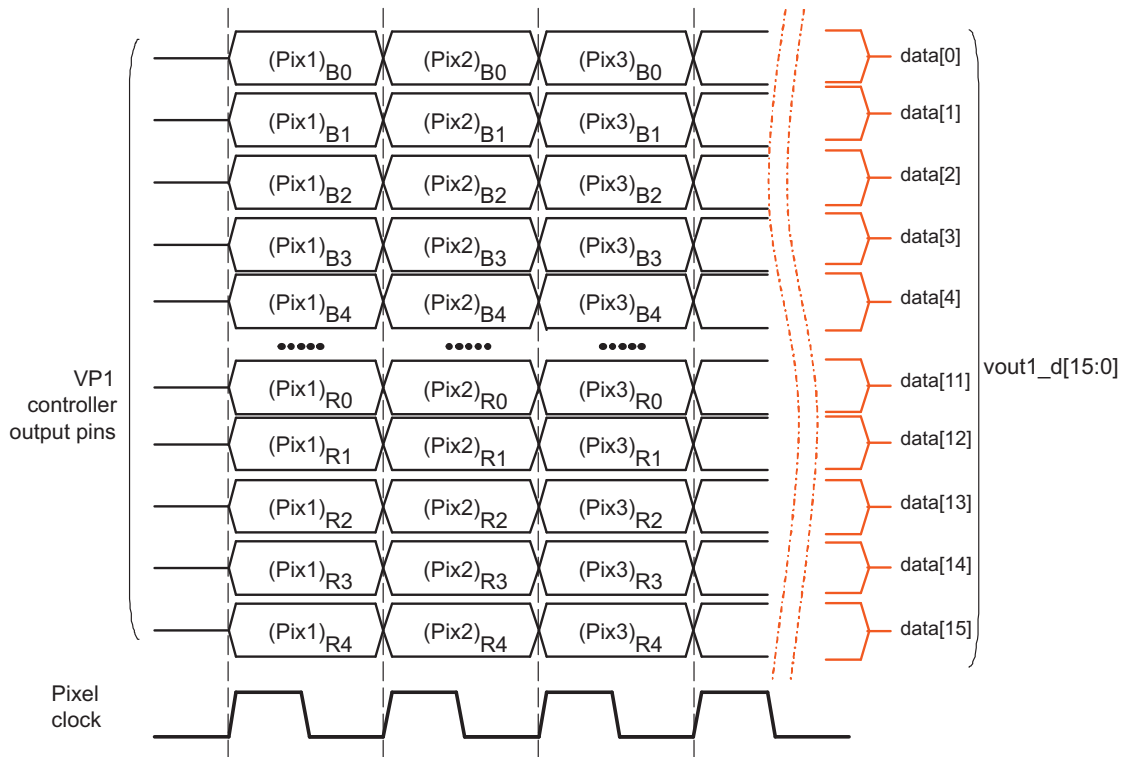

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel. [Figure 9-7](#) through [Figure 9-10](#) show 12-, 16-, 18-, and 24-active matrix displays, respectively. The width of the data bus can be configured through `DISPC_VP1_CONTROL[10:8] DATALINES` register bitfield.

9.2.2.2 DISPC VP1 Active Marix Display Timing Diagrams

Figure 9-11 through Figure 9-14 show timing diagrams of synchronization signals and pixel clocks for active matrix panels. The DISPC directly drives these signals, which are related to the programmable fields listed in Table 9-19.

Table 9-19. DISPC VP1 Programmable Fields for Active Matrix Display

Name	Register	Description
PPL	DISPC_VP1_SIZE_SCREEN[11:0] PPL value + 1	Pixels per line
LPP	DISPC_VP1_SIZE_SCREEN[27:16] LPP value + 1	Lines per panel
HBP	DISPC_VP1_TIMING_H[31:20] HBP value + 1	Horizontal back porch
HFP	DISPC_VP1_TIMING_H[19:8] HFP value + 1	Horizontal front porch
HSW	DISPC_VP1_TIMING_H[7:0] HSW value + 1	Horizontal synchronization pulse width
VBP	DISPC_VP1_TIMING_V[31:20] VBP value	Vertical back porch
VFP	DISPC_VP1_TIMING_V[19:8] VFP value	Vertical front porch
VSW	DISPC_VP1_TIMING_V[7:0] VSW value + 1	Vertical synchronization pulse width
ONOFF ⁽¹⁾	DISPC_VP1_POL_FREQ[17] ONOFF	DISPC_HSYNC and DISPC_VSYNC pixel clock control
RF ⁽²⁾	DISPC_VP1_POL_FREQ[16] RF	DISPC_HSYNC and DISPC_VSYNC pixel clock edge control
IEO	DISPC_VP1_POL_FREQ[15] IEO	Invert output enable
IPC ⁽³⁾	DISPC_VP1_POL_FREQ[14] IPC	Invert DISPC_PCLK
IHS	DISPC_VP1_POL_FREQ[13] IHS	Invert DISPC_HSYNC
IVS	DISPC_VP1_POL_FREQ[12] IVS	Invert DISPC_VSYNC

⁽¹⁾ DISPC_VP1_POL_FREQ[17] ONOFF and Control Module register CTRL_CORE_SMA_SW_1[DSS_CH0_ON_OFF must match.

⁽²⁾ DISPC_VP1_POL_FREQ[16] RF and Control Module register CTRL_CORE_SMA_SW_1[DSS_CH0_RF must match.

⁽³⁾ DISPC_VP1_POL_FREQ[14] IPC and Control Module register CTRL_CORE_SMA_SW_1[DSS_CH0_IPC must match.

- Active matrix timing configuration 1:
 - DISPC_VP1_POL_FREQ[17] ONOFF = 0 and CTRL_CORE_SMA_SW_1[DSS_CH0_ON_OFF = 0
 - DISPC_VP1_POL_FREQ[16] RF = 0 and CTRL_CORE_SMA_SW_1[DSS_CH0_RF = 0
The HSYNC and VSYNC signals are driven on the opposite edge of PCLK from the pixel data.
 - DISPC_VP1_POL_FREQ[15] IEO = 0
The DE signal is active high.
 - DISPC_VP1_POL_FREQ[14] IPC = 0 and CTRL_CORE_SMA_SW_1[DSS_CH0_IPC = 0
The pixel data are driven on the rising edge of PCLK.
 - DISPC_VP1_POL_FREQ[13] IHS = 0
The HSYNC signal is active high.
 - DISPC_VP1_POL_FREQ[12] IVS = 0
The VSYNC signal is active high.

9.2.3 DISPC Integration

This section describes the DISPC integration in the device (see Figure 9-23). For complete details about clocks and resets, see Section 9.1, *Display Subsystem Overview*.

Figure 9-23. DISPC Integration

dispc-065

Table 9-20 and Table 9-21 list the integration attributes and clock and resets, respectively.

Table 9-20. DISPC Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
DISPC	PD_DSS	128-bit master port to L3_MAIN for data transfer to/from system memory 32-bit slave port to L3_MAIN for configuration

Table 9-21. DISPC Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	DISPC_FCK_CLK	DSS_GFCLK	PRCM	Functional clock for the internal DISPC logic. Also DISPC interface clock. For additional details, see Section 9.1.2, Display Subsystem Integration .
	DISPC_CLK1	VID_PIX_CLK	PRCM	Clock used to generate the pixel clock (VP1_PCLK) for the video port (VP1) interface. For additional details, see Section 9.1.2, Display Subsystem Integration .
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	DISPC_RST	DSS_RST	PRCM	Hardware reset is coming from the PRCM module. For additional details, see Section 9.1.2, Display Subsystem Integration . NOTE: The DSS_RST signal is provided to the entire display subsystem. When inside the display subsystem boundaries, it is named DISPSS_RST, which on its end is provided to the DISPC and is named DISPC_RST.

Table 9-22. DISPC Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	DSP1_IRQ_51 DSP2_IRQ_51 IPU1_IRQ_23	DISPC interrupt request
DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5	Associated with the line trigger signal used for synchronization of a logical channel in the device-level EDMA for memory-to-memory transfer, generated by the DISPC module. There is no data received by the DISPC based on the DMA request. Indicates when the programmable line number matches the current primary VP1 panel refresh line number. See Section 9.2.4.5, DISPC DMA Requests , for more details.

NOTE: The “Default Mapping” column in [Table 9-22 DISPC Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.

For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#).

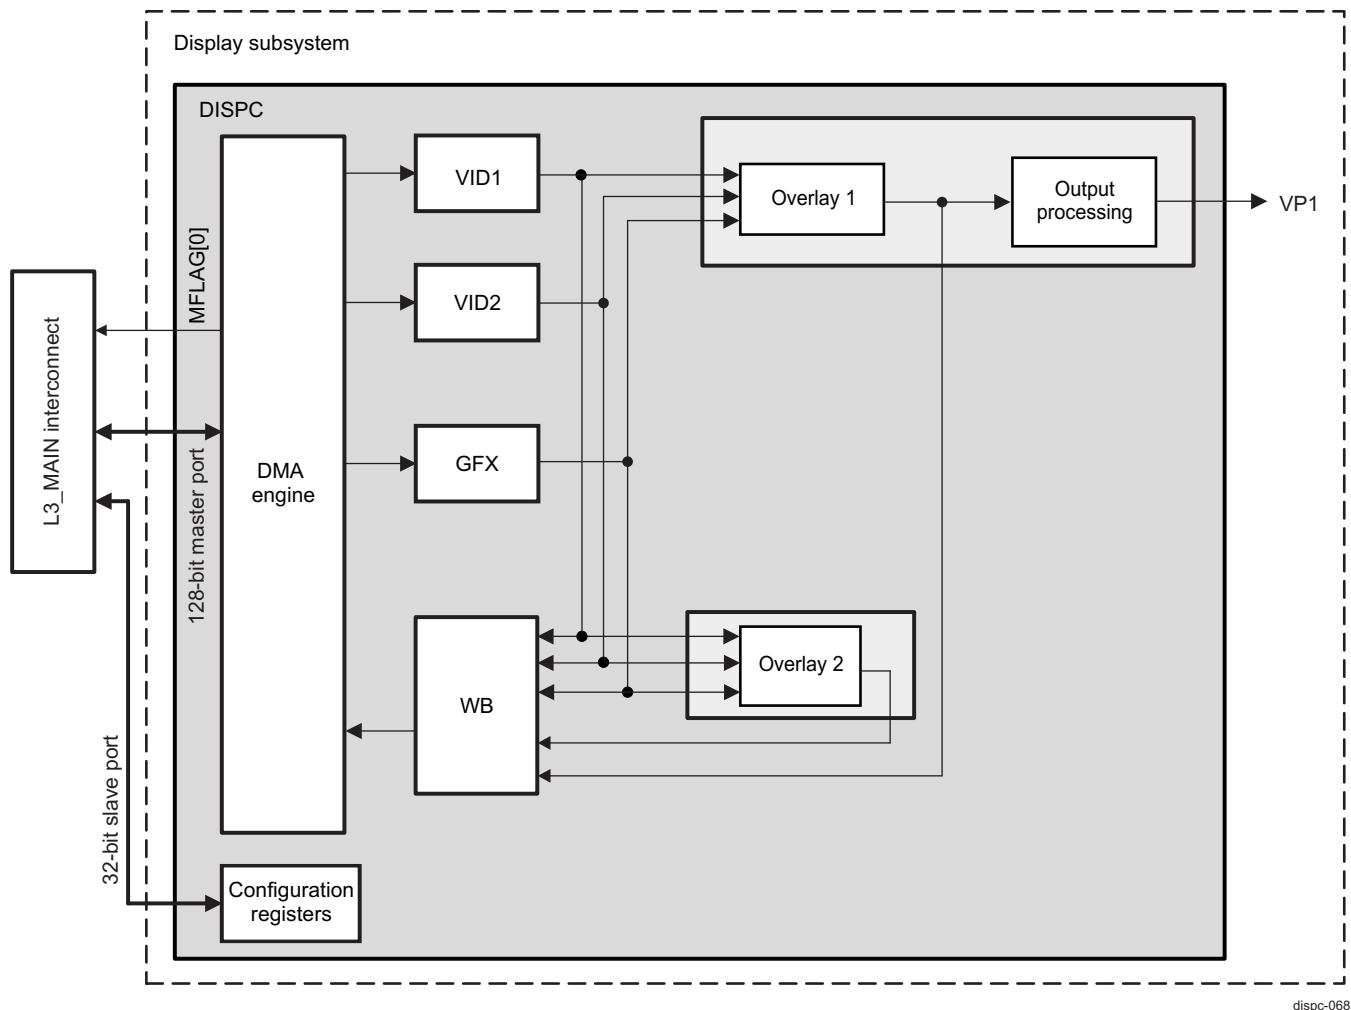

For more information about the DMA_CROSSBAR module, see [Section 14.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#).

For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#).

For more information about the device EDMA module, see [Chapter 12, Enhanced DMA](#).

9.2.4 DISPC Functional Description

Figure 9-24. DISPC Architecture Overview

dispc-068

The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (antialiasing) and video pipelines (VC-1, color space conversion, scaling, and so forth).

The data coming out of a pipeline is sent to the overlay managers (and from there to VP1 or WB), or to the WB pipeline directly. An overlay manager manages inputs of multiple pipelines. Transparency settings and user timing configurations for VP1 output are available, based on VESA-DMT and CEA-861 standards.

The DISPC allows the capturing of one of the pipeline outputs, or one of the overlay manager outputs, to redirect it into the WB pipeline. It allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing, and so forth, to perform memory-to-memory transfer with data processing. It can be used as a HW front end compositing unit in order to pre-compose the output frame and write in memory before being fetched again by DISPC for display on VP1.

NOTE: DISPC does not support any tiled frame buffer, nor any compressed frame buffer, and is not able to generate any compressed output to memory through the write-back pipeline. The DISPC has no capability to support by itself rotation of the frame buffer.

DISPC can be used for composition using memory to memory transfer. In that case the frame buffer on the input and output can be split into smaller blocks of pixels, processed separately by DISPC. Scaling/filtering of the split blocks requires fetching extra pixels around the processed pixel-block. This can be achieved by properly programming the initial accumulator (accu) value of the polyphase filter inside VID/WB pipelines. The number of taps used by the polyphase filter implies the number of extra pixels to fetch (5-tap requires 2 pixels on left/right/bottom/top to be fetched).

9.2.4.1 DISPC Clock Configuration

The VP1_PCLK clock for the VP1 output is provided directly from the DISPC_CLK1 input clock. There is no internal divisor on this clock.

The pixel clock transitions continuously as long as the VP1 is enabled and [DISPC_VP1_CONFIG\[0\] PIXELGATED](#) register bit is 0x0.

The DISPC functional clock FCK_CLK is the internal logic clock, and also acts as the interface clock.

The FCK_CLK has to be greater or equal to the VP1_PCLK, in order for DISPC internal logic to function properly.

The FCK_CLK must be faster or equal to the highest clock required by the user application, in order to support the processing for the VP1 output.

The minimum ratio between the pixel clock frequency and the core functional clock does not depend on the vertical scaling ratio. It is possible to rescale vertically between 16x and 0.25x with a clock ratio between functional clock and pixel clock of 1x. For the horizontal scaling, the minimum clock ratio does not depend on the video window width but on the display width. Considering for example 1080p video frame downscaled by 0.25 on a 1080p screen, the minimum clock ratio is 1x.

The pixel clock and the core functional clocks are asynchronous. There is re-synchronization logic between internal logic and the VP1 output interface.

9.2.4.2 DISPC Software Reset

To perform a software reset on the DISPC, set the [DISPC_SYSCONFIG\[1\] SOFTRESET](#) bit to 0x1. The [DISPC_SYSSTATUS\[0\] DISPC_FUNC_RESETDONE](#) bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the [DISPC_SYSCONFIG\[1\] SOFTRESET](#) bit is automatically reset. Software must ensure that the software reset completes before performing DISPC operations.

The completion of the software reset for the VP logic is indicated in the [DISPC_SYSSTATUS\[1\] DISPC_VP1_RESETDONE](#) bit.

9.2.4.3 DISPC Power Management

The DISPC supports the MStandby/Wait, IdleReq/SidleAck, Disconnect and Wake-up protocols as defined in [Chapter 3, Power, Reset, and Clock Management](#).

9.2.4.3.1 DISPC Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the `DISPC_SYSCONFIG[4:3]` SIDLEMODE bit field.

Condition of assertion of the SIdleAck signal:

- In no-idle mode: SIdleAck is never asserted.
- In force-idle mode: SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle delay with respect to an IdleReq assertion.

NOTE: The proper use of force-idle mode assumes that no interrupt needs to be generated.

- In smart-idle mode: SIdleAck is asserted when at least the following conditions are satisfied:
 - No interrupt is pending.
 - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted, the DISPC interface clock used by the slave port can be shut down at any time. Any transactions on the configuration port are ignored.

The conditions of deassertion of the SIdleAck signal are:

- In force-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.
- In smart-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.

Once SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

9.2.4.3.2 DISPC StandBy Mode

The DISPC supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the `DISPC_SYSCONFIG[13:12]` MIDDLEMODE bit field. The functional clock is always active, if the module is enabled. The L3_MAIN clock can be shut down at any time independently of the status of MStandby.

The conditions of assertion of the MStandby signal are:

- In no-standby mode: MStandby is never asserted.
- In force-standby mode: MStandby is asserted when the module is disabled.
- In smart-standby: In the case of one of the following conditions:
 - The GFX pipeline is disabled or enabled and the data fetch is complete for the GFX window, or the GFX pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - A VID pipeline (VID1 or VID2) is disabled or enabled and the data fetch is complete for the VID window, or the VID pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The WB pipeline is disabled or enabled and the data store to memory is complete for the WB picture, or the WB pipeline is enabled but the data storage did not complete and data in the DMA buffer is lower than the low threshold value.

The MStandby signal asserts whenever all the above events have occurred or the DISPC is disabled. While MStandby is asserted, the DISPC does not generate any transaction on the L3_MAIN master port.

The conditions of deassertion of the MStandby signal are:

- In force-standby mode: MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode: In the case of one of the following conditions:
 - The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
 - A VID pipeline (VID1 or VID2) is enabled but the data fetch did not complete for the VID window, and the data in the DMA buffer is less than the low threshold value.

- The WB pipeline is enabled but the data store did not complete for the WB picture, and the data in the DMA buffer more than the high threshold value.

The above events are conditions for MStandby signal de-assertion. MStandby signal is de-asserted whenever any one the above event happens.

Detection of the deassertion conditions assumes that the interface clocks are active.

9.2.4.3.3 DISPC Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG\[2\]](#) ENAWAKEUP bit. Because the SWakeup signal is asynchronous, it does not require the interface clock.

The conditions of assertion of the SWakeup signal are:

- The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
- At least one of the the video pipelines (VID1 or VID2) is enabled but the data fetch did not complete for the VID window, and the data in the DMA buffer is less than the low threshold value.
- The WB pipeline is enabled and the data in the DMA buffer is more than the high threshold value.
- The last pixel displayed into the VP1 panel if it is not the last frame

The SWakeup signal is asserted whenever any one of the abpveevents occurs and IdleAck is asserted, and Idlemode is set to smart-idle.

The condition of deassertion of the SWakeup signal is:

- Immediately after deassertion of IdleReq

9.2.4.4 DISPC Interrupt Requests

The interrupt line, DISPC_IRQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the [DISPC_IRQENABLE_SET](#) register.

To check when a particular interrupt event occurs and to reset a particular event, the [DISPC_IRQSTATUS](#) register must be accessed. This register regroups the status of internal events in the module that generate an interrupt (read 0: no interrupt occurred; read 1: interrupt occurred; write 1: status bit reset).

There are two level of interrupts. The first level, controlled by the [DISPC_IRQENABLE_SET](#), [DISPC_IRQENABLE_CLR](#) and [DISPC_IRQSTATUS](#) registers, is used to indicate common events and also source for the second level of interrupt. The second level of interrupts consists of status and enable interrupt registers for each pipeline and the video port.

Table 9-23. DISPC Interrupts - First Level

Interrupt Name	Description
VP1_IRQ	At least one event of the Video Port 1 interrupt events occurred
GFX_IRQ	At least one event of the GFX pipeline interrupt events occurred
VID1_IRQ	At least one event of the VID1 pipeline interrupt events occurred
VID2_IRQ	At least one event of the VID2 pipeline interrupt events occurred
WB_IRQ	At least one event of the WB pipeline interrupt events occurred
WAKEUP_IRQ	WakeUp: Occurs when the SWakeup signal is asserted.

The second level of interrupts for GXF pipeline is controlled through the [DISPC_GFX1_IRQENABLE](#) and [DISPC_GFX1_IRQSTATUS](#) registers.

Table 9-24. DISPC Interrupts - Second Level - GFX Pipeline

Interrupt Name	Description
GFXENDWINDOW_IRQ	End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame.

Table 9-24. DISPC Interrupts - Second Level - GFX Pipeline (continued)

Interrupt Name	Description
GFXBUFFERUNDERFLOW_IRQ	GFX DMA buffer underflow: The input graphics DMA buffer goes underflow.
GFXREGIONBASEDPIPESTART_IRQ	Graphics window started on overlay. Used for Region-based feature.
GFXREGIONBASEDPIPEEND_IRQ	Graphics window ended on overlay. Used for Region-based feature.

The second level of interrupts for VID pipelines is controlled through the [DISPC_VID_IRQENABLE](#) and [DISPC_VID_IRQSTATUS](#) registers.

Table 9-25. DISPC Interrupts - Second Level - VID Pipelines

Interrupt Name	Description
VIDENDWINDOW_IRQ	End of the VID window: The DMA engine has fetched all the data from memory for the VID for the current frame.
VIDBUFFERUNDERFLOW_IRQ	VID DMA buffer underflow: The input VID DMA buffer goes underflow. Does not necessary means that the buffer is empty (out of order refill), but simply that the required pixel is not in yet.
VIDREGIONBASEDPIPESTART_IRQ	Video window started on overlay. Used for Region-based feature.
VIDREGIONBASEDPIPEEND_IRQ	Video window ended on overlay. Used for Region-based feature.

The second level of interrupts for WB pipeline is controlled through the [DISPC_WB_IRQENABLE](#) and [DISPC_WB_IRQSTATUS](#) registers.

Table 9-26. DISPC Interrupts - Second Level - WB Pipeline

Interrupt Name	Description
WBUNCOMPLETEERROR_IRQ	The WB pipe is reset before all data of the frame currently written back are output to the system memory.
WBBUFFEROVERFLOW_IRQ	Write-back DMA buffer Overflow. The output Write-back DMA buffer goes overflow. It can not occur when write-back channel is used in memory to memory transfer mode, but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory to memory mode, there is timing constraint.
WBREGIONBASEDEVENT_IRQ	For Write-back region-based feature, event indicating end of current window.
WBSYNC_IRQ	Indicates that Write-back has synced to new configuration (configuration copied from shadow registers to work).
WBFRAMEDONE_IRQ	FrameDone interrupt for WriteBack. Indicates that the WB frame has been completely flushed out of WB-DMA.

The second level of interrupts for VP1 output is controlled through the [DISPC_VP1_IRQENABLE](#) and [DISPC_VP1_IRQSTATUS](#) registers.

Table 9-27. DISPC Interrupts - Second Level - VP1 Output

Interrupt Name	Description
FRAMEDONE_IRQ	Frame Done for VP1 output. After disabling the VP output of the DISPC, the interrupt is set when the active frame related to the VP has completed.
VSYNC_IRQ	VSYNC for VP1 output: VSYNC interrupt for the VP1 has occurred at the end of the frame.
VSYNC_ODD_IRQ	VSYNC for odd field. VSYNC_ODD interrupt has occurred at the end of the frame(EVSYNC received and the field polarity is odd).
PROGRAMMEDLINENUMBER_IRQ	Programmed line number: The VP1 has reached the user programmed line number.
SYNCLOST_IRQ	Synchronization lost on VP1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (VP1 output).

9.2.4.5 DISPC DMA Requests

The DISPC DMA request signal, DISPC_DREQ, is not a classical one, but rather a synchronization signal between the DISPC and device DMA controller. The device DMA controller is informed that a programmable number of lines are output to the VP1 and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER_IRQ described in [Table 9-27](#). This allows the device DMA controller channel to be synchronized with the internal DMA controller of the DISPC.

In other words, it allows synchronizing a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DISPC_DREQ request is generated at a programmable line number defined in the [DISPC_VP1_LINE_NUMBER\[11:0\]](#) LINENUMBER bit field. This process allows an application to use a single frame buffer and to update it after a certain number of lines are read by the DISPC.

9.2.4.6 DISPC DMA Engine

The DISPC DMA engine:

- Requests and supplies data from system memory to the GFX, VID1 and VID2 pipelines through the interconnect, based on the configuration of the DISPC and GFX/VID pipelines settings.
- Stores composed frames from GFX/VID pipelines or overlay managers to system memory through the WB pipeline and interconnect, based on the configuration of the DISPC and WB pipeline settings.
- Is fully programmable to support configuration with only 1D burst.

Each pipeline has a dedicated buffer and a channel with independent settings. [Table 9-28](#) lists the default size and allocation of the DMA buffer. Each DMA buffer is divided into two spaces, top and bottom. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each pipeline is from 0 (pipeline inactive) to the number of pipelines \times 2 (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of available spaces. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and system latency. The space assignments are done in the [DISPC_GLOBAL_BUFFER](#) register.

Table 9-28. DISPC DMA Buffer Size

Pipelines	DMA Buffer Size
GFX	4 lines \times 640 \times 128 bits
VID1	4 lines \times 640 \times 128 bits
VID2	4 lines \times 640 \times 128 bits
WB	4 lines \times 640 \times 128 bits

9.2.4.6.1 DISPC DMA Addressing and Bursts

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address
- Aligns the address
- Defines the burst structure:
 - Type of burst (1D only)
 - Length of the burst

The DMA engine generates scan addresses to read and write data to and from system memory. The base address defines the start address of the first pixel, and then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The ROW_INC registers of GFX/VID pipelines allow to access a frame using 1D bursts, but as a two-dimensional block by adding a fixed address offset at the end of a line. The ROW_INC can also be used to skip lines from the input frame. The byte address of each pixel in the frame buffer in the system memory is determined by:

$$\text{Pixel address} = \text{Base address} + x \times \text{bpp} + (y \times ((\text{width} \times \text{bpp}) + \text{increment}))$$

where:

- Base address corresponds to the base address (for YUV–NV12 or YUV4:2:0–NV21 format) defined by:
 - [DISPC_GFX1_BA_j\[31:0\]](#) BA bit fields
 - [DISPC_VID_BA_j\[31:0\]](#) BA bit fields
 - [DISPC_VID_BA_UV_j\[31:0\]](#) BA bit fields
- bpp corresponds to the number of bits per pixel defined by the [DISPC_GFX1_ATTRIBUTES\[6:1\]](#) FORMAT bit field or the [DISPC_VID_ATTRIBUTES\[6:1\]](#) FORMAT bit field.
- width corresponds to the number of pixels per line defined by the [DISPC_GFX1_SIZE\[11:0\]](#) SIZEX + 1 bit field or [DISPC_VID_SIZE\[11:0\]](#) SIZEX + 1 bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by the [DISPC_GFX1_ROW_INC\[31:0\]](#) ROWINC – 1 bit field or the [DISPC_VID_ROW_INC\[31:0\]](#) ROWINC – 1 bit field.
- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

NOTE: For YUV420–NV12 or YUV420–NV21 format, the pixel values are defined in two buffers (Y and UV). The base address of the Y buffers is defined in the [DISPC_VID_BA_j\[31:0\]](#) BA bit field. The base address of the UV buffers is defined in the [DISPC_VID_BA_UV_j\[31:0\]](#) BA bit field.

In case of interlaced mode, [DISPC_VID_BA_0](#) and [DISPC_VID_BA_UV_0](#) registers define the base address of the even field, and [DISPC_VID_BA_1](#) and [DISPC_VID_BA_UV_1](#) registers define the base address of the odd field.

[Table 9-29](#) summarizes the register settings for a simple access of a picture in the system memory.

Table 9-29. DISPC Register Settings for Accessing Image in Internal Memory

Registers	Value
DISPC_GFX1_BA_j/DISPC_VID_BA_j/DISPC_WB_BA_j	PBA, the physical base address of image in the memory
DISPC_VID_BA_UV_j/DISPC_WB_BA_UV_j	PBA, the physical base address of UV buffers image in the memory
DISPC_GFX1_PIXEL_INC/DISPC_VID_PIXEL_INC	1 or other in pixel incremental value
DISPC_GFX1_ROW_INC/DISPC_VID_ROW_INC	1 or other in row incremental value

An interconnect request (128 bits) corresponds to one or several pixels, depending on the bits per pixel. Therefore, the DMA engine determines the appropriate burst sequence to optimize the fetching/storing of each new line. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports only 1D burst. 1D burst is used, if the fetch/storage is linear in memory. The size of the burst can be one of the following values: 1x128bit, 2x128-bit, 4x128-bit or 8x128-bit. The default burst size at reset time is 8 × 128 bits. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue one or more smaller burst requests.

9.2.4.6.2 DISPC DMA Buffers

9.2.4.6.2.1 DISPC READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3_MAIN interconnect. Enabling or disabling the DISPC flushes the DMA buffers (except the WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3_MAIN interconnect.

- When low threshold (set in the [DISPC_GFX1_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD or [DISPC_VID_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3_MAIN interconnect to fill the DMA buffer.
- When high threshold (set in the [DISPC_GFX1_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD or [DISPC_VID_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.

NOTE: The following limitations on [DISPC_VID_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD must be considered:

- If VID scaler is disabled, BUFLOWTHRESHOLD can be programmed as low as interconnect latency and pixel output rate allow it
 - If VID scaler is enabled, BUFLOWTHRESHOLD must be programmed to guarantee that at least four full lines can be stored
-

To avoid underflow at the beginning of a frame and have sufficient encoded pixel data to start some processing, a preloading of the DMA buffer is configurable between a fixed value of bytes or the high threshold value. The preload ensures a minimum number of pixels present in the buffer. When the preload value is reached, the associated channel must start pulling pixels out of the DMA buffer. To enable the preload based on the value entered in the [DISPC_GFX1_PRELOAD\[11:0\]](#) PRELOAD or [DISPC_VID_PRELOAD\[11:0\]](#) PRELOAD bit field, the [DISPC_GFX1_ATTRIBUTES\[11\]](#) BUFPRELOAD bit or the [DISPC_VID_ATTRIBUTES\[19\]](#) BUFPRELOAD bit must be set to 0x0.

NOTE: When self-refresh mode is selected, meaning the data in the DMA buffers are used for multiple frames, and at the end of each frame, the DMA buffers are not flushed.

9.2.4.6.2.2 DISPC WRITE DMA Buffer (WB Pipeline)

Two modes are supported by the WB channel, selectable through the [DISPC_WB_ATTRIBUTES\[19\]](#) WRITEBACKMODE bit:

- Capture mode, WRITEBACKMODE bit set to 0: The OVR1 output, connected to external interface, is captured and at the same time the data are sent on the VP1 output. The WB timings are controlled by the VP1 timings. The output of a VID/GFX pipeline is not sent to the write back, when the WB pipeline is connected to an overlay used in capture mode.
- Memory-to-memory mode, WRITEBACKMODE bit set to 1: One of the overlay outputs or one of the pipeline outputs is captured to perform a memory-to-memory transfer, with some processing by the DISPC (rescaling, overlaying, color space conversion, etc.).

In capture mode: The DMA engine starts storing data to memory through the L3_MAIN-based interconnect as soon as enough data is available for the programmed burst size. When enabling/disabling the DISPC, the DMA buffer is flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

NOTE: In WB capture mode, if a new frame starts before the WB DMA buffers contents are fully written onto external memory, then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). The [DISPC_WB_IRQSTATUS\[1\]](#) WBUNCOMPLETEERROR_IRQ interrupt bit indicates this situation and triggers every frame. The WBUNCOMPLETEERROR interrupt can be enabled through the [DISPC_WB_IRQSTATUS\[1\]](#) WBUNCOMPLETEERROR_EN register bit.

In memory-to-memory mode: The WB pipeline is not synchronized to any internal or external timing generator. The WB pipeline stores the output of one of the overlay outputs or one of the pipelines. When enabling or disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

Programmable high and low thresholds are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

- When high threshold (set in the [DISPC_WB_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit

field) is reached, the DMA engine starts sending data on the L3_MAIN interconnect to empty buffer.

- When low threshold (set in the [DISPC_WB_BUF_THRESHOLD](#)[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine stops sending encoded pixels.

At the end of the frame, to completely drain the DMA buffer, some smaller bursts (even single requests) must be issued. To limit the number of interconnect requests from the DISPC, a number of IDLE cycles between requests can be inserted. IDLE cycles can be inserted only when WB is used in memory-to-memory mode. It is ignored when WB is in capture mode.

The number of IDLE cycles between requests can be activated and determined by:

- Setting the [DISPC_WB_ATTRIBUTES](#)[27] IDLESIZE bit to 0x0 (default value) and entering the number of idles between requests in the [DISPC_WB_ATTRIBUTES](#)[31:28] IDLENUMBER bit field. Idle numbers vary from 0 to 15.
- Setting the [DISPC_WB_ATTRIBUTES](#)[27] IDLESIZE bit to 0x1, which considers the size of the burst to determine the number of IDLE cycles. In this case, the number of IDLE cycles equals IDLENUMBER × 8 (0 to 120).

9.2.4.6.3 DISPC DMA MFLAG Mechanism and Arbitration

The MFLAG mechanism allows a dynamic increase of the priority of DISPC real-time traffic, when required, based on the fullness of the DISPC DMA read and write buffers.

The mechanism is implemented for all DMA buffers (GFX, VID1, VID2, and WB).

Programmable buffer thresholds (hysteresis) for each pipeline are used to indicate when the local MFLAG signal for each pipeline is generated. All local MFLAG signals are OR-ed to generate a single DSS MFLAG out band signal, which is provided to the L3 interconnect for granting OCP requests. The out band DSS MFLAG signal is asynchronous to any ongoing OCP transaction.

The threshold for each pipeline corresponds to the fullness of the associated DMA buffer, and is defined by two threshold parameters:

- HT_MFLAG: High threshold.
 - For read access from the GFX, VID1 and VID2 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
 - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
 - This threshold can be programmed in the following bit fields:
 - For the GFX pipeline in the [DISPC_GFX1_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
 - For the VID pipelines in the [DISPC_VID_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit fields
 - For the WB pipeline in the [DISPC_WB_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
- LT_MFLAG: Low threshold.
 - For read access from the GFX, VID1 and VID2 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
 - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
 - This threshold can be programmed in the following bit fields:
 - For the GFX pipeline in the [DISPC_GFX1_MFLAG_THRESHOLD](#)[15:0] LT_MFLAG bit field
 - For the VID pipelines in the [DISPC_VID_MFLAG_THRESHOLD](#)[15:0] LT_MFLAG bit fields
 - For the WB pipeline in the [DISPC_WB_MFLAG_THRESHOLD](#) [15:0] LT_MFLAG bit field

By default, the MFLAG mechanism is disabled ([DISPC_GLOBAL_MFLAG_ATTRIBUTE](#)[1:0] MFLAG_CTRL bit field = 0x0), and the DSS MFLAG out band signal is low (de-asserted). The arbitration scheme for the DISPC pipelines is the same as described in [Section 9.2.4.6.5, DISPC Arbitration](#). That is, round-robin either between high-priority pipelines, or between normal-priority pipelines (if all pipelines are of normal priority).

When the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field is set to 0x2, the MFLAG mechanism is enabled, and the DSS MFLAG out band signal is dynamically set to 0 or 1, depending on DMA buffers fullness and programmed threshold levels, as explained previously in this section. In this case, the arbitration scheme for DISPC pipelines is round-robin between those high-priority pipelines, which have asserted local MFLAG signals. If there are no high-priority pipelines with asserted local MFLAG signals, then the arbitration scheme is the same as described in [Section 9.2.4.6.5](#), *DISPC Arbitration*.

The [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[2\]](#) MFLAG_START bit defines additional rules for the MFLAG mechanism:

- If the MFLAG_START bit is set to 0x0 (default value), then in the beginning of the frame when the DMA buffer is empty, the local MFLAG signal of each pipeline is kept at 0 until PRELOAD is reached (for more information on preloading, see [Section 9.2.4.6.2.1](#), *DISPC READ DMA Buffers (GFX and VID Pipelines)*). Then, based on the setting of the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field, the MFLAG signal is generated and internal logic is arbitrating between pipeline requests.
- If the MFLAG_START bit is set to 0x1, then even in the beginning of the frame when the DMA buffer is empty, the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field defines the generation of the MFLAG signal for each pipeline.

9.2.4.6.4 DISPC DMA Predecimation

The predecimation process consists of downscaling an image by fetching only the necessary pixels in the memory. Vertical and horizontal predecimation are possible:

- Vertical predecimation: The picture stored in memory can be predecimated vertically by skipping lines. Burst mode is used to fetch the data when skipping lines. Only the lines that will be used by the DISPC are fetched from memory; the other lines are skipped. The DMA engine sends requests only for the useful lines using 1D burst. The base address indicates the first valid pixel to fetch from memory. The number of lines to skip is set in the [DISPC_GFX1_ROW_INC\[31:0\]](#) ROWINC or [DISPC_VID_ROW_INC\[31:0\]](#) ROWINC bit field.
- Horizontal predecimation: When fetching data from memory, it is possible to skip 1 of 2 pixel data containers, up to 1 of 2047 pixel data containers, by setting the [DISPC_GFX1_PIXEL_INC\[7:0\]](#) PIXELINC or [DISPC_VID_PIXEL_INC\[7:0\]](#) PIXELINC bit field to the number of pixel data containers to skip (n), multiplied by the size of a pixel data container (in bytes), + 1. See the following note for more details.

NOTE: The restriction to horizontal predecimation is that there is at least one useful pixel per 128-bit request. In that case, the DMA engine uses burst mode instead of singles to optimize the requests in terms of latency and SDRAM efficiency.

No decimation is supported when the input format is 1, 2, 4, or 8-bit BITMAP.

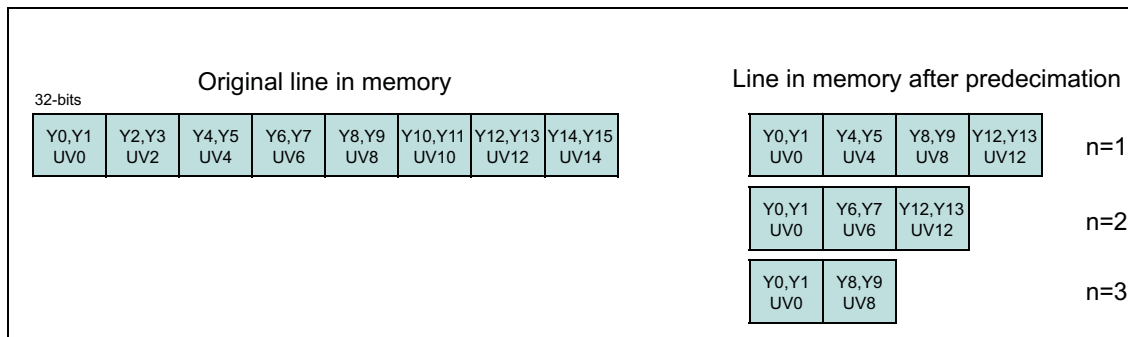

For RGB and YUV4:2:0 data formats, each pixel data container in memory holds 1 pixel. Thus, when configuring the PIXELINC bit field, the value of n equals the number of pixels to skip:

- For RGB format, one pixel data container = 32 bits = 1 pixel
- For YUV format:
 - One Y pixel data container = 8 bits = 1 pixel
 - One UV pixel data container = 16 bits = 1 pixel

For YUV4:2:2 format, each 32-bit pixel data container holds the Luma components for 2 pixels, and the Chrominance component of 1 pixel (see [Figure 9-25](#)). Therefore, for the valid values of the PIXELINC bit field in the case of the following YUV4:2:2 format, caution must be taken because n equals the number of pixel data containers to skip, not the number of pixels:

- For n = 1, PIXELINC = 5
- For n = 2, PIXELINC = 9
- For n = 3, PIXELINC = 13
- For n = 4, PIXELINC = 17, etc.

Figure 9-25. DISPC YUV4:2:2 Predecimation

dispc-094

9.2.4.6.5 DISPC DMA Arbitration

The requests (reads or writes) sent to the L3_MAIN interconnect are pipelined and arbitrated in a round-robin scheme. The default arbitration scheme must be modified by setting the priority attribute of each pipeline as defined in the following bits:

- [DISPC_GFX1_ATTRIBUTES\[14\] ARBITRATION](#)
- [DISPC_VID_ATTRIBUTES\[14\] ARBITRATION](#)
- [DISPC_WB_ATTRIBUTES\[14\] ARBITRATION](#)

By default, all pipelines have the same priority (normal), which means all pipeline requests are treated in a round-robin order manner. If one or more pipelines require a higher number of requests going to the L3_MAIN interconnect, its priority can be moved up to high priority. In this case, the high-priority pipeline is granted access before any pipeline in normal priority. If more than one active pipeline is in high priority, the behavior is the same as all active pipelines in normal priority. Normal active pipelines are not treated until all high active pipelines are finished. The ARBITRATION bit cannot be modified during the entire frame.

This functionality balances the bandwidth of the pipeline depending on its constraint. It can be used to give higher priority to the pipelines with real-time constraints versus non-real-time pipelines. For example, pipelines associated with the WB (used in memory-to-memory mode) must have lower priority than the pipelines associated with VP1 output.

9.2.4.6.6 DISPC DMA Power Modes

9.2.4.6.6.1 DISPC DMA Low-Power Mode

Each DMA buffer is divided into two spaces. Each space can be associated with the pipeline or merged with other DMA buffers. The total number of DMA buffers for each pipeline is from 0 (pipeline inactive) to the number of pipelines \times 2 (in that case all the DMA buffers are associated with a single pipeline). The sum of the number of DMA buffers allocated for each pipeline must not be greater than the maximum available. The correct number of DMA buffers must be allocated to ensure no underflow. The number of DMA buffers allocated to each pipeline must be greater than or equal to the minimum required to support the throughput and the system latency.

NOTE: When the number of buffers is changed, the thresholds must be reprogrammed to reflect the new configuration of the DMA buffer.

9.2.4.6.6.2 DISPC DMA Ultralow-Power Mode

In low-power mode, the L3_MAIN interconnect is used to fill up the DMA buffers to store all the data required to display a full frame. The L3_MAIN interconnect is not used to fetch new pixels for the following frames. The data in the DMA buffer are reused to display on the screen.

The setting of the mode is independent for each pipeline. One pipeline may have all the frame pixels in its DMA buffer and the other pipelines may have to refill their respective DMA buffers along the display scan because the frame buffer is too big to be stored in the DMA buffer.

The DMA buffers can be merged to optimize the L3_MAIN interconnect off time. Merging the DMA buffers into a single buffer can be used at the same time to improve ultralow-power mode (see [Section 9.2.4.6.6.1, Low-Power Mode](#)).

During the time in which the frames are fetched in the internal DMA buffer, MStandby must be asserted if the `DISPC_SYSCONFIG[13:12] MIDDLEMODE` bit field is set to 0x2 (smart-standby mode).

Two ultralow-power modes can be entered manually or automatically:

- Self-refresh mode: Starting self-refresh mode is done manually by setting the `DISPC_GFX1_ATTRIBUTES[15] SELFREFRESH` or `DISPC_VID_ATTRIBUTES[15] SELFREFRESH` bit to 0x1 after capturing a frame in the DMA buffers. Self-refresh mode is stopped by setting the `SELFREFRESH` bit to 0x0.
- Automatic self-refresh mode: By setting the `DISPC_GFX1_ATTRIBUTES[17] SELFREFRESHAUTO` or `DISPC_VID_ATTRIBUTES[17] SELFREFRESHAUTO` bit to 0x1, the transition from off to on self-refresh mode is done by hardware after capturing the first frame. The hardware reflects the status of the self-refresh mode by setting the `SELFREFRESH` bit to 0x1, which means that the data are read inside the DMA buffer without accessing the interconnect and system memory during the frame. Setting the `SELFREFRESH` bit to 0x0 updates the DMA buffer.

NOTE: The WB pipeline does not support ultralow-power mode.

9.2.4.7 DISPC Memory Formats

The graphic, video and write-back pipelines support various types of memory formats. [Table 9-30](#) lists all supported formats for each pipeline.

For the BITMAP formats in GFX pipeline the nibble mode can be enabled by setting the `DISPC_GFX1_ATTRIBUTES[7] NIBBLEMODE` bit to 0x1. For VID pipelines the nibble mode can be selected in `DISPC_VID_ATTRIBUTES[10] NIBBLEMODE` register bit.

Table 9-30. DISPC Memory Formats Supported

Formats	GFX	VID1	VID2	WB
BITMAP 1-bpp	x	x	x	
BITMAP 2-bpp	x	x	x	
BITMAP 4-bpp	x	x	x	
BITMAP 8-bpp	x	x	x

9.2.4.8 DISPC Graphics Pipeline

The input port of the graphics pipeline (GFX) is connected to the graphics DMA buffer controller. The output port of the GFX pipeline is connected to the overlay managers or WB pipeline. The pixel output is directed to the OVR1, OVR2 or WB path by setting the `DISPC_GFX1_ATTRIBUTES[8] CHANNELOUT` bit. [Table 9-41](#) lists the bit field settings to orient a pipeline to OVR1, OVR2 or WB output. The default value directs the GFX pipeline to OVR1. The GFX pipeline can be enabled by setting the `DISPC_GFX1_ATTRIBUTES[0] ENABLE` bit to 0x1.

- NOTE:** It is not possible to change the direction of the GFX pipeline on the fly. If the graphics pipeline must be connected to an overlay manager different from the one to which it is currently connected, then the following steps must be performed:
1. Disable the GFX pipeline by setting the `DISPC_GFX1_ATTRIBUTES[0] ENABLE` bit to 0x0.
 2. Direct the GFX pipeline to the new overlay manager by modifying the `DISPC_GFX1_ATTRIBUTES[8] CHANNELOUT` bit.
 3. Disable the DISPC output which corresponds with the overlay manager to which the GFX pipeline will be connected next. This is done by setting the in the following bits to 0x0 for the listed outputs:
 - The `DISPC_VP1_CONTROL1[0] VPENABLE` bit for VP1 output
 4. Enable the GFX pipeline by setting the `DISPC_GFX1_ATTRIBUTES[0] ENABLE` bit to 0x1.
 5. Enable the DISPC output that corresponds with the overlay manager to which the GFX pipeline will be connected. This is done by setting the following bits to 0x1 for the listed outputs:
 - The `DISPC_VP1_CONTROL1[0] VPENABLE` bit for VP1 output

The pipeline contains replication logic, an anti-aliasing filter, and one 256-entry Color Look-up Table (CLUT). The anti-aliasing filter processes the graphics data in RGB format to remove some of the vertical aliasing. The replication logic is used to convert the RGB, ARGB, RGBA pixel formats into ARGB48 format. The 256-entry CLUT is used to convert BITMAP (1, 2, 4, or 8-bit indexed formats) into RGB format.

NOTE: The GFX pipeline does not include a scaler.

Table 9-30 lists the input formats supported by the graphics pipeline.

Figure 9-26 shows the graphics pipeline.

Figure 9-26. DISPC Graphics Pipeline

9.2.4.8.1 DISPC GFX Replication Logic

The replication logic (RGB expansion) increases the color depth of the graphics-encoded pixels (from true color RGB 12 and 16, to 48 bpp).

- The replication logic is always enabled, and the MSBs are copied to the missing LSBs. Table 9-31 describes the remapping of the RGB pixels into ARGB 48-bit values.

Table 9-31. DISPC GFX Replication: RGB Pixel Formats Remapping Into ARGB48-12.12.12.12

Format	A[11:0]	R[11:0]	G[11:0]	B[11:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB

9.2.4.8.2 DISPC GFX Anti-Aliasing Filter

The anti-aliasing filter processes the graphics data to remove some of the vertical aliasing. It is based on a 3-tap FIR filter with fixed coefficients. For each pixel to be output from the graphics pipeline, the pixel above and below the current line must be read from the DMA graphics FIFO. Therefore, three lines of pixels must be stored in the DMA graphics FIFO.

The anti-aliasing equations for A, R, G, and B components are:

$$A_{out}(x,y) = 0.25 \times A_{in}(x,y - 1) + 0.5 \times A_{in}(x,y) + 0.25 \times A_{in}(x,y + 1)$$

$$R_{out}(x,y) = 0.25 \times R_{in}(x,y - 1) + 0.5 \times R_{in}(x,y) + 0.25 \times R_{in}(x,y + 1)$$

$$G_{out}(x,y) = 0.25 \times G_{in}(x,y - 1) + 0.5 \times G_{in}(x,y) + 0.25 \times G_{in}(x,y + 1)$$

$$B_{out}(x,y) = 0.25 \times B_{in}(x,y - 1) + 0.5 \times B_{in}(x,y) + 0.25 \times B_{in}(x,y + 1)$$

For the first line of processing, because there is no pixel above, the value (x,y) is duplicated.

$$Out(x,y) = 0.25 \times In(x,y) + 0.5 \times In(x,y) + 0.25 \times In(x,y + 1)$$

For the last line of processing, because there is no pixel below, the value (x,y) is duplicated.

$$Out(x,y) = 0.25 \times In(x,y-1) + 0.5 \times In(x,y) + 0.25 \times In(x,y)$$

NOTE: Anti-aliasing filtering is supported only in RGB formats and not in BITMAP formats.

Anti-aliasing is not supported for pictures with fewer than two lines. In this case, the user must disable the anti-aliasing processing.

By default, the anti-aliasing filtering is disabled. It can be enabled by setting the [DISPC_GFX1_ATTRIBUTES\[24\]](#) anti-aliasing bit to 0x1.

9.2.4.8.3 DISPC GFX Color Look-Up Table (CLUT)

The graphics pipeline supports conversion of BITMAP formats (1, 2, 4, or 8-bit indexed) into RGB24 format through a Color Look-Up Table (CLUT).

The look-up table consists of 3 separate 256 x 8-bit memories and is indexed by the source BITMAP data. The table is loaded through direct register access by writing to [DISPC_GFX1_CLUT](#) register.

The sequence to load the table is:

1. SW writes (only writes are supported) 32-bit values using single access, or burst access in linear increment burst mode, into [DISPC_GFX1_CLUT](#) register. The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table (see [Figure 9-27](#)).
2. Loop to Step 1, if there is a new access to the CLUT register. The SW can access other registers between two accesses to the CLUT register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

The usage of the CLUT is activated when a BITMAP format is selected in the [DISPC_GFX1_ATTRIBUTES\[6:1\]](#) FORMAT register bit-field.

Figure 9-27. DISPC GFX CLUT Data Memory Organization

9.2.4.9 DISPC Video Pipelines

Two identical video pipelines are available, VID1 and VID2. Each video pipeline is connected to the video DMA buffer controller for the input port, and to the overlay managers or WB pipeline. The pixel output is directed to the OVR1, OVR2 or WB path by configuring the [DISPC_VID_ATTRIBUTES\[16\]](#) CHANNELOUT register bit. [Table 9-41](#) summarizes the bit field settings to orient a pipeline to the OVR1, OVR2 or VP1 output. The default value directs all video pipelines to OVR1.

NOTE: It is not possible to change the direction of the video pipelines on the fly. If a video pipeline needs to be connected to a different overlay manager than what it is currently connected, then the following steps need to be performed:

1. Disable the VIDp pipeline by setting the `DISPC_VID_ATTRIBUTES[0]` ENABLE bit to 0x0.
2. Direct the VIDp pipeline to the new overlay manager by modifying the [16] CHANNELOUT bit in the `DISPC_VID_ATTRIBUTES` register.
3. Disable the DISPC output that corresponds with the overlay manager to which the VIDp pipeline will be connected next. This is done by setting the following bits to 0x0 for the listed outputs:
 - The `DISPC_VP1_CONTROL1[0]` VPENABLE bit for VP1 output
4. Enable the VIDp pipeline by writing 0x1 to the `DISPC_VID_ATTRIBUTES [0]` ENABLE bit.
5. Enable the DISPC output that corresponds with the overlay manager to which the VIDp pipeline will be connected next. This is done by setting the following bits to 0x1 for the listed outputs:
 - The `DISPC_VP1_CONTROL1[0]` VPENABLE bit for VP1 output

A video pipeline consists of a scaler unit, color space conversion (CSC) unit, VC-1 range mapping unit, one 256-entry Color Look-up Table (CLUT), and some programmable replication logic. The order of the video pipeline unit is configured like follows (see [Figure 9-28](#)):

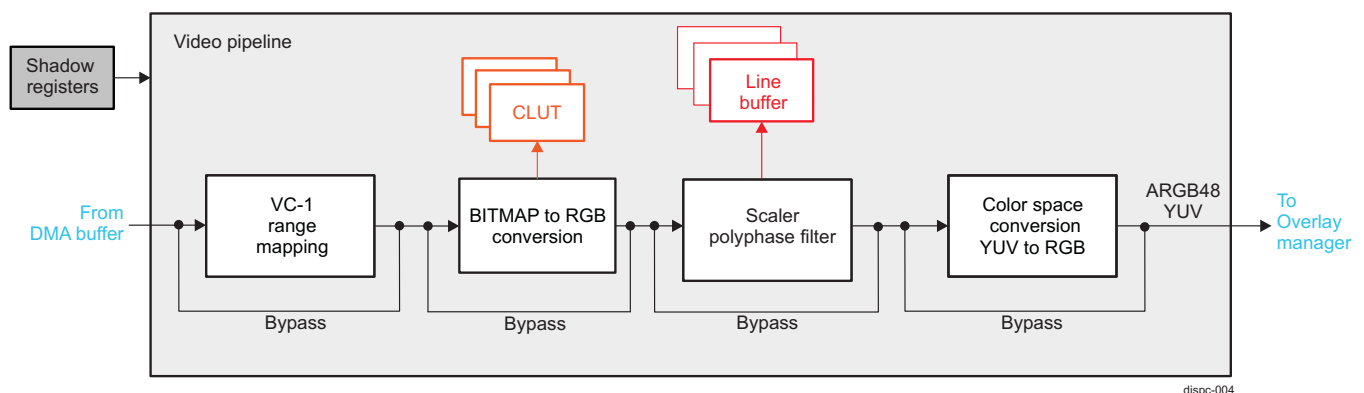

- VC-1 range mapping unit, followed by a color look-up table, then a scaler unit and then a CSC unit. The configuration is used to support RGB, ARGB, and RGBA formats, YUV4:2:2 and YUV420-NV12 (NV21) formats, taking advantage of the scaler to resample the chrominance using five taps horizontally and three or five taps vertically. Each block can be independently bypassed. The 256-entry CLUT is used to convert BITMAP (1, 2, 4, or 8-bit indexed formats) into RGB format.

NOTE: For a BITMAP format data, scaling is not supported. Scaling and color look-up table features are mutually exclusive. If color look-up feature is enabled, then video pipeline scaler has to be disabled.

[Table 9-30](#) lists the input formats supported by the video pipelines.

The video pipeline is enabled by setting the `DISPC_VID_ATTRIBUTES[0]` ENABLE bit to 0x1.

Figure 9-28. DISPC Video Pipeline Configuration

9.2.4.9.1 DISPC VID Replication Logic

The replication logic (RGB expansion) is used to convert the ARGB pixels into ARGB48 format.

Table 9-32. DISPC VID Replication: ARGB Pixel Formats Remapping Into ARGB48-12121212

RGBA16-4444	A[3:0]A[3:0]A[3:0]	R[3:0]R[3:0]R[3:0]	G[3:0]G[3:0]G[3:0]	B[3:0]B[3:0]B[3:0]

9.2.4.9.2 DISPC VID VC-1 Range Mapping Unit

The VC-1 range mapping unit is used when the video frame picture is decoded using a VC-1 codec by the video accelerator. It remaps the Y, Cb, and Cr components. The unit is used primarily for YUV4:2:0-NV12 (NV21) pixel format, but also can be applied to YUV4:2:2 pixel formats (YUV2 and UYVY).

The VC-1 range mapping unit is enabled by setting the `DISPC_VID_ATTRIBUTES2[0]` VC1ENABLE bit to 0x1. The `DISPC_VID_ATTRIBUTES2[3:1]` VC1_RANGE_Y and `DISPC_VID_ATTRIBUTES2[6:4]` VC1_RANGE_CBCR bit fields are two 3-bit values programmed by the user and are independent for each video pipeline. The module is governed by the equations:

$$Y_{out} = CLIP((((Y_{int} - 128) \times (VC1_RANGE_Y + 9) + 4) / 8) + 128)$$

$$C_b = CLIP((((C_b - 128) \times (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)$$

$$C_r = CLIP((((C_r - 128) \times (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)$$

NOTE: The input and output pixel values are unsigned (Y, Cr, and Cb).

The function CLIP () clips to 0 or 255 when minimum or maximum, respectively, are reached; otherwise, the resulting output remains identical.

9.2.4.9.3 DISPC VID Color Look-Up Table (CLUT)

The video pipelines support conversion of BITMAP formats (1, 2, 4, or 8-bit indexed) into RGB24 format through a Color Look-Up Table (CLUT).

The look-up table consists of 3 separate 256 x 8-bit memories and is indexed by the source BITMAP data. The table is loaded through direct register access by writing to `DISPC_VID_CLUT` register.

The sequence to load the table is:

1. SW writes (only writes are supported) 32-bit values using single access, or burst access in linear increment burst mode, into `DISPC_VID_CLUT` register. The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table (see [Figure 9-29](#)).
2. Loop to Step 1, if there is a new access to the CLUT register. The SW can access other registers between two accesses to the CLUT register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

The usage of the CLUT is activated when a BITMAP format is selected in the `DISPC_VID_ATTRIBUTES[6:1]` FORMAT register bit-field.

Figure 9-29. DISPC VID CLUT Data Memory Organization

9.2.4.9.4 DISPC VID CSC Unit YUV to RGB

The CSC unit converts the video-encoded pixel values from YUV4:4:4 format into RGB36 format (12-bit value per color component: red, green, and blue).

In case of YUV4:2:0 or YUV4:2:2 formats, a chrominance resampling to YUV4:4:4 is required before converting the YUV into RGB values (see [Section 9.2.4.9.4.1, Chrominance Resampling](#)). YUV4:2:2 or YUV4:2:0 to YUV4:4:4 chrominance resampling is a preprocessing to the color space conversion.

[Figure 9-30](#) through [Figure 9-31](#) show the 3 × 3 11-bit coefficients used to convert from YUV4:4:4 into RGB36. The coefficients are set according to the standard used to encode the pixel data in YUV color space. [Table 9-33](#) summarizes the coefficients with their respective register bit fields.

Table 9-33. DISPC VID Color Space Conversion YUV to RGB Register Bitfield Settings

Coefficients	Bit Field Registers
R _Y	DISPC_VID_CONV_COEF0[10:0] RY
R _{Cr}	DISPC_VID_CONV_COEF0[26:16] RCR
R _{Cb}	DISPC_VID_CONV_COEF1[10:0] RCB

G _{Cr}	DISPC_VID_CONV_COEF2[10:0] GCR
G _{Cb}	DISPC_VID_CONV_COEF2[26:16] GCB
B _Y	DISPC_VID_CONV_COEF3[10:0] BY
B _{Cr}	DISPC_VID_CONV_COEF3[26:16] BCR
B _{Cb}	DISPC_VID_CONV_COEF4[10:0] BCB
G offset	DISPC_VID_CONV_COEF5[31:19] GOFFSET
R offset	DISPC_VID_CONV_COEF5[15:3] ROFFSET
B offset	DISPC_VID_CONV_COEF6[15:3] BOFFSET

If the active range for the luminance samples (Y) is [256:3760] and [256:3840] for the chrominance samples (Cb and Cr), the range selection is done by setting the [DISPC_VID_ATTRIBUTES\[11\] FULLRANGE](#) bit to 0x0. The values of R, G, and B output components are clipped to the range [0:4095].

NOTE: The scaling and CSC clipping is set by the same bit, [DISPC_VID_ATTRIBUTES\[11\] FULLRANGE](#).

Figure 9-30. DISPC VID YCbCr to RGB Registers (FULLRANGE = 0), 12-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 256 \\ Cr_{IN} - 2048 \\ Cb_{IN} - 2048 \end{bmatrix}$$

dispc-005

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:4095], the range selection is done by setting the [DISPC_VID_ATTRIBUTES\[11\] FULLRANGE](#) bit to 0x1. The values of R, G, and B output components are clipped to the range [0:4095].

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 2048 \\ Cb_{IN} - 2048 \end{bmatrix}$$

dispc-006

9.2.4.9.4.1 DISPC VID Chrominance Resampling

The chrominance resampling is always performed using filtering (the scaler unit filter). Chrominance resampling and rescaling can be combined to support native rescaling of YUV format.

The usage of the scaler unit for resampling the chrominance of YUV4:2:0 and YUV4:2:2 is shown in Figure 9-32 and Figure 9-33, respectively. The settings of the scaler unit to perform chrominance resampling are described in Section 9.2.4.9.5, *DISPC Scaler Unit*.

Figure 9-32. DISPC VID YUV4:2:0 to RGB36 Using Scaler Unit for Resampling Chrominance

Figure 9-33. DISPC VID YUV4:2:2 to RGB36 Using Scaler Unit for Resampling Chrominance

9.2.4.9.5 DISPC VID Scaler Unit

All video formats are supported, including formats with alpha blending. Alpha blending is scaled with the same parameters as RGB color components. For the YUV formats, Y and Cb/Cr are processed independently. The filter is based on a finite impulse response (FIR) filter with 16 phases. The filter is a 5-tap for horizontal filtering, and can be configured for 3 or 5 taps for vertical filtering. The filtering can be used for different processing:

- Upsampling of the picture
- Downsampling of the picture
- Anti-aliasing reduction
- Chrominance resampling in case of YUV data formats

NOTE: The user must ensure that the resizing frame displays in the screen boundaries.

Figure 9-34 shows an example of video upsampling.

Figure 9-34. DISPC Video Upsampling

The upsampling/downsampling filter is a polyphase filter with 5 taps and 16 phases for the horizontal filter, and a programmable number of taps (3 or 5) and 16 phases for the vertical filter. The input buffer has six input memory lines. The following limitations must be considered:

- The upsampling ratio is up to x16.
- The downsampling ratio using 3-tap configuration is down to x0.5 for RGB format.
- The downsampling ratio using 5-tap configuration is down to x0.25 for RGB format.
- If the input format is changed from YUV4:2:2 to YUV4:2:0 (WB pipeline), the downsampling ratio is further reduced:
 - Using 5-tap configuration, the ratio is down to x0.5 for RGB format.
 - Using 3-tap configuration, no downscaling is available.
- Scaling capability of VID pipelines and WB pipeline can be combined to double the maximum rescaling factor.

For vertical upsampling and downsampling in a 3-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi) * A_{in}(n+i)) \gg 7$	$Y_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi_y) * Y_{in}(n+i)) \gg 7$
$R_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi) * R_{in}(n+i)) \gg 7$	$Cr_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\phi_c) * Cb_{in}(n+i)) \gg 7$
$G_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi) * G_{in}(n+i)) \gg 7$	$Cb_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\phi_c) * Cr_{in}(n+i)) \gg 7$
$B_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi) * B_{in}(n+i)) \gg 7$	

dispc-013

(9)

For vertical upsampling and downsampling in a 5-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi) * A_{in}(n+i) \right) \gg 7$ $R_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi) * R_{in}(n+i) \right) \gg 7$ $G_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi) * G_{in}(n+i) \right) \gg 7$ $B_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi) * B_{in}(n+i) \right) \gg 7$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi_y) * Y_{in}(n+i) \right) \gg 7$ $Cb_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cb_{in}(n+i) \right) \gg 7$ $Cr_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cr_{in}(n+i) \right) \gg 7$
--	---

dispc-012 (10)

For horizontal upsampling and downsampling in a 5-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * A_{in}(n+i) \right) \gg 7$ $R_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * R_{in}(n+i) \right) \gg 7$ $G_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * G_{in}(n+i) \right) \gg 7$ $B_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * B_{in}(n+i) \right) \gg 7$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi_y) * Y_{in}(n+i) \right) \gg 7$ $Cb_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hci}(\Phi_c) * Cb_{in}(n+i) \right) \gg 7$ $Cr_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hci}(\Phi_c) * Cr_{in}(n+i) \right) \gg 7$
--	---

dispc-014 (11)

NOTE: The pixel (n + 1) is the previous pixel with respect to pixel (n). The line (n + 1) is the previous line with respect to line (n).

The coefficients Ci() depend on the phase between input and output pixels.

NOTE: The coefficients are different for Y and Cr, Cb filtering because the calculations are independent due to the chrominance resampling for YUV4:2:2 and YUV4:2:0.

First, the vertical filter is applied to the encoded input pixel data, and then the horizontal filter is applied on the resulting pixel values to generate the output pixel values. The vertical input of the filter consists of six lines of 1280 × 32 bits for 5-tap configurations (see Table 9-34). In case of 3-tap configuration, the scaler input width capability is extended to 2560 pixels wide.

Table 9-34. DISPC VID Line Buffer Width for Scaler Unit

Vertical Taps	Maximum Input Width (Pixels)
3	2560
5	1280 ⁽¹⁾

⁽¹⁾ For the 5-tap configuration, the 6th video line is used on the output of the horizontal scaler, so that horizontal down-scaling can be supported with a minimum clock ratio equal to 1. The maximum output width is limited to 1280 pixels in order to be able to support clock ratio of 1 due to the 6th video line buffer.

At the beginning of frame scaling processing, the first line may be duplicated multiple times depending on the initial vertical phase programmed for the poly-phase filter.

At the end of frame scaling processing, the last line is duplicated if the scaling logic requires loading more lines and the last line has been reached.

Similarly, the first pixel may be duplicated multiple times depending on the initial horizontal phase programmed for the poly-phase filter. The last pixel is duplicated if the scaling logic requires loading more pixels and the last pixel has been reached.

The programmable coefficients of the polyphase filters are signed 10-bit values (except for the central coefficient, which is unsigned). The vertical video scaler has an 8-bit input and a 10-bit output. The vertical scaling changes the 8-bit input into a 10-bit clipped output, and the horizontal scaling takes the 10-bit input.

Figure 9-35 and Figure 9-36 show the scaler macro-architecture for the component A, R, G, B, and Y. Figure 9-37 and Figure 9-38 show the scaler macro-architecture for component Cr and Cb.

NOTE: The scaling and CSC clipping is set by the same bit, `DISPC_VID_ATTRIBUTES[11]` FULLRANGE.

NOTE: The table cells without color are duplicated from the grey cells.

Similar table approach applies to the vertical scaler (registers [DISPC_VID_FIR_COEF_V0_i](#) and [DISPC_VID_FIR_COEF_V12_k](#) are used).

Similar table approach applies to the coefficients for CbCr filtering in case of YUV format (registers [DISPC_VID_FIR_COEF_H0_C_i](#) and [DISPC_VID_FIR_COEF_H12_C_k](#), and [DISPC_VID_FIR_COEF_V0_C_i](#) and [DISPC_VID_FIR_COEF_V12_C_k](#)).

The VID scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC_VID_ATTRIBUTES\[8:7\]](#) RESIZEENABLE bit field.

A set of configurations must be valid before enabling the video upsampling and downsampling block.

The following fields define the configuration of the video upsampling downsampling block for VID pipelines:

- Vertical upsampling and downsampling increments the value of the [23:0] FIRVINC bit field in [DISPC_VID_FIRV](#) and [DISPC_VID_FIRV2](#) registers. The unsigned integer value range is 2^{23} . Software calculates the value using the following equation:

$$FIRVINC = 2^{21} * \left(\frac{MEMSIZEY+1}{SIZEY+1} \right)$$

dispc-066

(12)

- Horizontal upsampling and downsampling increments the value of the the [23:0] FIRHINC bit field in the [DISPC_VID_FIRH](#) and [DISPC_VID_FIRH2](#) registers. The unsigned integer value range is 2^{23} . Software calculates the value using the following equation:

$$FIRHINC = 2^{21} * \left(\frac{MEMSIZEH+1}{SIZEH+1} \right)$$

dispc-067

(13)

- Vertical up/downsampling accumulator value, [23:0] VERTICALACCU bit field in [DISPC_VID_ACCUV_j](#) and [DISPC_VID_ACCUV2_j](#) registers: The accumulator value indicates on which phase the vertical filtering starts. The register [DISPC_VID_ACCUV_0](#) is used for progressive output, and for interlace output [DISPC_VID_ACCUV_0](#) and [DISPC_VID_ACCUV_1](#) registers are used. Similarly, [DISPC_VID_ACCUV2_0](#) and [DISPC_VID_ACCUV2_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
- Vertical upsampling and downsampling line buffer configuration [DISPC_VID_ATTRIBUTES\[21\]](#)

VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.

- Horizontal upsampling and downsampling accumulator value, [23:0] HORIZONTALACCU bit field in [DISPC_VID_ACCUH_j](#) and [DISPC_VID_ACCUH2_j](#) registers: The accumulator value indicates on which phase the horizontal filtering starts. The register [DISPC_VID_ACCUH_0](#) is used for progressive output, and for interlace output the [DISPC_VID_ACCUH_0](#) and [DISPC_VID_ACCUH_1](#) registers are used. Similarly, [DISPC_VID_ACCUH2_0](#) and [DISPC_VID_ACCUH2_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.

[Table 9-36](#) lists the DISPC vertical and horizontal accumulator values and phases.

Table 9-36. DISPC VID Vertical and Horizontal Accumulator Phases

Accumulator Value (MSB bits)	Phases f
0	0
256 or -3840	1
512 or -3584	2
768 or -3328	3
1024 or -3072	4
1280 or -2816	5
1536 or -2560	6
1792 or -2304	7
2048 or -2048	8
2304 or -1792	9
2560 or -1536	10
2816 or -1280	11
3072 or -1024	12

3584 or -512	14
3840 or -256	15

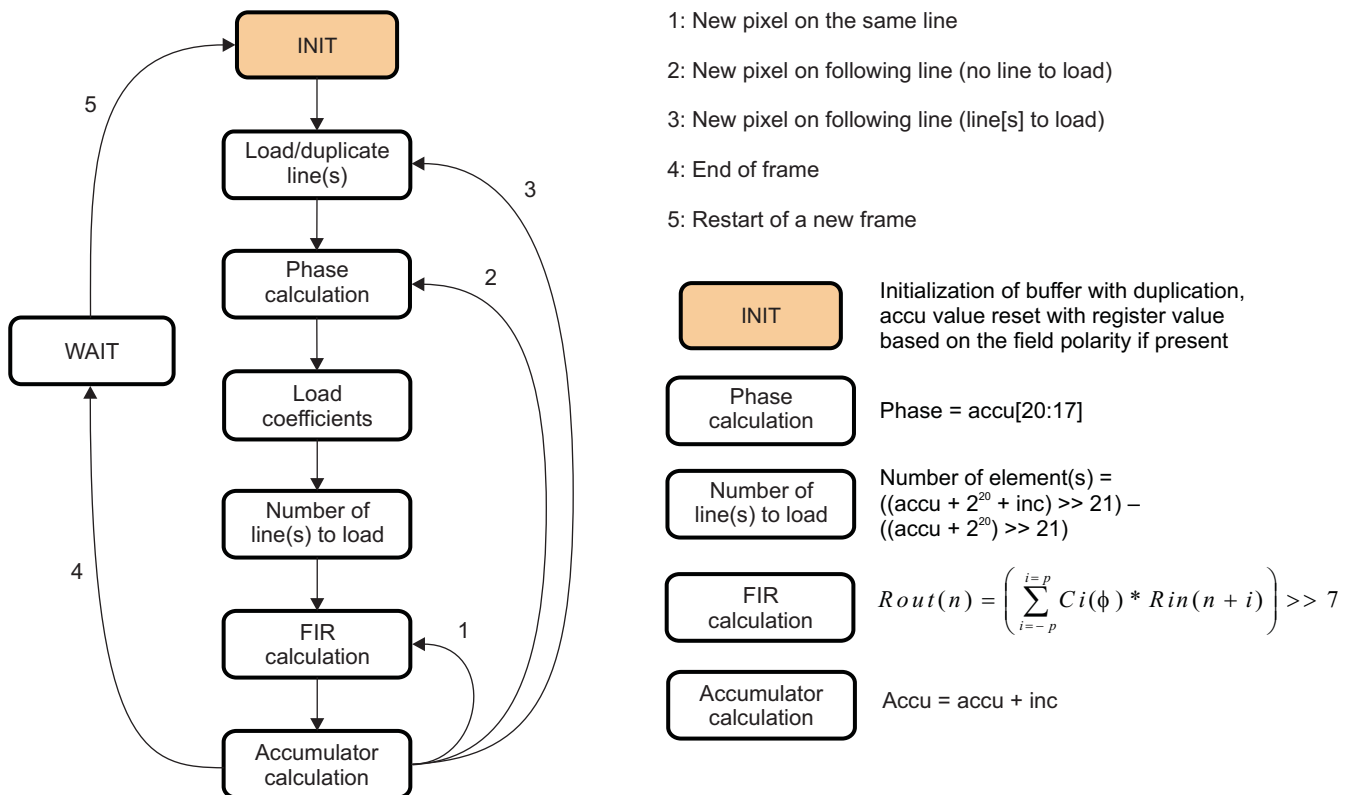

- Vertical upsampling and downsampling central coefficients:
 - The vertical upsampling and downsampling central coefficients are defined in the [DISPC_VID_FIR_COEF_V0_i](#) registers. There are 9 registers for the 16 phases with 1 coefficient for each of them. Symmetrical implementation is used, so only 9 coefficients are used. Each register contains one 10-bit unsigned coefficient (the central one).
 - Four YUV, the vertical upsampling and downsampling central coefficients are set in [DISPC_VID_FIR_COEF_V0_C_i](#) registers.
- Vertical upsampling and downsampling coefficients:
 - The vertical upsampling and downsampling coefficients are defined in the [DISPC_VID_FIR_COEF_V12_k](#) registers. There are 16 registers for the 16 phases with 2 coefficient for each of them, so a total of 32 programmable coefficients for the vertical up/down-sampling block. Each register contains two 10-bit signed coefficients.
 - Four YUV, the vertical upsampling and downsampling coefficients are set in [DISPC_VID_FIR_COEF_V12_C_k](#) registers.
- Horizontal upsampling and downsampling central coefficients:
 - The horizontal upsampling and downsampling central coefficients are defined in the [DISPC_VID_FIR_COEF_H0_i](#) registers. There are 9 registers for the 16 phases with 1 coefficient for each of them. Symmetrical implementation is used, so only 9 coefficients are used. Each register contains one 10-bit unsigned coefficient (the central one).
 - Four YUV, the horizontal upsampling and downsampling central coefficients are set in [DISPC_VID_FIR_COEF_H0_C_i](#) registers.
- Horizontal upsampling and downsampling coefficients:

- The horizontal upsampling and downsampling coefficients are defined in the [DISPC_VID_FIR_COEF_H12_k](#) registers. There are 16 registers for the 16 phases with 2 coefficient for each of them, so a total of 32 programmable coefficients for the horizontal up/down-sampling block. Each register contains two 10-bit signed coefficients.
- Four YUV, the horizontal upsampling and downsampling coefficients are set in [DISPC_VID_FIR_COEF_H12_C_k](#) registers.

9.2.4.9.5.1 DISPC Scaling Algorithms

Figure 9-39 and Figure 9-40 show details of the vertical and horizontal upsampling and downsampling finite state-machines (FSMs), respectively.

dispc-086

Figure 9-40 shows the horizontal up/downsampling FSM.

Figure 9-40. DISPC Horizontal Up/Downsampling Algorithm

- 1: New pixel (no pixel to load)
- 2: New pixel (pixel(s) to load)
- 3: End of line
- 4: Restart of a line

INIT	Initialization of buffer with duplication, accu value reset with register value based on the field polarity if present
Phase calculation	Phase = accu[20:17]
Number of line(s) to load	Number of element(s) = ((accu + 2 ²⁰ + inc) >> 21) - ((accu + 2 ²⁰) >> 21)
FIR calculation	$R_{out}(n) = \left(\sum_{i=-p}^{i=p} C_i(\phi) * R_{in}(n+i) \right) >> 7$
Accumulator calculation	Accu = accu + inc

dispc-087

9.2.4.9.6 DISPC VID Progressive to Interlace conversion

It is possible, in case of YUV420 format, to fetch only one out of two lines of the Y buffer and fetch all the CbCr lines in order to read a field (even lines, if the base address of the Y buffer points to an even line and odd lines, if it points to an odd line) from a YUV420 frame buffers (Y and CrCr buffers). The register configuration required is as follows:

- [DISPC_VID_ATTRIBUTES\[6:1\] FORMAT = 0x3D](#) (YUV420 NV12/NV21 format)
- [DISPC_VID_BA_j\[31\]](#) and [DISPC_VID_BA_UV_j\[31\]](#) = 0x0
- [DISPC_VID_ATTRIBUTES\[22\] DOUBLESTRIDE = 0x0](#)

9.2.4.10 DISPC Write-Back Pipeline

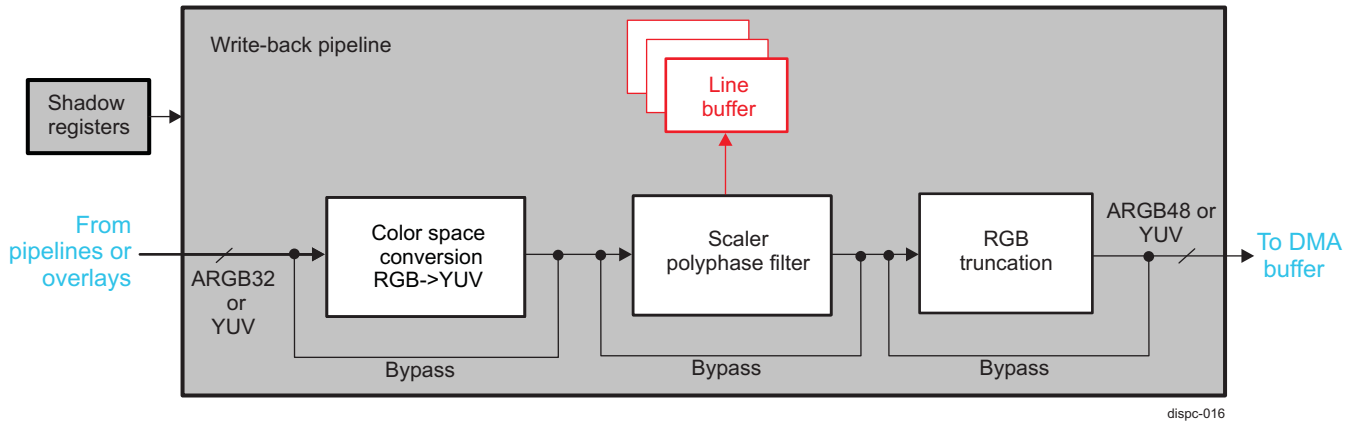

The write-back pipeline is used to store in the system memory the capture of one of the overlay outputs, or the output of one of the pipelines. The WB pipeline consists of a CSC unit, a scaler unit, and an RGB truncation logic. Because the overlay works on ARGB48 format and the video accelerator works on YUV format, the color space conversion from RGB to YUV is used to directly output to memory the format that can be encoded with no extra processing.

The write-back pipeline is connected to either one of the pipeline outputs (GFX, VID1 or VID2), or to one of the outputs of the overlay managers (OVR1 or OVR2). The input is selected by setting the [DISPC_WB_ATTRIBUTES\[18:15\] CHANNELIN](#) bit field, and the capture frame rate is set in the [DISPC_WB_ATTRIBUTES\[26:24\] CAPTUREMODE](#) bit field.

The output format of the overlay managers is ARGB48-12121212. The graphics pipeline output is ARGB48. The video pipeline outputs are YUV4:2:2, YUV4:2:0, or ARGB48.

The WB pipeline is enabled by setting the [DISPC_WB_ATTRIBUTES\[0\] ENABLE](#) bit to 0x1.

Figure 9-41 shows the WB pipeline.

Figure 9-41. DISPC Write-Back Pipeline

9.2.4.10.1 DISPC WB CSC Unit RGB to YUV

The RGB-to-YUV CSC unit converts the encoded pixel values from RGB24 into YUV4:4:4 format. For YUV4:2:0 or YUV4:2:2 formats, a chrominance sub-sampling is required after converting the RGB into YUV values. Because of the subsampling, the following limitations must be considered:

- When converting RGB into YUV4:2:0 NV12 (NV21) format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.5
- When converting RGB into YUV4:2:2 format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.25

Figure 9-42 and Figure 9-43 show the 3×3 11-bit coefficients used to convert from RGB24 into YUV4:4:4. The user sets the coefficients according to the standard used to encode the pixel data in YUV color space. Table 9-37 lists the coefficients with their respective bit fields.

Table 9-37. DISPC WB CSC RGB to YUV Bit Field Setting

Coefficients	Bit Fields
Y_R	DISPC_WB_CONV_COEF0[10:0] YR
Y_G	DISPC_WB_CONV_COEF0[26:16] YG
Y_B	DISPC_WB_CONV_COEF1[10:0] YB
Cr_R	DISPC_WB_CONV_COEF1[26:16] CRR
Cr_G	DISPC_WB_CONV_COEF2[10:0] CRG
Cr_B	DISPC_WB_CONV_COEF2[26:16] CRB
Cb_R	DISPC_WB_CONV_COEF3[10:0] CBR
Cb_G	DISPC_WB_CONV_COEF3[26:16] CBG
Cb_B	DISPC_WB_CONV_COEF4[10:0] CBB
G offset	DISPC_WB_CONV_COEF5[31:19] GOFFSET
R offset	DISPC_WB_CONV_COEF5[15:3] ROFFSET
B offset	DISPC_WB_CONV_COEF6[15:3] BOFFSET

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the `DISPC_WB_ATTRIBUTES[12]` FULLRANGE bit to 0x0.

Figure 9-42. DISPC WB RGB to YCbCr (FULLRANGE = 0)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 256 \\ 2048 \\ 2048 \end{bmatrix}$$

dispc-017

If the active range for the luminance samples (Y) and or the chrominance samples (Cb and Cr) is [0:255], the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the `DISPC_WB_ATTRIBUTES[12]` FULLRANGE bit to 0x1.

Figure 9-43. DISPC WB RGB to YCbCr (FULLRANGE = 1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 0 \\ 2048 \\ 2048 \end{bmatrix}$$

dispc-018

9.2.4.10.2 DISPC WB Scaler Unit

The functional aspect of the WB pipeline scaler unit is identical to the video pipeline scaler unit (see [Section 9.2.4.9.5, DISPC VID Scaler Unit](#)), except in the output width when scaling ARGB components. The resulting output format is ARGB32 instead of ARGB48.

The programmable coefficients of the polyphase filters are signed 10-bit values (except for the central coefficient, which is unsigned). The WB scaler component has an 8-bit input and an 8-bit output.

[Figure 9-44](#) and [Figure 9-45](#) show the scaler macro-architecture for the component A, R, G, B, and Y. [Figure 9-46](#) and [Figure 9-47](#) show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:255] or [16:240] by configuring the `DISPC_WB_ATTRIBUTES[12]` FULLRANGE bit.

Figure 9-44. DISPC WB Macro-Architecture of the Vertical Scaling for A, R, G, B, and Y Components

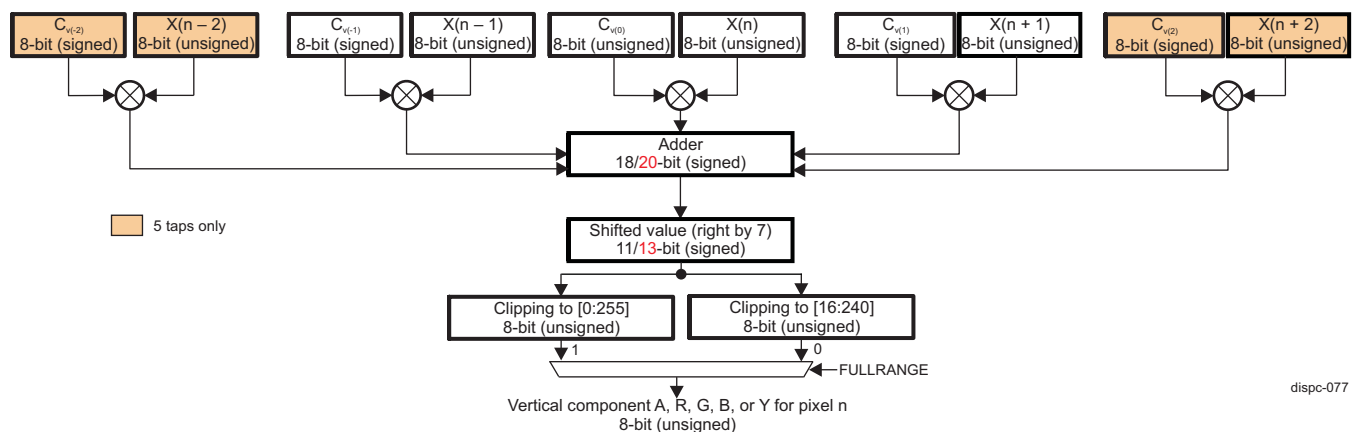

Figure 9-45. DISPC WB Macro-Architecture of the Horizontal Scaling for A, R, G, B, and Y Components

NOTE: The Table 9-38 cells without color are duplicated from the grey cells.

Similar table approach applies to the vertical scaler (registers [DISPC_WB_FIR_COEF_V0_i](#) and [DISPC_WB_FIR_COEF_V12_k](#)).

Similar table approach applies to the coefficients for CbCr filtering in case of YUV format (registers [DISPC_WB_FIR_COEF_H0_C_i](#) and [DISPC_WB_FIR_COEF_H12_C_k](#), and [DISPC_WB_FIR_COEF_V0_C_i](#) and [DISPC_WB_FIR_COEF_V12_C_k](#)).

The WB scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC_WB_ATTRIBUTES](#)[8:7] RESIZEENABLE bit field.

A set of configuration must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for WB:

- Vertical up/downsampling increments the value of [23:0] FIRVINC bitfield in the [DISPC_WB_FIRV](#) and [DISPC_WB_FIRV2](#) registers. The unsigned integer value range is $[1:2^{23}]$. Software calculates the value using the following equation:

$$FIRVINC = 2^{21} * \left(\frac{SIZEY+1}{MEMSIZEY+1} \right)$$

dispc-066wb

(14)

- Horizontal up/downsampling increments the value of the [23:0] FIRHINC bit field in the [DISPC_WB_FIRH](#) and [DISPC_WB_FIRH2](#) registers. The unsigned integer value range is [1:2²³]. Software calculates the value using the following equation:

$$FIRHINC = 2^{21} * \left(\frac{SIZEX+1}{MEMSIZEX+1} \right)$$

dispc-067wb

(15)

- Vertical up/downsampling accumulator value, [23:0] VERTICALACCU bit field in [DISPC_WB_ACCUV_j](#) and [DISPC_WB_ACCUV2_j](#) registers. The accumulator value indicates on which phase the vertical filtering starts. The register [DISPC_WB_ACCUV_0](#) is used for progressive output, and for interlace output the [DISPC_WB_ACCUV_0](#) and [DISPC_WB_ACCUV_1](#) registers are used. Similarly, [DISPC_WB_ACCUV2_0](#) and [DISPC_WB_ACCUV2_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
- Vertical up/downsampling line buffer configuration [DISPC_WB_ATTRIBUTES](#)[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
- Horizontal up/downsampling accumulator value, [23:0] HORIZONTALACCU bit field in [DISPC_WB_ACCUH_j](#) and [DISPC_WB_ACCUH2_j](#) registers. The accumulator value indicates on which phase the horizontal filtering starts. The register [DISPC_WB_ACCUH_0](#) is used for progressive output, and for interlace output the [DISPC_WB_ACCUH_0](#) and [DISPC_WB_ACCUH_1](#) registers are used. Similarly, [DISPC_WB_ACCUH2_0](#) and [DISPC_WB_ACCUH2_1](#) are used in progressive or interlace output to set the accumulator value of Cb and Cr components when scaling YUV format.

[Table 9-39](#) lists the DISPC WB vertical and horizontal accumulator values and phases.

Table 9-39. DISPC WB Vertical/Horizontal Accumulator Phase

3840 or -256	15

- Vertical up/downsampling coefficients:
 - The vertical up/downsampling central coefficients are defined in the [DISPC_WB_FIR_COEF_V0_j](#) registers. There are 9 registers for the 16 phases with 1 coefficient for each of them. Symmetrical implementation is used, so only 9 coefficients are required. Each register contains 10-bit unsigned coefficient (the central one).
 - The vertical up/downsampling coefficients are defined in the [DISPC_WB_FIR_COEF_V12_k](#)

registers. There are 16 registers for the 16 phases with 2 coefficients for each of them, so a total of 32 programmable coefficients for the vertical up/downsampling block are used. Each register contains two 10-bit signed coefficients.

Four YUV, the vertical up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_V0_C_i](#) and [DISPC_WB_FIR_COEF_V12_C_k](#) registers. [Table 9-38](#) summarizes all coefficients and their respective registers.

- Horizontal up/downsampling coefficients:
 - The horizontal up/downsampling central coefficients are defined in the [DISPC_WB_FIR_COEF_H0_i](#) registers. There are 9 registers for the 16 phases with 1 coefficient for each of them. Symmetrical implementation is used, so only 9 coefficients are required. Each register contains 10-bit unsigned coefficient (the central one).
 - The vertical up/downsampling coefficients are defined in the [DISPC_WB_FIR_COEF_H12_k](#) registers. There are 16 registers for the 16 phases with 2 coefficients for each of them, so a total of 32 programmable coefficients for the vertical up/downsampling block are used. Each register contains two 10-bit signed coefficients.

Four YUV horizontal up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_H0_C_i](#) and [DISPC_WB_FIR_COEF_H12_C_k](#) registers. [Table 9-38](#) summarizes all coefficients and their respective registers.

9.2.4.10.3 DISPC WB RGB Truncation Logic

Truncation logic is used to convert a pixel from ARGB 32-bit format into a lower color depth: 12- or 16-bit format based. The truncation is done by removing the necessary LSB of each component to match the output format.

NOTE: If there is no alpha field in the pixel format description, 0s are used. For example, in RGB12 pixel format, the upper 4 bits are set to 0s because the RGB value is only 12 bits inside a 16-bit container.

9.2.4.11 DISPC Region-Based Mechanism

9.2.4.11.1 Region-Based Mechanism Overview

The region-based mechanism is used in order to display multiple windows using the same layer. The layer can be graphics layer or a video layer. The reconfiguration of a pipeline is performed based on the different region-based interrupts (see [Section 9.2.4.4, DISPC Interrupt Requests](#)). When all the pixels for the current window have been output, then the pipeline uses the new configuration provided through the shadow registers in order to display the new window re-using the same layer.

It is possible to display unlimited number of windows on the screen using same layer considering the following restriction: only one window horizontally per layer at a given time.

In order to enable the feature, the SW needs to set to 0x1 the [24] [REGION_BASED](#) bit within [DISPC_GFX1_ATTRIBUTES2](#), [DISPC_VID_ATTRIBUTES2](#) or [DISPC_WB_ATTRIBUTES2](#) registers.

For the WB pipeline, an additional register [DISPC_WB_REGION_BASED_TOTAL_PICTURE_SIZEY](#), defining the total SIZEY value (total number of lines) of all the windows written back to the memory, needs to be programmed when the Region-based mechanism is enabled for the WB pipeline.

9.2.4.11.2 Region-Based Mechanism for a Single Region Write-Back

A typical use-case for the Region-Based Mechanism in the Write-Back pipeline is to capture one single region at a time per frame, while doing write-back in capture mode. This allows writing back only the region of interest from the entire frame displayed, thereby reducing the write-back bandwidth compared to when the whole frame is written back in a non region-based mode.

In a generic write-back region-based mechanism multiple regions are captured per frame. The last region to capture in a frame is indicated to the HW by resetting the [DISPC_WB_ATTRIBUTES2\[24\] REGION_BASED](#) bit. Due to this, when only a single region capture is needed, a specific programming sequence needs to be followed, which is described in [Table 9-40, DISPC Write-Back Region-Based Configuration Steps](#).

[Table 9-40](#) summarizes the configuration steps when the region-based mechanism for a single region is enabled for the WB pipeline.

Table 9-40. DISPC Write-Back Region-Based Configuration Steps

Step	Register/Bit-Field	Value
Initial programming (the very first frame)		
Enable the regional-based feature for WB pipeline.	DISPC_WB_ATTRIBUTES2[24] REGION_BASED	0x1
Configure the attributes of the region.	DISPC_WB_POSITION DISPC_WB_SIZE DISPC_WB_PICTURE_SIZE	- - -
Configure the total number of lines to be captured in the frame to be same as the number of lines in the region DISPC_WB_REGION_BASED_TOTAL_PICTURE_SIZEY .	DISPC_WB_REGION_BASED_TOTAL_PICTURE_SIZEY = DISPC_WB_PICTURE_SIZE[27:16] MEMSIZEY	-
Configure all other shadow registers, associated with the use case.		
Enable WBREGIONBASEDEVENT_IRQ.	DISPC_WB_IRQENABLE[3] WBREGIONBASEDEVENT_EN	0x1
Enable WBSYNC_IRQ.	DISPC_WB_IRQENABLE[4] WBSYNC_EN	0x1
Enable the Video Port (VP1) output.	DISPC_VP1_CONTROL[0] VPENABLE	0x1
Wait for the GOBIT bit to get reset by HW.	DISPC_VP1_CONTROL[5] GOBIT	0x0
From here on the region-based feature is active and will trigger both WBREGIONBASEDEVENT_IRQ and WBSYNC_IRQ every frame until the feature is completely disabled.		
The following actions need to be taken by SW in WBSYNC_IRQ and WBREGIONBASEDEVENT_IRQ routines every time those interrupts are triggered, until region-based feature is disabled.		
In WBSYNC_IRQ routine, reset the regional-based bit.	DISPC_WB_ATTRIBUTES2[24] REGION_BASED	0x0
In WBREGIONBASEDEVENT_IRQ routine, set the region-based bit.	DISPC_WB_ATTRIBUTES2[24] REGION_BASED	0x1
If the attributes of the region to be captured during next frame (position, size, base address) are different than the current region, then the corresponding changes must be applied to WB registers.		

9.2.4.12 DISPC Overlay Managers

DISPC implements two identical Overlay Managers (see [Figure 9-24, DISPC Architecture Overview](#)):

- OVR1, with output assigned to the Video Port (VP1).
- OVR2, with output assigned to the WB pipeline.

The overlay mechanism consists of displaying more than one layer (GFX, VID1 or VID2 pipeline layers) using:

- A priority rule based on a Z-order: Application can set the ordering layer of the frames.
- Transparency color keys: Destination and source transparency color keys can be set.
- Alpha blending values: Using the A component of a pixel or a blending set by the user for a layer, a level of transparency can be determined.

All pipelines (GFX, VID1 and VID2) can be assigned to one of the overlay managers (OVR1 or OVR2), or directly to the WB pipeline. The overlay managers can be connected to all pipeline outputs simultaneously. The GFX pipeline output is directed using the [DISPC_GFX1_ATTRIBUTES\[10:8\] CHANNELOUT](#) bitfield, while the VID1 and VID2 pipeline outputs are directed using the [DISPC_VID_ATTRIBUTES\[16:14\] CHANNELOUT](#) bit fields. [Table 9-41](#) summarizes the bit field settings to direct a pipeline to the OVR1, OVR2 or WB. The default register value directs all pipelines to OVR1.

Table 9-41. DISPC Pipeline Connection to VP1 or WB Output

Overlay Manager/Output	DISPC_GFX1_ATTRIBUTES	DISPC_VID_ATTRIBUTES
	[10:8] CHANNELOUT Bitfield	[16:14] CHANNELOUT Bitfield
OVR1/VP1	0x0	0x0
OVR2	0x1	0x1
WB	0x4	0x4

The output of OVR1 is connected to VP1 Color Phase Rotation (CPR) unit through the Gamma table.

NOTE:

- When the pixel format is ARGB or RGBA, the color key match logic uses only the RGB value defined by ARGB or RGBA. The alpha blending factor is ignored.

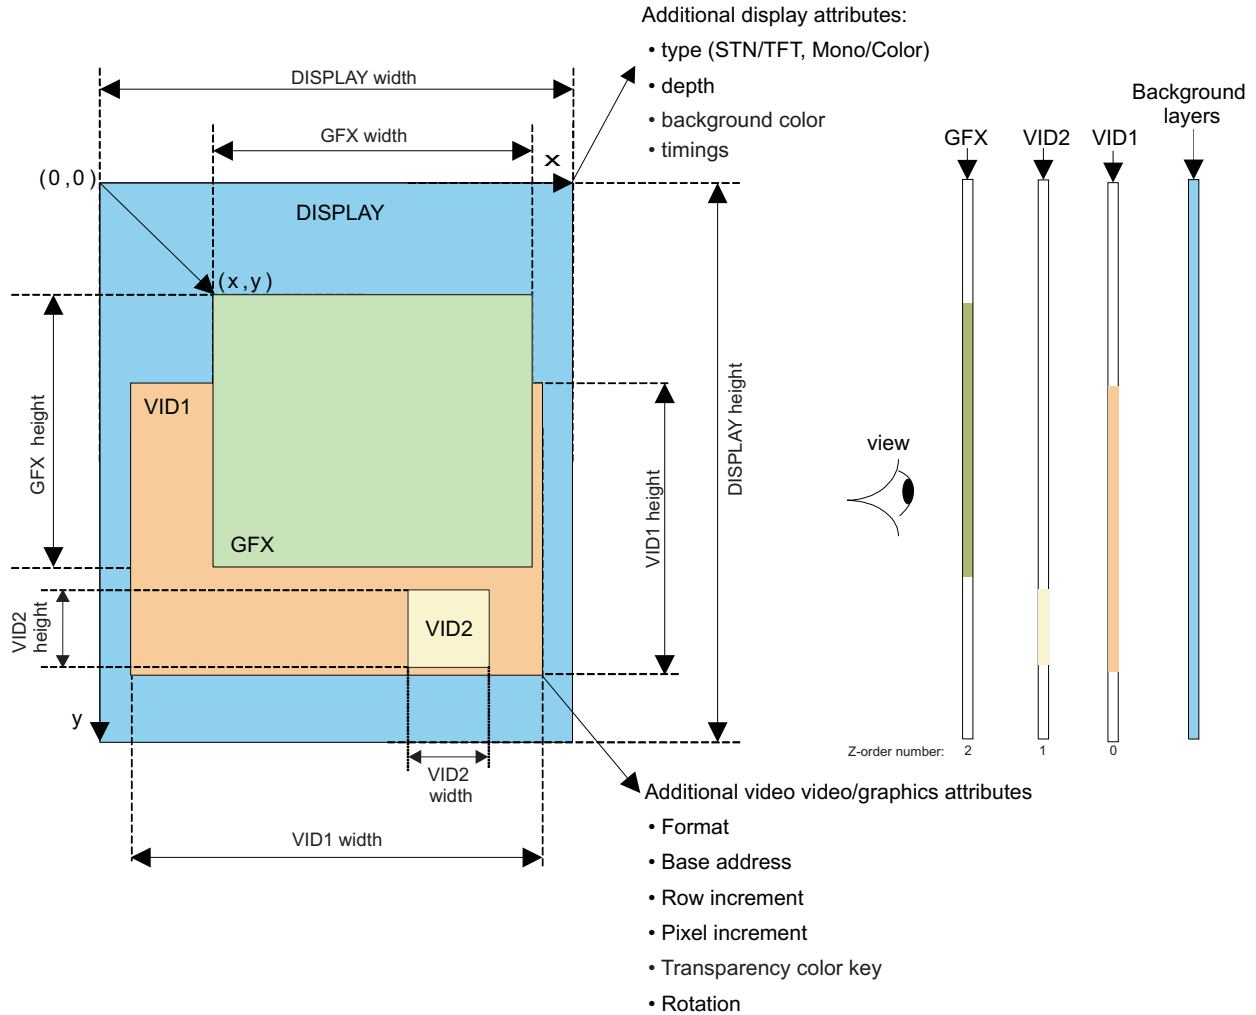

9.2.4.12.1 DISPC Overlay Priority Rule

The overlay manager is configured using the Z-order parameter. The Z-order value defined for each pipeline indicates the visibility order to the window on the screen. If the Z-order value of window A is lower than the Z-order to layer B, layer A is displayed below layer B. The transparency color keys and the alpha blending factors are then used to blend the layers together (see [Section 9.2.4.12.2, DISPC Alpha Blender](#), and [Section 9.2.4.12.3, DISPC Transparency Color Keys](#)). The Z-order for each pipeline is defined in the [DISPC_GFX1_ATTRIBUTES\[27:25\] ZORDER](#) and [DISPC_VID_ATTRIBUTES\[27:25\] ZORDER](#) register bit fields. Each ZORDER bit-field setting must be different for each active pipeline. It is not possible to use the same value for more than one pipeline.

The height and width of each enabled layer (pipeline) must be defined in the [11:0] SIZEX and [27:16] SIZEY bit fields of [DISPC_GFX1_SIZE](#) and [DISPC_VID_SIZE](#) registers. The x and y positions of each layer must be defined in the [11:0] POSX and [27:16] POSY bit fields of [DISPC_GFX1_POSITION](#) and [DISPC_VID_POSITION](#) registers. If there are no graphics or video-encoded pixels at a specific position, the programmable, solid background color appears. The solid background color is set in the [DISPC_OVR_DEFAULT_COLOR](#) register. [Figure 9-48](#) is an example of priority rule.

The Z-order reordering block must always map the pipelines to the blender logic in the same order - from background to foreground.

Figure 9-48. DISPC Overlay Example of Priority Rule: From Lower to Higher VID1, VID2, GFX

dispc-019

9.2.4.12.2 DISPC Overlay Alpha Blender

Figure 9-49 shows the alpha blending processing in detail.

Figure 9-49. DISPC Overlay Alpha Blending Architecture With Premultiplied Alpha Support

dispc-020

CAUTION

The Z order of the Source Transparency Layer must have the value 2 (0x2: Z-order 2: layer above all the other layers).

NOTE: 1-alpha operator corresponds to the basic 1s-complement operation.

The alpha blending value is defined by:

- The component value A when using an ARGB or RGBA pixel format.
 - For ARGB-1555, the alpha blending is defined using a 1-bit value. It is converted into an 8-bit value by duplicating the 1-bit value (see Table 9-42).
 - For ARGB-4444, the alpha blending is defined using a 4-bit value. It is converted into an 8-bit value by duplicating the 4-bit value (see Table 9-42).

- If the pixel format contains no alpha blending value, the pixel alpha value is considered to be 0xFF, and if alpha is equal to 0xFF, there is no multiplication.
- For BITMAP or YUV formats, there is no alpha blending factor associated with each pixel value. Only the global alpha blending factor associated with the window displaying the BITMAP or YUV format is used.
- Each 12x12 multiplication gives a result on 24 bits, which are shifted to the right to become an 12-bit value. All the values are unsigned.
- The global alpha blending value is set in the [DISPC_GFX1_GLOBAL_ALPHA](#) and [DISPC_VID_GLOBAL_ALPHA](#) registers, and is updated in synch with the selected output channel.

Table 9-42 lists the percentage of alpha blending in the function of the alpha blending value on 8 bits.

Table 9-42. DISPC Overlay Alpha Blending – ARGB

Alpha Blending 1-Bit Value (ARGB16-1555)	Alpha Blending 4-Bit Value (ARGB16-4444)	Alpha Blending 8-Bit Value (Converted Value or Resulting Alpha)	Percent Blending
0x0	0x0	0x00	100 (transparent)
N/A	0x1	0x11	93.33
N/A	0x2	0x22	86.6
N/A
N/A	0xE	0xEE	6.6
0x1	0xF	0xFF	0 (opaque)

Premultiplied Alpha

The image ARGB may have its RGB component already premultiplied with the alpha (ARGB) where:

- $R = A * R$
- $G = A * G$
- $B = A * B$

In that case, the processing is as follows:

- Color component of premultiplied layers are multiplied with the Global Alpha, if Global Alpha is not equal to 0.
- Color component of the composed underlying layers are multiplied with $(1 - A \times \text{Global Alpha})$.

The additional premultiplied alpha option is associated with the pipelines GFX, VID1 and VID2. The option is accessible through the [28] PREMULIPLYALPHA bit for the respective pipeline register:

- [DISPC_GFX1_ATTRIBUTES](#)
- [DISPC_VID_ATTRIBUTES](#)

The following settings are available:

- PREMULIPLYALPHA bit = 0: Source is not premultiplied with alpha. Full blending is done in the DISPC.
- PREMULIPLYALPHA bit = 1: Source is premultiplied with alpha. Partial blending is done.

NOTE: The *prealpha* controls in [Figure 9-49](#), correspond to the PREMULIPLYALPHA of the pipelines mapped on the respective layers.

The logic marked in red in [Figure 9-49](#) corresponds to the alpha value, computed when the write-back channel copies back to memory the premultiplied color component:

$$A (\text{destination}) = A (\text{source}) + (1 - A (\text{source})) \times A (\text{destination})$$

The default value for [DISPC_WB_ATTRIBUTES](#)[7] ALPHAENABLE bit is 0x0. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available:

- The ALPHAENABLE bit is set to 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay.

- The ALPHAENABLE bit is set to 0x0: The alpha value is not written back.

NOTE: The [DISPC_WB_ATTRIBUTES](#)[7] ALPHAENABLE bit is effective only when one of the output channels is written back, otherwise it is ignored.

9.2.4.12.3 DISPC Overlay Transparency Color Keys

There are two transparency color keys: the source transparency color key and the destination transparency color key. The source transparency color key can be used with BITMAP formats (1-, 2-, 4-, and 8-bpp), YUV, and RGB formats (ARGB, RGB, RGBA, xRGB, and RGBx). In this case the A information is ignored for the comparison between the pixel value and the color key value. It is possible to use YUV formats with some caution, because the comparison is between the input pixel value of the overlay manager from pipeline (GFX or one of the VID pipelines depending on the Z-order) and the color key value. The YUV data is converted to RGB format. If the original format is YUV, the user must consider the color space conversion processing to define the RGB color key value used for the comparison.

The transparency color key is enabled by setting the following bits to 0x1:

- [DISPC_OVR_CONFIG](#)[10] TCKLCDENABLE

The transparency color key is determined in the TRANSCOLORKEY bit fields of the following registers:

- [DISPC_OVR_TRANS_COLOR_MAX](#), [DISPC_OVR_TRANS_COLOR_MAX2](#), [DISPC_OVR_TRANS_COLOR_MIN](#) and [DISPC_OVR_TRANS_COLOR_MIN2](#)

NOTE:

- The video source transparency color key and graphics destination transparency color key cannot be active at the same time.
 - For CLUT bitmaps, the palette index is compared to the transparency color key and not to the palette value pointed out by the palette index.
-

- **Source transparency color key**

The value of the video source transparency color key defines the range of encoded pixel data considered as a transparent pixel. The encoded pixel values with the source color key value inside the valid range are not visible, and the encoded pixel values of the under layers or solid background color are visible.

The scaler can be enabled as a preprocessor in the VID pipelines, but it is necessary to consider the pixel scaling preprocessing in order to define the color key value to be used after the rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The source transparency color key mode is selected by setting the following bit to 0x1:

- [DISPC_OVR_CONFIG](#)[11] TCKLCDSELECTION

[Figure 9-50](#) shows an example of source color key. The pixels with the transparency color key are not displayed; instead, pixels of the resulting layer underneath are shown.

Figure 9-50. DISPC Overlay Source Transparency Color Key Example

disp-021

- **Destination transparency color key**

The graphics destination transparency color key values define the range of the encoded pixels in layer 1, which are not displayed. Other layer 1 pixels (not in the range of destination transparency color key value) are displayed over layer 2. The encoded pixels within the range of destination color key values are pixels not visible on the screen because pixels at the same position in layer 2 are visible; otherwise, encoded pixels are visible above layer 2. The destination transparency color key applies only if layer 1 overlaps layer 2 (see the Z-order section for details on layer position depending on the Z-order parameter in [Section 9.2.4.12.1](#), *DISPC Overlay Priority Rule*); otherwise, the destination transparency color key is ignored.

The scaler can be enabled as a preprocessor in the VID pipelines. It is necessary, however, to consider the pixel scaling preprocessing in order to define the color key value to be used after rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The destination transparency color key mode is selected by setting the following bit to 0x0:

- `DISPC_OVR_CONFIG[11] TCKLCDSELECTION`

[Figure 9-51](#) shows an example of the destination color key. The pixels, equal to the transparency color key, are not displayed and are replaced by layer 2 pixels. All other layer 1 pixels, different from the transparency color key, are displayed over layer 2.

Figure 9-51. DISPC Overlay Destination Transparency Color Key Example

dispc-022

9.2.4.13 DISPC Video Port Output

DISPC implements a single video port output (VP1). It processes data received from Overlay Manager 1 (OVR1). The VP1 output path consists of several processing blocks (see Figure 9-52):

- Gamma correction unit
- Color phase rotation (CPR) (also used for RGB-to-YUV conversion)
- Active matrix dithering with TDM
- BT.656
- BT.1120
- Timing generator

The display subsystem supports active matrix display technology. The configuration of colors depends on the color depth:

- 24 bpp supports 16,777,216 colors.
- 18 bpp supports 262,144 colors.
- 16 bpp supports 65,536 colors.
- 12 bpp supports 4096 colors.

Figure 9-52. DISPC VP1 Output Architecture

dispc-028

NOTE: In BT.656 mode only bits 9 through 0 are used from DISPC_VP1_DATA[23:0] data bus.

9.2.4.13.1 DISPC VP1 Gamma Correction Unit

When performing gamma correction, the selected encoded pixel values based on the color keys by the overlay manager from the video or graphics paths are sent to the gamma curve table. Each component of encoded pixel value is used as a pointer to index 1 out of 256 24-bit gamma curve entries in the table. Each 8-bit component is replaced with the 8-bit table value corresponding to R, G, or B component. The table is loaded by software. It is possible to load only part of the table. For each access to the table, the 24-bit value is associated with index in the table by concatenating the 24-bit value (LSB of 32-bit access) and the 8-bit index value (MSB of the 32-bit access).

The sequence to load the gamma table is:

1. SW writes (only writes are supported) 32-bit gamma correction values using single access, or burst access in streaming mode, into `DISPC_VP1_GAMMA_TABLE` register. The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table.
2. Loop to Step 1, if there is a new access to the gamma table register. The SW can access other registers between two accesses to the gamma table register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

The usage of the gamma table is activated by setting `DISPC_VP1_CONFIG[2]` `GAMMAENABLE` register bit to 0x1.

Figure 9-53 describes the format of one of the gamma curve values in the memory.

Figure 9-53. DISPC Data Memory Organization for Gamma Mode in VP1 Output

9.2.4.13.2 DISPC VP1 Color Phase Rotation Unit

The Color Phase Rotation (CPR) unit can be used to correct the display output colorimetry in case of nonpure white backlight.

The CPR is enabled by setting the `DISPC_VP1_CONFIG[15]` `CPR` bit to 0x1. The coefficients are programmed in the following registers:

- Red 10-bit signed coefficients in `DISPC_VP1_CPR_COEF_R`
- Green 10-bit signed coefficients in `DISPC_VP1_CPR_COEF_G`
- Blue 10-bit signed coefficients in `DISPC_VP1_CPR_COEF_B`

The CPR logic is integrated after the overlay manager while using the gamma correction and before the spatial/temporal dithering. The CPR can be selected to correct the nonpure white backlight of the display module by using a programmable matrix to convert the 36-bit RGB pixel value into a new 30-bit RGB pixel value. The matrix is programmed through a set of nine 10-bit signed coefficients. The output of the calculation is clipped to [0:4095]. The CPR is processed by the equation shown in Figure 9-54. Table 9-43 lists all coefficients with their respective register bitfields for settings.

Figure 9-54. DISPC VP1 CPR Matrix

$$\begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} R_r & R_g & R_b \\ G_r & G_g & G_b \\ B_r & B_g & B_b \end{bmatrix} * \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix}$$

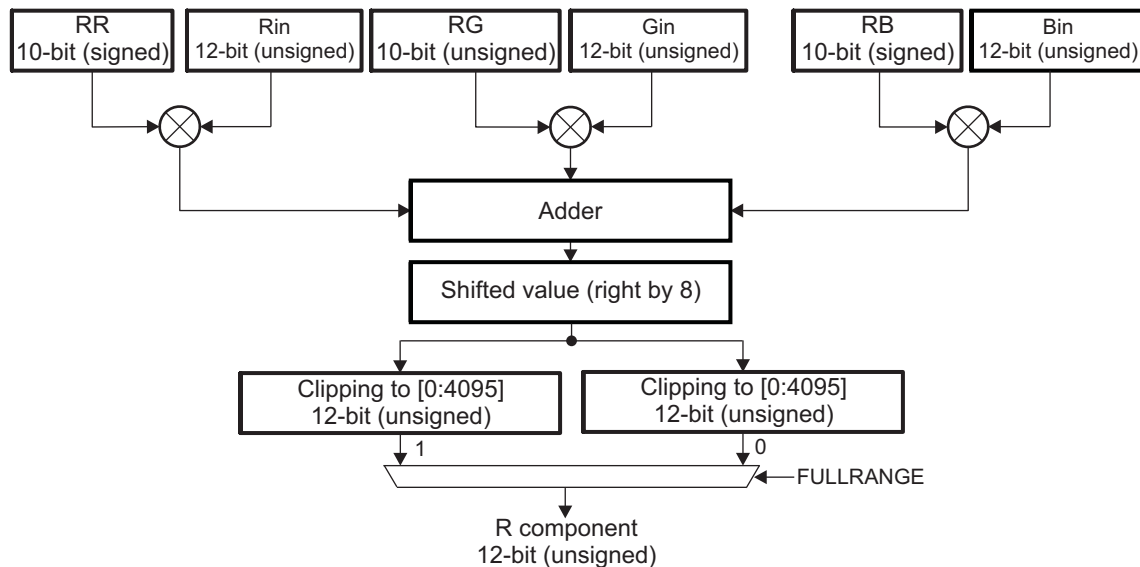

dispc-023

Table 9-43. DISPC VP1 CPR, or RGB to YUV Conversion Coefficients with Associated Register Bitfields

Registers	Bit Field	Color Phase Rotation	RGB to YUV
DISPC_VP1_CPR_COEF_R	RR	Rr	Yr
	RG	Rg	Yg
	RB	Rb	Yb
DISPC_VP1_CPR_COEF_G	GR	Gr	Cbr
	GG	Gg	Cbg
	GB	Gb	Cbb
DISPC_VP1_CPR_COEF_B	BR	Br	Crr
	BG	Bg	Crg
	BB	Bb	Crb

Figure 9-55 shows the CPR macro-architecture.

Figure 9-55. DISPC VP1 CPR Macro-Architecture

dispc-024

9.2.4.13.3 DISPC VP1 Color Space Conversion

The CPR block can be used to perform Color Space Conversion (CSC). Table 9-43 lists the associated coefficients with their respective register bit-fields. The CSC logic uses the CPR registers for the coefficients. Only the upper 10 bits of each color component are used for the CSC processing. The CSC processing is enabled by setting the DISPC_VP1_CONFIG[24] COLORCONVENABLE register bit to 0x1.

The color space conversion on the VP output can be selected in order to convert from 30-bit RGB to YUV444. The matrix is programmed through a set of nine 10-bit signed coefficients. The result is clipped to [64:940] for the luminance and [64:960] for the chrominance, when full-range equals zero (DISPC_VP1_CONFIG[25] FULLRANGE = 0).

Figure 9-56. DISPC VP1 CSC RGB to YUV Registers (FullRange=0)

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

If the programmed active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:1023], the values Y, Cb, and Cr are clipped to the range [0:1023]. The following equation gives the 11-bit coefficients of the RGB to YUV color space conversion, for full-range (DISPC_VP1_CONFIG[25] FULLRANGE = 1)

Figure 9-57. DISPC VP1 CSC RGB to YUV Registers (FullRange=1)

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

In order to provide YUV422 data to the BT-656 or BT-1120 blocks, the YUV444 format is converted to YUV422 by sub-sampling the chrominance values. The hardware does this by averaging two-by-two the chrominance samples. The conversion from YUV444 to YUV422 is performed when the color space conversion is enabled.

9.2.4.13.4 DISPC VP1 BT.656 and BT.1120 Modes

The VP1 output can be configured in BT.656 or BT.1120 mode. The following standards are not supported in BT.656 mode:

- BT.470 (Support for conventional Analog TV Systems)
- BT.803 (The avoidance of interference generated by digital television studio equipment)
- BT.1364 (Format of ancillary data signals carried in digital component studio interfaces)

Unsupported formats when BT.1120 mode is used:

- BT.1364 (Support for Ancillary Data during blanking period)

BT.656/BT.1120 modes use embedded EAV/SAV syncs.

Enabling BT.656 or BT.1120 format for VP1 output is done by setting DISPC_VP1_CONFIG[20] BT656ENABLE or [21] BT1120ENABLE register bits.

NOTE: It is not possible to enable BT.656 and BT.1120 mode simultaneously on the same output.

Figure 9-58 shows signal mapping on DISPC_VP1_DATA[23:0] data bus. Bits 9 to 0 are used in BT.656 mode (10-bit).

Figure 9-58. DISPC VP1 Data Mapping in BT.656 Mode

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Unused														BT.656									

NOTE: For compatibility with existing 8-bit interfaces, the two LSB are ignored, and only bits [9:2] are used.

Figure 9-59 shows signal mapping on DISPC_VP1_DATA[23:0] data bus for BT.1120 mode. Bits [19:10] (CbCr) and [9:0] (Y) are used in 20-bit mode. Bits [19:12] (CbCr) and [9:2] (Y) are used in 16-bit mode (YCbCr 4:2:2).

Figure 9-59. DISPC VP1 Data Mapping in BT.1120 Mode

VP1 supports progressive output for embedded syncs interface, when it is configured in BT.656/BT.1120 modes. For more information on timings configuration, see [Section 9.2.4.13.7, DISPC VP1 Timing Generator and Panel Settings](#).

9.2.4.13.4.1 DISPC BT Mode Blanking

During the transmission of the video signal, the portion of the stream in-between active video data segments is known as the horizontal blanking interval.

Strictly speaking this entire region is the blanking interval, but this interval also includes the EAV and SAV codes. The remaining bytes of information in a digital blanking interval are filled with values corresponding to the blanking levels of the Cb, Y and Cr signals respectively, and in accordance with the standard multiplex sequence for the stream (CbYCrY..). The blanking levels are as follows:

- Cb = 80h
- Y = 10h
- Cr = 80h.

The sequence in the BLANKING region of the data stream is therefore: *80h, 10h, 80h, 10h....80h, 10h*

For more details on setting the blanking timing values for BT.1120 and/or BT.656 mode, see [Section 9.2.4.13.7, DISPC Timing Generator and Panel Settings](#).

9.2.4.13.4.2 DISPC BT Mode EAV and SAV

The End of Active Video(EAV) and Start of Active Video (SAV) parts of the stream are timing codes. Their function can be summarized as follows:

- EAV – marks the end of the active video data within the current line and therefore also the start of the subsequent line.
- SAV – heralds the start of the active video data within the current line.

These codes are embedded within the BT.656 video data stream, thereby eliminating the need for additional timing signals (HSYNC, VSYNC) to be included as part of the interface.

Both EAV and SAV codes are comprised of a sequence of four bytes (FFh – 00h – 00h - XY). The first three bytes in the sequence constitute a fixed preamble. The fourth byte, contains information about the field being transmitted (Field 1 or Field 2 in an interlaced video signal), the state of field blanking (Vertical) and the state of line blanking (Horizontal). The bit assignment for this byte of the code is shown in [Figure 9-60](#), with the function of each bit described in [Table 9-44](#).

Figure 9-60. DISPC BT Mode Bit-Assignment for the Fourth Byte of EAV/SAV Codes

Table 9-44. DISPC BT Mode Bit Function

Bit	Symbol	Function
7	1	Always set to '1'.
6	F	Field bit. 0 – Field 1 1 – Field 2
5	V	Vertical Blanking Status bit. This bit goes High during a vertical field blanking interval, otherwise it remains Low.

Table 9-44. DISPC BT Mode Bit Function (continued)

Bit	Symbol	Function
4	H	Horizontal Blanking Status bit. 0 – byte is part of SAV code (i.e. stream is entering an active video data region for the current line) 1 – byte is part of EAV code (i.e. stream has entered a horizontal blanking interval - start of a new line)
3	P3	Protection bit 3
2	P2	Protection bit 2
1	P1	Protection bit 1
0	P0	Protection bit 0

The protection bits allow for detection and correction of 1-bit errors and the detection of 2-bit errors. The status of P3, P2, P1 and P0 depend on the states of bits F, V and H. This dependency is shown in [Table 9-45](#).

Table 9-45. DISPC BT Mode Status of Protection Bits as F, V and H Vary

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

9.2.4.13.5 DISPC VP1 Spatial/Temporal Dithering

The spatial/temporal dithering logic can be selected to enhance the quality of the active matrix outputs. The dithering logic is integrated after the CPR and before the TDM. The encoded pixel values are used by spatial/temporal dithering logic to display the data in a lower color depth on the display panel. The spatial/temporal dithering algorithm is based on the (x,y) pixel position and frame rate control. The dithering logic can process the pixels over one frame, two frames, or four frames. The number of frames is selected by setting the [DISPC_VP1_CONTROL](#)[31:30] SPATIALTEMPORALDITHERINGFRAMES bit field. In the case of a single frame, only spatial processing is applied. In case of multiple frames, spatial and temporal processing are applied to the pixels. The spatial/temporal dithering logic is enabled by setting the [DISPC_VP1_CONTROL](#)[7] STDITHERENABLE bit to 0x1.

NOTE:

- If the interface data bus is smaller than the pixel format size and spatial/temporal dithering is not enabled, the MSBs of the pixel color components are output on the interface data bus.
- If the interface data bus is larger than the pixel format size, by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus.

9.2.4.13.6 DISPC VP1 Multiple Cycle Output Format (TDM)

The pixels are formatted on one or multiple cycles (a maximum of three cycles). On three cycles, two pixels can concatenate and send to the panel. The cycle format is selected through the `DISPC_VP1_CONTROL[24:23]` `TDMCYCLEFORMAT` bit field. The number of bits for each cycle is set in the `DISPC_VP1_DATA_CYCLE_0` register for the first cycle, the `DISPC_VP1_DATA_CYCLE1` register for the second cycle, and the `DISPC_VP1_DATA_CYCLE2` register for the third cycle. The interface data bus width, when TDM mode is enabled (`DISPC_VP1_CONTROL[20]` `TDMENABLE = 1`), can be 8, 9, 12, or 16 bits, configurable through the `DISPC_VP1_CONTROL[22:21]` `TDMPARALLELMODE` bit field.

When the TDM is disabled (`DISPC_VP1_CONTROL[20]` `TDMENABLE = 0`), the DISPC outputs the pixels using the conventional formats: active matrix display monochrome/color. When TDM is disabled, the interface data bus width is configured through the `DISPC_VP1_CONTROL[10:8]` `DATALINES` bit field.

When using TDM mode, only up to 24-bit per pixel can be output on the interface. For higher color depth, only the upper bits are kept before converting each pixel into TDM output.

Figure 9-61 through Figure 9-64 show various examples of TDM settings in the function of pixel data formats and the interface data bus width.

9.2.4.13.7 DISPC VP1 Timing Generator and Panel Settings

The VP1 output has a dedicated timing generator supporting progressive and interlaced mode.

The size of the display panel is defined by:

- Number of lines, `DISPC_VP1_SIZE_SCREEN[27:16]` LPP bit field, with a value from 1 to 4096
- Number of pixels per line, `DISPC_VP1_SIZE_SCREEN[11:0]` PPL bit field, with a value from 1 to 4096

Standard HSYNC/VSYNC timing generation are programmable for VP1:

- Horizontal front porch is set in the [DISPC_VP1_TIMING_H\[19:8\]](#) HFP bit field.
- Horizontal back porch is set in the [DISPC_VP1_TIMING_H\[31:20\]](#) HBP bit field.
- Horizontal synchronization pulse width is set in the [DISPC_VP1_TIMING_H\[7:0\]](#) HSW bit field.
- Vertical front porch is set in the [DISPC_VP1_TIMING_V\[19:8\]](#) VFP bit field.
- Vertical back porch is set in the [DISPC_VP1_TIMING_V\[31:20\]](#) VBP bit field.
- Vertical synchronization pulse width is set in the [DISPC_VP1_TIMING_V\[7:0\]](#) VSW bit field.

When the output is in BT.1120 or BT.656 mode, the following timing constants are mapped onto the [DISPC_VP1_TIMING_H](#) and [DISPC_VP1_TIMING_V](#) registers:

- Progressive mode:
 - Horizontal blanking (12 bits) is set in the {[DISPC_VP1_TIMING_V\[3:0\]](#) VSW, [DISPC_VP1_TIMING_H\[7:0\]](#) HSW} bit fields; (up to 2048 bytes of horizontal blanking supported).
 - Vertical frame blanking No 1 is set in the [DISPC_VP1_TIMING_V\[19:8\]](#) VFP bit field.
 - Vertical frame blanking No 2 is set in the [DISPC_VP1_TIMING_V\[31:20\]](#) VBP bit field.
 - Number of lines is set in the [DISPC_VP1_SIZE_SCREEN\[27:16\]](#) LPP bit field
 - Number of pixels per line is set in the [DISPC_VP1_SIZE_SCREEN\[11:0\]](#) PPL bit field.
- Interlaced mode:
 - Horizontal blanking (12 bits) is set in the {[DISPC_VP1_TIMING_V\[3:0\]](#) VSW, [DISPC_VP1_TIMING_H\[7:0\]](#) HSW} bit fields; (up to 2048 bytes of horizontal blanking supported).
 - Vertical field blanking No 1 for Even Field is set in the [DISPC_VP1_TIMING_H\[19:8\]](#) HFP bit field.
 - Vertical field blanking No 2 for Even Field is set in the [DISPC_VP1_TIMING_H\[31:20\]](#) HBP bit field.
 - Vertical field blanking No 1 for Odd Field is set in the [DISPC_VP1_TIMING_V\[19:8\]](#) VFP bit field.
 - Vertical field blanking No 2 for Odd Field is set in the [DISPC_VP1_TIMING_V\[31:20\]](#) VBP bit field.
 - Number of lines per field (even) is set in the [DISPC_VP1_SIZE_SCREEN\[27:16\]](#) LPP bit field.
 - Delta number of odd field compared to even field (in a single line) is set in the [DISPC_VP1_SIZE_SCREEN\[15:14\]](#) DELTA_LPP bit field.
 - Number of pixels per line is set in the [DISPC_VP1_SIZE_SCREEN\[11:0\]](#) PPL bit field.

NOTE: The DELTA_LPP field only controls the output channel and not the size of the field fetched from the frame buffer in memory. This field shall be set to zero for YUV420 format.

Horizontal/vertical synchronization and output enable signals polarity are programmable by setting the [DISPC_VP1_POL_FREQ\[12\]](#) IVS, [DISPC_VP1_POL_FREQ\[13\]](#) IHS, and [DISPC_VP1_POL_FREQ\[15\]](#) IEO bits. These signals can be gated by setting the [DISPC_VP1_CONFIG\[7\]](#) VSYNCGATED and [DISPC_VP1_CONFIG\[6\]](#) HSYNCGATED bits.

The latch of data can be driven on the rising or falling edge of the pixel clock by setting the IPC bit of [DISPC_VP1_POL_FREQ\[14\]](#) IPC and CTRL_CORE_SMA_SW_1[] DSS_CH0_IPC (the values must match) registers. The drive of the SYNC and VSYNC signals in the function of the pixel clock is done by setting the [DISPC_VP1_POL_FREQ\[16\]](#) RF and CTRL_CORE_SMA_SW_1[] DSS_CH0_RF bit.

The timing generation of FID signal is defined by the [DISPC_VP1_CONFIG\[22\]](#) OUTPUTMODEENABLE bitfield. The selection can be changed only if the VP output is disabled.

- 0x0 (default): Progressive mode (FID signal is inactive: low level)
- 0x1: Interlaced mode (FID signal transition from low to high and from high to low to indicate on the VP interface the field polarity and internally the FID to be used for the registers with dual value: one for odd field and another one for even field). The FID signal toggles on the rising edge of the VSW pulse.

When in interlaced mode, the [DISPC_VP1_CONFIG\[23\]](#) FIDFIRST bit indicates which field is output first:

- 0x0: Even field first (FID = 0)
- 0x1: Odd field first (FID = 1)

Figure 9-65 shows the timing values description.

Figure 9-65. DISPC VP1 Timing Values (Display Screen)

dispc-031

The pixel clock can be gated by setting the `DISPC_VP1_CONFIG[5]` `PIXELCLOCKGATED` bit to 0x1.

9.2.4.13.8 DISPC VP1 Configuration for TV Support

Figure 9-66 shows the TV formats supported.

Figure 9-66. DISPC Example TV Timing Formats

dispc-061

The size of a frame (field, if interlaced mode) is defined by the fields:

- Number of lines, `DISPC_VP1_SIZE_SCREEN[27:16]` LPP bit field, with a value from 1 to 4096

- Number of pixels per line, [DISPC_VP1_SIZE_SCREEN](#)[11:0] PPL bit field, with a value from 1 to 4096
- Delta size between odd/even field, [DISPC_VP1_SIZE_SCREEN](#)[15:14] DELTA_LPP bit field. This bit field controls only the output channel and not the size of the data field fetched from the frame buffer in memory.

The hold time of the pixels on the data bus is determined in clock cycles by the [DISPC_VP1_CONTROL](#)[16:14] HT bit field. The default value at reset time is 0x0 (one cycle).

- When connected to external HDMI encoder, [Table 9-46](#) indicates the [DISPC_VP1_SIZE_SCREEN](#) register values for PPL and LPP for each HD standard.

Table 9-46. DISPC VP1 PPL and LLP Value for HD Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock DISPC_VP1_CONT ROL [16:14] HT = 0x0	DISPC_VP1_SIZE_SCREEN value

	720p 3D (frame packing)	1280	1470	148.5/148.35/148.5 MHz (60/59.94/50 frames/s)	0x05BD 04FF
	1080p 3D (frame packing)	1920	2205	148.5/148.35 MHz (24/23.98 frames/s)	0x089C 077F
	1080p 3D (side-by-side half)	1920	1080	148.5 MHz (60 frames/s)	0x0437 077F

NOTE: When configuring the DISPC for outputting any supported 3D frame-packing format, the following generic details must be considered:

- As defined by the *HDMI v1.4 Specification*, 3D frame-packing is a video format structure composed of two stereoscopic pictures: left and right.
- The stereoscopic pictures can be processed through the video pipelines (VID1 and VID2). For more information about the configuration of video pipelines, see [Section 9.2.4.9, DISPC Video Pipelines](#).
- The 3D frame can be generated by setting the VP1 overlay manager to combine the outputs of the selected video pipelines that hold the pictures. VID1 pipeline must carry the top field of the 3D frame (left stereoscopic picture), and VID2 pipeline must always carry the bottom field of the frame (right stereoscopic picture). The top and bottom fields are separated by an active space area.
- The pipeline carrying each field (top and bottom) of the 3D frame must have its height and width parameters defined in the [27:16] SIZEY and [11:0] SIZEX bit fields of the [DISPC_VP1_SIZE_SCREEN](#) register, and its Y and X positions defined in the [26:16] POSY and [10:0] POSX bit fields of the [DISPC_VID_POSITION](#) register. The active space area of the 3D frame can be encoded by setting the solid background color for the VP1 output (in the [DISPC_OVR_DEFAULT_COLOR](#) and [DISPC_OVR_DEFAULT_COLOR2](#) registers). For more information about the overlay mechanism, see [Section 9.2.4.12, DISPC Overlay Managers](#).

3D frame-packing format support using a single pipeline can be achieved using the DISPC region-based feature. Refer to [Section 9.2.4.11, DISPC Region-Based Mechanism](#), for more information.

9.2.4.14 DISPC Extended 3D Support

9.2.4.14.1 DISPC Extended 3D Support - Line Alternative Format

The DISPC supports Line Alternative Format for 3D displays, as defined by the HDMI Specification 1.4a.

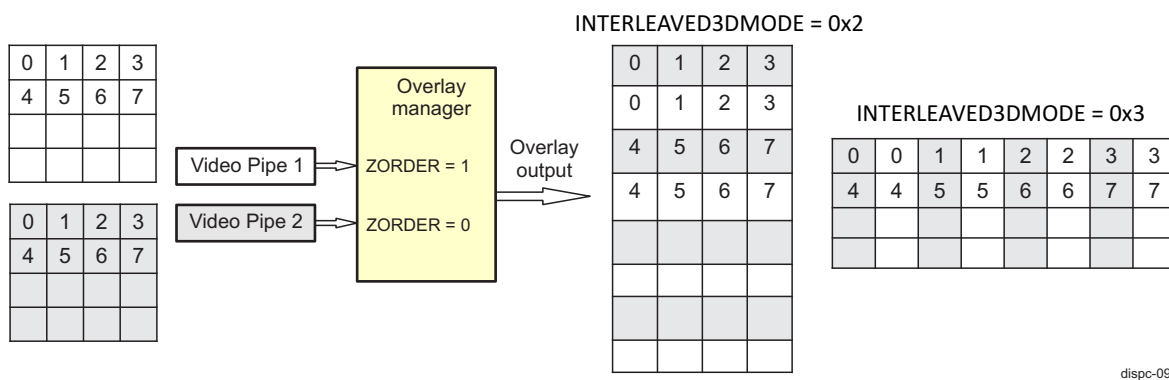

The processing is done in the overlay manager:

- The layers are grouped into two categories based on the z-order. Odd z-order may blend together and will interleave with even z-order pipes, which may blend together.
- Two types of interleaves are possible, line-based interleaving and pixel-based interleaving, to support landscape and portrait screen orientations.

The configuration is done through the `DISPC_OVR_CONFIG[9:8]` `INTERLEAVED3DMODE` register bitfield, which specifies the interleave pattern that needs to be added for each overlay manager:

- 0x0: No interleaving happens in the overlay manager
- 0x1: Reserved for future use
- 0x2: All even lines (all pixels) have a contribution from even z-order pipelines. All odd lines (all pixels) have a contribution from the odd z-order pipelines
- 0x3: All even pixels (for all lines) have a contribution from even z-order pipelines. All odd pixels (for all lines) have a contribution from the odd z-order pipelines

Figure 9-67. DISPC Illustration of 3D Interleaving

dispc-095

In addition, from [Figure 9-67](#), if `DISPC_OVR_CONFIG[9:8]` `INTERLEAVED3DMODE` is programmed as 0x2, in this case the entire screen composited by the overlay manager (defined by PPL x LPP) gets subdivided into odd and even lines. It is possible for a 3D window created using the two pipelines to have a non-zero position (that is, POSX and POSY not equal to zero).

In such cases, depending on the oddness or evenness of the POSY setting, the first line in the window may come from VID1 or VID2 pipeline.

For instance, if the POSX = 3 and POSY = 3 (set in `DISPC_VID_POSITION` registers), then the final composited screen with PPL = 8 and LPP = 12 (set in `DISPC_VP1_SIZE_SCREEN` register) may look like in [Figure 9-68](#):

Figure 9-68. DISPC Illustration of a Non-zero Position of 3D Window

dispc-096

NOTE: In this case the first line comes from the odd-zorder pipeline, that is, the VID1 pipeline.

The following limitations apply to the 3D Line alternative format:

- Software must ensure that the left/right frames are of same size.
- Software must ensure that in case of line interleaving the `DISPC_VID_SIZE[27:16]` SIZEY bitfield values is not greater than $LPP/2$.
- Software must ensure that in case of pixel interleaving the `DISPC_VID_SIZE[11:0]` SIZEX is not greater than $PPL/2$.
- Software must program POSX and POSY for both left and right frame to be the same.
- Color-keying is not available for 3D formats.
- Since each overlay manager can support 4k x 4k frames, the maximum resolution of each left/right frame must be restricted to 2k x 2k.

9.2.4.14.2 DISPC Extended 3D Support - Frame Packing Format

3D Frame Packing Format support using a single pipeline can be achieved using the region-based feature. Refer to [Section 9.2.4.11, DISPC Region-Based Mechanism](#), for more information.

9.2.4.15 DISPC Shadow Registers

Some DISPC registers are termed *shadow registers*. A shadow register change has no direct effect on the configuration of the DISPC. The registers are shadow registers in order the software to change the values of the registers at any time. When all the values for a given configuration are written into the registers, software must set 1 bit only to validate the configuration. When hardware reaches the end of the current frame and sees that the bit field has been set by software, the new configuration is now the configuration used by the hardware.

The bits enabling the hardware to use the new configuration are:

- `DISPC_VP1_CONTROL[5]` GOBIT bit for all the shadow registers of the pipeliens connected to the VP1 output

- NOTE:** As a general rule, all shadow registers are updated with the value of their shadow when:
- The interface is enabled, or
 - The GOBIT bit-field of the output, which the register is associated to, is set and the output sync is active

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							MFLAG_START		MFLAG_CTRL						

Bits	Field Name	Description	Type	Reset
31:3	RESERVED		R	0x0
2	MFLAG_START	0x0: reset value, when the DMA buffer is empty at the beginning of the frame, the MFLAG of each pipe is kept at 0 until PRELOAD is reached, then based on MFLAG_CTRL, MFLAG[1:0] are generated and internal logic is arbitrating between pipeline requests 0x1: Even at the beginning of the frame when the DMA buffer is empty, MFLAG_CTRL is used to determine how MFLAG dedicated to each pipe signal shall be driven	RW	0x0
1:0	MFLAG_CTRL	0x0: MFLAG mechanism is disabled: MFLAG[1:0] out band signals are set to 0 0x1: MFLAG mechanism is enabled: MFLAG[1:0] out band signals are always set to 1 0x2: MFLAG mechanism is enabled and MFLAG[1:0] out band signals are dynamically set to 0 or 1 depending on the MFLAG rules	RW	0x0

Address Offset	0x0000 0044	Instance	DISPC_COMMON
Physical Address	0x5801 0044		
Description	The register configures the DMA buffers allocations to the pipeline.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BUFFERFILLING	RESERVED																WB_BUFFER		RESERVED		VID2_BUFFER		VID1_BUFFER		RESERVED		RESERVED		GFX1_BUFFER		

Bits	Field Name	Description	Type	Reset
31	BUFFERFILLING	Controls if the DMA buffers are re-filled only when the LOW threshold is reached or if all DMA buffers are re-filled when at least one of them reaches the LOW threshold. wr: immediate 0x0: Each DMA buffer is re-filled when it reaches LOW threshold. 0x1: All DMA buffers are re-filled up to high threshold when at least one of them reaches the LOW threshold. (only active DMA buffers shall be considered and when reaching the end of the frame the DMA buffer goes to empty condition so no need to fill it again).	RW	0x0
30:21	RESERVED		R	0x0
20:18	WB_BUFFER	WB DMA buffer allocation to one of the pipelines. By default to video 1 pipeline. 0x6: DMA buffer allocated to the vdieo3 pipeline. 0x1: DMA buffer allocated to the gfx1 pipeline. 0x7: DMA buffer allocated to the write-back pipeline. 0x0: DMA buffer is not allocated to a pipeline. 0x2: DMA buffer allocated to the gfx2 pipeline. 0x4: DMA buffer allocated to the video1 pipeline. 0x5: DMA buffer allocated to the vdieo2 pipeline. 0x3: DMA buffer allocated to the gfx3 pipeline.	RW	0x7
17:15	RESERVED		R	0x0
14:12	VID2_BUFFER	Video2 DMA buffer allocation to one of the pipelines. By default to video 2 pipeline. 0x6: DMA buffer allocated to the vdieo3 pipeline. 0x1: DMA buffer allocated to the gfx1 pipeline. 0x7: DMA buffer allocated to the write-back pipeline. 0x0: DMA buffer is not allocated to a pipeline. 0x2: DMA buffer allocated to the gfx2 pipeline. 0x4: DMA buffer allocated to the video1 pipeline. 0x5: DMA buffer allocated to the vdieo2 pipeline. 0x3: DMA buffer allocated to the gfx3 pipeline.	RW	0x5

Bits	Field Name	Description	Type	Reset
11:9	VID1_BUFFER	Video1 DMA buffer allocation to one of the pipelines. By default to video 1 pipeline. 0x6: DMA buffer allocated to the video3 pipeline. 0x1: DMA buffer allocated to the gfx1 pipeline. 0x7: DMA buffer allocated to the write-back pipeline. 0x0: DMA buffer is not allocated to a pipeline. 0x2: DMA buffer allocated to the gfx2 pipeline. 0x4: DMA buffer allocated to the video1 pipeline. 0x5: DMA buffer allocated to the video2 pipeline. 0x3: DMA buffer allocated to the gfx3 pipeline.	RW	0x4
8:6	RESERVED		R	0x0
5:3	RESERVED		R	0x0
2:0	GFX1_BUFFER	Gfx1 DMA buffer allocation to one of the pipelines. By default to gfx1 pipeline. 0x6: DMA buffer allocated to the video3 pipeline. 0x1: DMA buffer allocated to the gfx1 pipeline. 0x7: DMA buffer allocated to the write-back pipeline. 0x0: DMA buffer is not allocated to a pipeline. 0x2: DMA buffer allocated to the gfx2 pipeline. 0x4: DMA buffer allocated to the video1 pipeline. 0x5: DMA buffer allocated to the video2 pipeline. 0x3: DMA buffer allocated to the gfx3 pipeline.	RW	0x1

Table 9-117. DISPC_WB_ACCUV2_j

Address Offset	0x0000 0018		
Physical Address	0x5801 5018 + (0x4 * j)	Instance	DISPC_WB
Description	The register configures the resize accumulator init value for vertical up/down-sampling of the write-back window. It is used for Cb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the HW, any value can be used for the bit-fields. Shadow register.		
Type	RW

Table 9-119. DISPC_WB_ATTRIBUTES

Address Offset	0x0000 0020		
Physical Address	0x5801 5020	Instance	DISPC_WB
Description	The register configures the attributes of the viwrite back pipeline. Shadow register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDLENUMBER				IDLESIZE	CAPTUREMODE	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	RESERVED	WRITEBACKMODE	CHANNELIN				RESERVED	FULLRANGE	COLORCONVENABLE	RESERVED	ALPHAENABLE	RESIZEENABLE	FORMAT				ENABLE						

Bits	Field Name	Description	Type	Reset
31:28	IDLENUMBER	Determines the number of idles between requests on the L3 interconnect. It is only used when the write-back pipeline does data transfer from memory to memory. When the output of an overlay is stored in memory through the write-back pipeline in capture mode, the bit-field IDLENUMBER is ignored since a timing generator is used to time the transfer. The number of IDLE cycles is IDLENUMBER (from 0 to 15) if IDLESIZE=0. The number of IDLE cycles is IDLENUMBERx8 (from 0 to 120) if IDLESIZE=1 and BURSTSIZE=2. The number of IDLE cycles is IDLENUMBERx4 (from 0 to 60) if IDLESIZE=1 and BURSTSIZE=1. The number of IDLE cycles is IDLENUMBERx2 (from 0 to 30) if IDLESIZE=1 and BURSTSIZE=0.	RW	0x0

Bits	Field Name	Description	Type	Reset
27	IDLESIZE	<p>Determines if the IDLENUMBER corresponds to a number of bursts or singles.</p> <p>0x0: The number of idles between requests is defined by IDLENUMBER as number of cycles.</p> <p>0x1: The number of idles between requests is defined by IDLENUMBER multiplied by burst size as number of cycles.</p>	RW	0x0
26:24	CAPTUREMODE	<p>Defines the frame rate capture.</p> <p>0x6: Only one out of six frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x1: Only one frame is captured.</p> <p>0x7: Only one out of seven frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x0: All frames are captures until the write-back channel is disabled or there is no more data generated by the overlay or the pipeline attached to the write-back channel.</p> <p>0x2: Only one out of two frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x4: Only one out of four frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x5: Only one out of five frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x3: Only one out of three frames is captured. The first one is captured then the second one is skipped and so on.</p>	RW	0x0
23	ARBITRATION	<p>Determines the priority of the write-back pipeline. The write-back pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The write-back pipeline is one of the normal priority pipeline.</p> <p>0x1: The write-back pipeline is one of the high priority pipeline.</p>	RW	0x0
22	DOUBLESTRIDE	<p>Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV420 and 2D access</p> <p>0x0: The CbCr stride value is equal to the Y stride.</p> <p>0x1: The CbCr stride value is double to the Y stride.</p>	RW	0x0
21	VERTICALTAPS	<p>Video Vertical Resize Tap Number</p> <p>0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used.</p> <p>0x1: 5 taps are used for the vertical filtering logic.</p>	RW	0x0
20	RESERVED		R	0x0
19	WRITEBACKMODE	<p>When connected to the overlay output of a channel the write back can operate as a simple transfer from memory to memory (composition engine) or as a capture channel.</p> <p>0x0: Capture mode (default mode)</p> <p>0x1: Memory to memory mode</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
18:15	CHANNELIN	WB Channel In configuration wr: immediate 0x0: OVR1 (VP1) 0x1: OVR2 0x4: GFX1SEL 0x7: VID1SEL 0x8: VID2SEL	RW	0x0
14:13	RESERVED		R	0x0
12	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0x0
11	COLORCONVENABLE	Enable the color space conversion. The HW does not enable/disable the conversion based on the pixel format. The bit-field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0x0
10	RESERVED		R	0x0
9	ALPHAENABLE	Premultiplied alpha enable 0x0: disabled. Disabled. This bit also disable the logic present in the associated channel out that compute the alpha component sent to the WB pipe 0x1: enabled.	RW	0x0
8:7	RESIZEENABLE	Resize Enable 0x0: Disable the resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
6:1	FORMAT	<p>Write-back Format. It defines the pixel format when storing the write-back picture into memory.</p> <p>0x9: RGBA32-8888</p> <p>0x8: ABGR32-8888</p> <p>0x5: ARGB16-1555</p> <p>0x2: RGBA16-4444</p> <p>0xB: RGB24-888 (24-bit container)</p> <p>0x4: BGR16-565</p> <p>0x32: RESERVED4</p> <p>0x23: RESERVED2</p> <p>0x1: ABGR16-4444</p> <p>0x3F: UYVY 4:2:2 co-sited</p> <p>0x28: xBGR32_8888</p> <p>0x0: ARGB16-4444</p> <p>0x3E: YUV2 4:2:2 co-sited</p> <p>0x25: xRGB16-1555</p> <p>0x3D: NV12/NV21 4:2:0 2 buffers (Y + UV)</p> <p>0x20: xRGB12-4444</p> <p>0x3: RGB16-565</p> <p>0x17: BGR565A8</p> <p>0x30: xRGB64-16161616</p> <p>0x11: RGBA64_16161616</p> <p>0x6: ABGR16-1555</p> <p>0x31: RGBX64_16161616</p> <p>0xA: BGRA32-8888</p> <p>0x26: xBGR16-1555</p> <p>0x10: ARGB64-16161616</p> <p>0x21: xBGR16-4444</p> <p>0x12: RESERVED5</p> <p>0x2B: RESERVED3</p> <p>0x18: RESERVED1</p> <p>0x16: RGB565A8</p> <p>0x2A: BGRX32_8888</p> <p>0x7: ARGB32-8888</p> <p>0x27: xRGB32-8888 (32-bit container)</p> <p>0x29: RGBx32-8888 (24-bit RGB aligned on MSB of the 32-bit container)</p> <p>0xC: RESERVED</p> <p>0x22: RGBx16-4444</p>	RW	0x0

Table 9-123. DISPC_WB_BA_j

Address Offset	0x0000 0028		
Physical Address	0x5801 5028 + (0x4 * j)	Instance	DISPC_WB
Description	The register configures the base address of the WB buffer (DISPC_WB_BA__0 DISPC_WB_BA__1 for ping-pong mechanism with external trigger, based on the field polarity otherwise only DISPC_WB_BA__0 is used). Shadow register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BA																															

Bits	Field Name	Description	Type	Reset
31:0	BA	Write-back base address Base address of the WB buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV422, 2-pixel alignment is required, and YUV420, byte alignment is supported)). In case of YUV 4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0

Description	The register configures the attributes of the video window. Shadow register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED	RESERVED	RESERVED	PREMULTIPLYALPHA	ZORDER	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	RESERVED	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	RESERVED	FULLRANGE	NIBBLEMODE	COLORCONVENABLE	RESIZEENABLE	FORMAT								ENABLE				

Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0x0
30	RESERVED		R	0x0
29	RESERVED		R	0x0
28	PREMULTIPLYALPHA	The field configures the DISPC VID1 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component	RW	0x0
27:25	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is SW responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3 0x4: Z-order 4: layer above layers with z-order value of 0, 1, 2 and 3 and below layer with z-order value of 5 0x5: Z-order 5: layer above all the other layers except cursor 0x3: Z-order 3: layer above layers with z-order value of 0, 1 and 2 and below layer with z-order value of 4	RW	0x0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video1 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0x0

Bits	Field Name	Description	Type	Reset
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0x0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV420 and 2D access 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0x0
21	VERTICALTAPS	Video Vertical Resize Tap Number. The vertical poly-phase filter can be configured in 3-tap or 5-tap configuration. According to the number of taps, the maximum input picture width is double while using 3-tap compared to 5-tap. 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit-fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0x0
20	RESERVED		R	0x0
19	BUFPRELOAD	Video Preload Value 0x0: H/W prefetches pixels up to the preload value defined in the preload register 0x1: H/W prefetches pixels up to high threshold value	RW	0x0
18	RESERVED	Write 0's for future compatibility. Reads return 0.	R	0x0
17	SELFREFRESHAUTO	Automatic self refresh mode 0x0: The transition from SELFREFRESH <disabled> to <enabled> is controlled by SW. 0x1: The transition from SELFREFRESH <disabled> to <enabled> is controlled only by HW.	RW	0x0
16:14	CHANNELOUT	Video Channel Out configuration wr: immediate 0x0: OVR1 (VP1) 0x1: OVR2 0x4: WB	RW	0x0
13:12	RESERVED		R	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0x0
10	NIBBLEMODE	Video Nibble mode (only for 1-, 2- and 4-bpp) 0x0: Nibble mode is disabled 0x1: Nibble mode is enabled	RW	0x0
9	COLORCONVENABLE	Enable the color space conversion. The HW does not enable/disable the conversion based on the pixel format. The bit-field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0x0

Bits	Field Name	Description	Type	Reset
8:7	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset

BA																															

Bits	Field Name	Description	Type	Reset
31:0	BA	Video base address When decompression is enabled bit[5:0] shall be set to 0. Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV422, 2-pixel alignment is required, and YUV420, byte alignment is supported)). In case of YUV 4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0

Bits	Field Name	Description	Type	Reset
31:26	RESERVED		R	0x0
25	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected. 0x1: Full range selected.	RW	0x0
24	COLORCONVENABLE	Enable the color space conversion. It shall be reset when CPR bit-field is set to 0x1. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0x0
23	FIDFIRST	Selects the first field to output in case of interlace mode. In case of progressive mode, the value is not used. 0x0: First field is even. 0x1: Odd field is first.	RW	0x0
22	OUTPUTMODEENABLE	Selects between progressive and interlace mode for the VP output. 0x0: Progressive mode selected. 0x1: Interlace mode selected.	RW	0x0
21	BT1120ENABLE	Selects BT-1120 format on the VP output. It is not possible to enable BT656 and BT1120 at the same time on the same VP output. 0x0: BT-1120 is disabled. 0x1: BT-1120 is enabled.	RW	0x0
20	BT656ENABLE	Selects BT-656 format on the VP output. It is not possible to enable BT656 and BT1120 at the same time on the same VP output. 0x0: BT-656 is disabled. 0x1: BT-656 is enabled.	RW	0x0
19:17	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x0

Bits	Field Name	Description	Type	Reset
16	BUFFERHANDSHAKE	Controls the handsSHAKE between DMA buffer and STALL signal in order to prevent from underflow. The bit shall be set to 0 when the module is not in STALL mode. 0x0: Only the STALL signal (generated by RFBI or DSI2 depending on which IP uses the LCD output) is used regardless of the DMA buffer fullness information in order to provide data to the RFBI or DSI2 module. 0x1: The STALL signal (generated by RFBI or DSI2 depending on which IP uses the LCD output) is used in combination with the DMA buffer fullness information in order to provide data to the RFBI or DSI2 module only when it does not generated buffer underflow.	RW	0x0
15	CPR	Color Phase Rotation Control VP output). It shall be reset when ColorConvEnable bit-field is set to 1. Shadow bit-field. 0x0: Color Phase Rotation Disabled 0x1: Color Phase Rotation Enabled	RW	0x0
14:9	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x0
8	EXTERNALSYNCEN	Selects between external sync and internal sync mode for the VP output. 0x0: Internal sync mode selected 0x1: External sync mode selected.	RW	0x0
7	VSYNCGATED	VSYNC Gated Enabled (VP output) Shadow bit-field. 0x0: VSYNC Gated Disabled 0x1: VSYNC Gated Enabled	RW	0x0
6	HSYNCGATED	HSYNC Gated Enabled (VP output) Shadow bit-field. 0x0: HSYNC Gated Disabled 0x1: HSYNC Gated Enabled	RW	0x0
5	PIXELCLOCKGATED	Pixel Clock Gated Enabled (VP output) Shadow bit-field. 0x0: Pixel Clock Gated Disabled 0x1: Pixel Clock Gated Enabled	RW	0x0
4	PIXELDATAGATED	Pixel Data Gated Enabled (VP output) Shadow bit-field. 0x0: Pixel Data Gated Disabled 0x1: Pixel Data Gated Enabled	RW	0x0
3	HDMIMODE	Configures the timing generator in HDMI compatible mode to generate same timings as HDMI wrapper timings. 0x0: Disable HDMI mode. 0x1: Enable HDMI mode timings: - vertical FSM starts with the VFP period (instead of VSYNC) - last frame ends with the last pixel of data state.	RW	0x0
2	GAMMAENABLE	Enable the gamma Shadow bit-field. 0x0: Gamma disabled 0x1: Gamma enabled	RW	0x0
1	DATAENABLEGATED	DE Gated Enable Shadow bit-field. 0x0: DE signal is not gated 0x1: DE signal is gated.	RW	0x0
0	PIXELGATED	Pixel Gated Enable Shadow bit-field. 0x0: Pixel clock always toggles (only in TFT mode) 0x1: Pixel clock only toggles when there is valid data to display. (only in TFT mode)	RW	0x0

9.3 Video Encoder

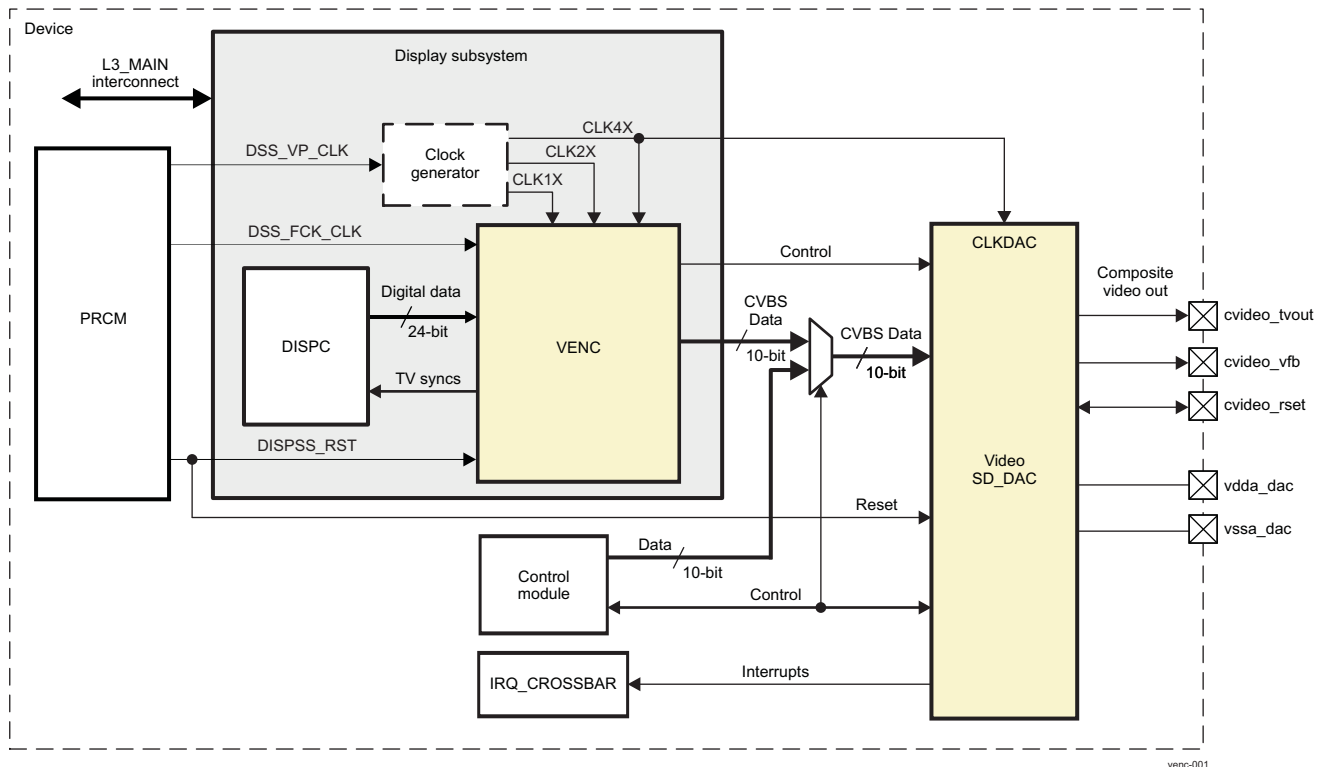

This section describes the video encoder (VENC) and associated video standard definition DAC (SD_DAC) modules for the device.

9.3.1 Video Encoder Overview

The VENC module provides the logic to display analog video on a TV set.

Figure 9-69 shows a block diagram of the video encoder and SD_DAC in the display subsystem.

Figure 9-69. Video Encoder Overview

The video encoder includes the following features:

- Supports the following standards for composite video (CVBS) :
 - NTSC-J, M
 - PAL-B, D, G, H, I
 - PAL-M
- Input data interface compatible with the following protocols:
 - 24-bit input bus compatible with external sync
 - RGB 4:4:4
- 10-bit interface for internal digital-to-analog converter (DAC) that supports:
 - 1.1V digital power supply, 1.8V analog power supply
 - 10-bit resolution
 - Sample rate of up to 60 megasamples per second (MSPS)
 - Supports Composite Video standart output
 - Supports TVOUT buffer bypass mode (DAC only mode)
 - Full-scale voltage output: 1.2 Vpp with a 75-Ω load
 - Internal TV-detect feature to detect both open and short conditions
 - Suitable for low-power wireless applications

- TV output data supports ITU-R BT 470-7 recommendation standard for consumer market
- Master clock input 13.5 MHz, 27 MHz (supports ITU-R 601 sampling for NTSC/PAL), and 54 MHz
- Programmable horizontal sync, vertical timing, and waveforms
- Programmable subcarrier frequency and SCH
- Internal test pattern generation (color bar, flat field, color burst)
- 2x/4x oversampling
- TV detection gating pulse generation
- Supports square pixel sampling (NTSC: 12.27 MHz, 24.54 MHz, 49.09 MHz PAL: 14.75 MHz, 29.5 MHz, 59 MHz)

CAUTION

In square pixel mode, an external clock generator is required to provide sampling frequencies.

9.3.2 Video Encoder Environment

To display analog video on a TV set, the path used is as follow:

- Display controller
- Video encoder
- 10-bit SD_DAC with video amplifier

The display controller module receives synchronization signals from the video encoder and synchronously sends pixel data to the video encoder with these signals. The digital output of the display controller is always a 24-bit RGB value based on a pixel request from the video encoder. For more information on the display controller settings and features, see [Section 9.2, Display Controller](#).

The video encoder converts RGB video signals to conform to the NTSC/PAL standards analog video. The video encoder includes an integrated synchronization signal generator and a video digital-to-analog converter (SD_DAC) with video amplifiers, data manager, luma stage, chroma stage, modulator, and a control interface.

The video encoder also provides the synchronization signals to the display controller: VSYNC, active VIDEo (AVID), and field ID (FID).

NOTE: To enhance the TV color display, it is highly recommended to set the DSS.DSS_VENC_CTRL[1] DAC_DEMEN register bit. See [Section 9.1.3, Display Subsystem Register Manual](#).

Figure 9-70 through Figure 9-72 show the TV display interface in composite mode.

Figure 9-70. Video Encoder Environment, Normal Mode DC-Coupling

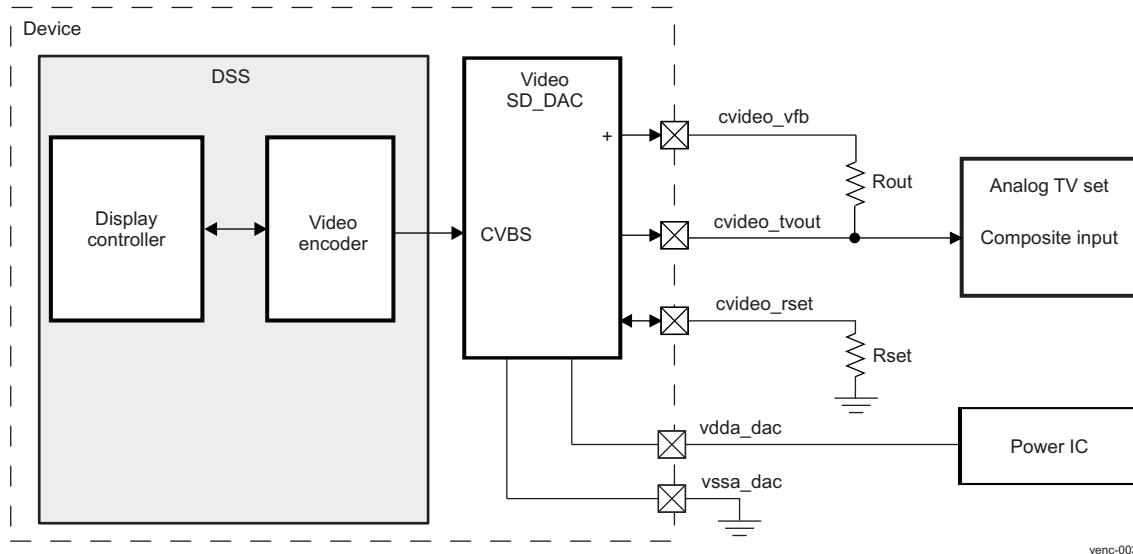

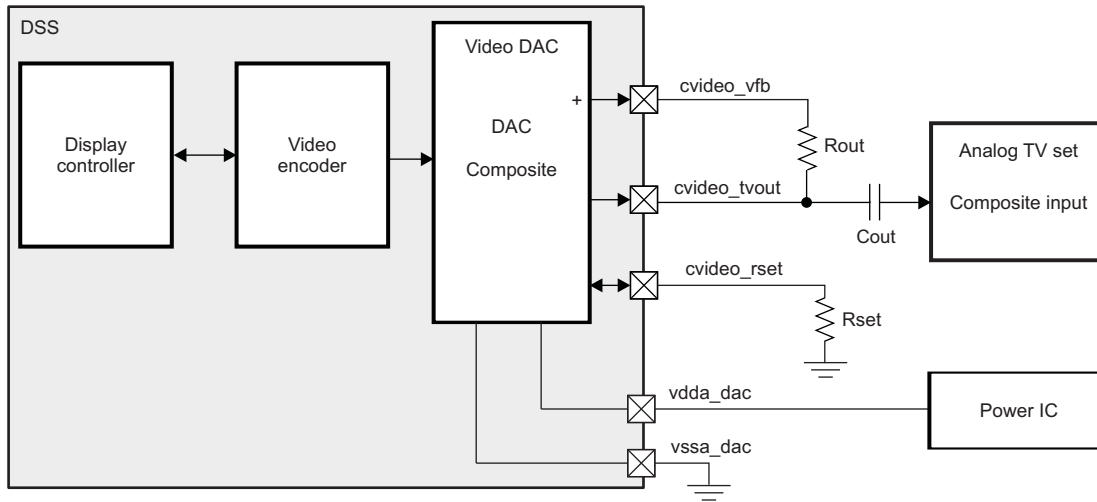

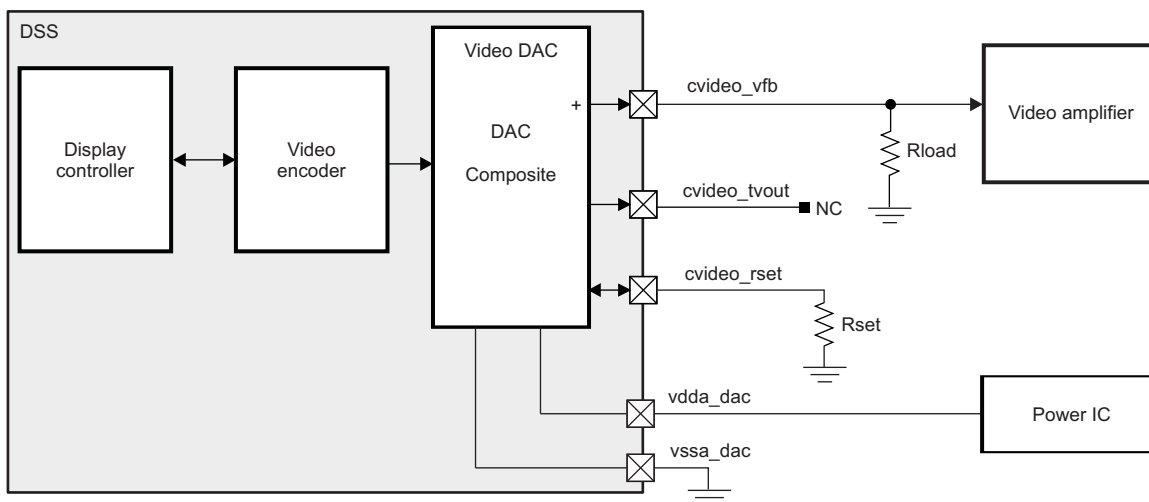

Figure 9-71. Video Encoder Environment, Normal Mode AC-Coupling

venc-015

Figure 9-72. Video Encoder Environment, Bypass Mode

venc-016

Table 9-310 describes the interface signals to/from the TV set for TV display support.

Table 9-310. TV Display Interface Pins

Pin Name	Type ⁽¹⁾	Description
cvideo_tvout	O	Composite video output. An external resistor (R_{out}) is connected between this node and the <i>cvideo_vfb</i> pin. The nominal value of R_{out} is 2700 Ω . This is the output node that drives the load (75 Ω). In AC-coupling mode, a series capacitor (C_{out}) must be connected. The nominal value for C_{out} is $\geq 200 \mu F$.
cvideo_vfb	O	In Normal mode (video DAC+Buffer), it acts as the buffer feedback node. An external resistor (R_{out}) shall be connected between this node and <i>cvideo_tvout</i> pin. In TVOUT Bypass mode, it acts as the video DAC output. A load resistor (R_{load}) shall be connected to the pin to ground. The nominal value of R_{load} is 1500 Ω .

⁽¹⁾ I = input; O = output; power = power pin

Table 9-310. TV Display Interface Pins (continued)

Pin Name	Type ⁽¹⁾	Description
cvideo_rset	I/O	External resistor (Rset) shall be connected to this pin to set the reference current of the video DAC. The value of the resistor depends on the mode of operation (Normal or TVOUT Bypass). In Normal mode, the nominal value for Rset is 4700 Ω. In TVOUT Bypass mode, the nominal value for Rset is 10000 Ω.
vdda_dac	Power	Analog supply voltage for the video DAC
vssa_dac	Power	Analog ground for the video DAC

CAUTION

- *cvideo_tvout* is a very high-frequency analog signal and must be routed with extreme care. As a result, the path of this signal must be as short as possible, and as isolated as possible from other interfering signals.
- During board design, the onboard traces and parasites must be matched for the channel. *cvideo_vfb* pin is the most sensitive pins in the TV out system. Low onboard resistance and capacitance is required for the traces that connect the Rout to the *cvideo_vfb* and *cvideo_tvout* pins. The resistance on those trace affects output impedance matching. Therefore, Rout resistor is suggested to be placed as close as possible to the device pins. The onboard traces lead to the TV OUT pin must have a characteristic impedance of 75 Ohm starting from the closest possible place to the device pin output.
- If the TV output is not used, the following configuration for the SD_DAC pins must be applied:
 - vdda_dac: Must be grounded
 - vssa_dac: Must be grounded
 - cvideo_rset: Must be floating, left unconnected
 - cvideo_tvout: Must be floating, left unconnected
 - cvideo_vfb: Must be floating, left unconnected
- To avoid current leakage, the following register bits must be set to 0:
 - DSS.DSS_VENC_CTRL[2] DAC_POWERDN_BGZ
 - DSS.VENC_OUTPUT_CONTROL[1] COMPOSITE_ENABLE
 - CONTROL.CTRL_CORE_SD_DAC_CONTROL[3] TVOUTBYPASS

Table 9-311 lists the typical values of the external components for different modes of the TV display interface.

Table 9-311. Typical Values for Rout, Rset, Rload, and Cout

	Composite, DC-Coupled	Composite, AC-Coupled	Bypass Mode	Unit
Rout	2700	2700	N/A	Ω
Rset	4700	4700	10,000	Ω
Rload	N/A	N/A	1500	Ω
Cout	N/A	≥ 220	N/A	μF

9.3.3 Video Encoder Integration

This section describes the integration of the VENC and video SD_DAC modules, and details clocks, resets, hardware requests, and power modes.

Figure 9-73 shows the integration of the VENC and SD_DAC in the device.

Figure 9-73. Video Encoder Integration

vinc-004

Table 9-312 shows the interrupt requests generated by the SD_DAC.

Table 9-312. Video SD_DAC Interrupt Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
SD_DAC	SD_DAC_IRQ_TVINT	IRQ_CROSSBAR_184	-	Interrupt for TV load detection from SD_DAC
	SD_DAC_IRQ_TVSHORT	IRQ_CROSSBAR_185	-	Interrupt for TV short detection from SD_DAC

NOTE: The "Default Mapping" column in Table 9-312 shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see Section 14.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 14, *Control Module*. For more information about the device interrupt controllers, see Chapter 13, *Interrupt Controllers*.

Table 9-313 describes the various Video encoder and SD_DAC clocks.

Table 9-313. Video Encoder and SD_DAC Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Video encoder	VENC_CLK	DSS_GFCLK	PRCM	VENC interface clock
	CLK1X	VID_PIX_CLK (indirect)	PRCM	VENC functional clocks, generated on DSS level through division and gating. Refer to Section 9.1.2.2, Display Subsystem Clocks , for more details.
	CLK2X		DSS clock generator	
	CLK4X			
SD_DAC	CLKDAC	VID_PIX_CLK (indirect)	PRCM DSS clock generator	Functional clock for SD_DAC module. Gating control is available on DSS level. Refer to Section 9.1.2.2, Display Subsystem Clocks , for more details.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Video encoder SD_DAC	VENC_RESETB RESETZ	DSS_RST	PRCM	Reset signal from the PRCM module.

NOTE: For information about PRCM clock gating and management, see [Chapter 3, Power, Reset, and Clock Management](#).

- Video encoder functional clocks:**

Three balanced clocks are provided to VENC module from DSS top level. Gating control for CLK4X clock is available through DSS.DSS_VENC_CTRL[0] VENC_CLOCK_4X_ENABLE bit (see [Section 9.1.2.2, Display Subsystem Clocks](#)).

Table 9-314. Digital Clock Division for the Video Encoder

VENC Clock Input	DSS Clock Generator Output
CLK4X	VID_PIX_CLK or 0 (gated)
CLK2X	VID_PIX_CLK/2
CLK1X	VID_PIX_CLK/4

NOTE: For proper video SD_DAC configuration, clock output CLK4X shall always be active by setting the DSS.DSS_VENC_CTRL[0] VENC_CLOCK_4X_ENABLE bit to 1 (see [Section 9.1.3, DSS Register Manual](#)).

CAUTION

DSS must be enabled first before VENC, in order the source clocks feeding VENC to be running before enabling the VENC.

VENC must be disabled before DSS, in order the source clocks feeding the VENC to be running before disabling the VENC. If DSS is disabled before VENC, the functional clocks will stop abruptly.

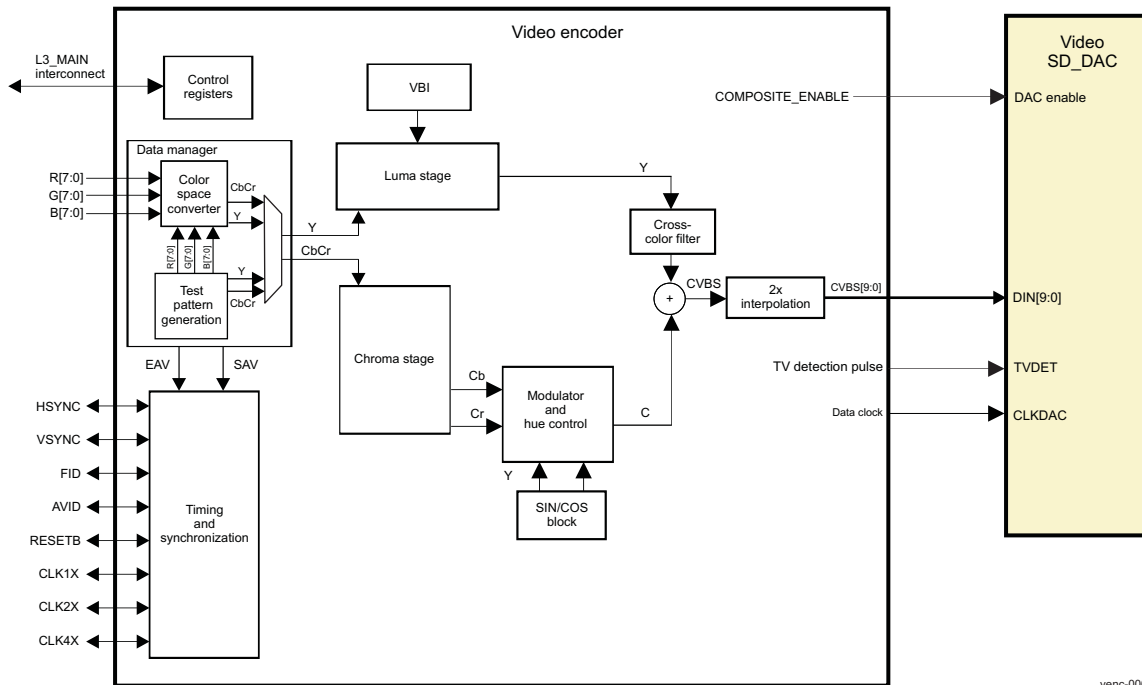

- Video SD_DAC clock:**

The video data sent from VENC to SD_DAC is latched on the positive edge of the CLKDAC clock.

9.3.4 Video Encoder Functional Description

Figure 9-74 shows an overview of the video encoder architecture.

Figure 9-74. Video Encoder Architecture Overview

venc-006

9.3.4.1 Video Encoder Data Manager

The data manager allows user to select two sources of data inputs, by programming [VENC_F_CONTROL\[7:6\]](#) SVDS bitfield:

- Data coming from the Display Controller, when SVDS = 0x0.
- Data coming from the test pattern generation, when SVDS = 0x1 or 0x2 (default value).

The source is selected

9.3.4.1.1 Video Encoder Color Space Converter

In the display subsystem, the input format from the display controller is always 24-bit RGB coming from the display controller or the test pattern generation. The RGB-to-YCbCr color space converter converts the 24-bit RGB pixel data into 16-bit YCbCr 4:2:2 data.

9.3.4.1.2 Video Encoder Test Pattern Generation

For diagnostic purposes, the data manager can be forced to output 100/100 color bar RGB/YCbCr data. To use the test pattern generation, the [VENC_F_CONTROL\[7:6\]](#) SVDS bitfield shall be set to 0x1. If [VENC_F_CONTROL\[1:0\]](#) FMT bitfield is set to 0x0, then the 24-bits RGB test pattern data will be converted into 16-bit YCbCr 4:2:2 data by the Color Space Converter. Otherwise, if [VENC_F_CONTROL\[1:0\]](#) FMT bitfield is set to 0x2, then 16-bit YCbCr 4:2:2 test pattern data are outputted directly, the color space converted is bypassed. [Table 9-315](#) resume the test paten generator data.

Table 9-315. Video Encoder 100/100 Color Bar Table

COLOR	R	G	B	Y	Cb	Cr
White	255	255	255	235	128	128
Yellow	255	255	0	210	16	146
Cyan	0	255	255	170	166	16

Table 9-315. Video Encoder 100/100 Color Bar Table (continued)

Green	0	255	0	145	54	34
Magenta	255	0	255	106	202	222
Red	255	0	0	81	90	240
Blue	0	0	255	41	240	110
Black	0	0	0	16	128	128

9.3.4.2 Video Encoder Luma Stage

The luma stage includes a luma pipeline delay, luma shaping, 2x interpolation filter, and luma variable delay. The luma pipeline delay block is used to match luma path length to chroma path length. In the luma gain shaper, a programmable gain is first applied to the luminance data output. The luminance gain is defined by the [VENC_GAIN_Y](#) register. Horizontal sync, vertical sync, and setup insertion are then performed.

Black level and blank level are programmable through the [VENC_BLACK_LEVEL](#) and [VENC_BLANK_LEVEL](#) registers. All the transition edges of the luminance signal, such as sync edges and active video edges, are properly shaped and filtered to keep the bandwidth within the standards.

After all required components of the luminance signal are added, the resulting signal is low-passed and interpolated to 2x-pixel rate. This 2x interpolation simplifies the external analog reconstruction filter design and improves the signal-to-noise ratio.

9.3.4.3 Video Encoder Chroma Stage

The chroma stage includes a low-pass filter, first-stage 2x interpolation, chroma gain shaper, and second-stage 2x interpolation. A pair of programmable gains adjusts the time-multiplexed U/V signal. The gains for U and V are independently controlled by the [VENC_GAIN_U](#) and [VENC_GAIN_V](#) register bits.

9.3.4.4 Video Encoder Subcarrier and Burst Generation

The encoder uses a 32-bit subcarrier increment to synthesize the subcarrier. The value of the subcarrier increments required to generate the desired subcarrier frequency for NTSC and PAL format is found by:

$$S_CARR = \text{ROUND} ([F_{sc}/F_{CLK2X}] \times 2^{32})$$

where:

F_{sc} = Frequency of the subcarrier

F_{CLK2X} = Frequency of the internal video encoder

The [VENC_S_CARR](#) register controls the subcarrier frequency. The [VENC_C_PHASE](#) register controls the phase of the subcarrier. The phase of the color subcarrier is reset to [VENC_C_PHASE](#). [Table 9-316](#) presents the [VENC_S_CARR](#) register values depending the standard and pixel type used.

Table 9-316. VENC_S_CARR Register Recommended Values

Standard	Pixel Type	Subcarrier Frequency (Fsc) (MHz)	Fclkenc (MHz)	VENC_S_CARR Register Value (hexa)
NTSC-M, J	ITU-R601	3.579545	27	0x21F07C1F
PAL-M	ITU-R601	3.5756083125	27	0x21E6EFE3
PAL-B, D, G, H, I	ITU-R601	4.43361875	27	0x2A098ACB
NTSC-M, J	Square pixel	3.579545	24.5454 ⁽¹⁾	0x25555555
PAL-M	Square pixel	3.579561149	24.5454 ⁽¹⁾	0x1F15C01E
PAL-B, D, G, H, I	Square pixel	4.43361875	29.50 ⁽¹⁾	0x26798C0C

⁽¹⁾ In square pixel mode, an external clock generator is needed to provide sampling frequencies (49.09 MHz for NTSC square pixel or 59 MHz for PAL square pixel).

The color subcarrier reset has four modes:

- No reset
- Reset every two lines
- Reset every two fields
- Reset every eight fields

The [VENC_C_PHASE](#) register can be used to adjust the SCH (subcarrier to horizontal sync phase). The [VENC_BSTAMP_WSS_DATA\[6:0\]](#) BSTAP bit field sets the amplitude of the color burst.

Phase alternation line refers to the encoding scheme in which the subcarrier alternates between two phases every scan line. Setting to 0x1, the [VENC_M_CONTROL\[1\]](#) PAL bit enables phase alternation line encoding. Otherwise, a normal subcarrier is generated. Two possible alternation sequences are possible by setting the [VENC_M_CONTROL\[5\]](#) PALPHS bit.

9.3.4.5 Video Encoder Vertical Blanking Interval

9.3.4.5.1 Video Encoder Closed Caption Encoding

The encoder can be programmed to encode closed-caption (CC) data and extended data in the selected line. The data stream consists of 7-bit US-ASCII code and 1 odd-parity bit (see [Video Encoder Closed-Caption Data Format](#)).

Video Encoder Closed-Caption Data Format

MSB							LSB
Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Odd parity

The standard service encodes closed caption in both fields; the extended service encodes closed caption in even fields. When set to 1, the [VENC_L21_WC_CTL\[0\]](#) L21EN bit enables closed-caption encoding in odd fields. When set to 1, the [VENC_L21_WC_CTL\[1\]](#) L21EN bit enables closed-caption encoding in even fields.

To select the scan line where the CC data are encoded, program the [VENC_LN_SEL\[4:0\]](#) SLINE bit field.

CAUTION

The setting of the [VENC_LN_SEL\[4:0\]](#) SLINE bit field value depends on the video standard:

- PAL mode: Because there is a one-line offset, program the desired line number – 1. To activate the closed caption on line 21 (0x15), program the value $0x15 - 1 = 0x14$. The default value is $0x15 + 1 = 0x16$ (line 22).
- NTSC mode: Because there is a four-line offset, program the desired line number – 4. To activate the closed caption on line 21 (0x15), program the value $0x15 - 4 = 0x11$. The default value is $0x15 + 4 = 0x19$ (line 25).

The [VENC_LN_SEL\[25:16\]](#) LN21_RUNIN bit field should be kept at reset value (0x10B). Four closed-caption data registers contain the data to be encoded. The [VENC_LINE21\[15:8\]](#) L21O and [VENC_LINE21\[7:0\]](#) L21O bit fields contain the first and the second bytes, respectively, of closed-caption data to be encoded in the odd field. The [VENC_LINE21\[31:24\]](#) L21E and [VENC_LINE21\[23:16\]](#) L21E bit fields contain the first and the second bytes, respectively, of data to be encoded in the even field.

Immediately after the closed-caption data is written to the registers, in either the odd field or even field, the corresponding closed-caption status bit ([VENC_STATUS\[4\]](#) CCE or [VENC_STATUS\[3\]](#) CCO) is reset to 0 to indicate that the closed-caption data is available in the closed-caption data registers and yet to be encoded.

Immediately after the closed-caption data is encoded, the `VENC_STATUS[4]` CCE bit or the `VENC_STATUS[3]` CCO bit is set to 1 to indicate that the closed-caption data has been encoded and is ready to accept new data. As seen in [Figure 9-75](#), a null character is automatically inserted if the closed-caption data is not written to the closed-caption data registers in time for encoding.

The running clock frequency is controlled by the `VENC_CC_CARR_WSS_CARR[15:0]` FCC bit field which should be kept at reset value (0x2631) to get 5034960.5Hz (32xfline) for NTSC-601. The closed-caption running clock common frequencies are detailed in [Table 9-317](#).

Table 9-317. Video Encoder Closed-Caption RunClock Frequency Settings

	NTSC-601	PAL-601	NTSC Square Pixel	PAL Square Pixel
<code>VENC_CC_CARR_WSS_CARR[15:0]</code> FCC bit field value	0x2631	0x25ED	0x2A03	0x22B6

The closed-caption data is encoded in nonreturn-to-zero (NRZ) format. Additionally, the data translates to the IRE scale as follows:

- 0 = 0 IRE
- Sync pulse = -40 IRE
- 1 = 50 IRE

[Figure 9-75](#) shows the parameters of closed-caption line data implemented in different standards.

Figure 9-75. Video Encoder Closed Captioning Timing

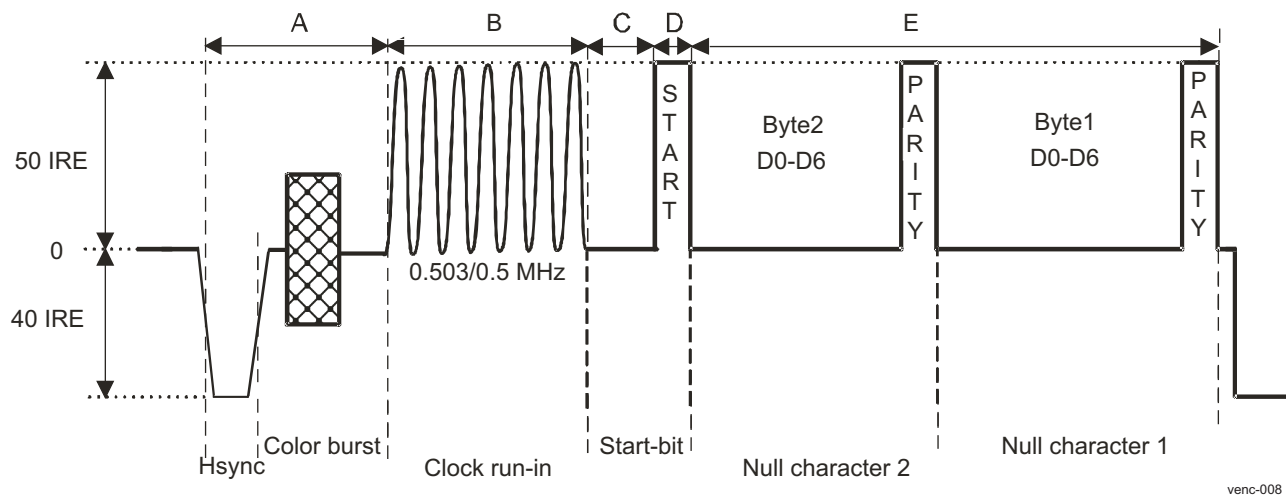

Table 9-318. Video Encoder Closed-Caption Standard Timing Values

Intervals	Description	Timing Values for Encoding			Timing Values for Decoding		
		Minimal	Nominal	Maximal	Lower Bound	Nominal	Upper Bound
A	HSYNC to clock running	10.250 μ s	10.500 μ s	10.750 μ s	10.000 μ s	10.500 μ s	11.000 μ s
B	Clock running		12.910 μ s			12.910 μ s	
C	Clock running to third start bit		3.972 μ s			3.972 μ s	
D	Start bit		1.986 μ s			1.986 μ s	
E	Data characters		31.778 μ s			31.778 μ s	

NOTE:

- The interval A is controlled by the [VENC_LN_SEL\[25:16\]](#) LN21_RUNIN bit field.
- The interval B is controlled by [VENC_CC_CARR_WSS_CARR\[15:0\]](#) FCC bit field.

All timing values listed in [Table 9-318](#) are measured from the mid-point (half amplitude) on all edges.

For a complete description of closed-caption standard including CGMS-A copy protection, see the CEA-608-x standard.

9.3.4.5.2 Video Encoder Wide-Screen Signaling (WSS) Encoding

The encoder can embed data, encoded in accordance with the IEC61880 and ITU-R 1119 data insertion standard, within the vertical blanking interval.

The encoder supports WSS data insertion on line 20 of every frame in the NTSC format. WSS data insertion is enabled by activating the [VENC_L21_WC_CTL\[14:13\]](#) EVEN_ODD_EN bit and by programming the [VENC_BSTAMP_WSS_DATA\[27:8\]](#) WSS_DATA bit field.

The running clock frequency is controlled by the [VENC_CC_CARR_WSS_CARR\[31:16\]](#) FWSS bit field. The wide-screen signaling running clock common frequencies are detailed in [Table 9-319](#)

Table 9-319. Video Encoder Wide-Screen Signaling RunClock Frequency Settings

	NTSC-601	PAL-601	NTSC Square Pixel	PAL Square Pixel
VENC_CC_CARR_WSS_CARR[31:16] FWSS bit field value	0x043F	0x2F72	0x04AC	0x2B6D

To select the line where the WSS data are encoded, program the [VENC_L21_WC_CTL\[12:8\]](#) LINE bit field.

CAUTION

The setting of the [VENC_L21_WC_CTL\[12:8\]](#) LINE bit field value depends on the video standard:

- PAL mode: Because there is a one-line offset, program the desired line number – 1. The recommended value on line 23 is $0x16 + 1 = 0x17$. The default value is $0x14 + 1 = 0x15$ (line 21).
- NTSC mode: Because there is a four-line offset, program the desired line number – 4. The recommended value on line 20 is $0x10 + 4 = 0x14$. The default value is $0x14 + 4 = 0x18$ (line 24).

The WSS encoding block assumes that a full 10-bit video range is used to determine the 70 percent of peak-white amplitude of a logic-1 bit. The encoder also supports WSS data insertion on line 23 in the PAL format. Both waveforms are shown in [Figure 9-76](#).

Figure 9-76. Video Encoder WSS Timing

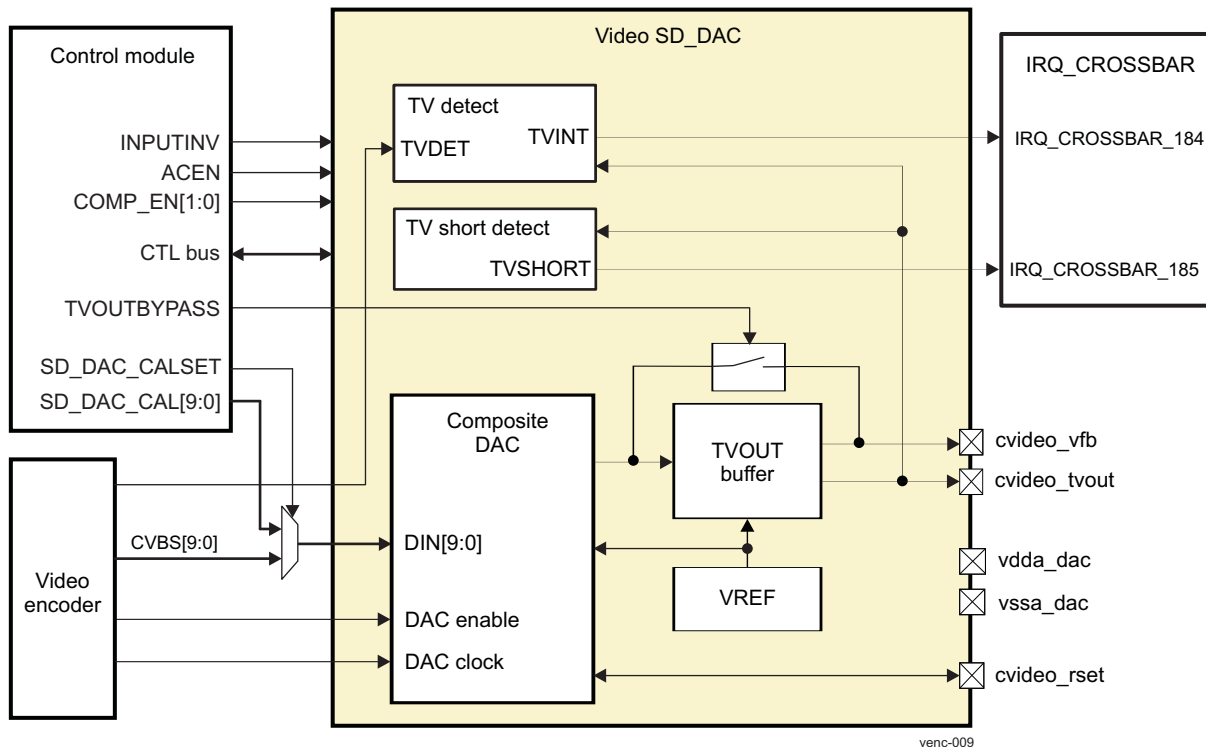

venc-007

9.3.4.6 Video Encoder SD_DAC

Figure 9-77 shows the architecture of the 10-bit video SD_DAC.

Figure 9-77. Video SD_DAC Architecture

The display subsystem provides the necessary control signals to interface the memory frame buffer directly to external displays. A 10-bit video SD_DAC is used to generate the video analog signal. The video SD_DAC also includes a TV detection/disconnection and power-down mode features.

9.3.4.6.1 Video SD_DAC DC/AC Coupled TV Load

The 10-bit video DAC supports both DC-coupled and AC-coupled TV loads. The CONTROL.CTRL_CORE_SD_DAC_CONTROL[2] ACEN bit is used to define which output coupling is used. This bit is the first one to be programmed according to the TV load on the PCB board.

NOTE: When DC coupling is used, there is a DC offset at the TVOUT output.

9.3.4.6.2 Video SD_DAC TV Detection/Disconnection Pulse Generation and Use

9.3.4.6.2.1 TV Detection/Disconnection Pulse Generation

The TV detect block is an integral part of the video SD_DAC module.

NOTE:

- The TV disconnection feature is recommended for power saving purpose. The TV detection/disconnection is only operational when video out is active. Therefore to detect cable connection automatically, it is necessary to periodically activate the video out to test for cable presence.
-

This block compares the output (*cvideo_tvout*) to reference voltage, to sense the condition of the load. To operate, the TV detect requires two digital signals, TVACEN and TVDET. The TVACEN signal indicates to both TVOUT buffer and the TV detect circuit, if the load is AC or DC coupling, to adjust accordingly. TVDET is a digital pulse at the frequency of the TV sync pulses. The operation of the circuit is based on the difference in voltage levels in the output of the buffer depending of the load status. The TV detect block compares the output against a couple of references and the result is latched at the start of every sync pulse. The status is read later in with the TVDET pulse rising edge.

The following registers are used to set the TV detection/disconnection pulse:

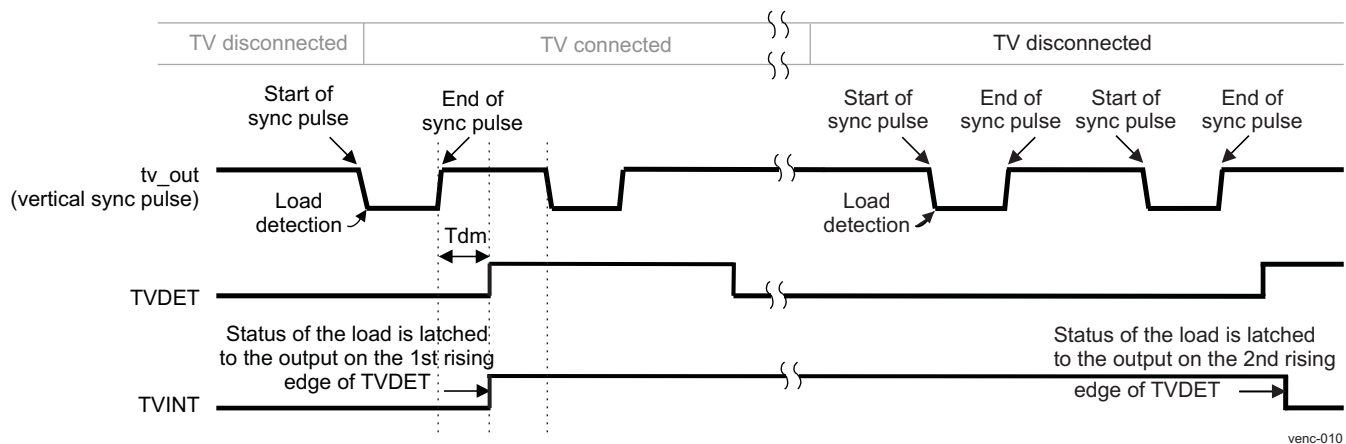

- The [VENC_TVDETGP_INT_START_STOP_X](#) register defines which pixels are used to start and stop the pulse inside their respective line.
- The [VENC_TVDETGP_INT_START_STOP_Y](#) register defines which lines are used to start and stop the pulse.
- The [VENC_GEN_CTRL\[0\]](#) EN bit enables or disables the TVDET pulse (0: Disable; 1: Enable).
- The [VENC_GEN_CTRL\[16\]](#) TVDP bit sets the TVDET pulse polarity (0: Active low; 1: Active high).

9.3.4.6.2.2 Recommended TV Detection/Disconnection Pulse Waveform

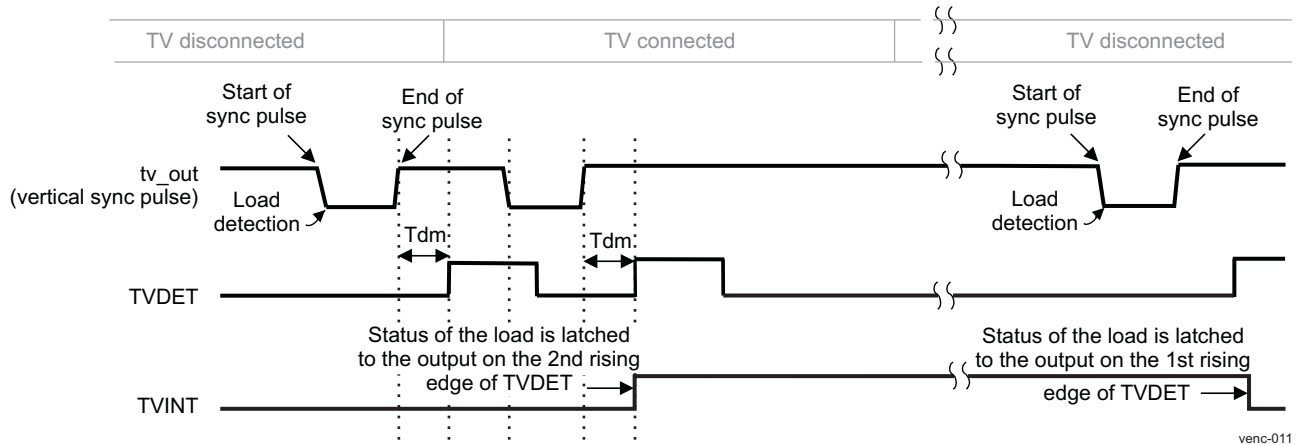

To enable the detection/disconnection of the load, the circuit requires that the TVDET pulse resembles the following waveform. By using the video encoder registers, the TVDET pulse polarity, start and stop is programmable. The only critical parameter is *Tdm*, which should be longer than the delay through the DAC and TVOUT buffer, which is at least 750 ns.

If DC-coupling is selected, the TVINT output signal for TV detection is latched at the rising edge of the first TVDET signal but the TVINT output signal for TV disconnection is latched after the next rising edge of the TVDET signal that happens during the next VSYNC timing. [Figure 9-78](#) shows the waveforms for the DC-coupling TV detect pulse (TVDET) when load is connected and disconnected.

Figure 9-78. Video SD_DAC DC-Coupling TV Detect Waveforms for TV Connected and Disconnected

If AC-coupling is selected, the TVINT output signal for TV detection is latched after the next rising edge of the TVDET signal that happens during the next VSYNC timing but the TVINT output signal for TV disconnection is latched at the rising edge of the first TVDET signal. [Figure 9-79](#) shows the waveforms for the ac-coupling TV detect pulse (TVDET) when load is connected and disconnected.

Figure 9-79. Video SD_DAC AC-Coupling TV Detect Waveforms for TV Connected and Disconnected

NOTE:

- When setting the [VENC_TVDETGPI_INT_START_STOP_X](#) register, software users must ensure that the TVDET signal is in the active area. To avoid any problem, the TVDET signal must not be longer than one line.
- The activation of the TVDET signal will not have a visual impact on the *cvideo_tvout* output signal.

9.3.4.6.2.3 TV Detection/Disconnection Use

The TV-detection/TV-disconnection is based on the difference in voltage levels in the output of the TV buffer depending on the load status. The operation is slightly different for AC and for DC operation.

- For DC operation, the *cvideo_tvout* voltage is compared against a voltage reference that makes the comparator trigger in each sync pulse while the load is connected. For DC-coupling mode, see [Figure 9-80](#).
- For AC operation, the *cvideo_tvout* voltage is compared against a voltage reference that makes the comparator trigger in each sync pulse while the load is disconnected. For AC-coupling mode, see [Figure 9-81](#).

In both cases, the TVINT output signal produces a logic 1 when a load is connected, and a logic 0 when a load is disconnected.

NOTE: Because the video SD_DAC and the video encoder must be awake for connection detection, consider that the video SD_DAC can take up to 10 μ s to wake up.

Figure 9-80. Video SD_DAC Signal Waveform Proposal for TV Detection/Disconnection in DC-Coupling Mode

Figure 9-81. Video SD_DAC Signal Waveform Proposal for TV Detection/Disconnection in AC-Coupling Mode

venc-013

9.3.4.6.3 Video SD_DAC TV Short Detection

A TV short-detection circuit, which can detect a short circuit condition at *cvideo_tvout* output during the vertical sync pulse, is integrated in the video SD_DAC module (see [Figure 9-77](#)).

When the output is shorted to ground, the TVSHORT signal turns to logic high. The TVSHORT signal is internally mapped in the device to allow interrupt generation (see [Section 9.3.3, Video Encoder Integration](#)). TV short detection is valid after two video frames pass with the short/no-short condition.

TV short detection has priority over TV load detection (see [Section 9.3.4.6.2.2, TV Detection/Disconnection Pulse Generation and Use](#)). Whenever a short is detected (with load or no-load), TVINT output is masked as long as the short remains. When released, the TV load detection resumes.

CAUTION

If TV short is detected, the video SD_DAC must be powered down by setting the DSS.DSS_VENC_CTRL[2] DAC_POWERDN_BGZ bit to 0.

9.3.4.6.4 Video SD_DAC Normal Mode

The normal mode of operation (DAC + TVOUT buffer) is the default mode of the video SD_DAC, with the CONTROL_CTRL_CORE_SD_DAC_CONTROL[3] TVOUTBYPASS bit set to 0 at device reset. The output of the DAC is internally connected to the TVOUT buffer, which can drive the composite video signal to 75 Ω load directly. For information about external connectivity, see [Section 9.3.2, Video Encoder Environment](#).

In normal mode, higher input values of the DAC code result in lower output voltage levels by default, because of the inverting configuration of the TVOUT buffer.

9.3.4.6.5 Video SD_DAC Bypass Mode

The 10-bit video SD_DAC has a TVOUT buffer bypass mode that turns off the TVOUT buffer and redirects directly the DAC output to the *cvideo_vfb* pin.

This bypass mode is activated by setting the CONTROL_CTRL_CORE_SD_DAC_CONTROL[3] TVOUTBYPASS bit to 1. The reset value of the TVOUTBYPASS bit is 0 (that is, the TVOUT buffer is not bypassed).

NOTE: In bypass mode:

- *cvideo_rset* pin requires a Rset resistor connected to the ground. The typical value of the Rset resistor is 10000 Ω .
- *cvideo_vfb* pin requires a Rload resistor connected to the ground. The typical value of the Rload resistor is 1500 Ω .

CAUTION

- The TV detect feature is not available in bypass mode.
- In bypass mode, an external video amplifier is needed on the *cvideo_vfb* pin.

9.3.4.6.6 Video SD_DAC Test Mode

10-bit external or internal datas values can be used to stimulate the DAC in debug mode, as shown in Figure 9-82.

Figure 9-82. Video SD_DAC Test Mode in Composite Video Mode

- Setting to 0x1 the [VENC_OUTPUT_CONTROL\[4\]](#) TEST_MODE bit will place the DAC under test.
- By setting the value of the [VENC_OUTPUT_CONTROL\[6\]](#) COMPOSITE_SOURCE bit to:
 - 0x0: the DAC input is coming from [VENC_OUTPUT_TEST\[9:0\]](#) COMPOSITE_TEST bit field
 - 0x1: the DAC input is coming from the display controller G[1:0], B[7:0]. To perform this configuration, the video encoder shall be configured to generate correct timing signals with the display controller, even if the video encoder is bypassed from data path perspective.

9.3.4.6.7 Video SD_DAC Power Management

After device reset, the DSS.DSS_VENC_CTRL[2] DAC_POWERDN_BGZ bit is set to 0, and the video SD_DAC is in power-down state.

[Table 9-320](#) lists the possible SD_DAC power-management configurations and the corresponding register settings.

Table 9-320. Video SD_DAC Power Management Configurations

Power Management Controls				
DSS_VENC_CTRL [2] DAC_POWERDN_BGZ bit	VENC_OUTPUT_CONT ROL [1] COMPOSITE_ENABLE bit	CTRL_CORE_SD_DAC CONTROL [3] TVOUTBYPASS bit	CTRL_CORE_SD_DAC CONTROL [2] ACEN bit	Power State
0	x	x	x	Total power down. Bandgap powered down.
1	0	x	x	Standby (analog in power down except bandgap/LDO)
1	1	0	0	Full power up in DC normal mode
1	1	0	1	Full power up in AC normal mode
1	1	1	x	Full power up in TVOUT bypass mode (DAC-only mode)

9.3.5 Video Encoder Programming Guide

9.3.5.1 Video Encoder Low-level Programming Models

9.3.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the video emodule is to be used for the first time after a device reset. This initialization of the surrounding modules is based on the integration and environment of the video encoder (for more information, see [Section 9.3.2](#) and [Section 9.3.3](#)).

CAUTION

DSS must be enabled first before VENC, in order the source clocks feeding VENC to be running before enabling the VENC.

VENC must be disabled before DSS, in order the source clocks feeding the VENC to be running before disabling the VENC. If DSS is disabled before VENC, the functional clocks will stop abruptly.

Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management
Control module	Module-specific pad muxing and configuration must be set in the control module. See Chapter 14, Control Module .
Display controller	See Section 9.2, Display Controller , for more information about the configuration.

9.3.5.1.2 Video Encoder Global Initialization

9.3.5.1.2.1 Main Sequence—Start Video Encoder

[Start Video Encoder](#) details the procedure to initialize the video encoder after a power-on or software reset.

Start Video Encoder

Step	Register/Bit Field/Programming Model	Value
Perform a video encoder reset.	See Section 9.3.5.1.2.3 .	
Save the DSS VP1 IRQ enable register value (DSS VP interrupts context).	DISPC_VP1_IRQENABLE	
Reset all DSS VP1 IRQ.	DISPC_VP1_IRQENABLE	0x00
Configure the video encoder registers for PAL 601 or NTSC 601.	See Table 9-321 .	0x--
Set the input video source and format.	VENC_F_CONTROL	See Table 9-321 .
Set the synchronization modes.	VENC_SYNC_CTRL	See Table 9-321 .
Configure the TV connection detection (optional).	See Section 9.3.5.1.2.4 .	
Enable the composite video signal output.	See Section 9.3.5.1.2.6 .	
Enable the display controller pipeline	See the display controller programming guide	
Wait until the first VSYNC pulse signal.		
Clear the SYNCLOST interrupt.	DISPC_VP1_IRQSTATUS[4] VPSYNCLOST_IRQ	0x1
Restore the DSS IRQ enable register.	DISPC_VP1_IRQENABLE	0x--

9.3.5.1.2.2 Main Sequence—Stop Video Encoder

[Start Video Encoder](#) details the procedure to stop the output of the composite signal.

Start Video Encoder

Step	Register/Bit Field/Programming Model	Value
Perform TV disconnection detection (optional).	See Section 9.3.5.1.2.5 .	
Disable the composite video signal output.	See Section 9.3.5.1.2.7 .	

9.3.5.1.2.3 Subsequence—Video Encoder Software Reset

[Reset Video Encoder](#) details the reset procedure.

Reset Video Encoder

Step	Register/Bit Field/Programming Model	Value
Activate reset.	VENC_F_CONTROL[8] RESET	0x1
Wait until reset is complete.	VENC_F_CONTROL[8] RESET	0x0

NOTE: Before changing the standard (NTSC or PAL) and related registers, a software reset is required to properly initialize the VENC module.

9.3.5.1.2.4 Subsequence—TV Connection Detection

[TV Connection Detection Subsequence](#) details the TV connection detection procedure.

TV Connection Detection Subsequence

Step	Register/Bit Field/Programming Model	Value
Set the pixel TV detection start and stop value.	VENC_TVDETP_INT_START_STOP_X	0x--
Set the line TV detection start and stop value.	VENC_TVDETP_INT_START_STOP_Y	0x--
Set the polarity of TV detection.	VENC_GEN_CTRL[16] TVDP	0x--
Enable TV detection.	VENC_GEN_CTRL[0] EN	0x1
Enable the composite video signal output.	See Section 9.3.5.1.2.6 .	
Wait until TVINT = 1.		

CAUTION

- If ac coupling is selected, two TVDET pulses are required to set high the TVINT signal. Due to the internal logic of the video SD_DAC, the TVINT signal is generated after the next positive edge of the TVDET signal that happens during the next VSYNC timing.
- If dc coupling is selected, only one TVDET pulse is required to set high the TVINT signal.

9.3.5.1.2.5 Subsequence—TV Disconnection Detection

[TV Disconnection Detection Subsequence](#) details the TV disconnection detection procedure.

TV Disconnection Detection Subsequence

Step	Register/Bit Field/Programming Model	Value
Set the pixel TV detection start and stop value.	VENC_TVDETGP_INT_START_STOP_X	0x--
Set the line TV detection start and stop value.	VENC_TVDETGP_INT_START_STOP_Y	0x--
Set the polarity of TV detection.	VENC_GEN_CTRL[16] TVDP	0x--
Enable TV disconnection.	VENC_GEN_CTRL[0] EN	0x1
Wait until TVINT = 0.		

CAUTION

- If dc coupling is selected, two TVDET pulses are required to set low the TVINT signal. Because of the internal logic of the video SD_DAC, the TVINT signal is generated after the next positive edge of the TVDET signal that happens during the next VSYNC timing.
- If ac coupling is selected, only one TVDET pulse is required to set low the TVINT signal.

9.3.5.1.2.6 Subsequence—Enable Video Composite Signal Output

[Enable Video Composite Signal Output](#) details the procedure to enable the video composite signal output.

Enable Video Composite Signal Output

Step	Register/Bit Field/Programming Model	Value
Enable the composite video signal output.	VENC_OUTPUT_CONTROL	0x0000 000A
Power up the vdda_dac voltage for SD_DAC and the TVOUT buffer.		

9.3.5.1.2.7 Subsequence—Disable Video Composite Signal Output

[Disable Video Composite Signal Output](#) details the procedure to enable the video composite signal output.

Disable Video Composite Signal Output

Step	Register/Bit Field/Programming Model	Value
Disable the composite video signal output.	VENC_OUTPUT_CONTROL	0x00000000
Power down the vdda_dac voltage for SD_DAC and the TVOUT buffer.		

9.3.6 Video Encoder Use Case and Tips

9.3.6.1 Video Encoder Register Settings

[Table 9-321](#) lists the register values to use in typical video encoder applications.

These values are validated programming values only for NTSC 601 and PAL 601 standards with a TV display resolution of 720×488 and 720×576, respectively.

Table 9-321. Video Encoder Register Programming Values

Register Name	NTSC 601	PAL 601
VENC_F_CONTROL	0x00000000	0x00000000
VENC_VIDOUT_CTRL	0x00000001	0x00000001

Table 9-321. Video Encoder Register Programming Values (continued)

Register Name	NTSC 601	PAL 601

VENC_GEN_CTRL	0x00F90000	0x00FF0000
VENC_OUTPUT_CONTROL	0x0000000A	0x0000000A
VENC_OUTPUT_TEST	0x00000000	0x00000000

NOTE: The following display controller fields must be programmed to the NTSC 601 video standard:

- DISPC_VP1_SIZE_SCREEN[11:0] PPL = $720 - 1 = 719 = 0x2CF$
- DISPC_VP1_SIZE_SCREEN[27:16] LPP = $(488/2) - 1 = 243 = 0xF3$

The following display controller fields must be programmed to the PAL 601 video standard:

- DISPC_VP1_SIZE_SCREEN[11:0] PPL = $720 - 1 = 719 = 0x2CF$
- DISPC_VP1_SIZE_SCREEN[27:16] LPP = $(576/2) - 1 = 287 = 0x11F$

For both standards, the base addresses should be handle as follow:

- DISPC_GFX1_BA0 or DISPC_VID_BA0 = Base address of even bit field data
- DISPC_GFX1_BA1 or DISPC_VID_BA1 = Base address of odd bit field data

10.3 L4 Interconnects	4006

10.1 Interconnect Overview

10.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- Initiator: Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).
- Target: Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

NOTE: A module can have several separate ports; therefore, a module can be an initiator and a target.

- Agent: Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- Interconnect: The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it. Quality of service (QoS) is guaranteed.
- Register target (RT): Special TA used to access the interconnect internal configuration registers
- Data-flow signal: Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behaviour is defined by the protocol semantics.
- Sideband signal: Any signal whose behaviour is not associated to a precise transaction or data flow.
- Out-of-band error: Any signal whose behaviour is associated to a device error-reporting scheme, as opposed to in-band errors.

NOTE: Interrupt requests and DMA requests are not routed by the interconnect in the device.

- Firewall: A programmable feature integrated in a target agent or L4 interconnect to prevent unauthorized access to or from a module. A firewall can be configured using three criteria:
 - Initiator requesting access
 - Address space access
 - Type of access
- ConnID: Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for firewall and error-logging mechanism.
- Firewall comparison mechanism: A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- MCcmd qualifier: Command bus that indicates the type of transfer requested. [Table 10-1](#) lists the commands encoded. For information specific to L3 Interconnect error logging, see *L3 Firewall Error-Logging Registers*

Table 10-1. MCcmd Qualifier Description

MCcmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Read link
1 0 1	Write nonposted
1 1 0	Write conditional

Table 10-1. MCmd Qualifier Description (continued)

MCmd[2:0]	Transaction Type
1 1 1	Write broadcast

- MReqInfo qualifier: Three MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 10-2](#).

Table 10-2. MReqInfo Qualifier Description

Qualifiers	Description
MReqType	0: Data access
	1: Opcode fetch
MReqSupervisor	0: User mode
	1: Supervisor mode
MReqDebug	0: Functional access
	1: Debug access

- Register that configures the combination of the MReqInfo, allowing access permission to the target module (TM) based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction, as described in [Table 10-3](#).

Table 10-3. SResp Qualifier Description

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

- MTagID: Interconnect qualifier generated by the L3_MAIN masters which purpose is to identify whether reordering is allowed or not relative to other transactions. Strong ordering is ensured by using same MTagID values between transactions. Reordering is allowed by using different MTagID values between transactions.
The MTagID values may or may not be changed by the interconnect, but the intended reordering restriction must match what came from the master. In other words, the interconnect allocates dynamically MTagID values in such a way that the intended reordering restrictions from each master are honored.

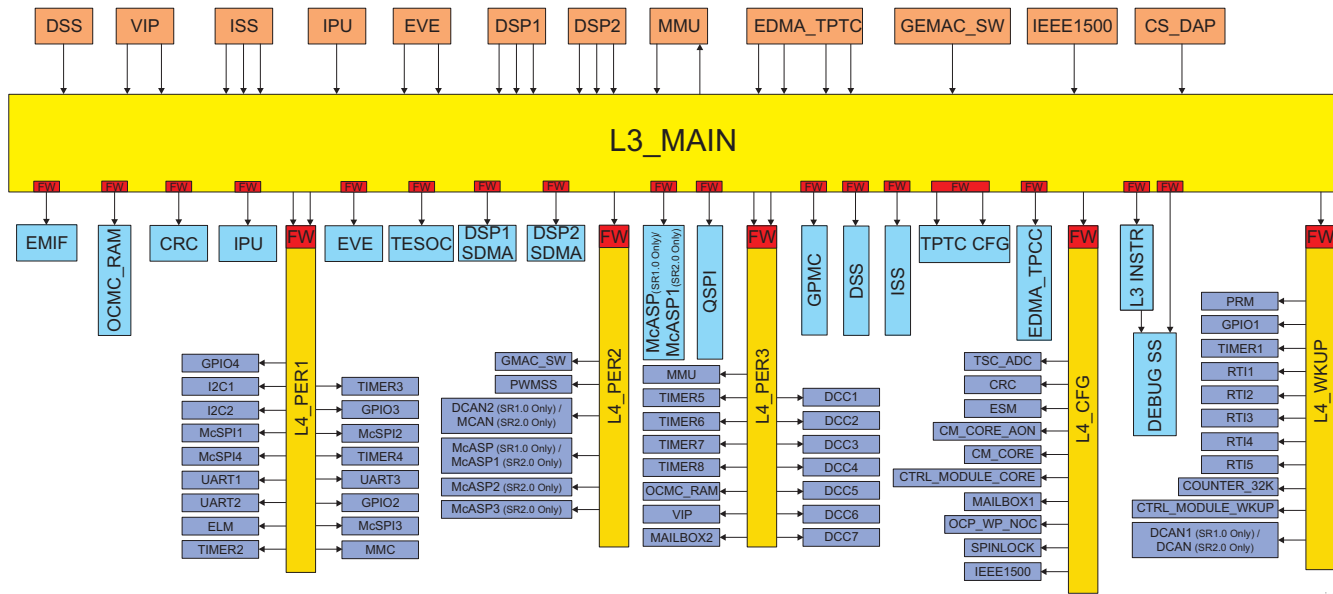

10.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- L1 and L2 memory spaces are associated with the IPU and DSP subsystems.
- The chip-level interconnect consists of one L3 interconnect and five L4 interconnects. It enables communication among the modules and subsystems in the device.

[Figure 10-2](#) shows an overview of the L3 and L4 interconnect architecture.

Figure 10-1. Interconnect Overview

- L3 handles many types of data transfers, especially exchanges with system-on-chip/external memories. L3 transfers data with a maximum width of 128 bits from the initiator to the target. The L3 interconnect is a little-endian platform
- The L4 is composed of the following:
 - L4_CFG: Includes the majority of the firewall configuration interface for level 3 (L3) system modules and peripheral interconnect;
 - L4_PER: Includes the main peripherals that require direct memory access access. L4_PER has three instances L4_PER1, L4_PER2 and L4_PER3. These three instances has the following ports connecting them to the L3_MAIN interconnect:
 - L4_PER1_P1, L4_PER1_P2
 - L4_PER2_P1
 - L4_PER3_P1, L4_PER3_P2
 Through the L3_MAIN interconnect, different initiators can access each of these ports. For information about which port can be accessed by each initiator, see [Figure 10-3](#).
 - L4_WKUP: Includes peripherals attached to the WKUP power domain.

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access, depending on the characteristics of the module.

To unauthorize a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default settings are fully functional; they enable all possible functional data paths and a minimal default protection setting.

10.2 L3_MAIN Interconnect

This section describes the L3_MAIN interconnect and its components. With the exception of register points, each component includes functions for the request and response networks.

10.2.1 L3_MAIN Interconnect Overview

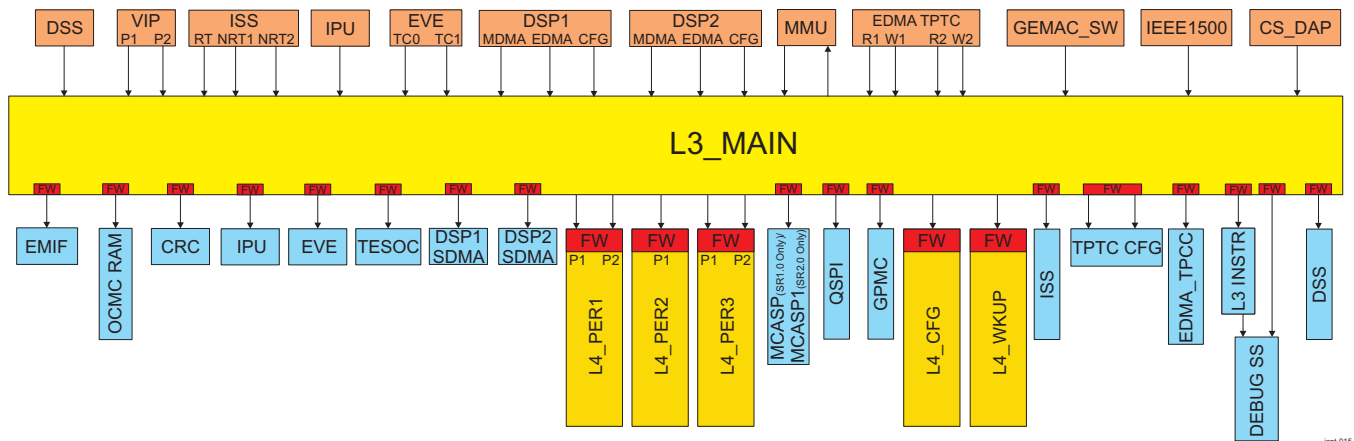

The L3_MAIN interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

The main features of the L3_MAIN interconnects are:

- NIUs: Master NIUs for the IAs and slave NIUs for the TAs
- A partially depleted cross-bar exchange network
- A special internal slave NIU for accessing L3_MAIN interconnect configuration registers
- QoS management for real-time hardware operators, while maintaining optimal memory latency for CPU access to memory resources
- True little-endian platform
- Transaction errors tracking and logging registers
- All signaling support for chip-level power-management infrastructure
- One interrupt line signaling transaction error
- One interrupt line for reporting statistical events on the L3_MAIN interconnect

Figure 10-2 shows an overview of the L3 interconnect and the peripherals attached to it.

Figure 10-2. L3_MAIN Interconnect Overview

sm-015

10.2.2 L3_MAIN Interconnect Integration

Table 10-4 through Table 10-6 summarize the integration of the module in the device.

Table 10-4. Integration Attributes

Module Instance	Attributes
L3_MAIN	Power Domain PD_COREAON

Table 10-5. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3_MAIN	L3_CLK1	L3MAIN1_L3_GICKL	PRCM	Functional and interface clock
	L3_CLK2	L3INSTR_L3_GICKL	PRCM	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3_MAIN_MAIN	L3_CORE_RET_RST	CORE_PWRON_RET_RST	PRCM	Reset of L3_MAIN interconnect registers
	L3_CORE_RST	CORE_RST	PRCM	Reset of L3_MAIN interconnect

Table 10-6. Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
L3_MAIN	L3_MAIN_IRQ_DBG_ERR	IRQ_CROSSBAR_4	DSP1_IRQ_35 DSP2_IRQ_35 EVE_IRQ_3	Interrupt indicating debug error occurrence.
	L3_MAIN_IRQ_APP_ERR	IRQ_CROSSBAR_5	DSP1_IRQ_36 DSP2_IRQ_36 EVE_IRQ_4	Interrupt indicating application error occurrence.
	L3_MAIN_IRQ_STAT_ALARM	IRQ_CROSSBAR_11	DSP1_IRQ_42 DSP2_IRQ_42	Statistic collector alarm interrupt.

NOTE: The “Default Mapping” column in [Table 10-6 Hardware Requests](#) shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#).

10.2.3 L3_MAIN Interconnect Functional Description

10.2.3.1 Module Use in L3_MAIN Interconnect

The L3_MAIN interconnect network components have ConnID values for each master NIU or slave NIU. The ID uniquely identifies the master NIU or the slave NIU for an interconnect transfer. The interconnect uses ConnIDs for a number of purposes, including the following:

- Slave NIUs for error logging
- Power disconnect slave NIU for error logging
- FLAGMUXes for masking interrupts
- Statistic Collectors (STATCOLL) for configuring and monitoring: The STATCOLL components compute the traffic statistics within a user-defined window and periodically report to the user through the debug interface.
- Bandwidth regulator for configuration

10.2.3.2 Module Distribution

Master NIUs and slave NIUs provide the interface to connect the different modules to their associated interconnect.

[Table 10-7](#) and [Table 10-8](#) list all modules and subsystems with their associated agents. The agents are listed for each L3_MAIN interconnect domain.

10.2.3.2.1 L3_MAIN Interconnect Agents

Any initiator or target core is connected to the L3_MAIN interconnect through an NIU. NIUs act as entry points to the L3_MAIN interconnect, and also include various programming registers. [Table 10-7](#) lists the supported master NIU ports.

Table 10-7. Master NIUs

Master NIU	Description
DSS1_INIT	Display SubSystem initiator port. One 128b initiator port
VIP_P1_INIT	Port 1 of VIP-128b initiator port.
VIP_P2_INIT	Port 2 of VIP-128b initiator port.
ISS_RT_INIT	ISS real time (RT) initiator port. One 128b initiator port.
ISS_NRT1_INIT	ISS non real time (NRT) initiator port 1. One 128b initiator port.
ISS_NRT2_INIT	ISS non real time (NRT) initiator port 2. One 128b initiator port.
IPU_INIT	IPU initiator port. One 64b initiator port
EVE_TC0_INIT	Embedded Vision Engine 1 (EVE) initiator port 1 (P1). One 128b initiator port.
EVE_TC1_INIT	Embedded Vision Engine 1 (EVE) initiator port 1 (P2). One 128b initiator port.
DSP1_MDMA_INIT	DSP1 Initiator port. One 128b MDMA interconnect initiator port (used also for cache requests)
DSP1_EDMA_INIT	DSP1 initiator port. One 128b EDMA interconnect initiator port.
DSP1_CFG_INIT	One 32b configuration initiator port.
DSP2_MDMA_INIT	DSP2 Initiator port. One 128b MDMA interconnect initiator port (used also for cache requests)
DSP2_EDMA_INIT	DSP2 initiator port. One 128b EDMA interconnect initiator port.
DSP2_CFG_INIT	One 32b configuration initiator port.
MMU_INIT	MMU initiator port. One 128b initiator port.
TPTC1_WR_INIT	EDMA TPTC initiator write port 1. One 128b initiator port.
TPTC1_RD_INIT	EDMA TPTC initiator read port 1. One 128b initiator port.
TPTC2_WR_INIT	EDMA TPTC initiator write port 2. One 128b initiator port.
TPTC2_RD_INIT	EDMA TPTC initiator read port 2. One 128b initiator port.

Table 10-7. Master NIUs (continued)

Master NIU	Description
GMAC_SW_INIT	GMAC_SW 32b initiator port.
IEEE1500_2_OCP_INIT	IEEE1500 32b initiator port.
DEBUGSS_CS_DAP_INIT	Debug subsystem CS_DAP 32b initiator port.

Table 10-8 lists the supported slave NIU ports.

Table 10-8. Slave NIUs

Slave NIU	Description
EMIF_P1_TARG	EMIF 128b target port.
OCMC_RAM_TARG	On-chip memory controller 128b target port.
CRC_TARG	CRC 64b target port.
IPU_TARG	IPU 64b target port.
EVE_TARG	EVE 128b target port.
TESOC_TARG	Tester-On-Chip 128b target port.
DSP1_SDMA_TARG	128b target port for system requests to DSP1 memory or DSP1 address space.
DSP2_SDMA_TARG	128b target port for system requests to DSP2 memory or DSP2 address space.
L4_PER1_P1_TARG (L4_PER_P0_TARG)	L4_PER1 32b target port 1 (P1).
L4_PER1_P2_TARG (L4_PER_P1_TARG)	L4_PER1 32b target port 2 (P2).
L4_PER2_P1_TARG (L4_PER_P3_TARG)	L4_PER2 32b target port 1 (P1).
L4_PER3_P1_TARG (L4_PER_P6_TARG)	L4_PER3 32b target port 1 (P1).
L4_PER3_P2_TARG (L4_PER_P7_TARG)	L4_PER3 32b target port 2 (P2).
MCASP_TARG (SR1.0 Only) / MCASP1_TARG (SR2.0 Only)	McASP 32b target port.
QSPI_TARG	QSPI 32b target port.
GPMC_TARG	GPMC 32b target port.
L4_CFG_TARG	L4_CFG 32b target port.
L4_WKUP_TARG	L4_WKUP 32b target port.
ISS_TARG	ISS 32b target port.
TPTC1_TARG	EDMA TPTC 32b target port 1.
TPTC2_TARG	EDMA TPTC 32b target port 2.
EDMA_TPCC_TARG	EDMA TPCC 32b target port.
L3_INSTR_TARG	L3 instrumentation 32b target port.
DEBUGSS_CT_TBR_TARG	Debug subsystem CT_TBR 64b target port.
DSS_TARG	Display subsystem 32b target port.
MMU_TARG	Memory management unit 128b target port.

10.2.3.2.2 L3_MAIN Connectivity Matrix

The L3 interconnect is divided into two clock domains L3_CLK1 and L3_CLK2. L3_CLK1 domain is further splitted into two sub groups:

- L3_CLK1_1: Low-power domain
- L3_CLK1_2: Peripherals and multimedia

L3_CLK2 is instrumentation (debug) associated. The two clock elements (L3_CLK1 and L3_CLK2) are implemented in different clock domains.

10.2.3.2.2.1 Clock Domain Mapping of the L3_MAIN Interconnect Modules

Each clock domain (L3_CLK1 and L3_CLK2) has its own host, flag mux, slave NIUs, and bandwidth regulators. [Table 10-9](#) lists the relationships between these domains and these elements.

Table 10-9. L3_MAIN Clock Domains and Elements

Figure 10-3 shows the functional paths between the L3_MAIN master NIUs and the L3_MAIN and L4 slave NIU agents. The functional paths in L3_MAIN are indicated by the following:

- A cell contains the letter C when a functional path exists.
- A cell is empty when a functional path does not exist.

1000-002

10.2.3.2.3 Master NIU Identification

A master NIU ID (ConnID) is assigned to every module in the device. The ID uniquely identifies the master NIU for an interconnect transfer (see Table 10-10). The interconnect uses ConnID values for a number of purposes, including:

- Master source identification for the protection mechanism
- Response route generation
- Firewall error logging
- L3_MAIN interconnect error logging

All L3_MAIN firewalls use 4-bit ConnID values from several registers in the control module instead of the L3_MAIN ConnIDs. Thus appropriate grouping of initiators based on a configurable ConnID can be done. The 4-bit ConnID is equal to bits[7:4] of the L3_MAIN 8-bit ConnID. The reset values of these control module registers match the value of bits[7:4]. The registers are the following:

- CTRL_CORE_FIREWALL_CONNID_CONTROL_0
- CTRL_CORE_FIREWALL_CONNID_CONTROL_1
- CTRL_CORE_FIREWALL_CONNID_CONTROL_2
- CTRL_CORE_FIREWALL_CONNID_CONTROL_3

Table 10-10. ConnID Values

8-bit ConnID (hex)	4-bit ConnID (hex)	Master NIU
10	1	DEBUGSS_CS_DAP_INIT
14	1	IEEE1500_2_OCP_INIT
20	2	DSP1_MDMA_INIT
24	2	DSP1_CFG_INIT
28	2	DSP1_EDMA_INIT
2C	2	DSP2_EDMA_INIT
30	3	DSP2_CFG_INIT
34	3	DSP2_MDMA_INIT
42	4	EVE_TC0_INIT
60	6	IPU_INIT
70	7	TPTC1_WR_INIT
72	7	TPTC1_RD_INIT
74	7	TPTC2_WR_INIT
76	7	TPTC2_RD_INIT
80	8	DSS1_INIT
86	8	MMU_INIT
90	9	VIP_P1_INIT
92	9	VIP_P2_INIT
AC	A	GMAC_SW_INIT
C0	C	ISS_RT_INIT
C4	C	ISS_NRT1_INIT
C8	C	ISS_NRT2_INIT
D2	D	EVE_TC1_INIT
E0	E	STATCOLL1
E0	E	STATCOLL2
E0	E	STATCOLL3
E0	E	STATCOLL4

The 8-bit ConnID values are used by error decoding to distinguish the different initiators, see [Section 10.2.3.8.4, Example for Decoding Standard/Custom Errors Logged in L3_MAIN](#). They are also used by the EMIF controller. The 4-bit ConnID values are used by the firewalls to allow or not an access to a slave NIU, see [Table 10-16](#).

10.2.3.3 Bandwidth Regulators

The bandwidth regulators prevent master NIUs from consuming too much bandwidth of a link, or a slave NIU that is shared between several data flows: packets are then transported at a slower rate. The value of a bandwidth can be programmed in the bandwidth regulator. When the bandwidth is below the programmed value, the pressure bit is set to 1, giving priority to this master. When the bandwidth is above the programmed value, the pressure bit is set to 0 and the concerned master has the same weight as others.

A counter is used to store the sum of data lengths (in bytes) of each packet passing through the bandwidth regulator, and a value equal to the expected bandwidth is subtracted from the counter at each clock cycle. The value of the counter is compared to a programmable threshold (called Watermark), and this comparison determines whether the packet is processed with high pressure for minimum latency or low pressure for best effort processing.

The bandwidth regulator monitors the traffic using open connections between the initiators and the targets. If there is insufficient bandwidth allocated to the connection, the bandwidth regulator can increase the pressure on connections. Generally, the connection is a dataflow between master and slave NIUs. In some cases, the bandwidth regulator is attached to the master and monitors single dataflow to a target (single connection).

Figure 10-4. Bandwidth Regulator Pressure Settings

NOTE: When Counter value falls below Watermark pressure bit is assigned to 1

icnt-003

When Counter Value (bytes) falls below Watermark, the pressure bit is assigned to 1

The bandwidth regulator effective resolution is set to 8.3125 MBps. The maximum average bandwidth (max watermark value) computed in a moving window is set to up to 4096 bytes of payload. These settings are implemented by hardware.

The following is an example of bandwidth regulator settings:

Suppose the bandwidth regulator is set to run at 200 MHz and the application requires an expected bandwidth of 165.888 MBps (± 5 MBps), computed through a moving window of 5 μ s (1000 cycles). To attribute high pressure on all packet requests, the watermark could be set to the maximum bandwidth needed in the 5- μ s window.

Considering the example, the settings of the bandwidth regulator are:

- **L3_BW_REGULATOR_WATERMARK**[11:0] WATERMARK = moving window \times expected bandwidth = 829.44 bytes = 0x33D
- **L3_BW_REGULATOR_BANDWIDTH**[15:0] BANDWIDTH = $\text{ceil}(165.888/8.3125) = \text{ceil}(19.956) = 20d = 0x14$

The bandwidth registers regulate the packet flow by applying flow control on the RX port, thus ensuring that the traffic does not exceed the allocated bandwidth. The next packet is sent only when an internal timer expires. The registers in this group are:

- **L3_BW_REGULATOR_WATERMARK**: Gives the amount of data allowed to exceed the average bandwidth during a short time period
- **L3_BW_REGULATOR_PRESS**: Describes the pressure applied to outgoing packets
- **L3_BW_REGULATOR_CLEARHISTORY**: Resets the traffic counter when set to 1. This register is

used after an update in the [L3_BW_REGULATOR_BANDWIDTH](#) and [L3_BW_REGULATOR_WATERMARK](#) registers (see [Section 10.2.5.1.7, L3 BW Regulator Register Summary and Description](#)).

Bandwidth regulators are mainly used to give priority to the following master NIUs:

- IPU_INIT
- EVE_TC0_INIT
- EVE_TC1_INIT
- DSP1_MDMA_INIT
- DSP2_MDMA_INIT
- GMAC_SW_INIT

Priority to the following master NIUs is given by setting their internal MFlag signals:

- DSS1_INIT
- VIP_P1_INIT
- VIP_P2_INIT
- ISS_RT_INIT

10.2.3.4 Bandwidth Limiters

Bandwidth limiters are added to control the bandwidth of:

- ISS_NRT1_INIT
- ISS_NRT2_INIT
- *IPU_INIT*
- *EVE_TC0_INIT*
- *EVE_TC1_INIT*
- *DSP1_MDMA_INIT*
- DSP1_EDMA_INIT
- *DSP2_MDMA_INIT*
- DSP2_EDMA_INIT
- MMU_INIT
- TPTC1_WR_INIT
- TPTC1_RD_INIT
- TPTC2_WR_INIT
- TPTC2_RD_INIT

This prevents a large number of RD requests being processed together, thus avoiding a large number of RD responses.

NOTE: The following initiator NIUs have also bandwidth regulators:

- *IPU_INIT*
 - *EVE_TC0_INIT*
 - *EVE_TC1_INIT*
 - *DSP1_MDMA_INIT*
 - *DSP2_MDMA_INIT*
-

The bandwidth limiter regulates the packet flow in the L3_MAIN interconnect by applying flow control when a user-defined bandwidth limit is reached. The next packet is served only after an internal timer expires, thus ensuring that traffic does not exceed the allocated bandwidth. Bandwidth limiter can be used with a watermark mechanism that allows traffic to temporarily exceed the peak bandwidth.

The registers in this group are:

- **L3_BW_LIMITER_WATERMARK_0**: Gives the amount of data allowed to exceed the average bandwidth during a short time period. To set the actual watermark to n bytes, the register must be set to n + 1.
- **L3_BW_LIMITER_CLEARHISTORY**: Resets the traffic counter when set to 1.
- **L3_BW_LIMITER_BANDWIDTH_FRACTIONAL** and **L3_BW_LIMITER_BANDWIDTH_INTEGER**: These two registers are used to set the average payload bandwidth.

Example of setting the Bandwidth Limiters:

L3_BW_LIMITER_BANDWIDTH_FRACTIONAL must be set to BandwidthConf [4 down to 0] and **L3_BW_LIMITER_BANDWIDTH_INTEGER** contains the remaining BandwidthConf bits, shifted to the right. BandwidthConf = AverageBandwidth / EffectiveResolution, where EffectiveResolution parameter is set to 8.3125 MHz at design time

AverageBandwidth is a parameter representing the value to which the payload bandwidth must be limited in average; this parameter depends on the use case and is the reason that makes the content of the registers variable. In addition the maximum packet length is 8 cells, that is 32 bytes.

Assuming that the use case requires that in average the payload bandwidth is limited to 200 MB/s, then registers must be set to the following values:

$$\text{BandwidthConf} = 200 \text{ MBps} / 8.3125 \text{ MHz} = 38 \text{ (0x26)}$$

$$\text{L3_BW_LIMITER_BANDWIDTH_FRACTIONAL} = \text{LSBs [4 down to 0] of BandwidthConf} = 0x6.$$

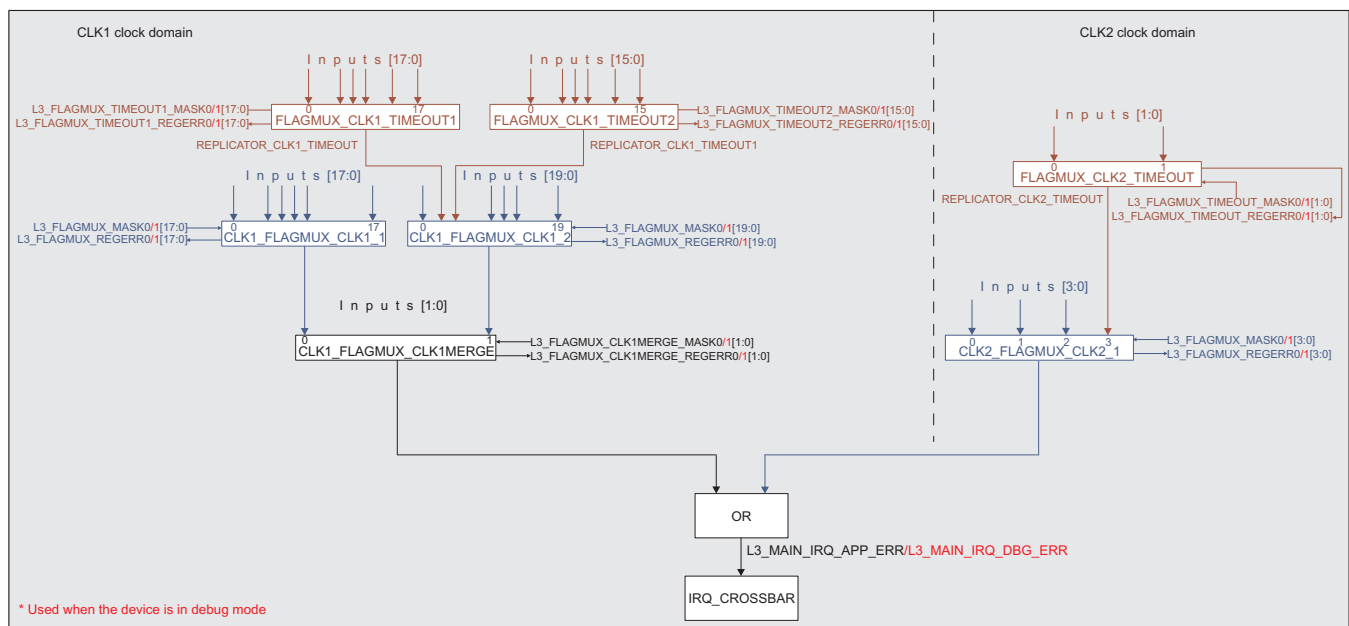

$$\text{L3_BW_LIMITER_BANDWIDTH_INTEGER} = \text{the remaining bits of BandwidthConf shifted to the right} = 0x1.$$

By setting **L3_BW_LIMITER_WATERMARK** to 65 (**L3_BW_LIMITER_WATERMARK_0** = 0x41), the bandwidth limiter is able to send three packets consecutively during peaks, therefore exceeding the peak traffic with two packets (64 bytes)

10.2.3.5 Flag Muxing

Flag muxing is used to collect information such as errors and interrupts from slave NIUs and interconnect firewalls. The result signals are then sent to the **IRQ_CROSSBAR** module without interfering with the interconnect traffic. **Figure 10-5** shows the flag muxing scheme.

Figure 10-5. Flag Muxing Scheme

The following three flag muxes collect information from targets in L3_CLK1 and L3_CLK2 clock domains:

- CLK1_FLAGMUX_CLK1_1
- CLK1_FLAGMUX_CLK1_2
- CLK2_FLAGMUX_CLK2_1

There are three [L3_FLAGMUX_MASK0](#) registers each associated with a single flag mux of the previously listed. Each bit in these registers is associated with only one source. If a bit is set to 0x0, the corresponding flag is masked which means that the input source is disabled, and if set to 0x1 the flag is unmasked. There are also three [L3_FLAGMUX_REGERR0](#) status registers for checking the source of error. A value of 0x1 indicates that the corresponding flag is set, that is, an error is generated. [Table 10-11](#) shows the mapping between the input sources and the bits in [L3_FLAGMUX_MASK0](#) and [L3_FLAGMUX_REGERR0](#) registers. The missing values are reserved and writing to these bits has no effect.

Table 10-11. Flag Mux Input Mapping

Flag Mux	Corresponding bit in registers L3_FLAGMUX_MASK0 and L3_FLAGMUX_REGERR0 (Flag Mux Input)	Flag Mux Input Sources	
CLK1_FLAGMUX_CLK1_1	1	EMIF_P1	
	2	DSP2_SDMA	
	3	TESOC	
	5	DSP1_SDMA	
	6	EVE	
	7	DSS	
	8	GPMC	
	10	L4_CFG	
	11	L4_WKUP	
	13	IPU	
	14	EDMA_TPCC	
	15	TPTC1 (EDMA)	
	16	TPTC2 (EDMA)	
	17	MMU	
	CLK1_FLAGMUX_CLK1_2	0	HOST_CLK1_1
		1	HOST_CLK1_2
		2	REPLICATOR_CLK1_TIMEOUT
4		REPLICATOR_CLK1_TIMEOUT1	
5		L4_PER2_P1 (L4_PER_P3)	
6		L4_PER1_P1 (L4_PER_P0)	
7		L4_PER1_P2 (L4_PER_P1)	
8		L4_PER3_P2 (L4_PER_P7)	
9		L4_PER3_P1 (L4_PER_P6)	
10		MCASP (SR1.0 Only) / MCASP1 (SR2.0 Only)	
12		OCMC_RAM	
16		QSPI	
18		CRC	
19	ISS		
CLK2_FLAGMUX_CLK2_1	0	L3_INSTR	
	1	DEBUGSS_CT_TBR	
	2	HOST_CLK2_1	
	3	REPLICATOR_CLK2_TIMEOUT	

Each of the three flag muxes has also the following two registers:

- [L3_FLAGMUX_STDHOSTHDR_COREREG](#) register for identification of the attached core type
- [L3_FLAGMUX_STDHOSTHDR_VERSIONREG](#) register for identification of the characteristics of the attached core

There is also a separate mux (CLK1_FLAGMUX_CLK1MERGE) that merges the outputs of the CLK1_FLAGMUX_CLK1_1 and CLK1_FLAGMUX_CLK1_2 flag muxes. Its functionality follows the same logic as the functionality of the flag muxes previously described. The following registers are available:

- [L3_FLAGMUX_CLK1MERGE_MASK0](#) register for enabling/disabling the corresponding input sources
- [L3_FLAGMUX_CLK1MERGE_REGERR0](#) status register for checking the source of error
- [L3_FLAGMUX_CLK1MERGE_STDHOSTHDR_COREREG](#) register for identification of the attached core type
- [L3_FLAGMUX_CLK1MERGE_STDHOSTHDR_VERSIONREG](#) register for identification of the characteristics of the attached core

In addition, it must be taken into account that the following registers (already described) with suffix "0" are used when the device is in application mode:

- [L3_FLAGMUX_MASK0](#)
- [L3_FLAGMUX_REGERR0](#)
- [L3_FLAGMUX_CLK1MERGE_MASK0](#)
- [L3_FLAGMUX_CLK1MERGE_REGERR0](#)

The following registers with suffix "1" are used when the device is in debug mode:

- [L3_FLAGMUX_MASK1](#)
- [L3_FLAGMUX_REGERR1](#)
- [L3_FLAGMUX_CLK1MERGE_MASK1](#)
- [L3_FLAGMUX_CLK1MERGE_REGERR1](#)

Both register groups have identical bits and follow same logic. The only difference is that registers with suffix "0" are used in application mode and registers with suffix "1" are used in debug mode.

10.2.3.5.1 Time-out Flag Muxing

If a target does not respond after a fixed number of clock cycles, a time-out error flag is generated if enabled. There are three time-out flag muxes:

- FLAGMUX_CLK1_TIMEOUT1 with registers [L3_FLAGMUX_TIMEOUT1_MASK0](#) and [L3_FLAGMUX_TIMEOUT1_REGERR0](#)
- FLAGMUX_CLK1_TIMEOUT2 with registers [L3_FLAGMUX_TIMEOUT2_MASK0](#) and [L3_FLAGMUX_TIMEOUT2_REGERR0](#)
- FLAGMUX_CLK2_TIMEOUT with registers [L3_FLAGMUX_TIMEOUT_MASK0](#) and [L3_FLAGMUX_TIMEOUT_REGERR0](#)

Each bit in the _MASK0 registers previously listed is associated with only one time-out source. If a bit is set to 0x0, the corresponding time-out flag is masked, and if set to 0x1 the flag is unmasked. To check the source of time-out error the corresponding bit in one of the three previously listed _REGERR0 registers should be read. A value of 0x1 indicates that a time-out error has occurred.

[Table 10-12](#) shows the mapping between the time-out input sources and the bits in _MASK0 and _REGERR0 registers. The missing values are reserved and writing to these bits has no effect.

Table 10-12. L3 Time-out Flag Mapping

Time-out Flag Mux	Flag Mux Input (Corresponding bit in registers _MASK0 and _REGERR0)	Flag Mux Time-out Input Sources
FLAGMUX_CLK1_TIMEOUT1	2	DSP1_SDMA
	3	DSP2_SDMA
	4	DSS

Table 10-12. L3 Time-out Flag Mapping (continued)

Time-out Flag Mux	Flag Mux Input (Corresponding bit in registers _MASK0 and _REGERR0)	Flag Mux Time-out Input Sources
	5	EVE
	6	IPU
	7	MMU
	8	EMIF_P1
	9	TESOC
	11	L4_PER_P0
	12	L4_PER_P1
	13	L4_PER_P3
	14	L4_PER_P7
	15	L4_PER_P6
	16	L4_CFG
	17	L4_WKUP
FLAGMUX_CLK1_TIMEOUT2	2	ISS
	4	QSPI
	6	EDMA_TPCC
	7	TPTC1
	8	TPTC2
	11	MCASP (SR1.0 Only) / MCASP1 (SR2.0 Only)
	12	OCMC_RAM
	14	GPMC
	15	CRC
FLAGMUX_CLK2_TIMEOUT	0	L3_INSTR
	1	DEBUGSS_CT_TBR

For example, to enable IPU time-out error the [L3_FLAGMUX_TIMEOUT1_MASK0\[6\]](#) bit must be set to 0x1. To check whether IPU time-out error has occurred the [L3_FLAGMUX_TIMEOUT1_REGERR0\[6\]](#) bit must be read.

10.2.3.6 Statistic Collectors Group

Statistic collectors are internal masters that share the same master address as the master NIUs. These components compute the traffic statistics within a defined window and periodically report through the DEBUG interface. The key features of the statistic collector are:

- Nonintrusive monitoring
- Programmable filters and counters
- Collects results at a programmable time interval

Event detectors are programmed through the [L3_STCOL_REQEVT](#) and [L3_STCOL_RSPEVT](#) configuration registers for request and response ports, respectively. The following events can be identified:

- Word transfer
- WAIT cycles
- Flow control
- Payload transfers
- Latency measurements

Performance monitoring is enabled through the [L3_STCOL_EN](#) register. The [L3_STCOL_SOFTEN](#) register enables software to monitor the performance. Event muxes are programmed through the [L3_STCOL_EVTMUX_SEL0](#) configuration register, which determines which port will be monitored by a filter configured by the filter registers (see [Section 10.2.5.1.9](#)).

Filters are programmed through the [L3_STCOL_FILTER_i_GLOBALEN](#) configuration register, along with additional selection criteria programmed through the mask/match registers (see [Table 10-221](#)). A filter can be configured to accept or reject:

- Read operations
- Write operations
- Errors
- Addresses

Filter operation is programmed through the L3_STCOL_OP registers (see [Table 10-221](#)).

There are four statistic collectors used for traffic monitoring on device ports. For more detailed description regarding statistic collectors, see [L3 Target Load Monitoring](#) and [L3 Master Latency Monitoring](#) in [Chapter 26 On-Chip Debug Support](#).

10.2.3.7 L3_MAIN Protection and Firewalls

Device protection relies on L3 firewalls and their configuration.

10.2.3.7.1 L3_MAIN Firewall Reset

The values of the L3_MAIN firewall registers upon reset are tied in hardware or exported from the control module registers.

Values exported from the control module are intended to give defined rights to the firewalls at reset and thus ensure the content after going out of reset.

The L3_MAIN firewall registers are located in the CORE_AON power domain and thus no retention capability is needed. The control module registers are reset by a cold reset only, whereas the L3_MAIN firewall registers are reset by clearing the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit. When the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit comes back automatically to 1, the exported values are loaded.

CAUTION

Before reprogramming the firewall registers and/or before using the FW_LOAD_REQ mechanism, the request must be asserted by configuring the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit.

To load the exported values at run time:

1. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Clear the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit by writing 0x1 to it.
3. Wait until the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit is reset to 0x1 by hardware.
4. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

To reprogram the firewall registers at run time:

1. Write 0x1 to the [REGUPDATE_CONTROL](#) register.
2. Update the firewall registers.
3. Write 0x0 to the [REGUPDATE_CONTROL](#) register.

NOTE: While reprogramming the firewall registers at run time it must be taken into account that the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit is written as '0' because a value of '1' reloads the firewall default values.

NOTE: At reset, exported values from the control module can modify hardware reset values.

10.2.3.7.2 Power Management

As part of the system-wide power-management scheme, the L3_MAIN interconnect goes into IDLE state after receiving a request from the power, reset, and clock management (PRCM) module after all commands are serviced. This function is handled by hardware.

To reduce power consumption, the L3_MAIN interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

L3_MAIN supports a partial retention scheme. Retention is performed on the following registers:

- Statistic collectors
- Bandwidth regulators
- Bandwidth limiters
- Firewalls
- Flag muxes

This process prevents reconfiguration after a clock domain switches off.

10.2.3.7.3 L3_MAIN Firewall Functionality

The access to the slave NIUs is granted only to master NIUs according to in-band attributes sent in each transaction crossing the L3_MAIN interconnect, such as:

- MCMD: Specifies the type of access (read or write) required by the master NIU
- ConnID: Used to determine the permission of the master NIU
- MReqInfo: Transaction attribute adding information about the access type

Table 10-13 lists the MReqInfo values.

Table 10-13. MReqInfo Values

Qualifier	Access Definition	Access Description
MReqDebug	0: Functional 1: Debug	When set, indicates that the request has been issued by a master NIU in DEBUG state
MReqType	00: Processor data access 01: Processor instruction access 10: DMA access 11: Other	Indicates whether the request is for processor instruction fetch, processor data access or DMA access
MReqSupervisor	0: User 1: Privilege	When set, indicates that the request is qualified with the supervisor attribute. It can be provided by a processor running in supervisor mode or by a module that inherited this attribute from the processor (DMA channel with a supervisor attribute).

The firewall comparison mechanism enables access to a protected slave NIU only when a correct combination of three MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed 4-bit pattern that corresponds to a combination of the parameters MReqDebug, MReqType, and MReqSupervisor. See Table 10-14.

Table 10-14. L3_MAIN ReqInfo Mapping

	ReqInfo Name	MReqDebug	MReqType	MReqSupervisor

10.2.3.7.3.1 Protection Regions

Each slave NIU address space is subdivided into protection regions. The regions are configurable with a size of 4-KiB granularity.

Table 10-15 lists the number of protected regions for each slave NIU.

Table 10-15. Slave NIU Firewall and Region Configuration

Firewall name	Slave NIU	Number of Firewall Regions
EMIF_FW	EMIF_P1_TARG	24
OCMC_RAM_FW	OCMC_RAM_TARG	24
CRC_FW	CRC_TARG	4
IPU_FW	IPU_TARG	4
EVE_FW	EVE_TARG	1
TESOC_FW	TESOC_TARG	4
DSP1_SDMA_FW	DSP1_SDMA_TARG	1
DSP2_SDMA_FW	DSP2_SDMA_TARG	1
MCASP_FW (SR1.0 Only) / MCASP1_FW (SR2.0 Only)	MCASP_TARG (SR1.0 Only) / MCASP1_TARG (SR2.0 Only)	1
QSPI_FW	QSPI_TARG	4
GPMC_FW	GPMC_TARG	8
ISS_FW	ISS_TARG	4
TPTC_FW	TPTC1_TARG and TPTC2_TARG	2
EDMA_TPCC_FW	EDMA_TPCC_TARG	1
L3_INSTR_FW	L3_INSTR_TARG	1
DEBUGSS_CT_TBR_FW	DEBUGSS_CT_TBR_TARG	2
DSS_FW	DSS_TARG	8

Two types of regions are distinguished in a slave NIU firewall:

- Default region: Available in all slave NIUs. The default region covers the entire slave NIU address range. Other firewall-configured regions must reset or overlay the default region, because it always has the lowest priority.
- Normal region: The number of normal regions varies in a slave NIU; they have identical capabilities (see Table 10-15).

Each region has the following characteristics:

- Start address: Physical slave NIU start address
- End address: Physical slave NIU end address
- Specific access rights (see Section 10.2.3.7.3.3, *Protection Mechanism per Region Examples*)
- Priority level

Depending on its priority level, a region can override the settings of another region; the access rights of the region with the highest priority apply. All regions have a fixed (not configurable) priority level that corresponds to their number: Region 0 has priority level 0 (lowest), region 1 has priority level 1, and so on.

Figure 10-6 shows the priority level with associated regions. This priority level scheme allows multiplying the flexibility and capability of the firewall. Figure 10-6 shows a 7-region firewall setting that creates 16 regions (twice the number of regions created than originally available).

Figure 10-6. L3 Interconnect Region Overlay and Priority Level Overview

icnt-005

The address range covered by the regions is defined in the [START_REGION_i](#) and [END_REGION_i](#) registers. The boundary checks are done on a minimum size of 4-KiB pages; thus, bits [11:0] of those 32-bit registers are not checked.

The address space size of the slave NIUs ([bits [31:12]]) depends on the size of the slave NIU to protect (that is, if a memory is only 48KiB, then the size is defined through bits [16:12] of the slave NIU start and end address registers of the firewall region ([START_REGION_i\[16:12\]](#) and [END_REGION_i\[16:12\]](#)).

To enable/disable regions the [END_REGION_i\[0\]](#) [END_REGION_i_ENABLE](#) bit should be set/cleared.

There is only one multiport firewall in this device. This is the TPTC_FW firewall which has two ports. The firewall configuration applies to all ports but there is one set of error logging registers per port. The [ERROR_LOG_0](#) register logs errors for traffic going to the TPTC1_TARG and the [ERROR_LOG_1](#) register logs errors for traffic going to the TPTC2_TARG.

The EMIF firewall (EMIF_FW) has 4 GiB address space and protects both the SDRAM and the EMIF configuration registers. Although the SDRAM is accessible at address space 0x8000_0000 through 0xFFFF_FFFF (total of 2GiB) the EMIF_FW sees that range in its address space at addresses 0x0000_0000 through 0x7FFF_FFFF. This means, to protect the SDRAM the start address in the [START_REGION_i](#) register should be 0x0000_0000, and not 0x8000_0000. The EMIF configuration registers are accessible through system base address 0x4C00_0000. But in the EMIF_FW address space that address is mapped to 0x8000_0000. In other words, EMIF_FW sees the EMIF configuration registers at 0x8000_0000. This means, to protect the EMIF configuration registers the start address in the [START_REGION_i](#) register should be 0x8000_0000, and not 0x4C00_0000.

10.2.3.7.3.2 L3_MAIN Firewall Registers Overview

[Table 10-16](#) and [Table 10-17](#) list the L3_MAIN firewall permission-setting registers.

Table 10-16. L3_MAIN Firewall Read/Write Permission-Setting Register

Register Name	Bits	Field Name	4-bit ConnID Value (hex) (see Table 10-10)	Field Modifiability
MRM_PERMISSION_REGION_HIGH_j	31	W15	ConnID = F write permission	RW
	30	R15	ConnID = F read permission	RW
	29	W14	ConnID = E write permission	RW
	28	R14	ConnID = E read permission	RW
	27	W13	ConnID = D write permission	RW
	26	R13	ConnID = D read permission	RW
	25	W12	ConnID = C write permission	RW
	24	R12	ConnID = C read permission	RW
	23	W11	ConnID = B write permission	RW
	22	R11	ConnID = B read permission	RW
	21	W10	ConnID = A write permission	RW
	20	R10	ConnID = A read permission	RW
	19	W9	ConnID = 9 write permission	RW
	18	R9	ConnID = 9 read permission	RW
	17	W8	ConnID = 8 write permission	RW
	16	R8	ConnID = 8 read permission	RW
	15	W7	ConnID = 7 write permission	RW
	14	R7	ConnID = 7 read permission	RW
	13	W6	ConnID = 6 write permission	RW
	12	R6	ConnID = 6 read permission	RW
	11	W5	ConnID = 5 write permission	RW
	10	R5	ConnID = 5 read permission	RW
	9	W4	ConnID = 4 write permission	RW
	8	R4	ConnID = 4 read permission	RW
	7	W3	ConnID = 3 write permission	RW
	6	R3	ConnID = 3 read permission	RW
	5	W2	ConnID = 2 write permission	RW
	4	R2	ConnID = 2 read permission	RW
	3	W1	ConnID = 1 write permission	RW
	2	R1	ConnID = 1 read permission	RW
	1	W0	ConnID = 0 write permission	RW
	0	R0	ConnID = 0 read permission	RW

Table 10-17. L3_MAIN Firewall Permission-Setting Register

Register name	Type of Permission	Bits	Field Name	Description	Field Modifiability
MRM_PERMISSION_REGION_LOW_j	Reserved	31:16	Reserved		
	Debug	15	PUB_PRV_DEBUG	PUBLIC PRIVILEGE DOMAIN DEBUG ALLOWED	RW
		14	PUB_USR_DEBUG	PUBLIC USER DOMAIN DEBUG ALLOWED	RW
	Reserved	13:12	Reserved		
	Access	11	PUB_PRV_READ	PUBLIC PRIVILEGE READ ACCESS ALLOWED	RW
		10	PUB_PRV_WRITE	PUBLIC PRIVILEGE WRITE ACCESS ALLOWED	RW
		9	PUB_PRV_EXE	PUBLIC PRIVILEGE EXE ACCESS ALLOWED	RW
		8	PUB_USR_READ	PUBLIC USER READ ACCESS ALLOWED	RW
		7	PUB_USR_WRITE	PUBLIC USER WRITE ACCESS ALLOWED	RW
		6	PUB_USR_EXE	PUBLIC USER EXE ACCESS ALLOWED	RW

10.2.3.7.3.3 Protection Mechanism per Region Examples

The access permission of each region is configurable and defined through the [MRM_PERMISSION_REGION_HIGH_j](#) and [MRM_PERMISSION_REGION_LOW_j](#) registers (see [Section 10.2.3.7.3.2, L3_MAIN Firewall Registers Overview](#)).

Master NIU permissions:

- To give read access to the master NIU with 4-bit ConnID = n(1), set the [MRM_PERMISSION_REGION_HIGH_j\[n × 2\]](#) Rn bit.
 - To give write access to the master NIU with 4-bit ConnID = n(1), set the [MRM_PERMISSION_REGION_HIGH_j\[n × 2 + 1\]](#) Wn bit.
- (1) - n should be first converted from hex to decimal value

Debug permissions:

- To give privilege debug access, set the [MRM_PERMISSION_REGION_LOW_j\[15\]](#) PUB_PRV_DEBUG bit.
- To give user debug access, set the [MRM_PERMISSION_REGION_LOW_j\[14\]](#) PUB_USR_DEBUG bit.

User, read, write, and executable permissions:

- To give privileged read access, set the [MRM_PERMISSION_REGION_LOW_j\[11\]](#) PUB_PRV_READ bit.
- To give privileged write access, set the [MRM_PERMISSION_REGION_LOW_j\[10\]](#) PUB_PRV_WRITE bit.
- To give privileged executable access, set the [MRM_PERMISSION_REGION_LOW_j\[9\]](#) PUB_PRV_EXE bit.
- To give user read access, set the [MRM_PERMISSION_REGION_LOW_j\[8\]](#) PUB_USR_READ bit.
- To give user write access, set the [MRM_PERMISSION_REGION_LOW_j\[7\]](#) PUB_USR_WRITE bit.
- To give user executable access, set the [MRM_PERMISSION_REGION_LOW_j\[6\]](#) PUB_USR_EXE bit.

Example: To provide debug write privilege access to the master NIU with 4-bit ConnID = 0x8, set to 0x1 the following bits:

- [MRM_PERMISSION_REGION_HIGH_j\[17\]](#) W8
- [MRM_PERMISSION_REGION_LOW_j\[15\]](#) PUB_PRV_DEBUG

10.2.3.7.3.4 L3_MAIN Firewall Error Logging

If a protection violation error is detected, the following signals are generated:

- An in-band error (SRESP = ERROR) is generated to the master NIU of the access.
- An out-band error is sent to the control module
- An interrupt is generated to the IRQ_CROSSBAR.

The L3_MAIN interconnect does not differentiate errors generated by firewalls from all other supported types of errors.

An in-band error is generated by modules each time an access is not allowed. When an in-band error is sent back into the transaction it is seen as an external prefetch or data abort by the initiator, depending on whether the transaction was an instruction fetch or a data access.

Information about in-band errors is logged into two registers:

- [ERROR_LOG_k](#): Logs the information about the start/end address of the hit region and the qualifiers of the transaction
- [LOGICAL_ADDR_ERRLOG_k\[31:12\]](#): Logs the address of the failed access

Table 10-18 lists the L3_MAIN firewall error-logging registers.

Table 10-18. L3 Firewall Error-Logging Registers

Register Name	Register Field Name	Field Modifiability	Parameter Comments
ERROR_LOG_k	RESERVED[31:24]	Read only	Reads return 0s.
	BLK_BURST_VIOLATION[23]	Read/write	Read 0x1: 2D burst not allowed or exceeds allowed size. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	RESERVED[22]	Read only	Read return 0s.
	REGION_START_ERRLOG[21:17]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	REGION_END_ERRLOG[16:12]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	REQINFO_ERRLOG[11:0]	Read/write	Mapping of the error according to the reqinfo vector: ConnID [3:0] MCMD [0] [3] MReqDebug [1] MReqSupervisor [0] MReqType

L3 firewall errors can be cleared by writing to the [ERROR_LOG_k](#) register in the firewall that recorded the error. Clearing the [ERROR_LOG_k](#) register deasserts the corresponding error if it exists.

The L3 firewall register [ERROR_LOG_k](#) must be cleared before clearing the [CTRL_CORE_SEC_ERR_STATUS_FUNC_i](#) (i = 1, 2 and 3) and [CTRL_CORE_SEC_ERR_STATUS_DEBUG_i](#) (i = 1, 2 and 3) registers in the control module.

When a protection violation occurs, an interrupt is sent to the IRQ_CROSSBAR and depending on the functional mode an error is logged in:

- the [CTRL_CORE_SEC_ERR_STATUS_FUNC_i](#) registers when the device is in application mode
- the [CTRL_CORE_SEC_ERR_STATUS_DEBUG_i](#) registers when the device is in debug mode

For more information, see [Chapter 14, Control Module](#).

10.2.3.8 L3_MAIN Interconnect Error Handling

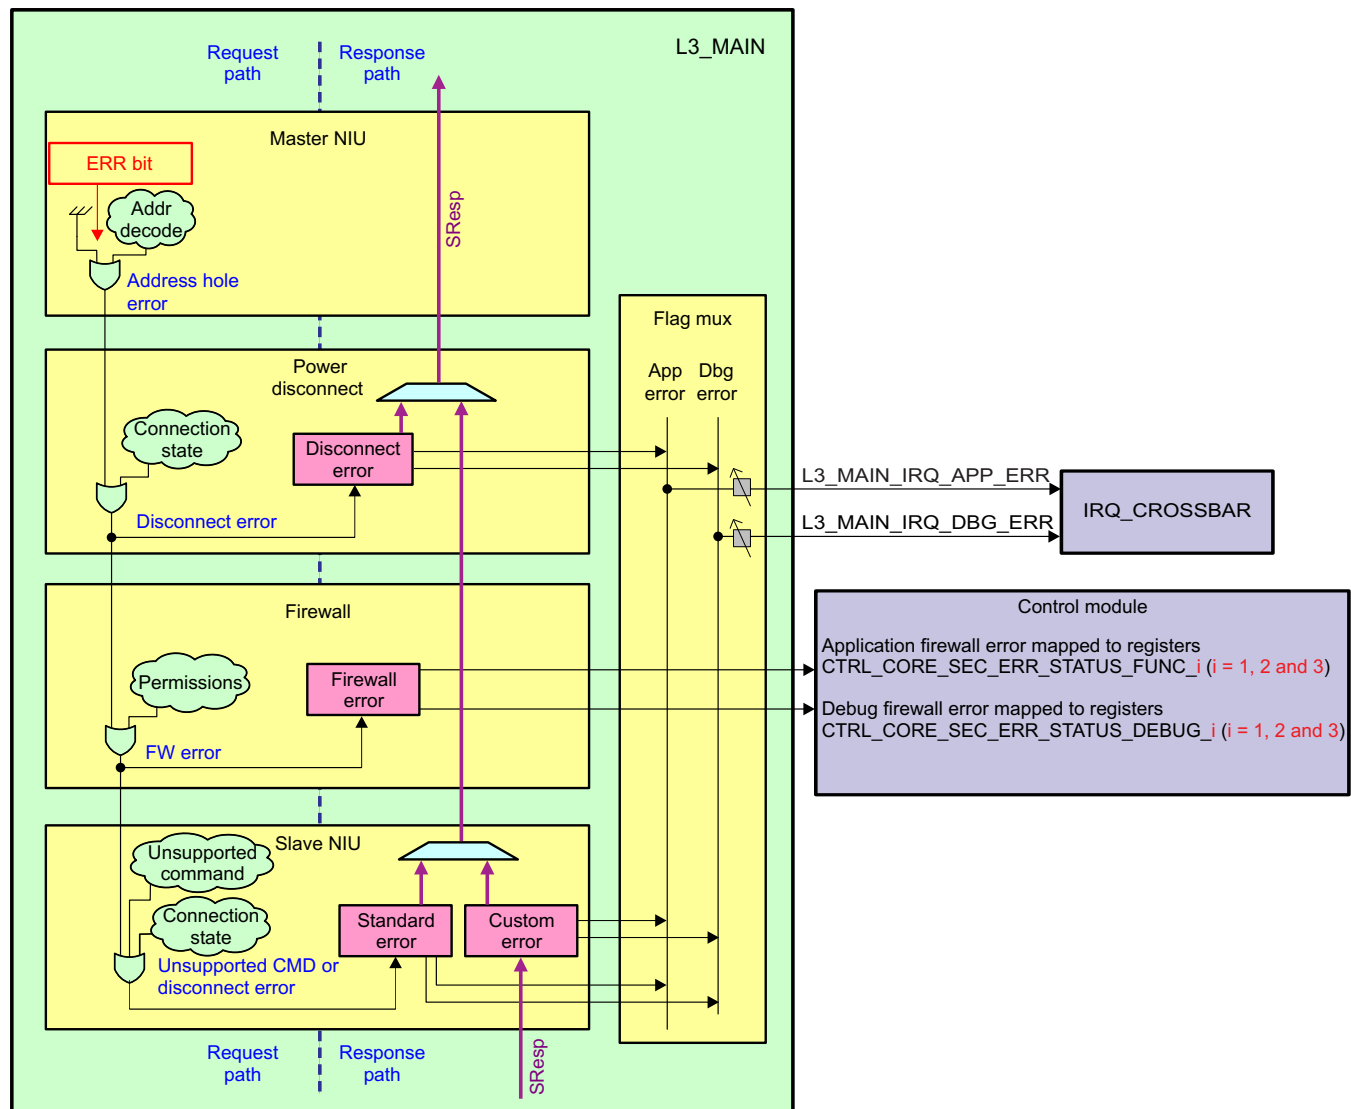

Error logging is enabled in the L3_MAIN interconnect. The three major types of errors are:

- Slave NIU errors
- Firewall errors (see [Section 10.2.3.7.3.4, L3_MAIN Firewall Error Logging](#))
- Flag mux errors

10.2.3.8.1 Global Error-Routing Scheme

Figure 10-7 shows the L3_MAIN global error-routing scheme.

Figure 10-7. L3_MAIN Global Error-Routing Scheme

icnt-006

10.2.3.8.2 Slave NIU Error Logging

Error logging is implemented only at slave NIUs. Because the interconnect does not support master NIU error logging, an erroneous packet must be created and sent to one of the slave NIUs. The slave NIU that receives an erroneous packet is predictable but can change per master (see [Table 10-19](#)).

Table 10-19. L3_MAIN Connectivity and Holes Error Routing

Master	Connectivity and Hole Errors Logged Into Slave NIUs
All initiators	GPMC_TARG

The slave NIU can:

- be configured to report standard errors (errors generated within the interconnect):
 - Firewall error (protection violation):
this error indicates that a request was rejected by a firewall and is reported to the control module. For more information, see [Section 10.2.3.7.3.4, L3_MAIN Firewall Error Logging](#).
 - Address hole:
this error reports an unknown address for a request. The address map is local to each master NIU; therefore, an address hole error is reported each time a master NIU requests an access to a slave NIU to which it is not logically connected, even if this address exists in the global L3_MAIN address map. This error is detected only once per burst.
 - Unsupported commands:
this error reports that the master NIU sent a command that cannot be processed, because the slave NIU cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
- be configured to report custom errors: basically, when the slave answer is SResp = ERR
- be configured to report severity level, for standard error and custom errors:
 - None: error logging for this type of error is disabled.
 - Error: error is logged for this type of error.
 - Fault: error is logged and interrupt is generated for this type of error.
- generate interrupt on two IRQ lines depending on the MReqDebug qualifier:
 - Application error - on L3_MAIN_IRQ_APP_ERR line
 - Debug error - on L3_MAIN_IRQ_DBG_ERR line

By default, all slave NIUs are configured with standard and custom error levels set to Fault. The errors are reported on the flag muxes (see [Figure 10-7](#)), depending on the access type, application or debug. For more information, see [Section 10.2.3.5, Flag Muxing](#).

The slave NIU power-disconnect component also has error logging enabled, because in this case the slave NIU is in a clock domain that is switched off and therefore cannot catch the error. By nature, this component can generate only standard errors. By default, it is configured with the error level set to Fault.

Wake up on demand: If an error packet reaches a slave NIU that is set with MDiscBehave = 1 (wake up on demand), then the active signal is asserted and L3 processes the error generation when the slave is awake. Although this is inefficient, it simplifies NIU implementation and should not be a problem because errors are supposed to occur only during software debug.

10.2.3.8.3 Severity Level of Standard and Custom Errors

The slave NIU registers are important for error logging.

- The [L3_TARG_STDERRLOG_SVRTSTDLVL](#) register shows the severity level for standard errors. According to the severity level, error logging is disabled, enabled with level ERROR, or enabled with level ERROR and flag FAULT.
- The [L3_TARG_STDERRLOG_SVRTCUSTOMLVL](#) register shows the severity level for custom errors.
- The [L3_TARG_STDERRLOG_MAIN](#) register (the main register for error-logging management) shows the validity of the logged information, standard or custom.
- The [L3_TARG_STDERRLOG_HDR](#) register stores packets in case of a standard error.
- The [L3_TARG_STDERRLOG_MSTADDR](#) register returns the MSTADDR field of the logged packet.
- The [L3_TARG_STDERRLOG_SLVADDR](#) register returns the SLVADDR field of the stored packet.
- The [L3_TARG_STDERRLOG_INFO](#) register saves the information field of the logged packet.

10.2.3.8.4 Example for Decoding Standard/Custom Errors Logged in L3_MAIN

Following is a procedure that must be followed for identifying Standard/Custom errors logged in L3_MAIN:

- Read registers [L3_HOST_STDERRLOG_MAIN](#) and [L3_TARG_STDERRLOG_MAIN](#):
 - bit[0]STDERRLOG_MAIN_ERRLOGVLD = 0 -> No error
 - bit[0]STDERRLOG_MAIN_ERRLOGVLD = 1 -> Error
 - Error type is visible through:
 - bit[1]STDERRLOG_MAIN_ERRTYPE = 0 -> Standard Error (FW error, Address Hole, Unsupported command)
 - bit[1]STDERRLOG_MAIN_ERRTYPE = 1 -> Custom Error
- Standard Error:
 - Read [L3_TARG_STDERRLOG_HDR\[3:0\]](#) STDERRLOG_HDR_OPCODE
 - Read [L3_TARG_STDERRLOG_MSTADDR\[7:0\]](#) STDERRLOG_MSTADDR - > 8-bit NTP master address used to distinguish the different initiators (see [Table 10-10](#)). That master address is also referred to as ConnID or MConnID.
 - Read [L3_TARG_STDERRLOG_SLVADDR\[4:0\]](#) STDERRLOG_SLVADDR -> NTP Slave Address of the logged packet
 - Read [L3_TARG_STDERRLOG_INFO\[7:0\]](#)STDERRLOG_INFO -> see , *Terminology* for details.

The procedure for Custom error is the same, but the `*_STDERRLOG_CUSTOMINFO_*` registers should be read.

10.2.4 L3_MAIN Interconnect Programming Guide

10.2.4.1 L3_MAIN Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L3_MAIN interconnect module.

10.2.4.1.1 Global Initialization

10.2.4.1.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the L3_MAIN interconnect module is to be used for the first time after a device reset. The initialization of surrounding modules is based on the integration of the L3_MAIN interconnect. For more information, see [Section 10.2.2, L3_MAIN Interconnect Integration](#) .

Table 10-20. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see Chapter 3, Power, Reset, and Clock Management .
Control module	For information about the configuration of the control module, see Chapter 14, Control Module .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description , in Chapter 14, Control Module
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 13 Interrupt Controllers

10.2.4.2 Operational Modes Configuration

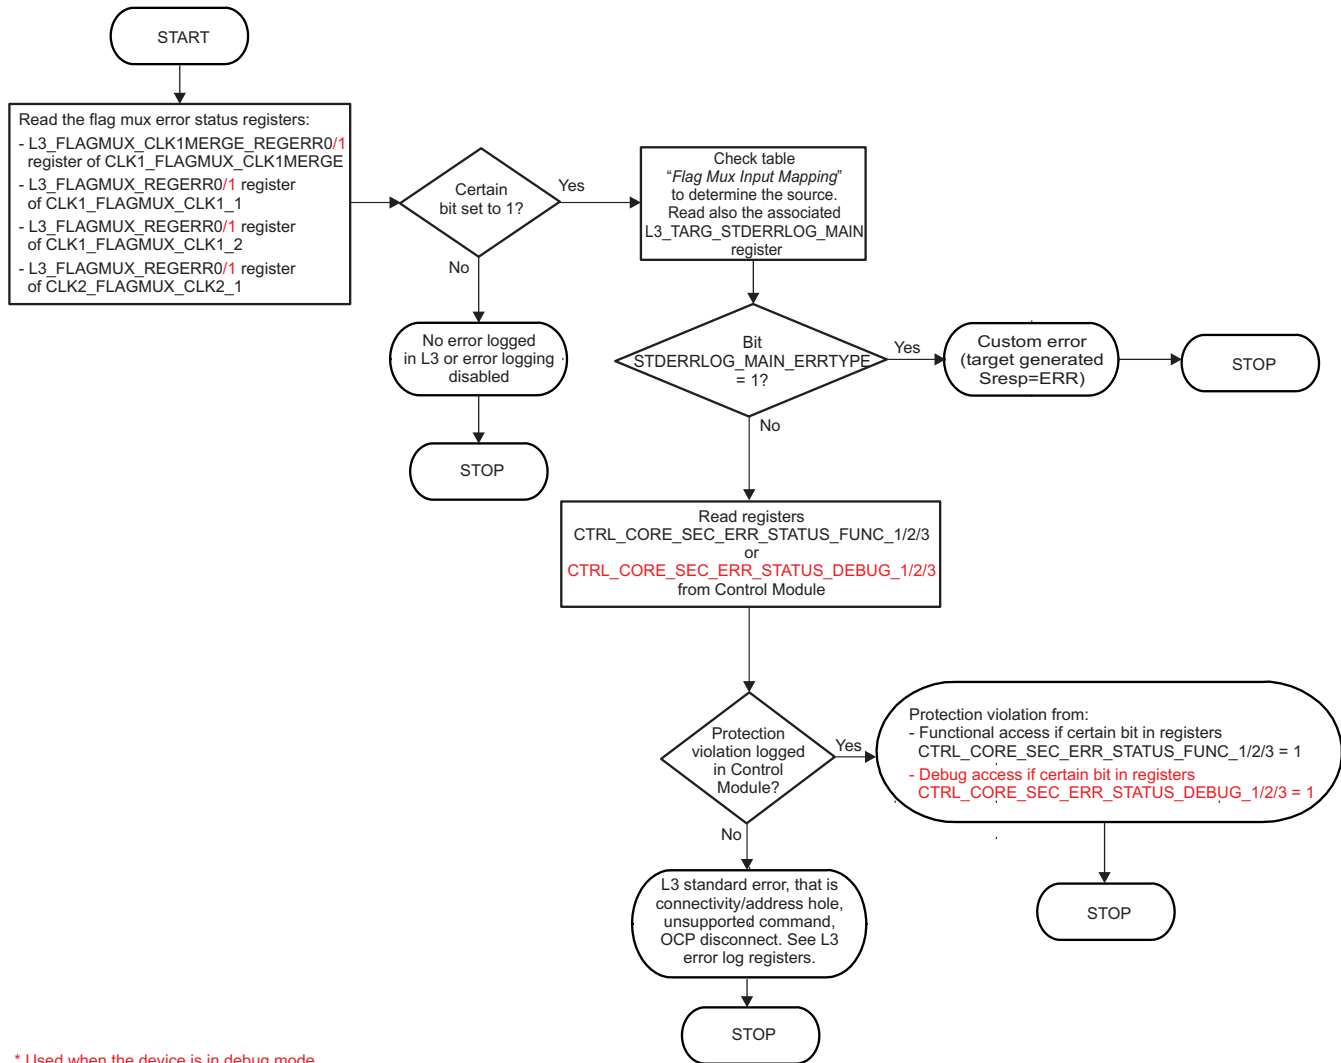

10.2.4.2.1 L3_MAIN Interconnect Error Analysis Mode

10.2.4.2.1.1 Main Sequence: L3_MAIN Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

Figure 10-8 shows the software sequence required in most cases.

Figure 10-8. Typical Error Analysis Sequence

* Used when the device is in debug mode

icnt-007

Table 10-21 lists the subprocess call summary for error analysis mode in the main sequence.

Table 10-21. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L3 interconnect error analysis	See Section 10.2.4.2.1, L3_MAIN Interconnect Error Analysis Mode.
L3_MAIN interconnect protection violation error identification	See Section 10.2.4.2.1.2, Subsequence: L3_MAIN Interconnect Protection Violation Error Identification.

Table 10-21. Subprocess Call Summary for Main Sequence – Error Analysis Mode (continued)

Subprocess	Cross-Reference
L3_MAIN interconnect unsupported command/address hole error identification	See Section 10.2.4.2.1.1.3 , <i>Subsequence: L3_MAIN Interconnect Standard Error Identification</i> .
L3_MAIN interconnect reset FLAGMUX and module	See Section 10.2.4.2.1.1.4 , <i>Subsequence: L3_MAIN Interconnect FLAGMUX Configuration</i> .

10.2.4.2.1.1.1 Subsequence: L3_MAIN Custom Error Identification

The procedure listed in [Table 10-22](#) describes custom error identification.

Table 10-22. Custom Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is custom error detected?	L3_TARG_STDERRLOG_MAIN[1] STDERRLOG_MAIN_ERRTYPE	=0x1
Read information field of the response packet.	L3_TARG_STDERRLOG_CUSTOMINFO_INFO[7:0] STDERRLOG_CUSTOMINFO_INFO	xxx
Read the address of the initiator that caused error.	L3_TARG_STDERRLOG_CUSTOMINFO_MSTADDR[7:0] STDERRLOG_CUSTOMINFO_MSTADDR	xxx
Read the type of operation (read/write).	L3_TARG_STDERRLOG_CUSTOMINFO_OPCODE[1:0] STDERRLOG_CUSTOMINFO_OPCODE	xxx
ENDIF		

10.2.4.2.1.1.2 Subsequence: L3_MAIN Interconnect Protection Violation Error Identification

The procedure listed in [Table 10-23](#) describes protection violation error identification and where it is logged in the control module registers. Two types of errors are logged: application errors and debug errors.

Table 10-23. L3_MAIN Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read the burst violation.	ERROR_LOG_k[23] BLK_BURST_VIOLATION	xxx
Read the initiator ConnID [3:0].	ERROR_LOG_k[11:8]	xxx
Read the command (MCMD [0]) that caused the error.	ERROR_LOG_k[7]	xxx
Read the address of the request that caused the error.	LOGICAL_ADDR_ERRLOG_k[31:0] SLVOFS_LOGICAL	xxx
IF: Is it an application error?	L3_FLAGMUX_REGERR0 [REGERROR0]	0x0
Read the status bits to see which module firewall has worked.	CTRL_CORE_SEC_ERR_STATUS_FUNC_i	xxx
Clear the status bits.	CTRL_CORE_SEC_ERR_STATUS_FUNC_i	xxx
Clear the status bit.	L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG	0x0
ELSE IF	L3_FLAGMUX_REGERR1[7:0] REGERROR1	= 0x1
Read the status bits to see the module.	CTRL_CORE_SEC_ERR_STATUS_DEBUG_i	xxx
Clear the status bits.	CTRL_CORE_SEC_ERR_STATUS_DEBUG_i	xxx
Clear the status bit.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_MAIN_CLRLOG	0x0
ENDIF		
Clear the burst violation.	ERROR_LOG_k[23] BLK_BURST_VIOLATION	0x0
Clear the error status.	ERROR_LOG_k[21:17] REGION_START_ERRLOG	0x00

10.2.4.2.1.1.3 Subsequence: L3_MAIN Interconnect Standard Error Identification

The procedure listed in [Table 10-24](#) describes the identification of standard errors inside the L3_MAIN interconnect. The standard errors are: unsupported command, address hole, and disconnect.

Table 10-24. L3_MAIN Standard Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is an error detected?	L3_TARG_STDERRLOG_MAIN[18] STDERRLOG_MAIN_ERRCNT	= 0x1
Read the corresponding flag.	L3_FLAGMUX_REGERR0[REGERROR0]	xxx
Read the corresponding flag.	L3_FLAGMUX_REGERR1[REGERROR1]	xxx
Localize the slave NIU that generated the error.	See Table 10-11 .	
ELSE		
Clear the error log.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_MAIN_CLRLOG	0x0
Clear the severity error status.	L3_TARG_STDERRLOG_SVRTSTDLVL[1:0] STDERRLOG_SVRTSTDLVL_0	0x2
ENDIF		

10.2.4.2.1.1.4 Subsequence: L3_MAIN Interconnect FLAGMUX Configuration

The procedures listed in [Table 10-25](#) and [Table 10-26](#) give information about the configuration of FLAGMUX masks.

Table 10-25. FLAGMUX Configuration

Step	Register/Bit Field/Programming Model	Value
Set the FLAGMUX masks to mask an event.	L3_FLAGMUX_MASK0[MASK0] L3_FLAGMUX_MASK1[MASK1]	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_REGERR0[REGERR0] L3_FLAGMUX_REGERR1[REGERR1]	xxx
Clear the slave NIU error log and the FLAGMUX error.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_SVRTSTDLVL_0	0x1

Table 10-26. FLAGMUX_CLK1_TIMEOUT1 and FLAGMUX_CLK1_TIMEOUT2 Configuration

Step	Register/Bit Field/Programming Model	Value
Enable time-out for target.	L3_FLAGMUX_TIMEOUTx_MASK0[MASK0]	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_TIMEOUTx_REGERR0[REGERR0]	xxx

Table 10-27. FLAGMUX_CLK2_TIMEOUT Configuration

Step	Register/Bit Field/Programming Model	Value
Enable time-out for target.	L3_FLAGMUX_TIMEOUT_MASK0[1:0] MASK0	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_TIMEOUT_REGERR0[1:0] REGERR0	xxx

10.2.5 L3_MAIN Interconnect Register Manual

10.2.5.1 L3_MAIN Register Group Summary

The registers in the L3 interconnect are divided into the following groups:

- Firewall registers (see [Table 10-29](#))
- HOST registers (see [Table 10-52](#))
- TARG registers (see [Table 10-88](#))
- Flag Muxing registers (see [Section 10.2.5.1.4](#) through [Section 10.2.5.1.6](#))
- Bandwidth Regulator registers (see [Table 10-186](#))
- Bandwidth Limiter registers (see [Table 10-202](#))
- STATCOLL registers (see [Table 10-221](#))

10.2.5.1.1 L3_MAIN Firewall Registers Summary and Description

Table 10-28. L3_MAIN Firewall Instance Summary

Module Name	Base Address	Size
DEBUGSS_CT_TBR_FW	0x4A22 4000	4KiB

Description			
Type	RW		

Bits	Field Name	Description	Type	Reset
31:4	RESERVED	Reserved	R	0x00000000
3	STDHOSTDR_MAINCTLREG_CM	Reserved for internal testing. Must be set to 0. Type: Control. Reset value: 0x0.	R	0
2	STDHOSTDR_MAINCTLREG_FLT	Asserted when a Fault condition is detected: if the unit includes Error Logging, Flt is asserted when the FltCnt register field indicates a Fault, and deasserted when FltCnt is reset. If no Error Logging is implemented, this bit becomes unit-dependent. In all cases, Flt bit and Flt pin (service network) have the same logical level. Type: Status. Reset value: X.	R	0
1	RESERVED	Reserved	R	0
0	STDHOSTDR_MAINCTLREG_EN	Sets the global core enable. Note: A disabled master does not generate any NTPP requests, and a disabled slave replies with an error packet to any request it receives. Type: Control. Reset value: 0x1.	RW	1

10.3 L4 Interconnects

This section details the device L4 interconnects.

10.3.1 L4 Interconnect Overview

The device uses three separate L4 interconnect structures to connect peripheral modules. All L4s handle transfers with peripherals but are located in distinct power domains.

Figure 10-9 is an overview of the L4 interconnects and the peripherals attached to them.

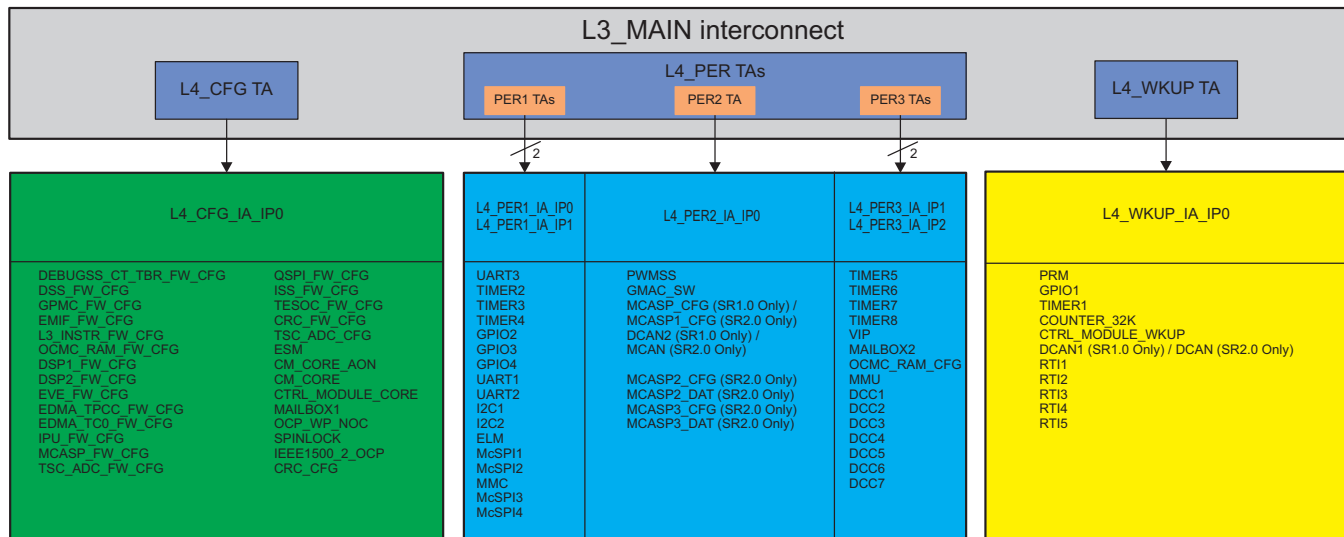

The L4 interconnect is composed of the following interconnects:

- L4_CFG: Includes the majority of the configuration interface for L3_MAIN system modules and peripheral interconnect
- L4_PER: Includes the main peripherals in the device. L4_PER is further divided into three sub-interconnects: L4_PER1, L4_PER2 and L4_PER3. Each of these L4_PERx sub-interconnects is connected to L3_MAIN initiators via the following ports:
 - L4_PER1_P1, L4_PER1_P2
 - L4_PER2_P1
 - L4_PER3_P1, L4_PER3_P2

L3_MAIN initiators access the L4_PERx peripherals through these ports. All peripherals attached to L4_PER1 and L4_PER3 are visible through the two L4_PER1 and L4_PER3 ports. For information about which initiator can access which L4_PERx port, see Figure 10-3.

- L4_WKUP: Includes peripherals attached to the WKUP power domain

Figure 10-9. L4 Interconnect Overview

icnt-008

The main features of the L4 interconnects are:

- Seven ports from L3_MAIN interconnect onto 5 parallel L4 interconnects
- One or two 32-bit initiator ports for each L4 interconnect instance (7 in total)
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little-endian platform
- Non-blocking architecture with fair arbitration between masters
- Target interfaces: Fully synchronous or divided synchronous clock frequencies
- L4_CFG and L4_PER1, L4_PER2, L4_PER3 frequency equals half of L3 frequency
- Protection logic that provides user-configurable access control to targets by each initiator

10.3.2 L4 Interconnect Integration

Table 10-334 and Table 10-335 summarize the integration of the module in the device.

Table 10-334. Integration Attributes

Module Instance	Attributes
	Power Domain
L4_PER1, L4_PER2, L4_PER3	PD_COREAON
L4_CFG	PD_COREAON
L4_WKUP	PD_WKUPAON

Table 10-335. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER1	L4_PER1_CLK	L4PER_L3_GICLK	PRCM module	Functional and interface clock
L4_PER2	L4_PER2_CLK	L4PER_L3_GICLK	PRCM module	Functional and interface clock
L4_PER3	L4_PER3_CLK	L4PER_L3_GICLK	PRCM module	Functional and interface clock
L4_CFG	L4_CFG_CLK	L4CFG_L3_GICLK	PRCM module	Functional and interface clock
L4_WKUP	L4_WKUP_CLK	WKUPAON_GICLK	PRCM module	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER1, L4_PER2, L4_PER3	L4_PER_RST	L4_PER_RST	PRCM module	Reset of L4_PERx interconnect
	L4_PER_RET_RST	L4_PER_PWRON_RET_RST	PRCM module	Reset of L4_PERx interconnect retention registers. For information about retention reset, see Chapter 3, Power, Reset, and Clock Management .
L4_CFG	L4_CFG_RST	CORE_RST	PRCM module	Reset of L4_CFG interconnect.
	L4_CFG_RET_RST	CORE_PWRON_RET_RST	PRCM module	Reset of L4_CFG interconnect retention registers. For information about retention reset, see Chapter 3, Power, Reset, and Clock Management .
L4_WKUP	L4_WKUP_RST	WKUPAON_RST	PRCM module	Reset of L4_WKUP interconnect
	L4_WKUP_RET_RST	L4_WKUP_RET_RST	PRCM module	Reset of L4_WKUP interconnect. For information about retention reset, see Chapter 3, Power, Reset, and Clock Management .

10.3.3 L4 Interconnect Functional Description

10.3.3.1 Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

Table 10-336 through Table 10-345 list all the modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

10.3.3.1.1 L4_PER1 Interconnect Agents

The L4_PER1 interconnect handles transfers only to peripherals in the PER power domain. Table 10-336 lists the L4_PER1 TAs.

Table 10-336. L4_PER1 TAs

Module Target Name	Description
UART3_TARG	Universal Asynchronous Receiver/Transmitter target port
TIMER2_TARG	General Purpose Timer 2 target port
TIMER3_TARG	TIMER3 target port
TIMER4_TARG	TIMER4 target port
GPIO2_TARG	GPIO2 target port
GPIO3_TARG	GPIO3 target port
GPIO4_TARG	GPIO4 target port
UART1_TARG	UART1 target port
UART2_TARG	UART2 target port
I2C1_TARG	I2C1 target port
I2C2_TARG	I2C2 target port
ELM_TARG	Error Location Module target port
MCSP11_TARG	Multi-channel Serial Peripheral Interface 1 target port
MCSP12_TARG	MCSP12 target port
MMC_TARG	MMC target port
MCSP13_TARG	MCSP13 target port
MCSP14_TARG	MCSP14 target port

Two ports communicate between the L3_MAIN interconnect and the L4_PER1 interconnect to allow the L3_MAIN initiators to access the L4_PER1 targets. Table 10-337 lists the L4_PER1 IAs.

For the list of initiators authorized to access the L4_PER1 peripherals, see Figure 10-3.

Table 10-337. L4_PER1 IAs

Module Initiator Name	Description
L4_PER1_IA_IP0	L4_PER1 Initiator Port 0 (IP0)
L4_PER1_IA_IP1	L4_PER1 Initiator Port 1 (IP1)

10.3.3.1.2 L4_PER2 Interconnect Agents

The L4_PER2 interconnect handles transfers only to peripherals in the PER power domain. Table 10-338 lists the L4_PER2 TAs.

Table 10-338. L4_PER2 TAs

Module Target Name	Description
MCASP_CFG_TARG (SR1.0 Only) / MCASP1_CFG_TARG (SR2.0 Only)	MCASP_CFG target port

Table 10-338. L4_PER2 TAs (continued)

Module Target Name	Description
PWMSS_TARG	Pulse-Width Modulation target port
DCAN2_TARG (SR1.0 Only) / MCAN_TARG (SR2.0 Only)	DCAN2 (SR1.0 Only) / MCAN (SR2.0 Only) target port
GMAC_SW_TARG	Ethernet Controller target port
MCASP2_DAT_TARG (SR2.0 Only)	MCASP2_DAT target port
MCASP2_CFG_TARG (SR2.0 Only)	MCASP2_CFG target port
MCASP3_DAT_TARG (SR2.0 Only)	MCASP3_DAT target port
MCASP3_CFG_TARG (SR2.0 Only)	MCASP3_CFG target port

One port communicates between the L3_MAIN interconnect and the L4_PER2 interconnect to allow the L3_MAIN initiators to access the L4_PER2 targets. [Table 10-339](#) lists the L4_PER2 IA.

For the list of initiators authorized to access the L4_PER2 peripherals, see [Figure 10-3](#).

Table 10-339. L4_PER2 IA

Module Initiator Name	Description
L4_PER2_IA_IP0	L4_PER2 Initiator Port 0 (IP0)

10.3.3.1.3 L4_PER3 Interconnect Agents

The L4_PER3 interconnect handles transfers only to peripherals in the PER power domain. [Table 10-340](#) lists the L4_PER3 TAs.

Table 10-340. L4_PER3 TAs

Module Target Name	Description
TIMER5_TARG	TIMER5 target port
TIMER6_TARG	TIMER6 target port
TIMER7_TARG	TIMER7 target port
TIMER8_TARG	TIMER8 target port
VIP_TARG	VIP target port
MAILBOX2_TARG	Mailbox 2 target port
OCMC_RAM_CFG_TARG	OCMC_RAM target port
MMU_TARG	MMU target port
DCC1_TARG	DCC1 target port
DCC2_TARG	DCC2 target port
DCC3_TARG	DCC3 target port
DCC4_TARG	DCC4 target port
DCC5_TARG	DCC5 target port
DCC6_TARG	DCC6 target port
DCC7_TARG	DCC7 target port

Two ports communicate between the L3_MAIN interconnect and the L4_PER3 interconnect to allow the L3_MAIN initiators to access the L4_PER3 targets. [Table 10-341](#) lists the L4_PER3 IAs.

For the list of initiators authorized to access the L4_PER3 peripherals, see [Figure 10-3](#).

Table 10-341. L4_PER3 IAs

Module Initiator Name	Description
L4_PER3_IA_IP1	L4_PER3 Initiator Port 1 (IP1)
L4_PER3_IA_IP2	L4_PER3 Initiator Port 2 (IP2)

10.3.3.1.4 L4_CFG Interconnect Agents

The L4_CFG interconnect handles only transfers to peripherals in the CORE power domain. [Table 10-342](#) lists the L4_CFG TAs.

Table 10-342. L4_CFG TAs

Module Target Name	Description
DEBUGSS_CT_TBR_FW_CFG_TARG	Debug subsystem firewall
DSS_FW_CFG_TARG	DSS firewall
GPMC_FW_CFG_TARG	GPMC firewall
EMIF_FW_CFG_TARG	EMIF firewall
L3_INSTR_FW_CFG_TARG	L3 Instrumentation firewall
OCMC_RAM_FW_CFG_TARG	OCMC_RAM firewall
DSP1_FW_CFG_TARG	DSP1 firewall
DSP2_FW_CFG_TARG	DSP2 firewall
EVE_FW_CFG_TARG	EVE firewall
EDMA_TPCC_FW_CFG_TARG	EDMA Channel Controller firewall
EDMA_TC0_FW_CFG_TARG	EDMA Transfer Controller firewall
IPU_FW_CFG_TARG	IPU firewall
MCASP_FW_CFG_TARG (SR1.0 Only) / MCASP1_FW_CFG_TARG (SR2.0 Only)	McASP firewall
TSC_ADC_FW_CFG_TARG	ADC firewall
QSPI_FW_CFG_TARG	QSPI firewall
ISS_FW_CFG_TARG	ISS firewall
TESOC_FW_CFG_TARG	TESOC firewall
CRC_FW_CFG_TARG	CRC firewall
TSC_ADC_CFG_TARG	ADC configuration target port
ESM_TARG	ESM target port
CM_CORE_AON_TARG	CM_CORE_AON target port
CM_CORE_TARG	CM_CORE target port
CTRL_MODULE_CORE_TARG	CTRL_MODULE_CORE target port
MAILBOX1_TARG	Mailbox1 target port
OCP_WP_NOC_TARG	OCP watchpoint target port
SPINLOCK_TARG	Spinlock target port
IEEE1500_2_OCP_TARG	IEEE1500 target port
CRC_CFG_TARG	CRC configuration target port

One port communicates between the L3_MAIN interconnect and the L4_CFG interconnect to allow the L3_MAIN initiators to access the L4_CFG targets. [Table 10-343](#) lists the L4_CFG IA.

For the list of initiators authorized to access the L4_CFG peripherals, see [Figure 10-3](#).

Table 10-343. L4_CFG IA

Module Initiator Name	Description
L4_CFG_IA_IP0	L4_CFG Initiator Port (IP0)

10.3.3.1.5 L4_WKUP Interconnect Agents

The L4-WKUP interconnect handles transfers only to peripherals in the WKUP power domain. [Table 10-344](#) lists the TAs. [Table 10-345](#) lists the L4 WKUP IA.

Table 10-344. L4_WKUP TAs

Module Target Name	Description
PRM_TARG	PRM target port
GPIO1_TARG	GPIO1 target port
TIMER1_TARG	Timer 1 target port
COUNTER_32K_TARG	Counter 32k timer
CTRL_MODULE_WKUP_TARG	CTRL_MODULE_WKUP target port
DCAN1_TARG (SR1.0 Only) / DCAN_TARG (SR2.0 Only)	DCAN1 (SR1.0 Only) / DCAN (SR2.0 Only) target port
RTI1_TARG	RTI1 target port
RTI2_TARG	RTI2 target port
RTI3_TARG	RTI3 target port
RTI4_TARG	RTI4 target port
RTI5_TARG	RTI5 target port

Table 10-345. L4_WKUP IA

Module Initiator Name	Description
L4_WKUP_IA_IP0	L4_WKUP Initiator Port (IP0)

10.3.3.2 Power Management

As part of the system-wide power-management scheme, the L4 interconnects go into IDLE state after receiving a request from the PRCM module after all commands are serviced. This function is handled by hardware. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

To reduce power consumption, each L4 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

L4_CFG, L4_PER1, L4_PER2, L4_PER3, and L4_WKUP are located in the always-on power domain and no retention is needed for these L4 interconnects.

10.3.3.3 L4 Firewalls

[Figure 10-10](#) is an internal view of the L4 interconnects in the overall interconnect. This architecture, with one initiator subsystem centralizing all initiator master requests and distributing them to all target modules (peripherals), enables the L4 interconnect firewall functions to be centralized at the L4 initiator subsystem level. The L4 firewall filters the accesses based on the configurable protection groups defined in the L4 address protection (AP) registers. Each module or TA is assigned to a protection group. The configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

Figure 10-10. L4 Initiator-Target Connectivity

icnt-009

NOTE: As Figure 10-10 shows, targets are attached to branches. Branches do not impact the function of the L4 interconnect but are present to simplify timing closure and reduce active power consumption.

Because of the large address spaces and the number of peripherals connected to an L4 interconnect, two parameters are used to set up access permission:

- Programmable groups for initiators:
 - Eight protection groups for the L4 interconnect
- Segments divided into regions
 - 78 regions for the L4_PER1 interconnect
 - 33 regions for the L4_PER2 interconnect
 - 93 regions for the L4_PER3 interconnect
 - 111 regions for the L4_CFG interconnect
 - 44 regions for the L4_WKUP interconnect

NOTE: There might be regions which are not used so the actual region count may not be the same as the listed above.

Protection group members are TAs with the same protection settings. A region is programmed to allow access to an unique selectable protection group. For better protection, different regions are grouped into protection group regions and associated with a protection group member.

10.3.3.3.1 Protection Group

The following registers are used to define a protection group:

- The CONNID_BIT_VECTOR field of register [L4_AP_PROT_GROUP_MEMBERS_k_L](#) defines which initiator belongs to a group. A protection group is accessible by an initiator when the bit position corresponding to its ConnID is set to 1 in the CONNID_BIT_VECTOR field. [Table 10-346](#) lists the L3 ConnIDs available at L4 level. They are 4-bit ConnIDs and are equal to bits [5:2] of the 6-bit L3_MAIN ConnIDs.
- The [L4_AP_PROT_GROUP_ROLES_k_L](#) register defines the initiator requests accepted or not by the L4 firewalls depending on the combination of MReqDebug and MReqSupervisor qualifiers. Each bit of this register corresponds to an unique combination of these two qualifiers. To accept a request with combination n, bit n of the [L4_AP_PROT_GROUP_ROLES_k_L](#) register must be set to 1. [Table 10-347](#) lists all possible combinations and the corresponding bits which have to be set to 1 for accepting particular combination.

NOTE: Permissions are identical for read and write accesses in L4 interconnect.

k indicates the protection group number.

L indicates the region number.

Table 10-346. L4 ConnID Definition

ConnID	L3 Initiator
0x1	DEBUGSS_CS_DAP_INIT, IEEE1500_2_OCP_INIT
0x2	DSP1_MDMA_INIT, DSP1_EDMA_INIT, DSP1_CFG_INIT, DSP2_EDMA_INIT
0x3	DSP2_MDMA_INIT, DSP2_CFG_INIT
0x4	EVE_TC0_INIT
0x6	IPU_INIT
0x7	TPTC1_WR_INIT, TPTC1_RD_INIT, TPTC2_WR_INIT, TPTC2_RD_INIT
0x8	DSS1_INIT, MMU_INIT
0x9	VIP_P1_INIT, VIP_P2_INIT
0xA	GMAC_SW_INIT
0xC	ISS_RT_INIT, ISS_NRT1_INIT, ISS_NRT2_INIT
0xD	EVE_TC1_INIT

Table 10-347. L4 Qualifiers Combination

MReqSupervisor	MReqDebug	Bit Positions In Register L4_AP_PROT_GROUP_ROLES_k_L Which Have To Be Set To 1
0	0	2
0	1	3
1	0	6
1	1	7

[Table 10-348](#) shows an example how to set the CONNID_BIT_VECTOR field.

Table 10-348. Example For Setting The CONNID_BIT_VECTOR Field Of Register L4_AP_PROT_GROUP_MEMBERS_k_L

Initiator	Access Allowed?	CONNID_BIT_VECTOR	Bits
Reserved	-	0	0
DEBUGSS_CS_DAP_INIT, IEEE1500_2_OCP_INIT	N	0	1
DSP1_MDMA_INIT, DSP1_EDMA_INIT, DSP1_CFG_INIT, DSP2_EDMA_INIT	N	0	2
DSP2_MDMA_INIT, DSP2_CFG_INIT	N	0	3
EVE_TC0_INIT	Y	1	4
Reserved	-	0	5
IPU_INIT	Y	1	6
TPTC1_WR_INIT, TPTC1_RD_INIT, TPTC2_WR_INIT, TPTC2_RD_INIT	N	0	7
DSS1_INIT, MMU_INIT	N	0	8
VIP_P1_INIT, VIP_P2_INIT	N	0	9
GMAC_SW_INIT	N	0	10
Reserved	-	0	11
ISS_RT_INIT, ISS_NRT1_INIT, ISS_NRT2_INIT	N	0	12
EVE_TC1_INIT	N	0	13
Reserved	-	0	14
Reserved	-	0	15

Setting to 0x1 bits 4 and 6 in the [L4_AP_PROT_GROUP_MEMBERS_k_L](#) (for example, k = 1) register defines that group 1 can be accessed by the following initiators:

- EVE_TC0_INIT
- IPU_INIT

Protection group 1 can be applied to multiple protection regions with no limitation. Each protection region that is configured with protection group 1 enables permission access only to the two initiators.

The [L4_AP_REGION_I_H\[22:20\]](#) PROT_GROUP_ID bit field determines with which protection group the region I is associated.

10.3.3.2 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation, as shown in [Figure 10-11](#). By default, some regions are attached to specific protection group members. This specificity lets users set up the permission access to certain types of modules requiring the same access protection without managing region allocation.

Figure 10-11. L4 Segmentation

icnt-011

All interconnect address spaces are covered by regions. [Table 10-349](#) through [Table 10-353](#) list the module mapping with their addresses, region numbers, and default protection group allocated to them.

NOTE: Module refers to the configuration registers of the module.

TA (Target Agent) refers to the interconnect configuration registers of the TA associated with the module.

10.3.3.3 L4 Firewall Address and Protection Register Settings

Table 10-354 lists the settings of the AP registers relative to an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

Table 10-354. L4 Firewall Register Description Overview

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_i_L ⁽¹⁾	31:0	BASE	Segment base address
	L4_AP_SEGMENT_i_H ⁽¹⁾	5:0	SIZE	Segment size equals to 2 ^{SIZE}
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L ⁽²⁾	15:0	CONNID_BIT_VECTOR	For L4 ConnID, see Table 10-346 .
	L4_AP_PROT_GROUP_ROLES_k_L ⁽²⁾	31:0	ENABLE	Defines the initiator requests accepted or not by the L4 firewalls depending on combination of L4 qualifiers.
Region setting	L4_AP_REGION_I_L ⁽³⁾	20:0	BASE	Defines the base address of a region with respect to its segment base address
	L4_AP_REGION_I_H ⁽³⁾	31:28	MADDRSPACE	Target interconnect MAddrSpace
		26:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	Protection group member attached to the region
		18:17	BYTE_DATA_WIDTH_EXP	Determines the number of bytes in an access
		14:8	PHY_TARGET_ID	Physical target ID
		6:1	SIZE	Size of the region equals to 2 ^{SIZE}
0	ENABLE	Enables the region protection		

⁽¹⁾ i = 0 to 1 for L4_PER1_AP
i = 0 for L4_PER2_AP
i = 0 for L4_PER3_AP
i = 0 to 2 for L4_CFG_AP
i = 0 to 3 for L4_WKUP_AP

⁽²⁾ k = 0 to 7 for L4_PER1_AP
k = 0 to 7 for L4_PER2_AP
k = 0 to 7 for L4_PER3_AP
k = 0 to 7 for L4_CFG_AP
k = 0 to 7 for L4_WKUP_AP

⁽³⁾ l = 0 to 77 for L4_PER1_AP
l = 0 to 32 for L4_PER2_AP
l = 0 to 92 for L4_PER3_AP
l = 0 to 110 for L4_CFG_AP
l = 0 to 43 for L4_WKUP_AP

10.3.3.4 L4 Error Detection and Reporting

10.3.3.4.1 IA and TA Error Detection and Logging

The L4 interconnect provides mechanisms for handling internally detected errors or errors reported by modules attached to the L4 target ports.

NOTE: L4_IA denotes the IA for all L4 interconnects: L4_PER1, L4_PER2, L4_PER3, L4_CFG, and L4_WKUP.

L4_TA denotes the TA for all L4 interconnects: L4_PER1, L4_PER2, L4_PER3, L4_CFG, and L4_WKUP.

The L4 interconnects handle four types of errors:

- No target core found or address hole, detected and logged at IA
- Unsupported command, detected and logged at IA
- Protection violation, detected and logged at IA (see [Section 10.3.3.3, L4 Firewalls](#))
- Target does not service a request before a time-out expires. The error is detected and logged at TA (see [Section 10.3.3.4.2, Time-Out](#)).

[Table 10-355](#) lists the value of the L4_IA_ERROR_LOG_L[25:24] CODE bit field stored when an error occurs.

Table 10-355. L4 CODE Bit Field Definition

CODE (bits 1:0)	Error Type	REQ_INFO	Secondary	ConnID	CMD
0	No error				
1	Unsupported command	x	x	x	x
2	Address hole	x	x	x	x
3	Protection violation	x		x	x

- No target core found/address hole: This error indicates that a request was addressed to a hole in the L4 address map. When this error occurs, an in-band error response is returned to the L3 level. The error is also logged into the [L4_IA_AGENT_STATUS_L\[27\] INBAND_ERROR](#) bit. Additionally, an address hole error code is logged to the [L4_IA_ERROR_LOG_L\[25:24\] CODE](#) bit field.
- Unsupported command: This error indicates that the command type of the request is not supported by the accessed target register. The error is logged into the [L4_IA_AGENT_STATUS_L\[27\] INBAND_ERROR](#) bit. An unsupported command error code is written to the [L4_IA_ERROR_LOG_L\[25:24\] CODE](#) bit field for the initiator interface.
- Protection violation: This error indicates that a request is not issued from an allowed initiator member or is issued with the inappropriate ReqInfo qualifiers associated with the target region. This error is reported using an in-band error and is written to the [L4_IA_AGENT_STATUS_L\[27\] INBAND_ERROR](#) bit. A protection violation error code is saved into the [L4_IA_ERROR_LOG_L\[25:24\] CODE](#) bit field for the same initiator interface. A protection violation is also logged in the [L4_IA_AGENT_STATUS_L\[31\] PROT_ERROR_SECONDARY](#) bit when the device is in debug mode or in the [L4_IA_AGENT_STATUS_L\[30\] PROT_ERROR_PRIMARY](#) bit when the device is in application mode. The [L4_IA_ERROR_LOG_L\[30\] SECONDARY](#) bit indicates whether the error occurred in application or debug.
The [L4_IA_ERROR_LOG_H\[15:0\] REQ_INFO](#) bit field returns the type of access (MreqInfo qualifier) that has caused the error.
The [L4_IA_ERROR_LOG_L\[13:8\] CONNID](#) bit field returns the ConnID of the initiator that has caused the error.
The [L4_IA_ERROR_LOG_ADDR_L\[31:0\] ADDR](#) register logs the address for error conditions.

10.3.3.4.2 Time-Out

A time-out mechanism can be enabled at the interconnect level and on a per-target basis. If the mechanism is enabled for a TA and interconnect and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

The error is logged in the [L4_TA_AGENT_STATUS_L\[8\] REQ_TIMEOUT](#) bit. The affected TA enters an error state that causes it to send an error response to any new request targeted at it. To recover from this state, system software must reset the TA. The time-out is counted starting from the moment a command is presented to the target, regardless of the target response to this command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. The time-base circuit offers four possible sets of four time-base signals. The time-base signals are selected by programming the [L4_LA_NETWORK_CONTROL_L\[10:8\] TIMEOUT_BASE](#) bit field.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, using the [L4_TA_AGENT_CONTROL_L\[10:8\] REQ_TIMEOUT](#) bit field. These four signals are referred to as 1X time-base, 4X time-base, 16X time-base, and 64X time-base.

[Table 10-356](#) lists all values in number of L4 clock cycles.

Table 10-356. L4 Time-out Link and TA Programming

L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT					
L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE	0	1	2	3	4
0	All L4 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16,384
3		1024	4096	16,384	65,536
4		4096	16,384	65,536	262,144

The default reset value is 0x2 for REQ_TIMEOUT and 0x4 for TIMEOUT_BASE, implying 16,384 clock cycles.

A time-out condition is detected when the command acceptance or the response is not received after a delay of from one to three time-base periods.

Example:

- L4 frequency = 65MHz, 15.3- μ s period
- TIMEOUT_BASE = 4 in the [L4_LA_NETWORK_CONTROL_L](#) register
- REQ_TIMEOUT = 2 in the [L4_TA_AGENT_CONTROL_L](#) for TA A
- REQ_TIMEOUT = 4 in the [L4_TA_AGENT_CONTROL_L](#) for TA B

At agent A, the time-base unit is 16,384 cycles. A time-out is issued when a request to the attached module is not accepted, or no response is sent after a delay of 252 μ s to 756 μ s.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 4 ms to 12 ms.

When a time-out condition is detected, the TA logs the error in the [L4_TA_AGENT_STATUS_L](#)[8] REQ_TIMEOUT bit, and it also reports the error to the IA, which forwards it to the L3 interconnects.

After the time-out is detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed-out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, software is assumed to first reset the faulty module and then the TA using the [L4_TA_AGENT_CONTROL_L](#)[0] OCP_RESET bit.

10.3.3.4.3 Error Reporting

[Figure 10-12](#) shows the error-reporting scheme used in the L4 interconnects. All L4 in-band errors are reported to their respective L3 TA, where errors are converted in an out-of band error signals (L3_MAIN_IRQ_APP_ERR and L3_MAIN_IRQ_DBG_ERR) going to the IRQ_CROSSBAR.

To enable interrupt reporting in case of error occurrence, one or all of the following bits (depending on user's desire) must be set to 0x1:

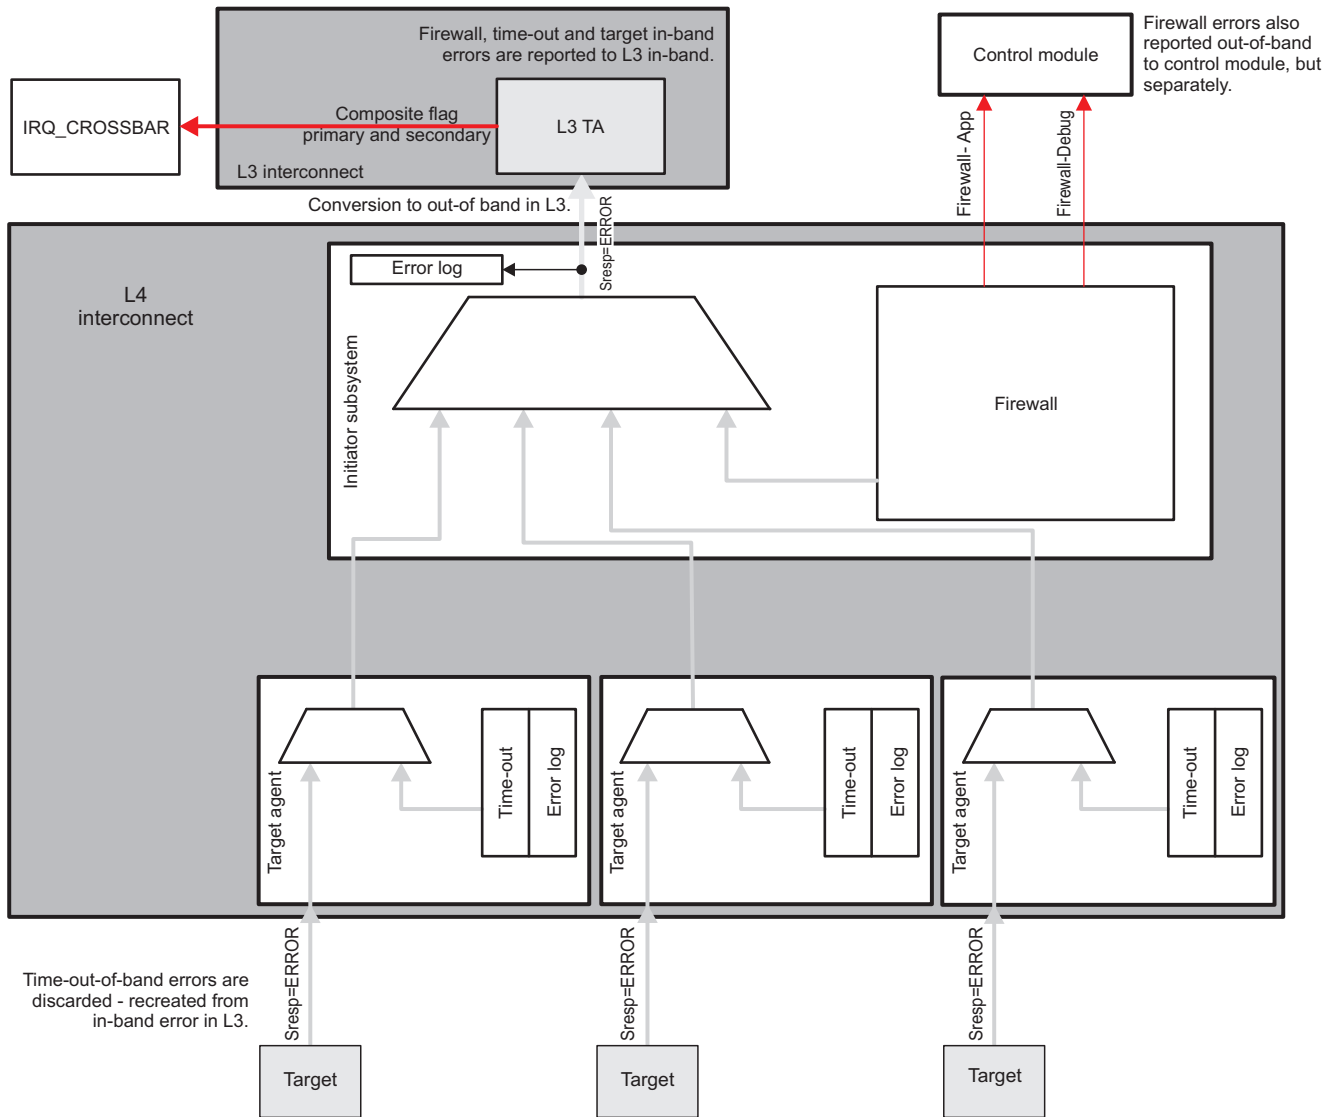

- CLK1_FLAGMUX_CLK1_1.L3_FLAGMUX_MASK0[10] for L4_CFG
- CLK1_FLAGMUX_CLK1_1.L3_FLAGMUX_MASK0[11] for L4_WKUP
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[5] for L4_PER2_P1
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[6] for L4_PER1_P1
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[7] for L4_PER1_P2
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[8] for L4_PER3_P2
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[9] for L4_PER3_P1

The following bits must also be set to 0x1:

- L3_FLAGMUX_CLK1MERGE_MASK0[1]

- L3_FLAGMUX_CLK1MERGE_MASK0[0]

Figure 10-12. L4 Error Reporting

icnt-012

10.3.3.4.4 Error Recovery

Setting the **L4_TA_AGENT_CONTROL_L[0] OCP_RESET** bit to 1 initiates the software reset period. Software reset must be asserted for at least 16 cycles of the target module interface clock, which can be a divided clock with respect to the L4 clock.

During the software reset period:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to prevent unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The **L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT** status bit is cleared.

Setting the **L4_TA_AGENT_CONTROL_L[0] OCP_RESET** bit to 0 terminates the software reset period.

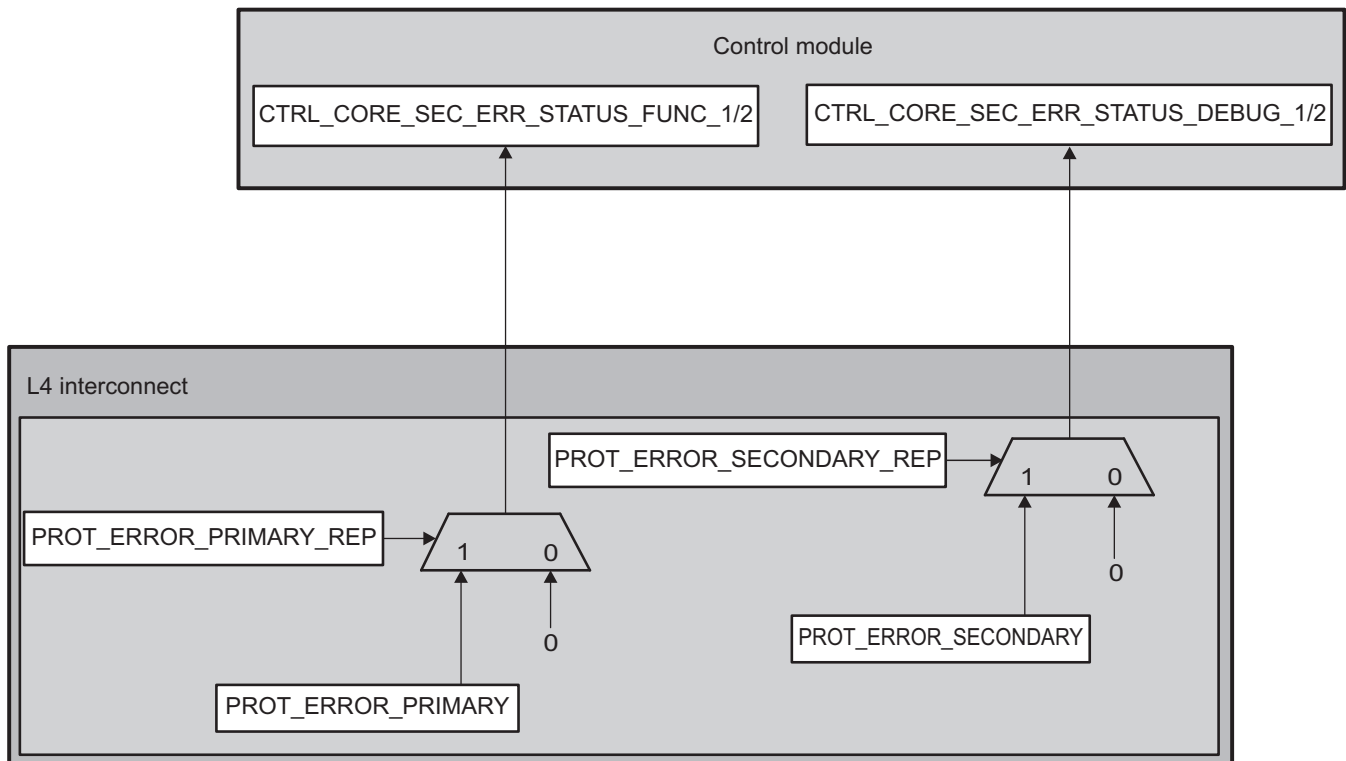

Reset the attached module to complete the recovery.

10.3.3.4.5 Firewall Error Logging in the Control Module

When a protection violation occurs, an interrupt is sent to the IRQ_CROSSBAR. An in-band error is sent back to L3 IA and an out-of-band error is logged in the CTRL_CORE_SEC_ERR_STATUS_FUNC_1/2 register (used in application mode) or in the CTRL_CORE_SEC_ERR_STATUS_DEBUG_1/2 register (used in debug mode). These out-of-band errors are enabled at the L4 IA level by setting to 0x1 the [L4_IA_AGENT_CONTROL_L\[31\] PROT_ERROR_SECONDARY_REP](#) bit when the device is in debug mode or the [L4_IA_AGENT_CONTROL_L\[30\] PROT_ERROR_PRIMARY_REP](#) bit when the device is in application mode.

Figure 10-13 shows the global protection error reporting to the control module.

Figure 10-13. Protection Violation Out-of-Band Error Reporting

10.3.4 L4 Interconnect Programming Guide

10.3.4.1 L4 Interconnect Low-level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

10.3.4.1.1 Global Initialization

10.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the L4 interconnects are used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the L4 interconnects. For more information, see [Section 10.3.2, L4 Interconnect Integration](#).

[Table 10-357](#) lists the surrounding modules.

Table 10-357. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see Chapter 3, Power, Reset, and Clock Management .
Control module	For information about the configuration of the control module, see Chapter 14, Control Module .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description , in Chapter 14, Control Module
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 13 Interrupt Controllers
L3_MAIN interconnect	For more information about the L3_MAIN interconnect configuration, see Section 10.2, L3_MAIN Interconnect .

10.3.4.1.2 Operational Modes Configuration

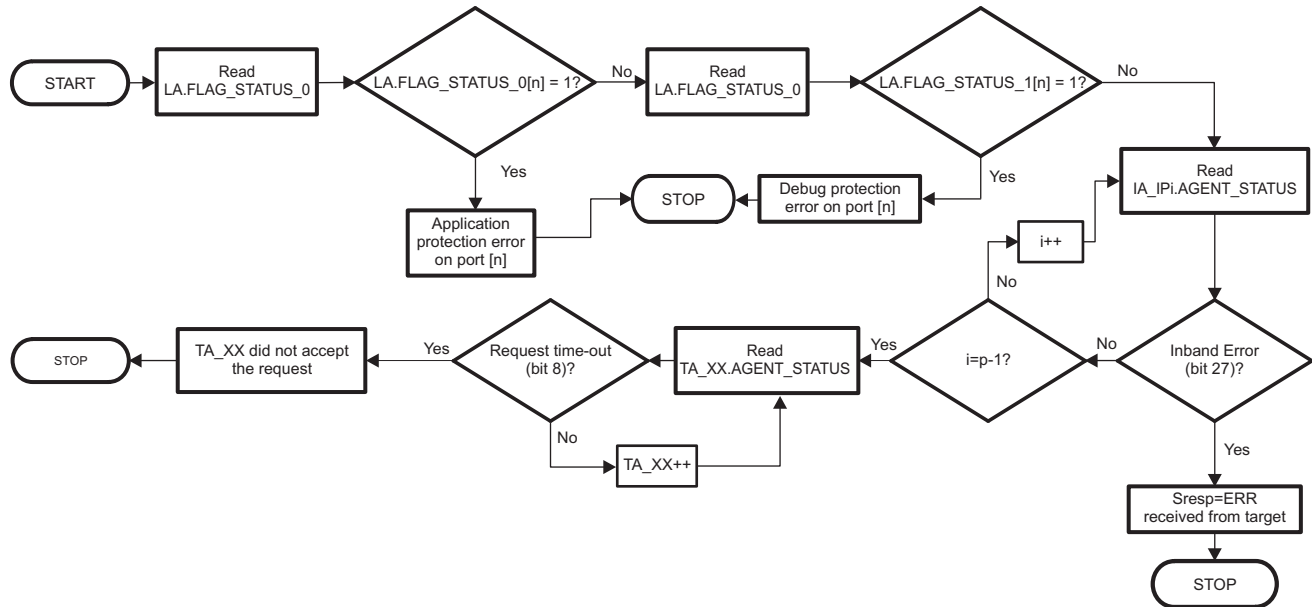

10.3.4.1.2.1 L4 Interconnect Error Analysis Mode

10.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 10-14](#) shows the software sequence required in most cases.

Figure 10-14. Typical Error Analysis Sequence

icnt-014

NOTE: L4 interconnects don't log any address or other specific information for a custom error returned from any target IP. They rather pass an error response up to the master supposed to analyze it.

In case of posted writes, the master access completes before it actually completed at the end slave level, this way no error response is sent back to the master, making it impossible to have a direct way of understanding the origin of L4 error during posted writes. However, even though no address is logged, an error flag is generated and needs to be processed.

10.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see [Table 10-358](#)).

Table 10-358. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x-
Read the initiator ConnID.	L4_IA_ERROR_LOG_L[13:8] CONNID	0x-
Read the command that has caused the error.	L4_IA_ERROR_LOG_L[2:0] CMD	0x-
Read address of request that has caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	0x-
IF: Is it a primary error?	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
Read status bits.	CTRL_CORE_SEC_ERR_STATUS_FUNC_1/2	0x-
	CTRL_CORE_SEC_ERR_STATUS_FUNC_1[16] L4_PERIPH1_FW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_FUNC_1[17] L4_CONFIG_FW_ERROR	0x1
Write 1 to clear status bits.	CTRL_CORE_SEC_ERR_STATUS_FUNC_1[22] L4_WAKEUP_FW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_FUNC_2[4] L4_PERIPH2_FW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_FUNC_2[5] L4_PERIPH3_FW_ERROR	0x1

Table 10-358. Protection Violation Error Identification (continued)

Step	Register/Bit Field/Programming Model	Value
Write 1 to clear IA status bit.	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
ELSE		
Read status bits.	CTRL_CORE_SEC_ERR_STATUS_DEBUG_1/2	0x-
	CTRL_CORE_SEC_ERR_STATUS_DEBUG_1[16] L4_PERIPH1_DBGFW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_DEBUG_1[17] L4_CONFIG_DBGFW_ERROR	0x1
Write 1 to clear status bits.	CTRL_CORE_SEC_ERR_STATUS_DEBUG_1[22] L4_WAKEUP_DBGFW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_DEBUG_2[4] L4_PERIPH2_DBGFW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_DEBUG_2[5] L4_PERIPH3_DBGFW_ERROR	0x1
Write 1 to clear IA status bit	L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY	0x1
ENDIF		
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear in-band error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

10.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see [Table 10-359](#)).

Table 10-359. Unsupported Command/Address Hole Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x-
Read the initiator ConnID.	L4_IA_ERROR_LOG_L[11:8] CONNID	0x-
Read command that has caused the error.	L4_IA_ERROR_LOG_L[2:0] CMD	0x-
Read the address of the request that has caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	0x-
Read secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x-
Write 1 to clear secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x1
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear inband error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

10.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure describes the reset TA and module (see [Table 10-360](#)).

Table 10-360. Reset TA and Module

Step	Register/Bit Field/Programming Model	Value
Reset TA.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x1
Wait until target module clock = 16 cycles.		
Write 0 to clear TA time-out status.	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	0x0
Write 0 to clear TA reset.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x0
Reset the attached module.	For more information, see the respective module chapter.	

10.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

10.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see [Table 10-361](#)).

Table 10-361. Time-Out Configuration

Step	Register/Bit Field/Programming Model	Value
Disable time-out.	L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE	0x0
Clear TA time-out error status. ⁽¹⁾	L4_TA_AGENT_STATUS_L [8] REQ_TIMEOUT	0x1
Set time-out at TA level. ⁽¹⁾	L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT	0x-
Set time-out base.	L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE	0x-

⁽¹⁾ Required for each TA.

10.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

10.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see [Table 10-362](#)).

Table 10-362. Firewall Configuration

Step	Register/Bit Field/Programming Model	Value
Define the members of protection group k. In other words, define which initiators can access the protection group k. For ConnID values, see Table 10-346 .	L4_AP_PROT_GROUP_MEMBERS_k_L [15:0] CONNID_BIT_VECTOR ⁽¹⁾	0x-
For the protection group k define the initiator requests accepted or not by the L4 firewalls depending on combination of L4 qualifiers. For more details, see Table 10-347	L4_AP_PROT_GROUP_ROLES_k_L [31:0] ENABLE ⁽¹⁾	0x-
Assign the region l to a protection group.	L4_AP_REGION_l_H [22:20] PROT_GROUP_ID ⁽²⁾	0x-

⁽¹⁾ Required for each protection group.

⁽²⁾ Required for each region.

10.3.5 L4 Interconnects Register Manual

Table 10-363 through Table 10-367 list all L4 register blocks for IA, TA, AP, and LA. Each module instance is shown with the module register mapping and bit and bit field definitions.

Table 10-440. L4_TA_AGENT_CONTROL_L

Address Offset	0x0000 0020		
Physical Address	See Table 10-396 to Table 10-431	Instance	See Table 10-396 to Table 10-431
Description	Enable error reporting		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								SERROR_REP	RESERVED												REQ_TIMEOUT	RESERVED								OCP_RESET	

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	SERROR_REP	Enable logging of error	R	0x0
23:11	RESERVED	Read returns 0.	R	0x0
10:8	REQ_TIMEOUT	Time-out Bound. Values are: 0 - No time-out 1 - 1x base cycles. 2 - 4x base cycles. 3 - 16x base cycles. 4 - 64x base cycles.	RW	0x2
7:1	RESERVED	Read returns 0.	R	0x00
0	OCP_RESET	The OCP_RESET field controls the OCP reset signal to the attached core. Setting this bit clears any pending transfers and resets the OCP interface. The bit must be cleared to deassert the OCP reset signal. When the software reset feature is available on a target agent, the target agent OCP must also have a reset signal directed to the target core.	RW	0

Address Offset	0x0000 0024	Instance	L4_PER1_LA L4_PER2_LA L4_PER3_LA L4_CFG_LA L4_WKUP_LA
Physical Address	0x4800 0824 0x4840 0824 0x4880 0824 0x4A00 0824 0x4AE0 0824		
Description	Control interconnect global power control		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLOCK_GATE_DISABLE	RESERVED		THREAD0_PRI	RESERVED								EXT_CLOCK	RESERVED										

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0
23:21	RESERVED	Read returns 0.	R	0x0
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	1
19:9	RESERVED	Read returns 0.	R	0x000
8	EXT_CLOCK	Global external clock control. When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	RESERVED	Read returns 0.	R	0x00

Memory Subsystem

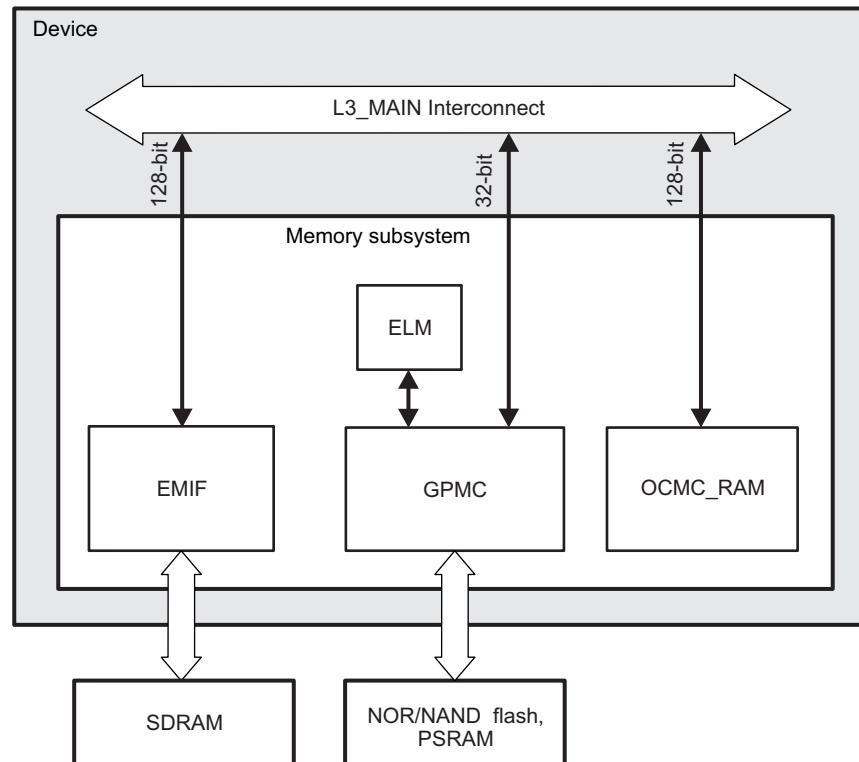

This chapter describes the Memory Subsystem for the device.

Topic	Page
11.1 Memory Subsystem Overview	4077
11.2 EMIF Controller.....	4081
11.3 General-Purpose Memory Controller	4231
11.4 Error Location Module.....	4377
11.5 On-Chip Memory (OCM) Subsystem	4406

11.1 Memory Subsystem Overview

Figure 11-1 shows a functional diagram of all memory subsystems in the device.

Figure 11-1. Memory Subsystem Functional Diagram

memss_over-001

11.1.1 EMIF Overview

The EMIF module provides connectivity between DDR memory types and manages data bus read/write accesses between external memory and device subsystems which have master access to the L3_MAIN interconnect and DMA capability.

The EMIF module has the following capabilities:

- Supports JEDEC standard-compliant LPDDR2/DDR2-SDRAM and DDR3/DDR3L-SDRAM memory types
- 2-GiB SDRAM address range over one chip-select.
- Supports SDRAM devices with one, two, four or eight internal banks
- Data bus widths:
 - 128-bit L3_MAIN (system) interconnect data bus width
 - 32-bit SDRAM data bus width
 - 16-bit SDRAM data bus width used in narrow mode
- Supported CAS latencies:
 - DDR3: 5, 6, 7, 8, 9, 10 and 11
 - DDR2: 2, 3, 4, 5, 6 and 7
 - LPDDR2: 3, 4, 5, 6, 7, and 8
- Supports 256-, 512-, 1024-, and 2048-word page sizes
- Supported burst length: 8
- Supports sequential burst type
- SDRAM auto initialization from reset or configuration change

- Supports self refresh and power-down modes for low power
- Partial array self-refresh mode for low power when DDR3 is used
- Output impedance (ZQ) calibration for DDR3
- Supports on-die termination (ODT) for DDR2 and DDR3
- Supports prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Programmable SDRAM timing parameters
- Write and read leveling/calibration and data eye training for DDR3.
- ECC on the SDRAM data bus:
 - 7-bit ECC over 32-bit data
 - 6-bit ECC over 16-bit data when narrow mode is used
 - 1-bit error correction and 2-bit error detection
 - Programmable address ranges to define ECC protected region
 - ECC calculated and stored on all writes to ECC protected address region
 - ECC verified on all reads from ECC protected address region
 - Statistics for 1-bit ECC and 2-bit ECC errors
 - The total width of the ECC DDR data bus is 8 bits

The EMIF module does not support:

- Burst chop for DDR3
- Interleave burst type
- Auto precharge because of better Bank Interleaving performance
- OCD calibration for DDR2
- CAS Read Latency of 2 and CAS Write Latency of 1 for DDR2
- DLL disabling from EMIF side

11.1.2 GPMC Overview

The General Purpose Memory Controller (GPMC) is an external memory controller of the device. Its data access engine provides a flexible programming model for communication with all standard memories.

The GPMC supports the following various access types:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, and 16 Word16)
- Synchronous read/write access
- Synchronous read/write burst access without wrap capability (4, 8 and 16 Word16)
- Synchronous read/write burst access with wrap capability (4, 8 and 16 Word16)
- Address-data-multiplexed (AD) access
- Address-address-data (AAD) multiplexed access
- Little- and big-endian access

The GPMC can communicate with a wide range of external devices:

- External asynchronous or synchronous 8-bit wide memory or device (non burst device)
- External asynchronous or synchronous 16-bit wide memory or device
- External 16-bit non-multiplexed NOR flash device
- External 16-bit address and data multiplexed NOR Flash device
- External 8-bit and 16-bit NAND flash device
- External 16-bit pseudo-SRAM (pSRAM) device

The main features of the GPMC are:

- 8- or 16-bit-wide data path to external memory device
- Supports up to eight CS regions of programmable size and programmable base addresses in a total address space of 1 GiB
- Supports transactions controlled by a firewall
- On-the-fly error code detection using the Bose-Chaudhuri-Hocquenghem (BCH) ($t = 4, 8, \text{ or } 16$) or Hamming code to improve the reliability of NAND with a minimum effect on software (NAND flash with 512-byte page size or greater)
- Fully pipelined operation for optimal memory bandwidth use
- The clock to the external memory is provided from GPMC functional clock divided by 1, 2, 3, or 4
- Supports programmable autoclock gating when no access is detected
- Independent and programmable control signal timing parameters for setup and hold time on a per-chip basis. Parameters are set according to the memory device timing parameters, with a timing granularity of one GPMC functional clock cycle.
- Flexible internal access time control (WAIT state) and flexible handshake mode using external WAIT pin monitoring
- Support bus keeping
- Support bus turnaround
- Prefetch and write posting engine associated with a device DMA controller to achieve full performance from the NAND device with minimum effect on NOR/SRAM concurrent access

NOTE: Page mode is available only in nonmultiplexed mode.

11.1.3 ELM Overview

In the case of NAND modules with no internal correction capability, sometimes referred to as bare NAND, the correction process can be delegated to the error location module (ELM) used in conjunction with the GPMC.

The ELM supports the following features:

- 4, 8, and 16 bits per 512-byte block error location based on BCH algorithm
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation when error location process completes:
 - When the full page has been processed in page mode
 - For each syndrome polynomial (checksum-like information) in continuous mode

11.1.4 OCM Overview

There is one on-chip memory controller (OCMC) in the device.

The OCM Controller supports the following features:

- L3_MAIN data interface:
 - Used for maximum throughput performance
 - 128-bit data bus width
 - Burst supported
- L4 interface:
 - Used for access to configuration registers
 - 32-bit data bus width
 - Only single accesses supported
 - The L4 associated OCMC clock is two times lower than the L3 associated OCMC clock
- Error correction and detection:

- Single error correction and dual error detection
- 9-bit Hamming error correction code (ECC) calculated on 128-bit data word which is concatenated with memory address bits
- Hamming distance of 4
- Enable/Disable mode control through a dedicated register
- Single bit error correction on a read transaction
- Exclusion of repeated addresses from correctable error address trace history
- ECC valid for all write transactions to an enabled region
- Sub-128-bit writes supported via read modify write
- ECC Error Status Reporting:
 - Trace history buffer (FIFO) with depth of 4 for corrected error address
 - Trace history buffer with depth of 4 for non correctable error address and also including double error detection
 - Interrupt generation for correctable and uncorrectable detected errors
- ECC Diagnostics Configuration:
 - Counters for single error correction (SEC), double error detection (DED) and address error events (AEE)
 - Programmable threshold registers for exceptions associated with SEC, DED and AEE counters
 - Register control for enabling and disabling of diagnostics
 - Configuration registers and ECC status accessible through L4 interconnect
- Circular buffer for sliced based VIP frame transfers:
 - Up to 12 programmable circular buffers mapped with unique virtual frame addresses
 - On the fly (with no additional latency) address translation from virtual to OCMC circular buffer memory space
 - Virtual frame size up to 8 MiB and circular buffer size up to 1 MiB
 - Error handling and reporting of illegal CBUF addressing
 - Underflow and Overflow status reporting and error handling
 - Last access read/write address history
- Two Interrupt outputs configured independently to service either ECC or CBUF interrupt events

The OCM controller does not have a memory protection logic and does not support endianism conversion.

11.2 EMIF Controller

This section describes mainly the features and functions of the external memory interface (EMIF) controller and also its associated PHYs.

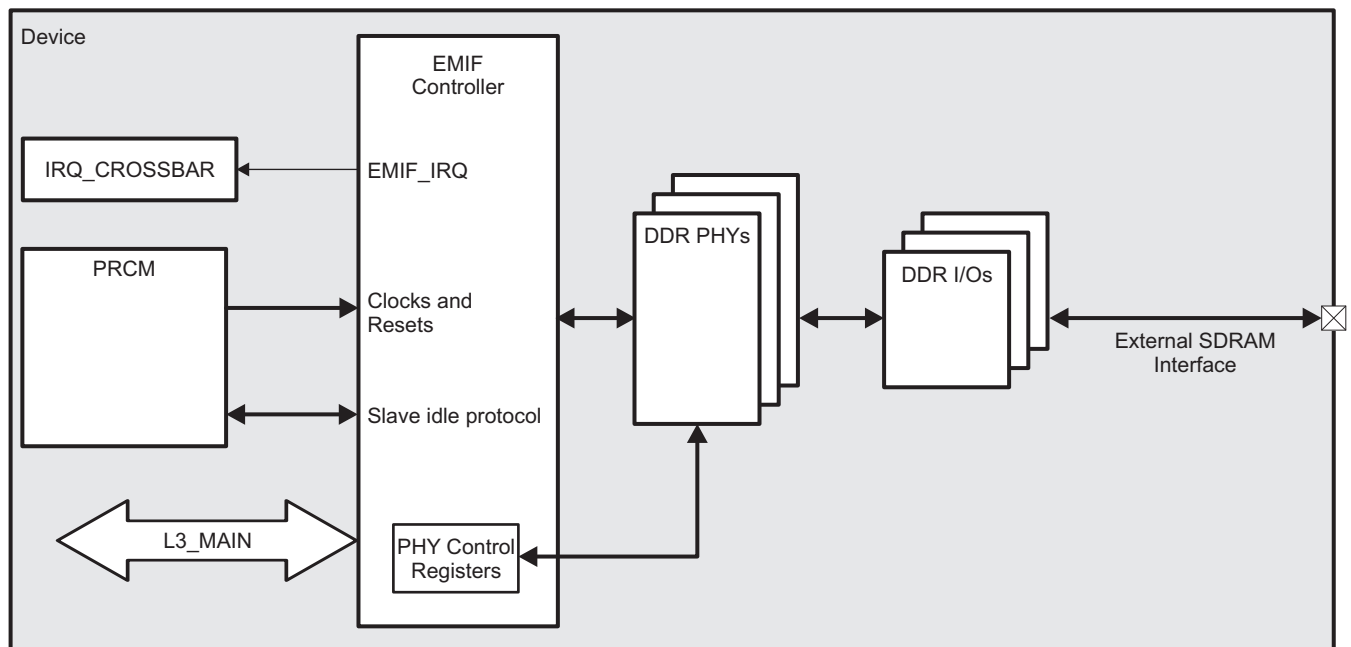

11.2.1 EMIF Controller Overview

The EMIF controller provides connectivity between the device and LPDDR2/DDR2/DDR3/DDR3L types of memories and manages data bus read/write accesses between external memories and the device subsystems which have access to the L3_MAIN interconnect and DMA capability too.

The EMIF features are introduced in [Section 11.1.1 EMIF Overview](#) of [Section 11.1 Memory Subsystem Overview](#).

The device includes one EMIF controller. [Figure 11-2](#) shows an overview of this EMIF controller and also the connections to the other surrounding modules. As can be seen on [Figure 11-2](#) the EMIF is not directly available on device pads. That is, it is not directly connected to the external SDRAM. There are DDR PHYs and then DDR I/Os between the EMIF controller and external SDRAM. The EMIF controller, the DDR PHYs and the DDR I/Os work like a single unit to manage data exchanges to and from external memories. To achieve successful data transaction between an internal device initiator and external SDRAM all these three components must be used.

Figure 11-2. EMIF Controller Overview

emif-001

11.2.2 EMIF Module Environment

This section describes the external connections of the EMIF module.

[Figure 11-3](#) shows an example EMIF DDR2/DDR3/DDR3L configuration without ECC memory connected.

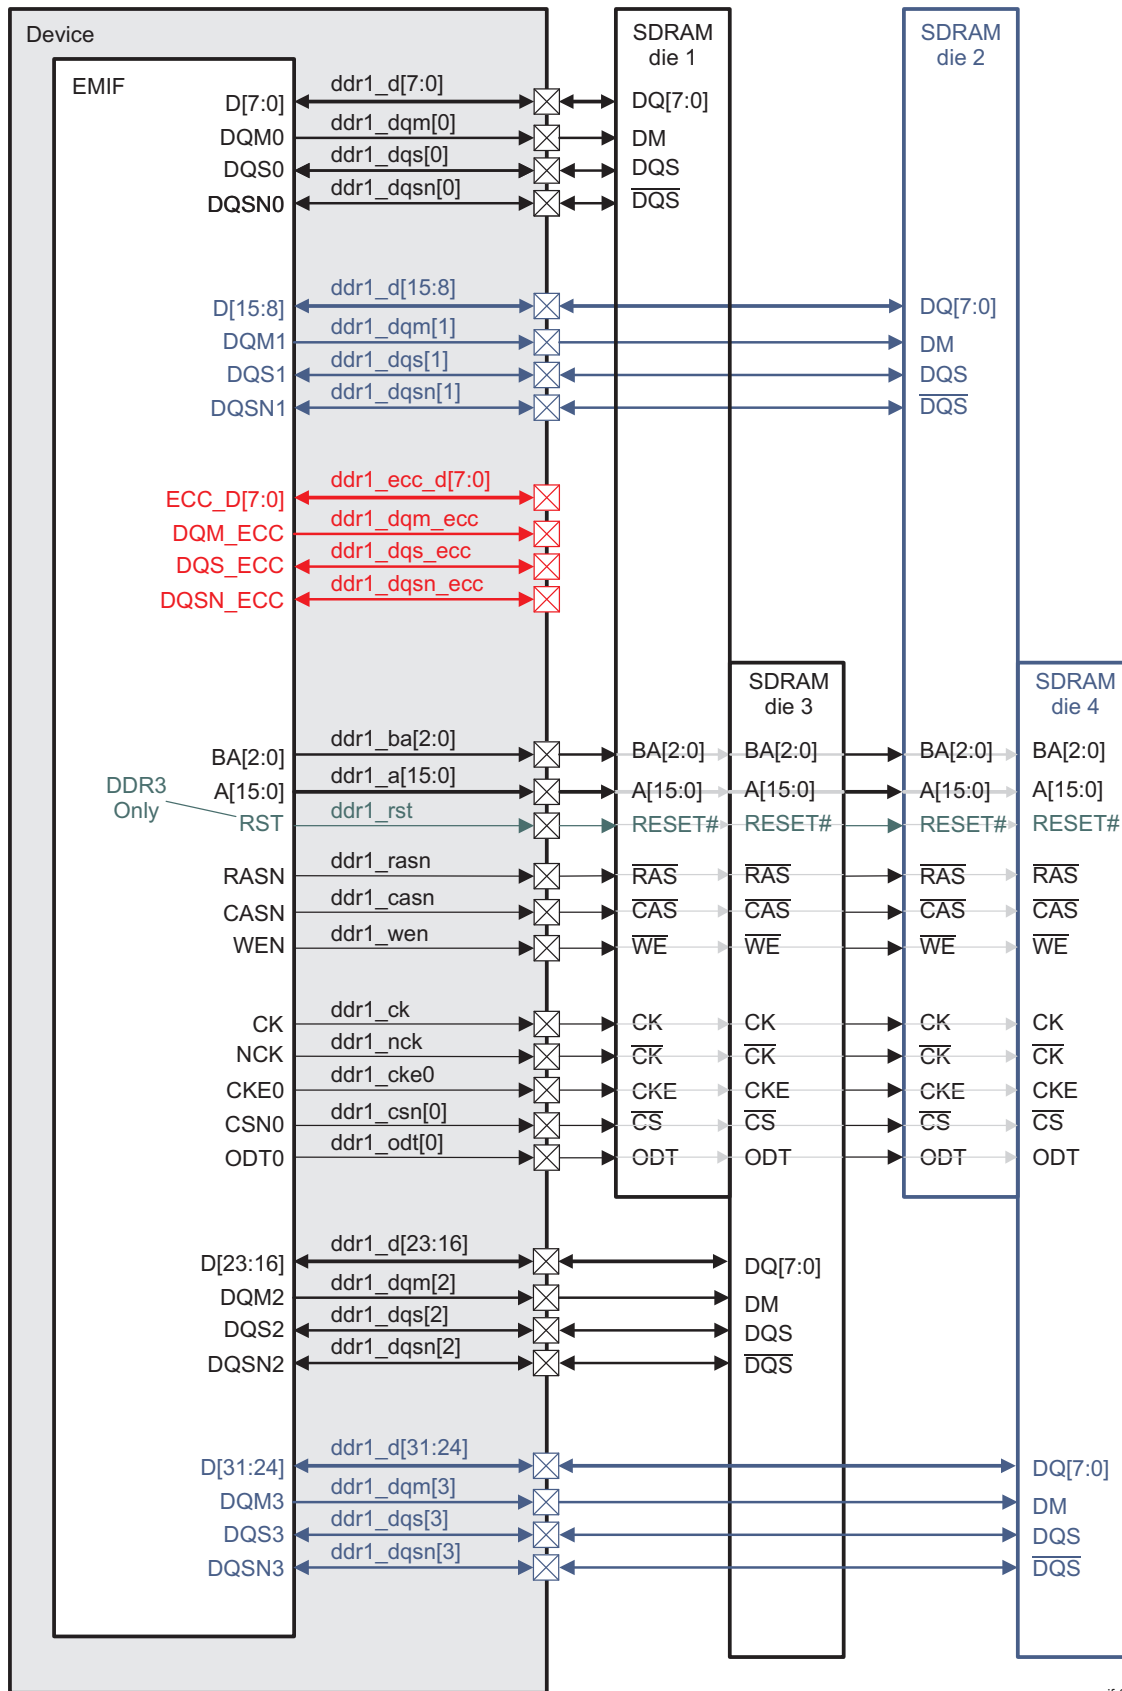

[Figure 11-4](#) shows an example EMIF DDR2/DDR3/DDR3L configuration with ECC memory connected.

[Figure 11-5](#) shows an example EMIF LPDDR2 configuration without ECC memory connected.

[Figure 11-6](#) shows an example EMIF LPDDR2 configuration with ECC memory connected.

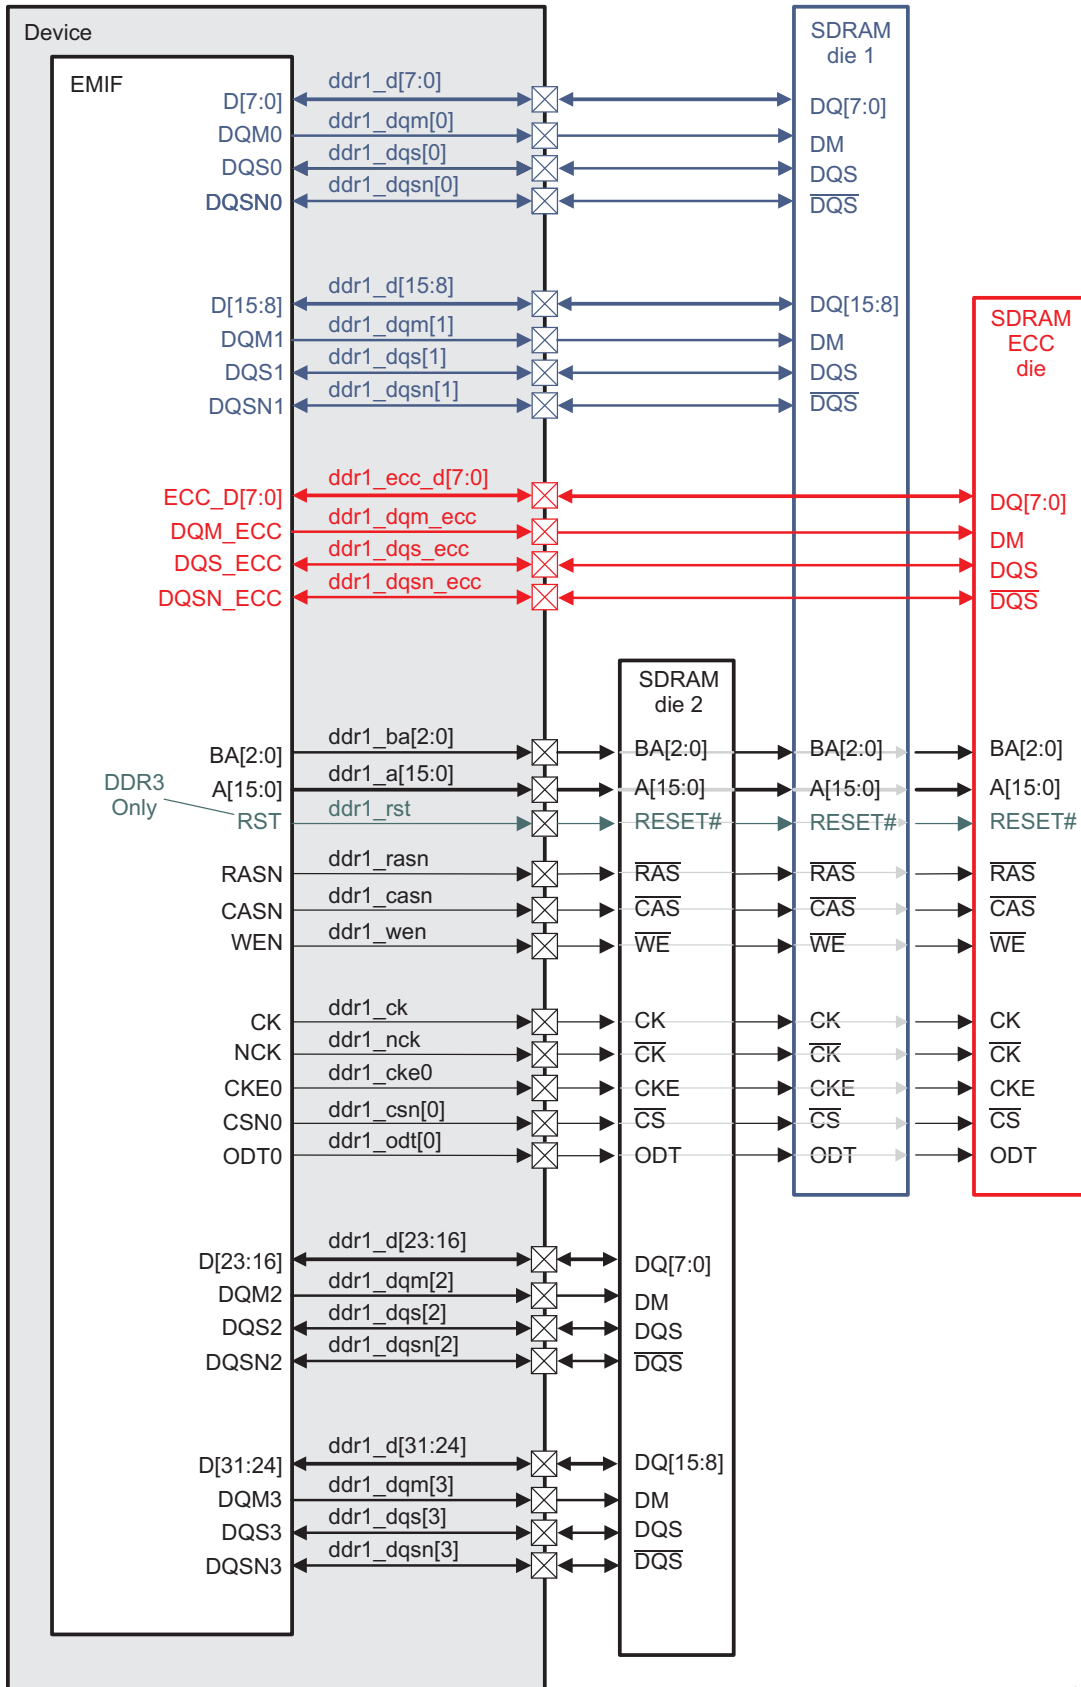

For simplification the DDR PHYs and DDR I/Os are not shown. Only the I/O signals and their corresponding EMIF pins are shown.

⁽¹⁾ I = Input; O = Output

⁽²⁾ These signals are available only in non-PoP package. For more information about signal availability in PoP and non-PoP packages, see the corresponding device data manual.

Table 11-2. EMIF Module I/O Signals Used For Connection to LPDDR2 Memories (continued)

EMIF Pin Name	Device I/O Signal Names	I/O ⁽¹⁾	Description
CA9	ddr1_ba[2]	O	Command/Address bus - bit 9

The CKE0 memory pin is dynamically driven by the EMIF module according to the memory interface activity.

The ddr1_cke0 pad can also be forced to tri-state by a dedicated Control Module register. For more information, see [Section 11.2.4.18 Forcing CKE to tri-state](#).

The DDR memory connected to the DDR ECC bus does NOT need to be the same part number as the DDR memories connected to the DDR data bus. However, some constraints do apply. When selecting a memory for the DDR ECC bus, the following restrictions must be adhered to.

Compared to the DDR memories on the data bus, the DDR ECC memory must:

- Match the same DDR type (for example, DDR3) and speed grade
- Have an equal number of internal banks
- Have an equal number of columns
- Have a greater or equal number of rows

In addition,

- Unused pins should be properly tied off as described in the routing guidelines of the device data manual.
- EMIF register settings should be configured to satisfy the larger minimum timing requirements and the smaller maximum timing requirements between the two different DDR memories to ensure that all DDR memories connected to the EMIF channel are running within their specified range.

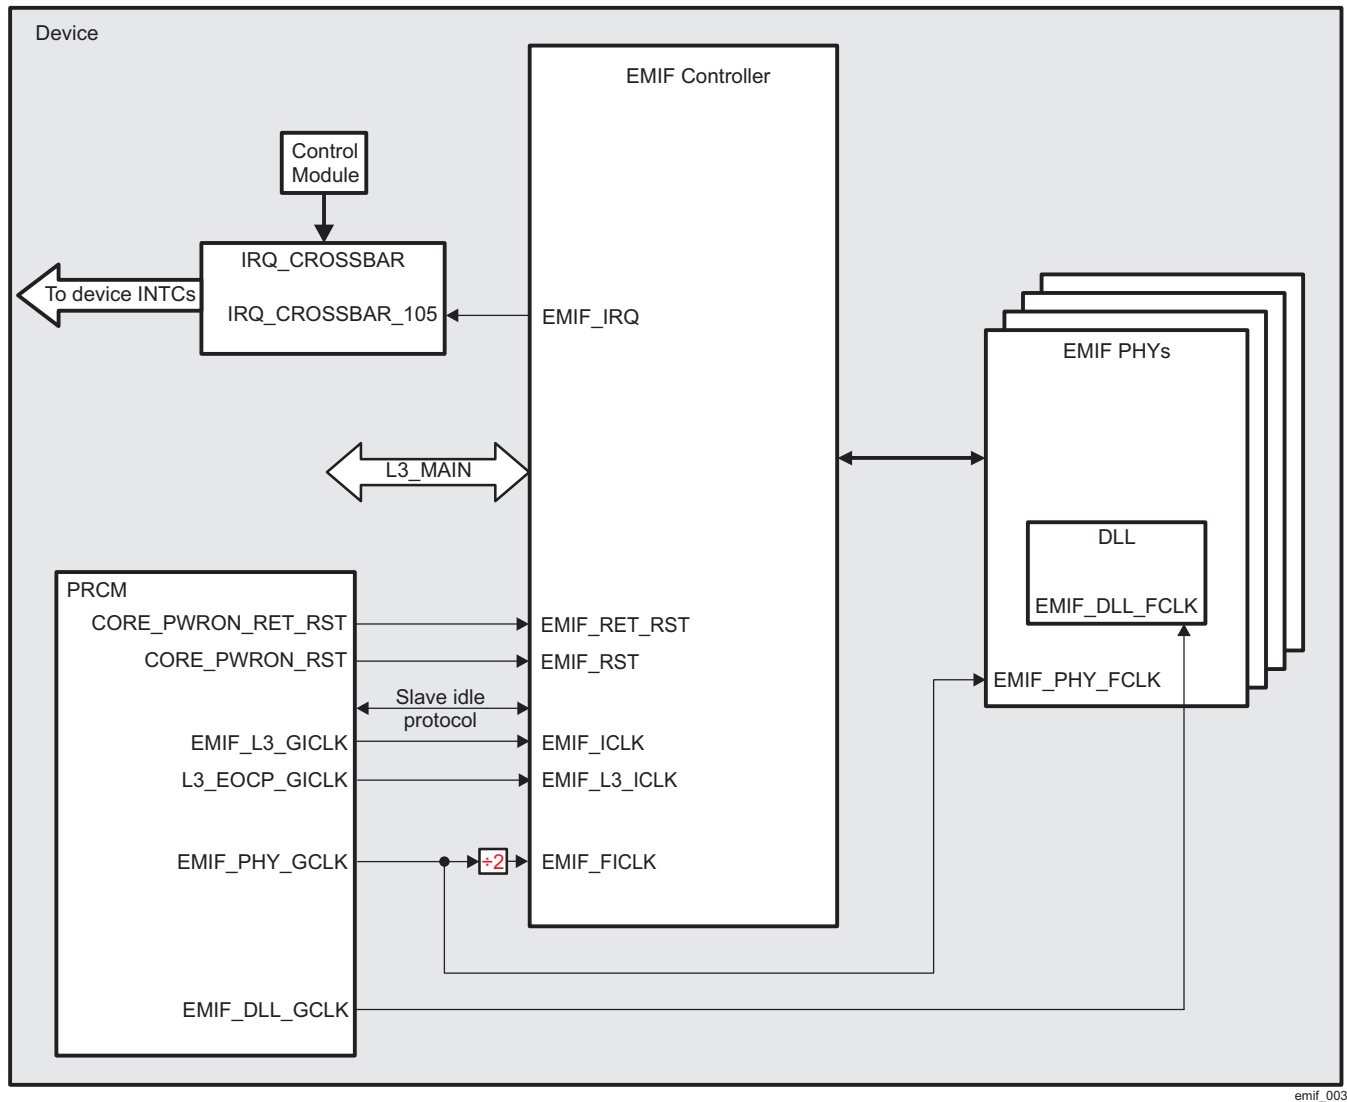

NOTE: For a full list of supported DDR device types, frequencies, and topologies, refer to the routing guidelines of the device data manual.

11.2.3 EMIF Module Integration

This section describes the integration of the EMIF module in the device and includes information about clocks, resets, and hardware requests.

Figure 11-7 shows the integration of the EMIF module in the device.

Figure 11-7. EMIF Module Integration

NOTE: For more information about the slave idle protocol, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 11-3 through Table 11-5 summarize the integration of the EMIF module in the device.

Table 11-3. EMIF Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
EMIF	PD_COREAON	No	L3_MAIN

Table 11-4. EMIF Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF	EMIF_ICLK	EMIF_L3_GICLK	PRCM	Interface clock for EMIF used for driving the L3 interface logic and for SDRAM Read Data FIFO.
	EMIF_L3_ICLK	L3_EOCP_GICLK	PRCM	Additional interface clock for EMIF which frequency is equal to EMIF_L3_GICLK interface clock. Used for command/write data pre-FIFO to Command/Write Data FIFO paths.
	EMIF_PHY_FCLK	EMIF_PHY_GCLK	PRCM	Common functional clock for the EMIF associated PHYs. This clock is equal to the DDR-SDRAM clock rate.
	EMIF_FICLK	EMIF_PHY_GCLK/2	PRCM	Functional and interface clock for the EMIF. This clock runs at half the DDR-SDRAM clock rate.
	EMIF_DLL_FCLK	EMIF_DLL_GCLK	PRCM	Common functional clock for all DLLs associated with the EMIF PHYs.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF	EMIF_RET_RST	CORE_PWRON_RET_RST	PRCM	Power-on reset
	EMIF_RST	CORE_PWRON_RST	PRCM	Power-on reset

Table 11-5. EMIF Hardware Requests

Interrupt Requests				
Module Instance	IRQ Source Name	IRQ_CROSSBAR Input	Default IRQ Source Mapping	Description
EMIF	EMIF_IRQ	IRQ_CROSSBAR_105	-	EMIF interrupt request. This IRQ source signal is not mapped by default to any device INTC.

NOTE: The “Default IRQ Source Mapping” column in [Table 11-5 EMIF Hardware Requests](#) shows the default mapping of the IRQ sources listed in column “IRQ Source Name” to a certain interrupt line of one of the device interrupt controllers. These IRQ sources can also be mapped to other interrupt lines of each device interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#).

NOTE: For the description of the interrupt source, see [Section 11.2.4.5, Interrupt Requests](#).

11.2.4 EMIF Functional Description

11.2.4.1 Block Diagram

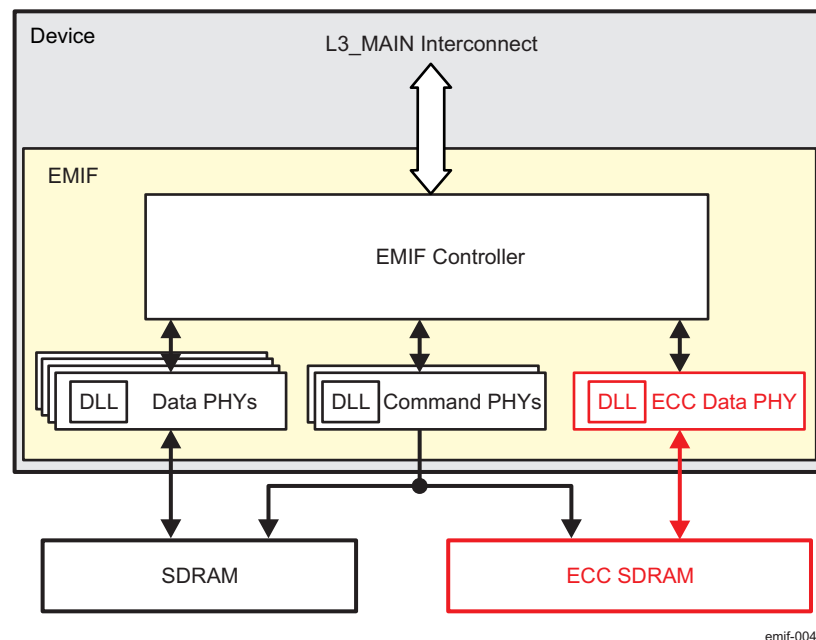

The EMIF module provides an interface to LPDDR2, DDR2 and DDR3/DDR3L SDRAM memories.

Figure 11-8 shows the interconnection between the EMIF module and the other modules.

Digital locked loops (DLLs) are used to delay the input DQS signals during reads so that these strobe signals can be used to latch incoming data on the DQ pins, as required by the DDR standard.

Physical layers (PHYS) convert single-data rate (SDR) signals to DDR signals.

Figure 11-8. EMIF Block Diagram

emif-004

11.2.4.1.1 Local Interface

The EMIF controller has only one local (on-chip) interface. It is called system interface and connects the EMIF to the L3_MAIN interconnect. The system interface is used to request all external memory device accesses, to access the EMIF registers, and to transfer all data to and from the EMIF controller.

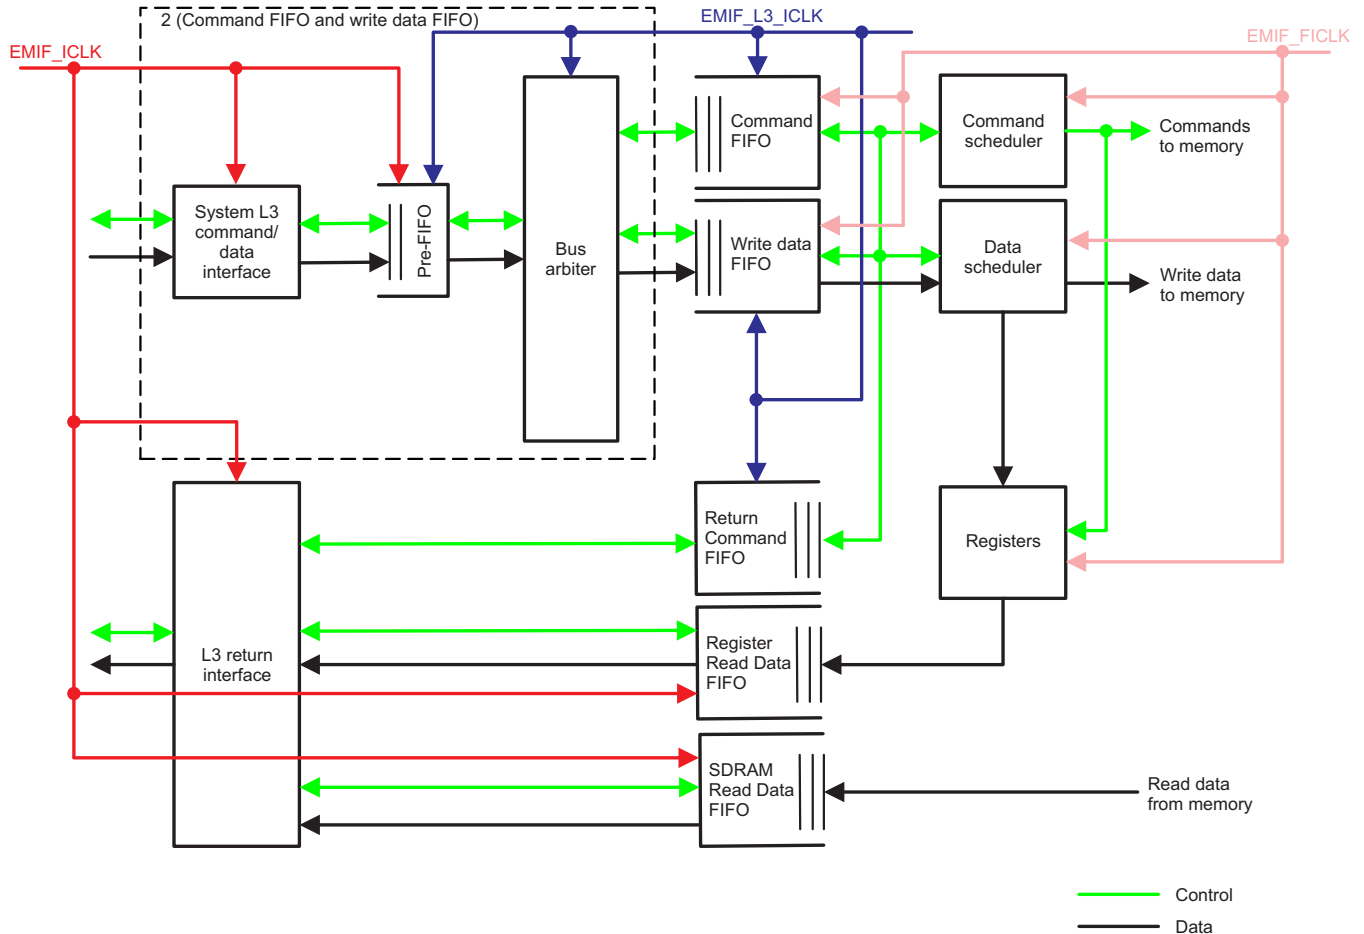

11.2.4.1.2 FIFO Description

The EMIF module contains the following FIFOs:

- Command FIFO
- Write data FIFO
- Return command FIFO
- Two read data FIFOs

Figure 11-9 shows the overall architecture of the EMIF FIFOs.

Figure 11-9. FIFO Block Diagram

emif_005

Table 11-6 lists the allocation of the entries.

Table 11-6. FIFO Allocation

Parameter	Local System Interface Entries
Pre Command FIFO	6
Command FIFO	Programmable ⁽¹⁾
Pre Write FIFO	6
Write Data FIFO (256-bit)	Up to (19 x 256 bits) + 6
Return Command FIFO	22
SDRAM Read Data FIFO	22
Register Read Data FIFO	2

⁽¹⁾ The total number of entries in the command FIFO is 10.

The command FIFO stores all the commands coming in on the local command interface. The allocation of entries in the command FIFO is programmable using the [EMIF_OCP_CONFIG\[27:24\]](#) [SYS_THRESH_MAX](#) bit field.

The write data FIFO stores the write data for all write transactions coming in on the local write data interface.

The return command FIFO stores all the return transactions that have to be issued to the local return interface. These include the write status return and the read data return commands.

Two read data FIFOs store the read data to be sent to the local return interface. One read data FIFO stores read data from the memory mapped registers. The other read data FIFO stores read data from external memory.

A write command is executed only when four local words of the corresponding data are received in the write data FIFO, or when it is the last data, and if there is space in the return command FIFO. The EMIF schedules a read-only if the results can fit into the return command FIFO and the corresponding read data FIFOs.

11.2.4.1.3 Arbitration of Commands in the Command FIFO

The EMIF looks at all the commands stored in the command FIFO to schedule commands to the external memory. All commands with the same MTagID on a particular local interface complete in order. The EMIF does not ensure ordering between commands with different MTagIDs. For information about MTagID, see [Section 10.1.1, Terminology in Chapter 10, Interconnect](#).

The EMIF must also open and close SDRAM banks and maintain the refresh counts for an SDRAM. The priority of SDRAM commands with respect to refresh levels are:

1. SDRAM refresh request when refresh-must level is reached (highest priority)
2. ZQ calibration
3. Leveling
4. local request for a read or write
5. local request for a write
6. SDRAM activate commands
7. SDRAM deactivate commands
8. SDRAM power-down request
9. SDRAM refresh request when refresh-may or release level is reached
10. SDRAM self-refresh request (lowest priority)

To avoid continuous blocking effect which can be caused by a continuous stream of high-priority commands which thus block the lower priority commands, the EMIF momentarily raises the priority of the oldest command over all other commands when the time for the oldest command configured through the [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) bit field expires.

It should be taken into account that while performing the scheduling algorithm described, the EMIF may also encounter a condition in which continuous stream of SDRAM commands to a row in an open bank can block commands to another row in the same bank.

In addition to this scheduling, the highest priority condition is a reset command. If this condition occurs, the EMIF abandons what it is currently doing and begins its start-up sequence. In this case, commands and data stored in the FIFOs are lost. The EMIF also starts its start-up sequence whenever the [EMIF_SDRAM_CONFIG](#) register is written and the [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS](#) bit is set to 0. In this case, commands and data stored in the FIFOs are not lost. The EMIF ensures that in-flight read or write transactions to the SDRAM are complete before starting the initialization sequence.

All the accesses to an SDRAM are pipelined to maximize use of the external bus. All of these are done while fulfilling the access timing requirements of an SDRAM.

11.2.4.2 Clock Management

The EMIF can gate EMIF_FICLK. There is an internal mechanism that can stop EMIF_FICLK automatically. EMIF_FICLK is stopped only after the SDRAM is put into self-refresh mode and the power-idle protocol on the local bus completes. The EMIF_FICLK frequency can be changed only after putting the external SDRAM in self-refresh mode.

The EMIF waits for the DLL lock before performing any memory access.

EMIF_FICLK frequency is equal to half of the EMIF_PHY_FCLK frequency.

11.2.4.3 Reset

The EMIF does not support a software reset.

The EMIF supports a global warm reset mode, during which the EMIF keeps the SDRAM content. Upon a request from the PRCM module indicating a need to enter global warm reset mode, the EMIF does the following:

1. During leveling operation, EMIF will immediately exit this mode and automatically perform a write to the MR1 register of DDR3 memory to disable the leveling at the memory side too.
2. EMIF completes the ongoing access, and then puts the SDRAM in self-refresh mode. If the [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS](#) field is set to 1, the EMIF does not put SDRAM in self-refresh mode.
3. EMIF clears all its FIFO contents.
4. EMIF does not wait for all interrupts to be serviced.

To exit the global warm reset:

1. If the EMIF was in Self Refresh state, it will exit Self Refresh state.
2. If leveling was enabled at the time of a global warm reset, a PHY reset must occur to bring the PHY back into a known state, as it may have been left in a leveling state upon warm reset assertion. To guarantee that the SDRAM memory clocks are off when issuing PHY reset, software can use the [EMIF_POWER_MANAGEMENT_CONTROL](#) register to enter self refresh before asserting the PHY reset.

11.2.4.4 System Power Management

11.2.4.4.1 Power-Down Mode

The EMIF supports SDRAM power-down mode for low power. The EMIF automatically puts the SDRAM into power-down mode after it is idle for [EMIF_POWER_MANAGEMENT_CONTROL\[15:12\] PD_TIM](#) number of DDR clock cycles and the [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field is set to 0x4. In power-down mode, the EMIF does not stop the clocks to the SDRAM. The EMIF maintains CKE pin low to maintain the power-down mode.

If refresh-must level is not reached before power-down entering, EMIF will not precharge all SDRAM banks before it issues the power-down command. As a result of this EMIF puts the SDRAM in active power-down mode. If refresh-must level is reached before power-down entering, EMIF will precharge all SDRAM banks and before it issues the power-down command, EMIF issues refreshes until refresh-release level is reached. As a result of this EMIF puts the SDRAM in precharge power-down mode.

When the SDRAM is in power-down mode, the EMIF services register accesses normally.

If the SDRAM is in power-down mode and one of the following occurs, the EMIF brings SDRAM out of power-down mode:

- [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field is changed from 0x4 to some other value.
- An SDRAM access is requested.
- The refresh-must level is reached.

If refresh-must level brings the SDRAM out of power-down mode, EMIF puts it in power-down again when the refreshes are complete and keeps this state until the next SDRAM request.

To exit power-down, the EMIF:

1. Drives CKE high after $t_{cke} + 1$ cycles have elapsed since the power-down command was issued. The value of t_{cke} is taken from [EMIF_SDRAM_TIMING_2\[2:0\] T_CKE](#) bit field.
2. Waits for [EMIF_SDRAM_TIMING_2\[30:28\] T_XP](#) + 1 cycles
3. Enters its idle state and can issue any commands

11.2.4.4.2 LPDDR2 Deep Power-Down Mode

For ultimate power savings, the EMIF supports deep power-down mode for LPDDR2.

The SDRAM can be forced into deep power-down mode through software by setting the [EMIF_POWER_MANAGEMENT_CONTROL\[11\] DPD_EN](#) bit to 0x1. In this case the EMIF continues normal operation until all SDRAM access requests are serviced. At this point the EMIF issues a deep power-down command. The EMIF then maintains CKE pin low to maintain deep power-down mode. In deep power-down mode, the EMIF automatically stops the clocks to the SDRAM.

Setting the [EMIF_POWER_MANAGEMENT_CONTROL\[11\] DPD_EN](#) bit to 1 overrides the setting of the [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field. Therefore, if the SDRAM is in any other power-saving mode, and the [EMIF_POWER_MANAGEMENT_CONTROL\[11\] DPD_EN](#) bit is set to 1, the EMIF exits those modes and goes into deep power-down mode.

When the SDRAM is in deep power-down mode, the EMIF services register accesses normally.

If the [EMIF_POWER_MANAGEMENT_CONTROL\[11\] DPD_EN](#) bit is set to 0x0, the EMIF brings the SDRAM out of deep power-down mode.

11.2.4.4.3 Self-Refresh Mode

The EMIF supports SDRAM self-refresh mode for low power. The EMIF automatically puts the SDRAM into self-refresh mode after the EMIF is idle for [EMIF_POWER_MANAGEMENT_CONTROL\[7:4\] SR_TIMING](#) number of DDR clock cycles and the [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field is set to 0x2. The EMIF will complete all pending refreshes before it puts the SDRAM into self-refresh. Therefore, after the expiration of [SR_TIMING](#), the EMIF will start issuing refreshes to complete the refresh backlog, and then issue a self-refresh command to the SDRAM.

In self-refresh mode, the EMIF automatically stops the SDRAM clock. The EMIF drives CKE pin low to maintain self-refresh mode.

When the SDRAM is in self-refresh mode, the EMIF services register accesses normally.

If the SDRAM is in self-refresh mode and one of the following occurs, the EMIF brings SDRAM out of self-refresh mode:

- The [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field is changed from 0x2 to some other value.
- SDRAM access is requested.
- [EMIF_SDRAM_TIMING_2\[2:0\] T_CKE](#) + 1 cycles have elapsed since the last self-refresh command.

To exit self-refresh, for LPDDR2, the EMIF:

1. Waits for [EMIF_SDRAM_TIMING_2\[2:0\] T_CKE](#) + 1 cycles have elapsed since the self-refresh command was issued and enables clocks
2. Drives CKE pin high
3. Waits for [EMIF_SDRAM_TIMING_2\[24:16\] T_XSNR](#) + 1 cycles
4. Starts an auto-refresh cycle in the next cycle. It also services all refreshes down to the refresh-release level.
5. Enters its idle state and can issue any commands

To exit self-refresh, for DDR2, the EMIF:

1. Enables the SDRAM clock
2. Drives CKE pin high
3. Waits [EMIF_SDRAM_TIMING_2\[24:16\] T_XSNR](#) + 1 cycles
4. Starts a refresh cycle in the next cycle.
5. Enters its idle state and can issue any other command except write or read command. A write or a read command is issued only after [EMIF_SDRAM_TIMING_2\[15:6\] T_XSRD](#) + 1 cycles clock cycles have elapsed since pin CKE is driven high.

To exit self-refresh, for DDR3, the EMIF does the following:

1. Enables the SDRAM clock
2. Drives CKE pin high
3. Waits [EMIF_SDRAM_TIMING_2\[24:16\] T_XSNR](#) + 1 cycles

4. Starts a refresh cycle in the next cycle. EMIF also services all refreshes down to the refresh-release level.
5. Enters its idle state and can issue any other command except write or read command. A write or a read command is issued only after [EMIF_SDRAM_TIMING_2\[15:6\]](#) T_XSRD + 1 cycles clock cycles have elapsed since pin CKE is driven high.

To use partial array self-refresh, the [EMIF_SDRAM_REFRESH_CONTROL\[26:24\]](#) PASR bits must be appropriately programmed. The EMIF performs bank interleaving when [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 0x0. Because the SDRAM is partially refreshed during partial array self-refresh, for software ease, it is recommended that the IBANK_POS bit field to be set to 0x1, 0x2, or 0x3 depending on the scheme used. If IBANK_POS is set to 0x0, software must move critical data into the banks that are going to be refreshed during partial array self-refresh.

11.2.4.5 Interrupt Requests

The EMIF controller generates one interrupt request (EMIF_IRQ) which is connected to the IRQ_CROSSBAR module. This interrupt line can be asserted by one of the interrupt events listed in [Table 11-7](#).

The EMIF controller generates an interrupt on its interrupt line only if the interrupts are enabled by setting to 0x1 the corresponding bits in the [EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET](#) register. These interrupts can be disabled by setting to 0x1 the corresponding bits in the [EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_CLEAR](#) register. After the interrupt has been serviced the corresponding status flag must be cleared by software. This is done by setting to 0x1 the corresponding bit in the [EMIF_SYSTEM_OCP_INTERRUPT_STATUS](#) register which also clears the corresponding bit in the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS](#) register. The status flags in the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS](#) register are set even if the corresponding interrupt is disabled unlike those in the [EMIF_SYSTEM_OCP_INTERRUPT_STATUS](#) register, which are set only if the corresponding interrupt is enabled. An interrupt is also generated by the EMIF controller, if certain bit in the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS](#) register is set to 0x1 and the corresponding interrupt is enabled through the [EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET](#) register. This feature is useful when user software debugging is performed. In addition, even if interrupts are not enabled, certain status bit in [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS](#) register can be cleared by setting to 0x1 the corresponding bit in the [EMIF_SYSTEM_OCP_INTERRUPT_STATUS](#) register.

The EMIF sets both the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS\[0\]](#) ERR_SYS and [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[0\]](#) ERR_SYS bits to 0x1, if access request for an unsupported command type or an unsupported addressing mode is received.

The EMIF sets both the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS\[3\]](#) WR_ECC_ERR_SYS and [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[3\]](#) WR_ECC_ERR_SYS bits to 0x1, if a write access with byte count that is not multiple of the ECC quanta or with a non ECC quanta aligned address is performed within the address range protected by the ECC.

The EMIF sets both the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS\[4\]](#) TWOBIT_ECC_ERR_SYS and [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[4\]](#) TWOBIT_ECC_ERR_SYS bits to 0x1, if 2-bit ECC error for a read access performed within the address range protected by the ECC occurs.

The EMIF sets both the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS\[5\]](#) ONEBIT_ECC_ERR_SYS and [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[5\]](#) ONEBIT_ECC_ERR_SYS bits to 0x1, if the threshold for 1-bit ECC error is reached. For more information about the EMIF ECC feature, see [Section 11.2.4.15, Error Correction And Detection Feature](#).

[Table 11-7](#) lists the event flags and their corresponding event mask bits of the sources which can cause module interrupts.

Table 11-7. Events

Event Flag	Event Mask	Description
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[5] ONEBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[5] ONEBIT_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[5] ONEBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[5] ONEBIT_ECC_ERR_SYS	Interrupt if one bit ECC error threshold is reached
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[4] TWOBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[4] TWOBIT_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[4] TWOBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[4] TWOBIT_ECC_ERR_SYS	Interrupt for two bit error detection
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[3] WR_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[3] WR_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[3] WR_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[3] WR_ECC_ERR_SYS	Interrupt for memory access made to a non-quanta aligned location or done with byte count not multiple of the ECC quanta
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[1] TA_SYS / EMIF_SYSTEM_OCP_INTERRUPT_STATUS[1] TA_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[1] EN_TA_SYS / EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[1] EN_TA_SYS	Interrupt for LPDDR2 temperature alert
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[0] ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[0] ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[0] EN_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[0] EN_ERR_SYS	Interrupt for command or address error

11.2.4.6 SDRAM Refresh Scheduling

The EMIF uses two counters to schedule the Refresh (REF) commands: a 13-bit decrementing refresh interval counter and a 4-bit refresh backlog counter. The interval counter is used to define the rate at which connected SDRAM devices are refreshed. It is loaded with the value of the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\] REFRESH_RATE](#) bit field at reset (only the 13 LSBs are taken). The interval counter decrements by 1 each cycle until it reaches 0x0, at which point it reloads from the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\] REFRESH_RATE](#) bit field and restarts decrementing. The counter also reloads and restarts decrementing whenever the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\] REFRESH_RATE](#) bit field is updated.

The refresh backlog counter records the number of the outstanding REF commands which the EMIF controller currently has. The backlog counter increments by 1 each time the interval counter reloads (unless it has reached its maximum value of 8). The backlog counter decrements by 1 each time the EMIF issues a REF command (unless it is already 0). For the range of values that the backlog counter can take, there are three levels of urgency with which the EMIF must perform refresh cycle in which it issues REF commands:

1. Refresh-may level is reached when the backlog count is greater than 0x0, which indicates that there is a refresh backlog and if the EMIF is not busy and there are no open SDRAM banks, the EMIF must perform refresh cycle.
2. Refresh-release level is reached when the backlog count is greater than 0x4, which indicates that the refresh backlog is getting bigger and if the EMIF is not busy it must perform refresh cycle even if there is an open SDRAM bank.
3. Refresh-must level is reached when the backlog count is greater than 0x7, which indicates that the refresh backlog is becoming excessive and the EMIF must perform refresh cycle before any new memory access request being serviced. The EMIF starts servicing new memory accesses after the refresh-release level is cleared.

The two counters do not operate when SDRAM is in self-refresh mode. They start tracking the missed refreshes (the outstanding REF commands) only after initialization is complete in case of DDR2/DDR3. For LPDDR2, the refresh counters will start tracking missed refreshes after RESET command is issued. For LPDDR2, the EMIF will also ensure that no more than 8 REF (Refresh) commands are issued in any rolling tREFBW (=4*8*tRFC) window.

The time between two REF commands is set through the [EMIF_SDRAM_TIMING_3\[12:4\] T_RFC](#) bit field.

11.2.4.7 SDRAM Initialization

NOTE: To avoid error responses from the EMIF controller the SDRAM initialization must be performed per 16-Byte blocks if [EMIF_SDRAM_CONFIG\[15:14\] NARROW_MODE = 0x0](#) or per 8-Byte blocks if [EMIF_SDRAM_CONFIG\[15:14\] NARROW_MODE = 0x1](#).

11.2.4.7.1 DDR2 SDRAM Initialization

On coming out of reset, the EMIF controller begins the DDR2 initialization sequence after a write to any one of the following three registers, providing that the corresponding listed conditions are met:

1. [EMIF_SDRAM_CONFIG](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS = 0](#) (that is, cleared before the write to [EMIF_SDRAM_CONFIG](#))
2. [EMIF_SDRAM_TIMING_1](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS = 0](#) (that is, cleared before the write to [EMIF_SDRAM_TIMING_1](#)) AND
 - b. Condition 2: The write access modifies the register bit field T_WR (bits 20:17)
3. [EMIF_SDRAM_REFRESH_CONTROL](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS = 0](#) AND
 - b. Condition 2: The write access modifies the register bit field SRT (bit 29), ASR (bit 28), or PASR (bits 26:24).

For the first DDR2 initialization sequence, the EMIF controller performs the following actions:

1. Drives the CKE pin low.
2. After 16 SDRAM refresh rate intervals, issues a NOP command with CKE pin held high. The SDRAM refresh rate is as defined in the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\] REFRESH_RATE](#) bit field.
3. After 1 SDRAM refresh rate interval, issues Precharge all Banks command.
4. Issues EMRS command to the DDR2 EMR(2) register (bits BA[2:0] = 0x2) with bits A[15:0] = 0x0.
5. Issues EMRS command to the DDR2 EMR(3) register (bits BA[2:0] = 0x3) with bits A[15:0] = 0x0.
6. Issues EMRS command to the DDR2 EMR(1) register (bits BA[2:0] = 0x1) with bits A[15:0] set as in [Table 11-8](#).

Table 11-8. Load Value For The EMR(1) Register During DDR2 SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Output buffer enabled
A[11]	0x0	RDQS disable
A[10]	EMIF_SDRAM_CONFIG[23] DDR2_DDQS	Differential DQS enable value
A[9:7]	0x0	Exit OCD calibration mode
A[6], A[2]	EMIF_SDRAM_CONFIG[26:24] DDR_TERM	DDR2 termination resistor value. For DDR2 the EMIF_SDRAM_CONFIG[26] bit is not used.
A[5:3]	0x0	Additive latency = 0
A[1]	EMIF_SDRAM_CONFIG[19:18] SDRAM_DRIVE	SDRAM drive strength. For DDR2 the EMIF_SDRAM_CONFIG[19] bit is not used.
A[0]	EMIF_SDRAM_CONFIG[20] DDR_DISABLE_DLL = 0x0	Enable DLL

7. Issues MRS command to the DDR2 MR register (BA[2:0] = 0x0) with A[15:0] set as in [Table 11-9](#).

Table 11-9. Load Value For The MR Register During DDR2 SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Active power down exit time - fast exit
A[11:9]	EMIF_SDRAM_TIMING_1 [20:17] T_WR	Write recovery for autoprecharge
A[8]	0x1	DLL reset
A[7]	0x0	Normal mode
A[6:4]	EMIF_SDRAM_CONFIG [13:10] CL	CAS latency value. For DDR2 the EMIF_SDRAM_CONFIG [13] bit is not used.
A[3]	0x0	Sequential burst type
A[2:0]	0x3	Burst length of 8

8. After 267 clock cycles, issues Precharge all Banks command.
9. After two Refresh commands, issues MRS command to the DDR2 MR register (BA[2:0] = 0x0) with A[15:0] set as in [Table 11-10](#).

Table 11-10. Another Load Value For The MR Register During DDR2 SDRAM Initialization

Bits	Value	Description
A[15:9]	Equal to Step 7	
A[8]	0x0	No DLL reset
A[7:0]	Equal to Step 7	

10. Issues EMRS command to the DDR2 EMR(1) register (bits BA[2:0] = 0x1) with bits A[15:0] equal to Step 6.
11. The EMIF enters its IDLE state.

The EMIF updates the DDR Mode registers if the DDR2 initialization sequence is triggered again. However, the EMIF controller starts from Step 3.

The EMIF does not perform any transactions until the DDR2 initialization sequence is complete.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately $16 \times \text{REFRESH_RATE} / \text{input frequency}$.

NOTE: The values of the bit fields in the [EMIF_SDRAM_CONFIG](#) register are loaded by the control module at reset. These values must not be modified during run time, because they reflect the used hardware SDRAM memory configurations.

11.2.4.7.2 DDR3/DDR3L SDRAM Initialization

On coming out of reset, the EMIF controller begins the DDR3 initialization sequence after a write to any one of the following three registers, providing that the corresponding listed conditions are met.

1. [EMIF_SDRAM_CONFIG](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL](#)[31] INITREF_DIS = 0 (that is, cleared before the write to [EMIF_SDRAM_CONFIG](#))
2. [EMIF_SDRAM_TIMING_1](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL](#)[31] INITREF_DIS = 0 (that is, cleared before the write to [EMIF_SDRAM_TIMING_1](#)) AND
 - b. Condition 2: The write access modifies the register bit field T_WR (bits 20:17)
3. [EMIF_SDRAM_REFRESH_CONTROL](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL](#)[31] INITREF_DIS = 0 AND
 - b. Condition 2: The write access modifies the register bit field SRT (bit 29), ASR (bit 28), or PASR (bits 26:24).

For the first DDR3 initialization sequence, the EMIF controller performs the following actions:

1. After 7 SDRAM refresh rate intervals, de-asserts the RST pin.
2. After 16 SDRAM refresh rate intervals, issues a NOP command with CKE pin held high. The SDRAM refresh rate is as defined in the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\]](#) REFRESH_RATE bit field.
3. After 1 SDRAM refresh rate interval, issues MRS command to the DDR3/DDR3L MR2 register (bits BA[2:0] = 0x2) with bits A[15:0] set as in [Table 11-11](#)

Table 11-11. Load Value For The MR2 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:11]	0x0	Reserved
A[10:9]	EMIF_SDRAM_CONFIG[22:21] DYN_ODT	Dynamic ODT value
A[8]	0x0	Reserved
A[7]	EMIF_SDRAM_REFRESH_CONTR OL[29] SRT	Self-refresh temperature range
A[6]	EMIF_SDRAM_REFRESH_CONTR OL[28] ASR	Auto self-refresh enable
A[5]	0x0	Reserved
A[4:3]	EMIF_SDRAM_CONFIG[17:16] CWL	CAS write latency
A[2:0]	EMIF_SDRAM_REFRESH_CONTR OL[26:24] PASR	Partial array self-refresh

4. After T_{RFC} + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR3 register (bits BA[2:0] = 0x3) with A[15:0] = 0x0
5. After T_{RFC} + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR1 register (BA[2:0] = 0x1) with A[15:0] set as in [Table 11-12](#)

Table 11-12. Load Value For The MR1 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Output buffer enabled
A[11]	0x0	TDQS disable
A[10]	0x0	Reserved
A[9], A[6], A[2]	EMIF_SDRAM_CONFIG[26:24] DDR_TERM	DDR3/DDR3L termination resistor value
A[8]	0x0	Reserved
A[7]	0x0	Write leveling disabled
A[5], A[1]	EMIF_SDRAM_CONFIG[19:18] SDRAM_DRIVE	SDRAM drive strength
A[4:3]	0x0	Additive latency = 0
A[0]	EMIF_SDRAM_CONFIG[20] DDR_DISABLE_DLL = 0x0	Enable SDRAM DLL

6. After T_{RFC} + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR0 register (BA[2:0] = 0x0) with A[15:0] set as in [Table 11-13](#)

Table 11-13. Load Value For The MR0 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Slow exit. The DDR3 SDRAM DLL is "OFF" after entering precharge power-down.

Table 11-13. Load Value For The MR0 Register During DDR3/DDR3L SDRAM Initialization (continued)

Bits	Value	Description
A[11:9]	EMIF_SDRAM_TIMING_1 [20:17] T_WR	Write recovery for autoprecharge
A[8]	0x1	DLL reset
A[7]	0x0	Normal mode
A[6:4], A[2]	EMIF_SDRAM_CONFIG [13:10] CL	Value for CAS latency
A[3]	0x0	Nibble sequential read burst type
A[1:0]	0x0	Burst length of 8

- After T_{RFC} + 1 DDR clock cycles, issues a ZQCL command to start long ZQ calibration
- Waits for t_{DLLK} and t_{ZQinit} to complete
- Issues REF command
- The EMIF enters its IDLE state.

The EMIF updates the DDR Mode registers if the DDR3 initialization sequence is triggered again. However, the EMIF controller first issues a precharge command and then starts from Step 3.

The EMIF does not perform any transactions until the DDR3/DDR3L initialization sequence is complete.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately $16 \times \text{REFRESH_RATE} / \text{input frequency}$.

11.2.4.7.3 LPDDR2 SDRAM Initialization

When coming out of reset, if the [EMIF_SDRAM_CONFIG](#)[31:29] SDRAM_TYPE bit field is equal to 4, the EMIF performs an LPDDR2 initialization sequence as follows:

- Drives the CKE pin high and starts to issue NOP commands continuously
- After 16 SDRAM refresh rate intervals, issues a Precharge-All command. The SDRAM refresh rate is defined in the [EMIF_SDRAM_REFRESH_CONTROL](#)[15:0] REFRESH_RATE bit field.
- Issues a RESET command
- The EMIF enters its IDLE state.
- Software then must initialize LPDDR2 using the [EMIF_LPDDR2_MODE_REG_CONFIG](#) and [EMIF_LPDDR2_MODE_REG_DATA](#) registers. Software must enable refreshes by writing 1 in the [EMIF_LPDDR2_MODE_REG_CONFIG](#)[30] REFRESH_EN bit during the last MRW command.

The EMIF also performs the initialization sequence whenever the [EMIF_SDRAM_CONFIG](#) register is written and the LPDDR2 initialization was not performed previously because the [EMIF_SDRAM_REFRESH_CONTROL](#)[31] INITREF_DIS bit was set to 0. Once the EMIF performs initialization, rewriting to the [EMIF_SDRAM_CONFIG](#) register does not cause reinitialization.

The EMIF does not perform any transactions until the LPDDR2 initialization sequence completes.

When the EMIF comes out of reset, the delay time in step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately $16 \times \text{EMIF_SDRAM_REFRESH_CONTROL}[15:0] \text{ REFRESH_RATE} / \text{input frequency}$.

11.2.4.8 DDR3/DDR3L Read-Write Leveling

The EMIF supports one type of write/read leveling for DDR3/DDR3L memories - full leveling.

The full leveling consists of three parts:

- Write leveling
- Read data eye training
- Read DQS gate training

Write leveling

The goal of write leveling is to locate the delay between the rising edge of the write DQS signal and the rising edge of the SDRAM memory clock (CK). When this delay is identified, the system is able to accurately align the write DQS signal with the DDR3 memory clock. During Write leveling, the ODT function must be on and proper ODT values must be selected at the external memory side by setting Rtt_Nom (A9, A6, A2) bits in MR1 register of the external DDR3 memory. For more information about write leveling, see the *DDR3 SDRAM Standard*, section *Write leveling*.

Read data eye training

Through the read data eye training the delay between the rising edge of the read DQS signal and the rising and falling edges of the associated DQ data eye is determined. By identifying these delays, the midpoint between them can be calculated and thus the rising edge of the read DQS signal can be accurately centered within the DQ data eye.

Read DQS gate training

Read DQS Gate training is used for timing the internal read window during a read operation as opposed to the write leveling and read data eye training which are used for skew compensation of external signals. The goal of read DQS gate training is to locate the shortest delay that can be applied to each DQS gate such that it functions properly, then find the longest delay that can be applied to each DQS gate and keep its proper function again, and then align the midpoint of the DQS gate delay between these two.

11.2.4.8.1 Full Leveling

The EMIF does not perform full leveling after initialization upon reset. Full leveling must be triggered by software after the EMIF's registers are properly configured.

Full leveling is triggered by setting the [EMIF_READ_WRITE_LEVELING_CONTROL](#)[31] RDWRLVLFULL_START bit to 0x1. The leveling execution order is as follows:

1. Write leveling
2. Read DQS gate training
3. Read data eye training

After leveling procedure has finished the [EMIF_READ_WRITE_LEVELING_CONTROL](#)[31] RDWRLVLFULL_START bit clears itself automatically.

NOTE: SDRAM Refreshes must be disabled before triggering full leveling.

NOTE: The [EMIF_EXT_PHY_CONTROL_2](#) through [EMIF_EXT_PHY_CONTROL_21](#) registers have to be configured only in case of software leveling.

11.2.4.8.2 Software Leveling

In case of software leveling, the following registers must be configured:

- [EMIF_EXT_PHY_CONTROL_2](#) to [EMIF_EXT_PHY_CONTROL_6](#) containing the PHY_REG_FIFO_WE_SLAVE_RATIO value
- [EMIF_EXT_PHY_CONTROL_26](#) to [EMIF_EXT_PHY_CONTROL_30](#) containing the REG_PHY_GATELVL_INIT_RATIO value
- [EMIF_EXT_PHY_CONTROL_25](#) containing the DQ offset value

The bit fields of the [EMIF_EXT_PHY_CONTROL_2](#) to [EMIF_EXT_PHY_CONTROL_6](#) registers must be loaded with same values. The bit fields of the [EMIF_EXT_PHY_CONTROL_26](#) to [EMIF_EXT_PHY_CONTROL_30](#) registers must also be loaded with same values.

The REG_PHY_DQ_OFFSET fields in register [EMIF_EXT_PHY_CONTROL_25](#) must be loaded with 0x40. That value corresponds to quarter cycle shift between the DQS signals and the data to be written to the SDRAM.

To calculate the PHY_REG_FIFO_WE_SLAVE_RATIO value one of the following two formulas can be used:

- $0x80 + 2 * [(Board\ Delay\ in\ ps) * 0x100] / (Clock\ Period\ in\ ps)$. This formula is used when the [EMIF_DDR_PHY_CONTROL_1\[18\] PHY_INVERT_CLKOUT](#) bit is set to 0x1.
- $2 * [(Board\ Delay\ in\ ps) * 0x100] / (Clock\ Period\ in\ ps)$. This formula is used when the [EMIF_DDR_PHY_CONTROL_1\[18\] PHY_INVERT_CLKOUT](#) bit is set to 0x0.

The Board Delay in the previously described formulas is measured directly from the board. It depends on the trace length. When the calculated value for [PHY_REG_FIFO_WE_SLAVE_RATIO](#) is greater than 0x20, then a value of 0x27 must be used. That means, 0x27 must be loaded in registers [EMIF_EXT_PHY_CONTROL_2](#) to [EMIF_EXT_PHY_CONTROL_6](#).

To calculate the [REG_PHY_GATELVL_INIT_RATIO](#) value the following formula is used:

$$REG_PHY_GATELVL_INIT_RATIO = PHY_REG_FIFO_WE_SLAVE_RATIO - 0x20$$

When the calculated value for [REG_PHY_GATELVL_INIT_RATIO](#) is less than 0x0, then a value of 0x0 must be used. When the calculated value is greater than or equal to 0x0, then that value is used for registers [EMIF_EXT_PHY_CONTROL_26](#) to [EMIF_EXT_PHY_CONTROL_30](#).

In addition, when read DQS gate training is not performed the [PHY_REG_FIFO_WE_SLAVE_RATIO](#) value is used. When read DQS gate training is performed [REG_PHY_GATELVL_INIT_RATIO](#) is used and [PHY_REG_FIFO_WE_SLAVE_RATIO](#) is don't care.

NOTE: Software leveling is not recommended to be used. Hardware leveling must be used instead.

11.2.4.9 EMIF Access Cycles

By default, the EMIF keeps its SDRAM \overline{CS} signal high (CS is active-low). To direct a command to only one of the SDRAMs, EMIF asserts its \overline{CS} signal to the SDRAM for the duration of the command.

The EMIF always performs burst accesses to the SDRAM. Multiple SDRAM bursts may need to service a single local burst request. [Table 11-14](#) through [Table 11-19](#) show a few examples how EMIF performs SDRAM accesses for a linear incrementing transaction type. T0, T1, etc. are clock cycles. R0 is read starting at column 0, R8 is read starting at column 8, and R16 is read starting at column 16. D0-1 is the data from column 0 and 1, D2-3 is the data from column 2 and 3, and so on.

Table 11-14. 64-Byte Linear Read Starting at Address 0x0 (All DDR)

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11

Table 11-19. 64-Byte Linear Read Starting at Address 0x18 (All DDR)

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13
R6		R8				R16							
			D6-7	Unused	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	D20-21	Unused	

The EMIF uses the unused data phases in the preceding figures by issuing successive read commands if there are reads to open banks pending in the command FIFO.

The write data conversion from SDR to DDR is done outside the EMIF.

11.2.4.10 Turnaround Time

Table 11-20 lists the turnaround time that EMIF introduces on the data bus for various back-to-back accesses. The EMIF takes advantage of the CAS latencies and packs the commands as close as possible on the control bus to introduce the following turnaround time on the data bus.

Table 11-20. Turnaround Time

Current Access	Next Access	Turnaround Time (Number of DDR Clock Cycles)
SDRAM write	SDRAM read	EMIF_SDRAM_TIMING_1 [2:0] T_WTR + 1 + CL
SDRAM read	SDRAM write	EMIF_SDRAM_TIMING_1 [31:29] T_RTW + 1

11.2.4.11 PHY DLL Calibration

When running in normal locked mode, the PHY DLL gets a reference clock (EMIF_DLL_FCLK) from the PRCM, which is used by the DLL master to lock to the right frequency and provide the control code for a full period phase shift to the slave. The slave uses this code as a control for its internal delay line to produce the required delay for the signal considered.

When working in locked mode, the delay lines only get an updated control value from the master DLLs when an explicit `dll_calib` command is issued by the EMIF controller. Failure to send such commands on a timely basis will result in inaccurate delay-line information if there is a significant voltage and temperature drift in the system. It is recommended to issue at least one command every 100 μ s. EMIF automatically sends `ctrl_update` commands for:

- Refresh Exit
- Self Refresh Exit
- `phy_ready` asserted during initialization

The PHY also internally generates a control value update upon completion of a leveling operation. Control is also added when leveling is not used and there are gradual voltage changes during frequency change. The [EMIF_DLL_CALIB_CTRL](#) register can be programmed to generate a `phy_dll_calib` for a periodic interval based on `EMIF_FICLK` cycles, so allow continued memory access as voltage is changing. A safe window of no activity will be guaranteed for this periodic generation of `phy_dll_calib`. In addition, a one shot generator for `phy_pll_calib` has also been added that will generate a single `phy_dll_calib` by setting the [EMIF_MISC_REG\[0\]](#) `DLL_CALIB_OS` bit to 1.

11.2.4.12 SDRAM Address Mapping

From the system point of view, the external SDRAM is seen as one block of SDRAM. If two external 64-MiB devices are used, a 128-MiB memory block is observed. If two external 32-MiB devices are used, a 64-MiB block is observed.

[Table 11-21](#) shows the SDRAM address space.

Table 11-21. SDRAM Addressing Space

Module Name	Base Address
EMIF-CSN0-SDRAM	0x8000 0000

When addressing SDRAM, if the [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS` bit field is set to 0, the EMIF uses the following two bit fields to determine the mapping from the source address to the SDRAM row, column and bank:

- [EMIF_SDRAM_CONFIG\[6:4\]](#) `IBANK`
- [EMIF_SDRAM_CONFIG\[2:0\]](#) `PAGESIZE`

If the [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS` bit field is set to 1, 2, or 3, the EMIF uses the following three bit fields to determine the mapping from the source address to the SDRAM row, column and bank:

- [EMIF_SDRAM_CONFIG\[6:4\]](#) `IBANK`
- [EMIF_SDRAM_CONFIG\[2:0\]](#) `PAGESIZE`
- [EMIF_SDRAM_CONFIG\[9:7\]](#) `ROWSIZE`

In all cases the EMIF considers its SDRAM address space to be a single logical block, regardless of the number of physical devices.

11.2.4.12.1 Address Mapping for `IBANK_POS = 0` and `EBANK_POS = 0`

For [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 0` and [EMIF_SDRAM_CONFIG_2\[27\]](#) `EBANK_POS = 0`, [Table 11-22](#) lists which source address bits (`MAddr`) are mapped to the SDRAM row, column and bank bits for all combinations of `IBANK` and `PAGESIZE`.

Table 11-22. Local Address to SDRAM Address Mapping for `IBANK_POS = 0` and `EBANK_POS = 0`

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
row address		bank address		column address	
ROWSIZE value	row width (bits)	IBANK value	bank[2:0] width (bits)	PAGESIZE value	col width (bits)
In this case the ROWSIZE bit field is not used	16	0	0	0	8
		1	1	1	9
		2	2	2	10
		3	3	3	11

NOTE: The `ROWSIZE` bit field is unused in case of `IBANK_POS = 0` and `EBANK_POS = 0`.

For [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 0`, the effect of the address-mapping scheme is that as the source address increments across the SDRAM pages, EMIF moves to page with the same number as in the previous bank. This movement across the banks continues until the same page is accessed in all banks and then EMIF moves to the next page in the first bank. The EMIF uses this movement across internal banks while remaining on the same page to maximize the number of the open SDRAM banks within the overall SDRAM space.

Thus, the EMIF can keep a maximum of 8 banks open at a time, and can interleave among all of them.

11.2.4.12.2 Address Mapping for `IBANK_POS = 1` and `EBANK_POS = 0`

[Table 11-23](#) list the local address to SDRAM address mapping when `IBANK_POS = 1` and `EBANK_POS = 0`.

Table 11-23. Local Address to SDRAM Address Mapping for `IBANK_POS = 1` and `EBANK_POS = 0`

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2]		row address		bank address[1:0]		column address	
IBANK value	bank[2] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[1:0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	0	2	11	2	2	2	10
3	1	3	12	3	2	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 1`, the EMIF interleaves banks the same as for [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 0` but the interleaving of banks is limited to four banks. Thus, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 4 of them.

11.2.4.12.3 Address Mapping for `IBANK_POS = 2` and `EBANK_POS = 0`

[Table 11-24](#) list the local address to SDRAM address mapping when `IBANK_POS = 2` and `EBANK_POS = 0`.

Table 11-24. Local Address to SDRAM Address Mapping for `IBANK_POS = 2` and `EBANK_POS = 0`

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2:1]		row address		bank address[0]		column address	
IBANK value	bank[2:1] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	1	2	11	2	1	2	10
3	2	3	12	3	1	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 2`, the EMIF interleaves banks the same as for [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 0` but the interleaving of banks is limited to two banks. Thus, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 2 of them.

11.2.4.12.4 Address Mapping for IBANK_POS = 3 and EBANK_POS = 0

Table 11-25 list the local address to SDRAM address mapping when IBANK_POS = 3 and EBANK_POS = 0.

Table 11-25. Local Address to SDRAM Address Mapping for IBANK_POS = 3 and EBANK_POS = 0

MAAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
bank address		row address		column address	
IBANK value	bank width (bits)	ROWSIZE value	row width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	8
1	1	1	10	1	9
2	2	2	11	2	10
3	3	3	12	3	11
		4	13		
		5	14		
		6	15		
		7	16		

If [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 3, the bank interleaving is not possible for EMIF.

11.2.4.12.5 Address Mapping for IBANK_POS = 0 and EBANK_POS = 1

Table 11-26 list the local address to SDRAM address mapping when IBANK_POS = 0 and EBANK_POS = 1.

Table 11-26. Local Address to SDRAM Address Mapping for IBANK_POS = 0 and EBANK_POS = 1

MAAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
row address		bank address		column address	
ROWSIZE value	row width (bits)	IBANK value	bank width (bits)	PAGESIZE value	col width (bits)

2	2	2	11	2	10
3	3	3	12	3	11
		4	13		

Table 11-29. Local Address to SDRAM Address Mapping for IBANK_POS = 3 and EBANK_POS = 1 (continued)

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
bank address		row address		column address	
IBANK value	bank width (bits)	ROWSIZE value	row width (bits)	PAGESIZE value	col width (bits)
		5	14		
		6	15		
		7	16		

For [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 3 and [EMIF_SDRAM_CONFIG_2\[27\]](#) EBANK_POS = 1, the bank interleaving is not possible for EMIF.

11.2.4.13 Output Impedance Calibration

The EMIF controller supports automatic output impedance (ZQ) calibration for LPDDR2 and DDR3/DDR3L memories. This feature is not supported by DDR2 memories. The ZQ calibration can be enabled by setting to 0x1 the [EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG\[30\]](#) ZQ_CS0EN bit. The EMIF supports three types of ZQ calibration commands:

- ZQINIT: ZQ calibration command during initialization
- ZQCL: ZQ calibration long command
- ZQCS: ZQ calibration short command

For DDR3/DDR3L, the EMIF automatically issues ZQINIT command during initialization. For LPDDR2, software must issue a ZQINIT command (MRW to mode register 10). The EMIF issues ZQCS command each time the [EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG\[15:0\]](#) ZQ_REFINTERVAL bit field expires. In other words, the ZQ_REFINTERVAL defines the interval between two ZQCS commands. When ZQCS command is issued, the EMIF waits and blocks any other command for [EMIF_SDRAM_TIMING_3\[20:15\]](#) ZQ_ZQCS + 1 number of DDR clock cycles.

If the [EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG\[28\]](#) ZQ_SFEXITEN bit field is set to 0x1, the EMIF issues ZQCL command every time it exits self-refresh, active power-down and precharge power-down modes. When ZQCL command is issued, the EMIF waits and blocks any other command for ([EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG\[17:16\]](#) ZQ_ZQCL_MULT + 1) × ([EMIF_SDRAM_TIMING_3\[20:15\]](#) ZQ_ZQCS + 1) number of DDR clock cycles.

The ZQINIT is a non periodic command issued only once during DDR initialization as opposed to the ZQCL and ZQCS calibration commands which are issued by the EMIF periodically at regular intervals.

11.2.4.14 LPDDR2 Temperature Monitoring

The EMIF supports automatic temperature monitoring to facilitate the software update of the refresh rate according to the temperature changes of the LPDDR2. Temperature monitoring can be enabled per chip select by setting the [EMIF_TEMPERATURE_ALERT_CONFIG\[31\]](#) TA_CS1EN and [EMIF_TEMPERATURE_ALERT_CONFIG\[30\]](#) TA_CS0EN bits.

The EMIF polls the temperature of the LPDDR2 (issues an MRR command to mode register 4) every time the [EMIF_TEMPERATURE_ALERT_CONFIG\[21:0\]](#) TA_REFINTERVAL bit field expires. In other words, TA_REFINTERVAL defines the interval between temperature alert polls. If the EMIF sees a 1 on bit 7 of the read data value from the MRR, which indicates the temperature has changed, the [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[1\]](#) TA_SYS bit is set and the module sends an interrupt. When the interrupt is received, software must update the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\]](#) REFRESH_RATE bit field to the required value as per the temperature change.

If the [EMIF_TEMPERATURE_ALERT_CONFIG\[28\]](#) TA_SFEXITEN bit is set to 1, the EMIF polls for temperature change every time it exits self-refresh, active power-down, and precharge power-down modes.

Because the EMIF is performing a LPDDR2 mode register read, it needs information about how the LPDDR2 is connected. The [EMIF_TEMPERATURE_ALERT_CONFIG\[27:26\]](#) TA_DEVWDT and [EMIF_TEMPERATURE_ALERT_CONFIG\[25:24\]](#) TA_DEVCNT bit fields provide the necessary information to the EMIF for MRR data compare. For example, if TA_DEVWDT is set to 0, which indicates 8-bit devices are used, and if TA_DEVCNT is set to 2, which indicates four devices are used to form a 32-bit bus, the mask used for checking is 0b1111, that is, the EMIF expects data on each byte lane on a 32-bit bus.

11.2.4.15 Error Correction And Detection Feature

For data integrity, the EMIF supports ECC on the data written or read from the SDRAM and is enabled by programming the [EMIF_ECC_CTRL_REG](#) register. 7-bit ECC is calculated over 32-bit data when in 32-bit DDR mode. 6-bit ECC is calculated over 16-bit data when in 16-bit DDR mode. The ECC is calculated for all accesses that are within the address ranges protected by ECC. The address ranges are specified in the [EMIF_ECC_ADDRESS_RANGE_1](#) and [EMIF_ECC_ADDRESS_RANGE_2](#) registers. Both registers have identical bits and functionality. This provides flexibility allowing two non-overlapping memory regions to be ECC protected.

NOTE: For LPDDR2 ECC is supported only in 16-bit narrow mode.

The system must ensure that any burst access with starting address in the ECC protected region must not cross over to the un-protected region and vice-versa. The ECC is stored inside the SDRAM during writes. If a write access with byte count that is not a multiple of ECC quanta or with a non quanta aligned address is performed within the address range protected by ECC, the EMIF will send out a write ECC error interrupt. The EMIF will also report an error on the system response interface. In this case, the EMIF will perform the write to the SDRAM. However, the ECC value written to the SDRAM will be corrupted. The EMIF will also log the MConnID, MCmd and MBurstSeq for the first error transaction in the [EMIF_OCP_ERROR_LOG](#) register.

The ECC quanta is either 32-bit or 16-bit based on the [EMIF_SDRAM_CONFIG\[15:14\]](#) NARROW_MODE bit field. For 32-bit mode (128 bits per EMIF clock cycle), an ECC quanta is 32 bits. For 16-bit narrow mode (64 bits per EMIF clock cycle), the ECC quanta is 16 bits.

Once ECC is enabled the entire protected region must be initialized with data. These writes must be quanta-sized and quanta-aligned.

The ECC is read and verified during reads. For 1-bit ECC error in the data, the EMIF will correct the data and send it on the system return interface. The EMIF will log the starting address of the SDRAM burst in an internal 4 deep address FIFO. The internal FIFO will store the first four 1-bit ECC errors. The [EMIF_1B_ECC_ERR_ADDR_LOG](#) register will display the address on top of the internal FIFO. The software must write a 0x1 to the [EMIF_1B_ECC_ERR_ADDR_LOG](#) register to pop the FIFO and display the next address stored. For subsequent reads in the ECC regions, the FIFO will be loaded with the address for the next 1-bit ECC error if it is not full. It must be noted that no address comparison will be performed, that is, if a single address has ECC errors back-to-back, that address will be logged twice.

The number of 1-bit ECC errors can be counted using the [EMIF_1B_ECC_ERR_CNT](#) register. The EMIF also supports programming a threshold and a window in the [EMIF_1B_ECC_ERR_THRSH](#) register. The window is programmed in number of refresh periods. When the programmed window value is 0x0, that is, window is disabled, and the internal error count meets the programmed threshold, the EMIF will generate a 1-bit ECC error interrupt. When the programmed window value is non-zero, that is, window is enabled, the EMIF will generate a 1-bit ECC error interrupt only if the internal error count meets the programmed threshold in that window. The internal error count is reset every time the window expires. The software can use this to gauge the degree of 1-bit ECC errors occurring in the system.

For diagnosis, the EMIF supports a 1-Bit ECC data error distribution register ([EMIF_1B_ECC_ERR_DIST_1](#)) that represent whether an error has occurred in a given data channel location. This is advantageous to detect whether the errors are random or systemic. The distribution registers will be overlay of all 1-bit ECC errors until the software clears the register. Therefore, multiple bits could be set as a result of multiple 1-bit ECC errors occurring over multiple read accesses.

For 2-bit ECC errors in the data, the EMIF will generate a 2-bit ECC error interrupt. For any bit errors in the address, the EMIF will generate an address error interrupt. It must be noted that the EMIF will neither correct the data for these uncorrectable errors. Along with generating the interrupts, the EMIF will also report an error on the system return interface. In this case the EMIF will send the resultant data from the ECC correction logic. The read data received from the memory may have further been corrupted by the ECC correction logic since it will have attempted to correct the read data but failed due to uncorrectable error.

For all uncorrectable ECC errors listed above, the EMIF will log the starting address of the SDRAM burst in the [EMIF_2B_ECC_ERR_ADDR_LOG](#) register. This register will show the address of the first uncorrectable error. After the software clears the register, it will be loaded with the address for the next uncorrectable error.

In the event that the EMIF detects a single bit ECC error, although the error is corrected on the returned data, the data in the SDRAM is not corrected. It is the responsibility of the system software to correct the ECC error at that location. To the extent possible, the system software should correct multiple bit errors with the caveat that the returned data was not corrected but corrupted by the ECC correction logic.

11.2.4.16 Class of Service

The commands in the Command FIFO can be mapped to two classes of service namely 1 and 2. The mapping of commands to a particular class of service can be done based on the priority or the master ID. The mapping based on priority can be done by setting the appropriate values in the [EMIF_PRIORITY_TO_CLASS_OF_SERVICE_MAPPING](#) register. The mapping based on master ID can be done by setting the appropriate values of master ID and the masks in the [EMIF_CONNECTION_ID_TO_CLASS_OF_SERVICE_1_MAPPING](#) and [EMIF_CONNECTION_ID_TO_CLASS_OF_SERVICE_2_MAPPING](#) registers. There are 3 master ID and mask values that can be set for each class of service. In conjunction with the masks, each class of service can have a maximum of 144 master IDs mapped to it. For example, a master ID value of 0xFF along with a mask value of 0x3 will map all master IDs from 0xF8 to 0xFF to that particular class of service.

Each class of service has an associated latency counter ([EMIF_COS_CONFIG\[23:16\] COS_COUNT_1](#) and [EMIF_COS_CONFIG\[15:8\] COS_COUNT_2](#)). When the latency counter for a command expires, that is, reaches the value programmed for the class of service that the command belongs to, that command is executed next. If there is more than one command that has expired latency counter, the command with the highest priority is executed first. One exception to this rule is, if the [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) value expires for the oldest command in the queue. That command is executed first irrespective of priority or class of service. This is done to prevent the continuous blocking effect.

The [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) value is used to identify when the oldest command in the command FIFO has timed out. At this point during the arbitration process, this oldest command is issued regardless of the priority of the other commands in the FIFO. This feature is disabled when writing 0x0 to the [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) bit field. After issuing the oldest command, the other remaining commands in the FIFO are reordered by age. The next oldest command in the FIFO is given highest priority again and issued after the [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) value expires. If a new value in the [PR_OLD_COUNT](#) bit field is written during counting, that is, before [PR_OLD_COUNT](#) expires, the counter keeps working but if this value is smaller the oldest command is issued sooner and if this value is larger the oldest command is issued later.

The master ID mapping allows the same master ID to be put in both class of service 1 and 2. Also, a transaction might belong to one class of service if viewed by master ID and might belong to another class of service if viewed by priority. In these cases, the command will belong to both class of service. The EMIF will try executing the command as soon as possible, when the smaller of the two counters ([EMIF_COS_CONFIG\[23:16\] COS_COUNT_1](#) and [EMIF_COS_CONFIG\[15:8\] COS_COUNT_2](#)) expires.

11.2.4.17 Performance Counters

The [EMIF_PERFORMANCE_COUNTER_1](#) and [EMIF_PERFORMANCE_COUNTER_2](#) registers are used to monitor or calculate the EMIF Controller bandwidth and efficiency. These counters are able to count events such as accesses made to EMIF, Activate (ACT) commands sent to SDRAM, read and write accesses made to EMIF, and other events. Each counter counts independently of the other. In addition to the ability of events counting, the counters can also filter the events from a particular master or address space. The events counting and filter enabling are configured using the [EMIF_PERFORMANCE_COUNTER_CONFIG](#) register. The filter value used is configured through the [EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT](#) register. Each counter can be configured independently.

Table 11-30 lists all the events that can be counted and whether a filter can be applied to a particular event. A filter is applied to an event if the following bits are set to 0x1 for that event:

- For Performance Counter 1: [EMIF_PERFORMANCE_COUNTER_CONFIG\[15\]](#) CNTR1_MCONNID_EN and [EMIF_PERFORMANCE_COUNTER_CONFIG\[14\]](#) CNTR1_REGION_EN;
- For Performance Counter 2: [EMIF_PERFORMANCE_COUNTER_CONFIG\[31\]](#) CNTR2_MCONNID_EN and [EMIF_PERFORMANCE_COUNTER_CONFIG\[30\]](#) CNTR2_REGION_EN.

Table 11-30. Performance Counter Filter Configuration

CNTR _n _CFG ⁽¹⁾	CNTR _n _REGION_EN	CNTR _n _MCONNID_EN	Description
0x0	0x0	0x0 or 0x1	Count the accesses made to EMIF
0x1	0x0	0x0 or 0x1	Count the Activate (ACT) commands sent to SDRAM
0x2	0x0 or 0x1	0x0 or 0x1	Count the read accesses made to EMIF
0x3	0x0 or 0x1	0x0 or 0x1	Count the write accesses made to EMIF
0x4	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Command FIFO is full
0x5	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Write Data FIFO is full
0x6	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Read Data FIFO is full
0x7	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Return Command FIFO is full
0x8	0x0 or 0x1	0x0 or 0x1	Count number of priority elevations
0x9	0x0	0x0	Count number of EMIF_FICLK clock cycles that a command was pending
0xA	0x0	0x0	Count number of EMIF_FICLK cycles used by the EMIF controller for reads and writes.
0xB - 0xF	0x0	0x0	Reserved for future use.

⁽¹⁾ n = 1 or 2

NOTE: When the MReqDebug qualifier is set to 0x1 for a particular local command, the performance counters are not incremented for that particular command if the CNTR_n_CFG values are equal to 0x0, 0x1, 0x2, 0x3, or 0xA.

NOTE: The EMIF performance counters cannot distinguish between single access and burst access. In both cases they are incremented by 1. If the actual SDRAM bandwidth of an initiator has to be measured the EMIF performance counters may not be sufficient.

11.2.4.17.1 Performance Counters General Examples

- **General Example for Counting All Write Accesses made to EMIF**
If the [EMIF_PERFORMANCE_COUNTER_1](#) register is used to count all write accesses made to EMIF from master with connection ID equal to 0x86 (this is the system MMU) the following steps should be performed:

- To enable the writes counting, the [EMIF_PERFORMANCE_COUNTER_CONFIG\[3:0\]](#) CNTR1_CFG bit field must be set to 0x3.
- The [EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT\[15:8\]](#) MCONNID1 bit field must be set to 0x86.
- To enable filtering, the [EMIF_PERFORMANCE_COUNTER_CONFIG\[15\]](#) CNTR1_MCONNID_EN bit must be set to 0x1.

With this configuration [EMIF_PERFORMANCE_COUNTER_1](#) counts every write made to the EMIF from master 0x86 to any address space. This does not include accesses from other masters and commands other than writes.

- **General Example for Counting Total Accesses made to EMIF**

If the [EMIF_PERFORMANCE_COUNTER_2](#) register is used to count total accesses made to EMIF regardless of the address space or master the following steps should be performed:

- To enable counting of all accesses to the SDRAM, the [EMIF_PERFORMANCE_COUNTER_CONFIG\[19:16\]](#) CNTR2_CFG bit field must be set to 0x0.
- To disable filtering, both the [EMIF_PERFORMANCE_COUNTER_CONFIG\[31\]](#) CNTR2_MCONNID_EN and [EMIF_PERFORMANCE_COUNTER_CONFIG\[30\]](#) CNTR2_REGION_EN bits must be set to 0x0.

With this configuration [EMIF_PERFORMANCE_COUNTER_2](#) counts every access made to the EMIF. This includes all accesses from all masters and to any address space.

- **General Example for Counting All Read Accesses made to EMIF**

If the [EMIF_PERFORMANCE_COUNTER_1](#) register is used to count all read accesses made to EMIF from master with connection ID equal to 0x86 (this is the system MMU) to address space 0x0 the following steps should be performed:

- To enable the reads counting, the [EMIF_PERFORMANCE_COUNTER_CONFIG\[3:0\]](#) CNTR1_CFG bit field must be set to 0x2.
- The [EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT\[15:8\]](#) MCONNID1 bit field must be set to 0x86
- The [EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT\[1:0\]](#) REGION_SEL1 bit field must be set to 0x0.
- To enable filtering, both the [EMIF_PERFORMANCE_COUNTER_CONFIG\[15\]](#) CNTR1_MCONNID_EN and the [EMIF_PERFORMANCE_COUNTER_CONFIG\[14\]](#) CNTR1_REGION_EN bits must be set to 0x1.

With this configuration, [EMIF_PERFORMANCE_COUNTER_1](#) counts every read made to the EMIF from master 0x86 to address space 0x0. This does not include accesses from other masters or to other address spaces and does not include commands other than reads.

11.2.4.18 Forcing CKE to tri-state

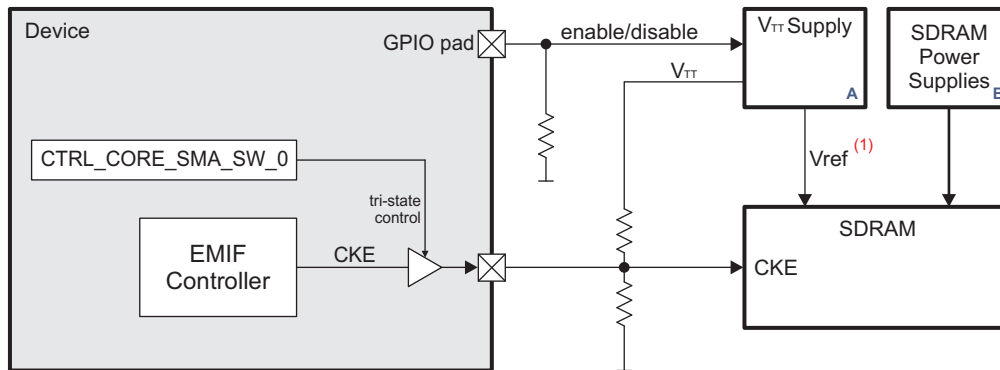

The CKE pad can be forced to tri-state when the CTRL_CORE_SMA_SW_0[0] CKE_ASSERTION bit is set to 0x1. This functionality facilitates fast resume by allowing a strong external pull-down resistor to hold the CKE memory pad low thus keeping the SDRAM in self-refresh while the device is completely powered off. [Figure 11-10](#) and the following example sequence provide more details how this functionality can be used:

- When device is running configure EMIF for self refresh. As a result it drives CKE low.
- Disable V_{TT} supply (can be controlled through a device GPIO pad).
- Ramp down all power rails to the device. When power is already off, EMIF doesn't drive CKE low. The external pull-down does this instead. Note that only V_{TT} must be off. All SDRAM supplies (including V_{REF}) must be on.
- After these three steps the device is completely powered off and the SDRAM is in self-refresh. The waking-up from this state is system specific.
- To resume from self-refresh the CKE pad must be forced to tri-state by writing 0x1 to one of the CKE_ASSERTION bits previously mentioned. Then EMIF must be configured for self-refresh so that its state becomes consistent with the actual SDRAM state.
- Write 0x0 to the corresponding CKE_ASSERTION bit to release CKE driver from tri-state. This allows

EMIF to take control over CKE which is now driven low as EMIF has already been configured for self-refresh.

- Enable V_{TT} supply.
- Access the SDRAM to bring it out of self refresh and resume application.

Figure 11-10. Example for Using the CKE Tri-state Functionality

(1) - Vref (derived either from A or B) must remain ON when V_{TT} is OFF.

emif-009

NOTE: In case the device is powered off but the SDRAM is in self-refresh (as previously described) it must be taken into account that the SDRAM RESET# signal has to be controlled externally to preserve the SDRAM contents. This is needed as ddr1_rst signal is not controlled by the CTRL_CORE_SMA_SW_0 register and therefore cannot be used.

11.2.5 EMIF Programming Guide

11.2.5.1 EMIF Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the EMIF module.

11.2.5.1.1 Global Initialization

Table 11-31. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description , in Chapter 14, Control Module
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 13 Interrupt Controllers

11.2.5.1.1.1 EMIF Configuration Sequence

[Table 11-32](#) shows all steps needed to configure and use the EMIF.

Table 11-32. EMIF Configuration Sequence

Step	Register/ Bit Field	Value
Configure DPLL_DDR to the required frequency:		
· IF DPLL_DDR is locked:	CM_IDLEST_DPLL_DDR[0] ST_DPLL_CLK	0x1
Unlock DPLL_DDR	CM_CLKMODE_DPLL_DDR[2:0] DPLL_EN	0x6
· ENDIF

Define the SDRAM refresh rate in the shadow register of EMIF_SDRAM_REFRESH_CONTROL	EMIF_SDRAM_REFRESH_CONTROL_SHADOW [15:0] REFRESH_RATE_SHDW	0x-

⁽¹⁾ These values are only used when CM_DLL_CTRL[0] DLL_OVERRIDE is set to 0x1. This is used only for debug purposes.

⁽²⁾ The values of these fields do not depend on the board topology.

⁽³⁾ These fields control the delay between the corresponding DQ byte lane and DQS/DQSN pair. Their values should correspond to delay of 1/4 clock cycle to center the DQ relative to the rising/falling edges of DQS/DQSN. Regardless of topology, it is recommended that all the DQ bits are skew matched to the corresponding DQS/DQSN pair.

Table 11-32. EMIF Configuration Sequence (continued)

Step	Register/ Bit Field	Value
Define the SDRAM refresh rate	EMIF_SDRAM_REFRESH_CONTROL[15:0] REFRESH_RATE	REFRESH_RATE_SHD W
Disable SDRAM initialization and refreshes	EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS	0x1

	EMIF_STATUS [5] <code>RDLVLTO</code>	0x1
	EMIF_STATUS [4] <code>WRLVLTO</code>	0x1
IF special ⁽⁶⁾ use-cases:		

⁽⁶⁾ In some special use-cases with features like suspend to RAM where EMIF may be reset but SDRAM content needs to be maintained correctly across such an event. In such cases, when EMIF is configured at first boot with hardware leveling enabled, the hardware leveling output from `EMIF_PHY_STATUS_x` registers is copied to the `EMIF_EXT_PHY_CONTROL_x` registers. When EMIF comes back from a reset state and needs to be reconfigured without losing SDRAM content, the `EMIF_READ_WRITE_LEVELING_RAMP_CONTROL`[31] `RDWRLV_EN` bit must be 0 and hardware leveling must not be triggered. In this case, the `EMIF_EXT_PHY_CONTROL_2` through `EMIF_EXT_PHY_CONTROL_21` registers take effect. Here it is expected that SDRAM is moved to self-refresh mode before EMIF enters reset state and SDRAM content is maintained correctly by appropriate circuitry external to the SoC.

Table 11-32. EMIF Configuration Sequence (continued)

Step	Register/ Bit Field	Value
Copy EMIF_PHY_STATUS_12 through EMIF_PHY_STATUS_16 to EMIF_EXT_PHY_CONTROL_2 through EMIF_EXT_PHY_CONTROL_6

Table 11-39. EMIF LPDDR2-SDRAM Deep Power-Down Mode Exiting

Step	Register/ Bit Field / Programming Model	Value
Clear DPD_EN bit.	EMIF_POWER_MANAGEMENT_CONTROL[11] DPD_EN	0
Write the shadow register of EMIF_POWER_MANAGEMENT_CONTROL	EMIF_POWER_MANAGEMENT_CONTROL_SHA DOW	0x-

11.2.5.1.2.5 LPDDR2 Temperature Monitoring Mode

Table 11-40. LPDDR2 Temperature Monitoring Mode

Step	Register/ Bit Field / Programming Model	Value
Determine which chip-select (0 or 1) is used for temperature alert polling	EMIF_TEMPERATURE_ALERT_CONFIG [31] TA_CS1EN EMIF_TEMPERATURE_ALERT_CONFIG [30] TA_CS0EN	0x-
Define the interval (number of refresh periods) between temperature alert polls.	EMIF_TEMPERATURE_ALERT_CONFIG [21:0] TA_REFINTERVAL	0x-
Define the width of the physical memory device	EMIF_TEMPERATURE_ALERT_CONFIG [27:26] TA_DEVWDT	0x-
Define which external byte lanes contain a device for temperature monitoring (which devices to be polled).	EMIF_TEMPERATURE_ALERT_CONFIG [25:24] TA_DEVCNT	0x-
(Optional) Enable the issuing of a temperature alert poll on Self-Refresh exit (poll for temperature change every time EMIF exits Self-Refresh, Active Power-Down, and Precharge Power-Down modes).	EMIF_TEMPERATURE_ALERT_CONFIG [28] TA_SFEXITEN	0x1
Enable System L3 interrupt for SDRAM temperature alert.	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SE T[1] EN_TA_SYS	0x1

11.2.5.1.2.6 EMIF ECC Configuration

Table 11-41. EMIF ECC Configuration

Step	Register/ Bit Field / Programming Model	Value
Before configuring the EMIF ECC registers, the ECC must be enabled from the Control Module	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT [16] EMIF1_EN_ECC	0x1
Configure the address ranges which have to be ECC protected	EMIF_ECC_ADDRESS_RANGE_1 and EMIF_ECC_ADDRESS_RANGE_2 ⁽¹⁾	0x-
Enable the first ECC protected address range	EMIF_ECC_CTRL_REG [0] REG_ECC_ADDR_RGN_1_EN	0x1
Enable the second ECC protected address range	EMIF_ECC_CTRL_REG [1] REG_ECC_ADDR_RGN_2_EN ⁽¹⁾	0x1
Configure whether the EMIF accesses within the address ranges defined by EMIF_ECC_ADDRESS_RANGE_1 and EMIF_ECC_ADDRESS_RANGE_2 are ECC protected (=0x1) or the EMIF accesses outside these address ranges are ECC protected (=0x0).	EMIF_ECC_CTRL_REG [30] REG_ECC_ADDR_RGN_PROT	0x-
(Optional) Configure the thresholds to generate 1-bit error interrupt	EMIF_1B_ECC_ERR_THRSH	0x-
Enable ECC	EMIF_ECC_CTRL_REG [31] REG_ECC_EN	0x1
Initialize the ECC protected memory regions with quanta-sized and quanta-aligned data	EMIF_1B_ECC_ERR_CNT	Read the register value and write it back to clear
Clear the status flags and other status history	EMIF_1B_ECC_ERR_DIST_1	0xFFFF FFFF
	EMIF_2B_ECC_ERR_ADDR_LOG	0x1
	EMIF_SYSTEM_OCP_INTERRUPT_STATUS [5:3]	0x7

⁽¹⁾ It is not mandatory to enable both address ranges. This is provided for flexibility allowing two non-overlapping ECC protected regions to be created.

NOTE: The xxx_RATIO8 and xxx_RATIO9 bit fields are associated with the ECC data PHY and must be loaded with values same as in the xxx_RATIO0 through xxx_RATIO7 bit fields from registers EMIF_EXT_PHY_CONTROL_xx. This must be taken into account to avoid unexpected behavior and possible errors, if ECC is used.

11.2.6 EMIF Register Manual

Table 11-42 lists the EMIF instance.

11.2.6.1 EMIF Instance Summary

Table 11-42. EMIF Instance Summary

Module Name	Base Address	Size
EMIF	0x4C00 0000	16 MiB

11.2.6.2 EMIF Registers

Many register values are programmed with full-speed DDR clock cycles, whereas EMIF always runs at half the speed of this clock. Because EMIF is only capable of decrementing these values at half speed (taking into account the minus 1 programming model) the following model applies for data issued on a lower bus:

- REG_VALUE = 0 → 2 DDR clocks
- REG_VALUE = 1 → 2 DDR clocks
- REG_VALUE = 2 → 4 DDR clocks
- REG_VALUE = 3 → 4 DDR clocks
- REG_VALUE = 4 → 6 DDR clocks
- REG_VALUE = 5 → 6 DDR clocks
- REG_VALUE = 6 → 8 DDR clocks
- REG_VALUE = 7 → 8 DDR clocks

Activate and deactivate commands use the upper bus. Register values associated with these operations follow the general rule:

- REG_VALUE = 0 → 1 DDR clocks
- REG_VALUE = 1 → 2 DDR clocks
- REG_VALUE = 2 → 2 DDR clocks
- REG_VALUE = 3 → 4 DDR clocks
- REG_VALUE = 4 → 4 DDR clocks
- REG_VALUE = 5 → 6 DDR clocks
- REG_VALUE = 6 → 6 DDR clocks

NOTE: Shadow registers are loaded on any frequency change or SideReq/SidleAck transition at the point where the EMIF has put SDRAM into self-refresh mode.

Table 11-43 summarizes the EMIF register mapping.

Table 11-46. EMIF_STATUS

Address Offset	0x0000 0004	Instance	EMIF
Physical Address	0x4C00 0004		
Description	SDRAM Status Register (STATUS)		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BE	DUAL_CLK_MODE	FAST_INIT	RESERVED													RDLVLGATETO	RDLVLTO	WRLVLTO	RESERVED	PHY_DLL_READY	RESERVED										

Bits	Field Name	Description	Type	Reset
31	BE	Big endian mode select for 8 and 16-bit devices, set to 1 for big endian or 0 for little endian operation. In current implementation, only 32-bit devices are supported - this bit is don't care.	R	0
30	DUAL_CLK_MODE	Dual Clock mode. Defines whether the EMIF_L3_ICLK and EMIF_FICLK clock are asynchronous. EMIF_L3_ICLK and EMIF_FICLK clock are asynchronous, if set to 1.	R	0
29	FAST_INIT	Fast Init. Defines whether the EMIF fast initialization mode has been enabled. Fast initialization is enabled if set to 1.	R	0
28:7	RESERVED	Reserved	R	0x00 0000
6	RDLVLGATETO	Read DQS Gate Training Timeout. Value of 1 indicates read DQS gate training has timed out because read DQS gate training done was not received from the PHY.	R	0
5	RDLVLTO	Read Data Eye Training Timeout. Value of 1 indicates read data eye training has timed out because read data eye training done was not received from the PHY.	R	0
4	WRLVLTO	Write Leveling Timeout. Value of 1 indicates write leveling has timed out because write leveling done was not received from the PHY.	R	0
3	RESERVED		R	0
2	PHY_DLL_READY	DDR PHY Ready. The DDR PHY is ready for normal operation, if set to 1.	R	0
1:0	RESERVED	Reserved	R	0x0

Table 11-48. EMIF_SDRAM_CONFIG

Address Offset	0x0000 0008	Instance	EMIF
Physical Address	0x4C00 0008		
Description	SDRAM Config Register. A write to this register will cause the EMIF to start the SDRAM initialization sequence. CAUTION: This register is loaded with values by control module at device reset.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SDRAM_TYPE			IBANK_POS			DDR_TERM			DDR2_DDQS	DYN_ODT	DDR_DISABLE_DLL	SDRAM_DRIVE		CWL		NARROW_MODE	CL				ROWSIZE			IBANK		RESERVED	PAGESIZE				

Bits	Field Name	Description	Type	Reset
31:29	SDRAM_TYPE	SDRAM Type selection. This field is loaded from e-fuse. Set to 2 for DDR2 Set to 3 for DDR3 Set to 4 for LPDDR2 All other values are reserved. Please check the device data manual for supported DDR memory types.	RW	0x0
28:27	IBANK_POS	Internal bank position. See Section 11.2.4.12, SDRAM Address Mapping .	RW	0x0
26:24	DDR_TERM	DDR3 termination resistor value. Set to 0 to disable termination. For DDR3, set to 1 for RZQ/4, set to 2 for RZQ/2, set to 3 for RZQ/6, set to 4 for RZQ/12, and set to 5 for RZQ/8. All other values are reserved.	RW	0x0
23	DDR2_DDQS	Differential DQS enable. Set to 0 for single ended DQS (Not supported). Set to 1 for differential DQS.	RW	0
22:21	DYN_ODT	DDR3 Dynamic ODT. Not supported . Set to 0 to turn off dynamic ODT.	RW	0x0
20	DDR_DISABLE_DLL	Disable DLL select. Set to 1 to disable DLL inside SDRAM.	RW	0
19:18	SDRAM_DRIVE	SDRAM drive strength. For DDR2, set to 0 for normal, and set to 1 for weak drive strength. For DDR3, set to 0 for RZQ/6 and set to 1 for RZQ/7. All other values are reserved.	RW	0x0
17:16	CWL	DDR3 CAS Write latency. Value of 0, 1, 2, and 3 (CAS write latency of 5, 6, 7, and 8) are supported. Use the lowest value supported for best performance. All other values are reserved.	RW	0x0
15:14	NARROW_MODE	SDRAM data bus width. Set to 0 for 32-bit data bus width. Set to 1 for 16-bit data bus width. All other values are reserved.	RW	0x0

Bits	Field Name	Description	Type	Reset
13:10	CL	<p>CAS Latency (referred to as read latency (RL) in some SDRAM specs). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices.</p> <p>Values of 2, 3, 4 and 5 (CAS latency of 2, 3, 4 and 5) are supported for DDR2.</p> <p>Values of 2, 4, 6, 8, 10, 12 and 14 (CAS latency of 5, 6, 7, 8, 9, 10 and 11) are supported for DDR3.</p> <p>Values of 3, 4, 5, 6, 7, and 8 (CAS latency of 3, 4, 5, 6, 7, and 8) are supported for LPDDR2-SDRAM. The write latency (WL) is tied to the RL for the LPDDR2. See the LPDDR2 SDRAM standard.</p> <p>All other values are reserved.</p>	RW	0x0
9:7	ROWSIZE	<p>Row Size. Defines the number of row address bits of connected SDRAM devices.</p> <p>Set to 0 for 9 row bits, Set to 1 for 10 row bits, Set to 2 for 11 row bits, Set to 3 for 12 row bits, Set to 4 for 13 row bits, Set to 5 for 14 row bits, Set to 6 for 15 row bits, Set to 7 for 16 row bits.</p> <p>This field is only used when EMIF_SDRAM_CONFIG[28:27] IBANK_POS field is set to 1, 2, or 3 or EBANK_POS field in EMIF_SDRAM_CONFIG_2 register is set to 1.</p>	RW	0x0
6:4	IBANK	<p>Internal Bank setup. Defines number of banks inside connected SDRAM devices.</p> <p>Set to 0 for 1 bank, Set to 1 for 2 banks, Set to 2 for 4 banks, Set to 3 for 8 banks.</p> <p>All other values are reserved.</p>	RW	0x0
3	RESERVED		R	0
2:0	PAGESIZE	<p>Page Size. Defines the internal page size of connected SDRAM devices.</p> <p>Set to 0 for 256-word page (8 column bits), Set to 1 for 512-word page (9 column bits), Set to 2 for 1024-word page (10 column bits), Set to 3 for 2048-word page (11 column bits).</p> <p>All other values are reserved.</p>	RW	0x0

Table 11-52. EMIF_SDRAM_REFRESH_CONTROL

Address Offset	0x0000 0010	Instance	EMIF
Physical Address	0x4C00 0010		
Description	SDRAM Refresh Control Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
INITREF_DIS	RESERVED	SRT	ASR	RESERVED	PASR				RESERVED								REFRESH_RATE															

Bits	Field Name	Description	Type	Reset
31	INITREF_DIS	Initialization and Refresh disable. When set to 1, EMIF will disable SDRAM initialization and refreshes, but will carry out SDRAM write/read transactions.	RW	1
30	RESERVED		R	0
29	SRT	DDR3 Self Refresh temperature range. Set to 0 for normal operating temperature range and set to 1 for extended operating temperature range when the ASR field is set to 0. This bit must be set to 0 if the ASR field is set to 1. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0
28	ASR	DDR3 Auto Self Refresh enable. Set to 1 for auto Self Refresh enable. Set to 0 for manual Self Refresh reference indicated by the SRT field. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0
27	RESERVED		R	0
26:24	PASR	Partial Array Self Refresh. These bits get loaded into the Extended Mode Register of DDR3 during initialization. For DDR3, set to 0 for full array, set to 1 or 5 for 1/2 array, set to 2 or 6 for 1/4 array, set to 3 or 7 for 1/8 array, and set to 4 for 3/4 array to be refreshed. All other values are reserved. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0x0
23:16	RESERVED		R	0x00
15:0	REFRESH_RATE	Refresh Rate. Value in this field is used to define the rate at which connected SDRAM devices will be refreshed. SDRAM refresh rate = REFRESH_RATE / EMIF_PHY_FCLK. A 533-MHz DDR clock rate system that requires a 7.8 μ s refresh rate would need $7.8 \times 533 = 4157$ or 0x103D value to be written. To avoid lock-up situations, the programmer must not program REFRESH_RATE < (6 \times EMIF_SDRAM_TIMING_3[12:4] T_RFC). NOTE: The SDRAM refresh rate can be changed on-the-fly by writing to this field. When changing the SDRAM refresh rate all timing parameters that use the refresh rate value have to be recalculated. For example, tRASmax specified in the EMIF_SDRAM_TIMING_3[3:0] T_RAS_MAX field must be recalculated.	RW	0x0000

Table 11-64. EMIF_SDRAM_TIMING_3

Address Offset	0x0000 0028	Instance	EMIF
Physical Address	0x4C00 0028		
Description	SDRAM Timing 3 Register. If this register is byte written, care must be taken that all the fields are written before performing any accesses to the SDRAM.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T_PDLL_UL				RESERVED		T_CKESR		ZQ_ZQCS				T_TDGSKMAX		T_RFC				T_RAS_MAX													

Bits	Field Name	Description	Type	Reset
31:28	T_PDLL_UL	Minimum number of DDR clock cycles for PHY DLL to unlock. A value of N will be equal to N x 128 clocks.	RW	0x0
27:24	RESERVED		R	0x0
23:21	T_CKESR	Minimum number of DDR clock cycles for which SDRAM must remain in Self Refresh, minus one.	RW	0x0
20:15	ZQ_ZQCS	Number of DDR clock cycles for a ZQCS command, minus one.	RW	0x00
14:13	T_TDQSKMAX	Number of DDR clock that satisfies tDQSKmax for LPDDR2, minus one.	RW	0x0
12:4	T_RFC	Minimum number of DDR clock cycles from Refresh or Load Mode to Refresh or Activate, minus one.	RW	0x000
3:0	T_RAS_MAX	Maximum number of REFRESH_RATE intervals from Activate to Precharge command. This field must be equal to ((tRASmax / tREFI)-1) rounded down to the next lower integer. Value for T_RAS_MAX can be calculated as follows: If tRASmax = 120 us and tREFI = 15.7 us, then T_RAS_MAX = ((120/15.7)-1) = 6.64. Round down to the next lower integer. Therefore, the programmed value must be 6.	RW	0x0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T_PDLL_UL_SHDW				T_CSTA_SHDW				T_CKESR_SHDW				ZQ_ZQCS_SHDW				T_TDQSKMAX_SHDW				T_RFC_SHDW				T_RAS_MAX_SHDW							

Bits	Field Name	Description	Type	Reset
31:28	T_PDLL_UL_SHDW	Shadow field for T_PDLL_UL. This field is loaded into T_PDLL_UL field in EMIF_SDRAM_TIMING_3 register when SldleAck is asserted.	RW	0x0
27:24	T_CSTA_SHDW	Shadow field for T_CSTA. This field is loaded into T_CSTA field in EMIF_SDRAM_TIMING_3 register when SldleAck is asserted.	RW	0x0
23:21	T_CKESR_SHDW	Shadow field for T_CKESR. This field is loaded into T_CKESR field in EMIF_SDRAM_TIMING_3 register when SldleAck is asserted.	RW	0x0

Bits	Field Name	Description	Type	Reset
20:15	ZQ_ZQCS_SHDW	Shadow field for ZQ_ZQCS. This field is loaded into ZQ_ZQCS field in EMIF_SDRAM_TIMING_3 register when SldleAck is asserted.	RW	0x00
14:13	T_TDQSKMAX_SHDW	Shadow field for T_TDQSKMAX. This field is loaded into EMIF_SDRAM_TIMING_3 [14:13] T_TDQSKMAX field when SldleAck is asserted.	RW	0x0
12:4	T_RFC_SHDW	Shadow field for T_RFC. This field is loaded into EMIF_SDRAM_TIMING_3 [12:4] T_RFC when SldleAck is asserted.	RW	0x000
3:0	T_RAS_MAX_SHDW	Shadow field for T_RAS_MAX. This field is loaded into EMIF_SDRAM_TIMING_3 [3:0] T_RAS_MAX field when SldleAck is asserted.	RW	0x0

Table 11-100. EMIF_DLL_CALIB_CTRL

Address Offset	0x0000 0098	Instance	EMIF
Physical Address	0x4C00 0098		
Description	Control register to force idle window time to generate a phy_dll_calib that can be used for updating PHY DLLs during voltage ramps. NOTE: Should always be loaded via the shadow register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED												ACK_WAIT				RESERVED				DLL_CALIB_INTERVAL											

Bits	Field Name	Description	Type	Reset
31:20	RESERVED		R	0x000
19:16	ACK_WAIT	The ack_wait determines the required wait time after a phy_dll_calib is generated before another command can be sent. Value program is in terms of EMIF_FICLK cycle count. CAUTION: 5 must be the minimum value ever programmed.	RW	0x9
15:9	RESERVED		R	0x00

Bits	Field Name	Description	Type	Reset
8:0	DLL_CALIB_INTERVAL	This field determines the interval between phy_dll_calib generation. This value is multiplied by a precouter of 16 EMIF_FICLK cycles. Program this field one less the value you are targeting; program 1 to achieve interval of 2 (minimum interval supported). Programming zero turns off function. Note the final intervals between dll_calib generation is also a function of ACK_WAIT. Final periodic interval is calculated by: $((DLL_CALIB_INTERVAL + 1) \times 16) + ACK_WAIT$	RW	0x000

Table 11-126. EMIF_DDR_PHY_CONTROL_1

Address Offset	0x0000 00E4	Instance	EMIF
Physical Address	0x4C00 00E4		
Description	PHY control register 1		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0												
RESERVED								RESERVED				PHY_HALF_DELAYS				PHY_CLK_STALL_LEVEL				PHY_DIS_CALIB_RST				PHY_INVERT_CLKOUT				PHY_DLL_LOCK_DIFF				PHY_FAST_DLL_LOCK				RESERVED				READ_LATENCY			

Bits	Field Name	Description	Type	Reset
31:28	RESERVED	Reserved	RW	0x0
27	RDLVL_MASK	Writing a 1 to this field will mask read data eye training during full leveling command, plus drives reg_phy_use_rd_data_eye_level control low to allow user to use programmed ratio values.	RW	0
26	RDLVLGATE_MASK	Writing a 1 to this field will mask dqs gate training during full leveling command, plus drives reg_phy_use_rd_dqs_level control low to allow user to use programmed ratio values.	RW	0
25	WRLVL_MASK	Writing a 1 to this field will mask write leveling training during full leveling command, plus drives reg_phy_use_wr_level control low to allow user to use programmed ratio values.	RW	0
24:22	RESERVED	Reserved	RW	0x0
21	PHY_HALF_DELAYS	Adjust slave delay line delays to support 2x mode 1: 2x mode (MDLL clock is half the rate of PHY) 0: 1x mode (MDLL clock rate is same as PHY)	RW	0

Bits	Field Name	Description	Type	Reset
20	PHY_CLK_STALL_LEVEL	Enable variable idle value for delay lines. Enable during normal operations to avoid differential aging in the delay lines.	RW	0
19	PHY_DIS_CALIB_RST	Disable the dll_calib (internally generated) signal from resetting the Read Capture FIFO pointers and portions of data PHYs. Debug only. Note: dll_calib is generated by 1. EMIF_MISC_REG[0] DLL_CALIB_OS set to 1, or 2. by the PHY when it detects that the clock frequency variation has exceeded the bounds set by PHY_DLL_LOCK_DIFF or 3. periodically throughout the leveling process.	RW	0
18	PHY_INVERT_CLKOUT	Inverts the polarity of DRAM clock. 0: core clock is passed on to DRAM 1: inverted core clock is passed on to DRAM	RW	0
17:10	PHY_DLL_LOCK_DIFF	The maximum number of delay line taps variation while maintaining the master DLL lock. When the PHY is in locked state and the variation on the clock exceeds the variation indicated by this field, the lock signal is de-asserted and a dll_calib signal is generated. To prevent the dll_calib signal from being asserted in the middle of traffic when the clock jitter exceeds the variation, this register needs to be set to a value which will ensure that the lock will not be lost. Recommended value is 16.	RW	0x02
9	PHY_FAST_DLL_LOCK	Controls master DLL to lock fast or average logic must be part of locking process. Set to 1 before OPP transition commences, and set back to 0 after OPP transition completes. 1: MDLL lock is asserted based on single sample 0: MDLL lock is asserted based on average of 16 samples.	RW	0
8:5	RESERVED	Reserved	RW	0x00
4:0	READ_LATENCY	This field defines the read latency for the read data from SDRAM in number of DDR clock cycles. This field is used by the EMIF as well as the PHY. READ_LATENCY = RL + reg_phy_rdc_we_to_re - 1. EMIF uses above equation to calculate reg_phy_rdc_we_to_re and forward it to the PHY. For DDR3, the true RL is used, not the decoded value. See JEDEC spec. The write latency (WL) is tied to the RL for the LPDDR2. See the LPDDR2 SDRAM standard.	RW	0x01E

25:16	REG_PHY_WRLVL_INIT_RATIO 9	The user programmable initialization ratio value used by the write leveling finite state machine (hardware leveling) for the write DQS slave DLL in PHY ECC data macro, chip select 1. This is the fraction of a clock cycle in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line. NOTE: Chip select 1 is not supported on this device.	RW	0x0
15:10	RESERVED		R	0x0
9:0	REG_PHY_WRLVL_INIT_RATIO 8	The user programmable initialization ratio value used by the write leveling finite state machine (hardware leveling) for the write DQS slave DLL in PHY ECC data macro, chip select 0. This is the fraction of a clock cycle in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.	RW	0x0

Address Offset	0x0000 0318	Instance	EMIF
Physical Address	0x4C00 0318		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																REG_PHY_RDC_FIFO_RST_ERR_CNT_CLR		REG_PHY_MDLL_UNLOCK_CLR		REG_PHY_FIFO_WE_IN_MISALIGNED_CLR		REG_PHY_WRLVL_NUM_OF_DQ0				REG_PHY_GATELVL_NUM_OF_DQ0					

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x0
10	REG_PHY_RDC_FIFO_RST_ERR_CNT_CLR	Clear/reset the phy_reg_rdc_fifo_rst_err_cnt, phy_reg_rdfifo_wrptr and phy_reg_rdfifo_rdptr status flags. A value of 0x1 clears the flag. A value of 0x0 has no effect.	RW	0x0
9	REG_PHY_MDLL_UNLOCK_CLR	Clears the phy_reg_status_mdll_unlock_sticky flag. A value of 0x1 clears the flag. A value of 0x0 has no effect.	RW	0x0
8	REG_PHY_FIFO_WE_IN_MISALIGNED_CLR	Clears the phy_reg_fifo_we_in_misaligned_sticky status flag. A value of 0x1 clears the flag. A value of 0x0 has no effect.	RW	0x0
7:4	REG_PHY_WRLVL_NUM_OF_DQ0	Determines the number of samples for <i>dq0_in</i> for each ratio increment by the write leveling finite state machine (hardware leveling). The minimum value supported is 3; however, the default setting of 7 is recommended. NOTE: In this case <i>dq0_in</i> represents all 8 DQ bits OR-ed together.	RW	0x7
3:0	REG_PHY_GATELVL_NUM_OF_DQ0	Determines the number of samples for <i>dq0_in</i> for each ratio increment by the gate training finite state machine (hardware leveling). The minimum value supported is 3; however, the default setting of 7 is recommended. NOTE: In this case <i>dq0_in</i> represents the corresponding DQS signal.	RW	0x7

11.3 General-Purpose Memory Controller

This section describes the features and functions of the device GPMC controller.

11.3.1 GPMC Overview

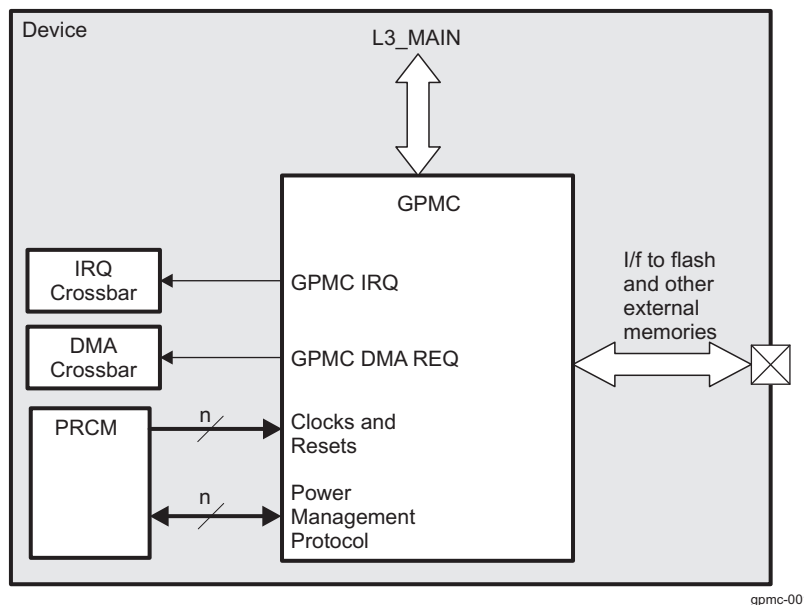

The general-purpose memory controller (GPMC) is a unified memory controller dedicated for interfacing with external memory devices like:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in nonmultiplexed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

Figure 11-11 shows the GPMC module overview.

The GPMC features are introduced in Section 11.1.2, *GPMC Overview* of Section 11.1, *Memory Subsystem Overview*.

Figure 11-11. GPMC Overview

11.3.2 GPMC Environment

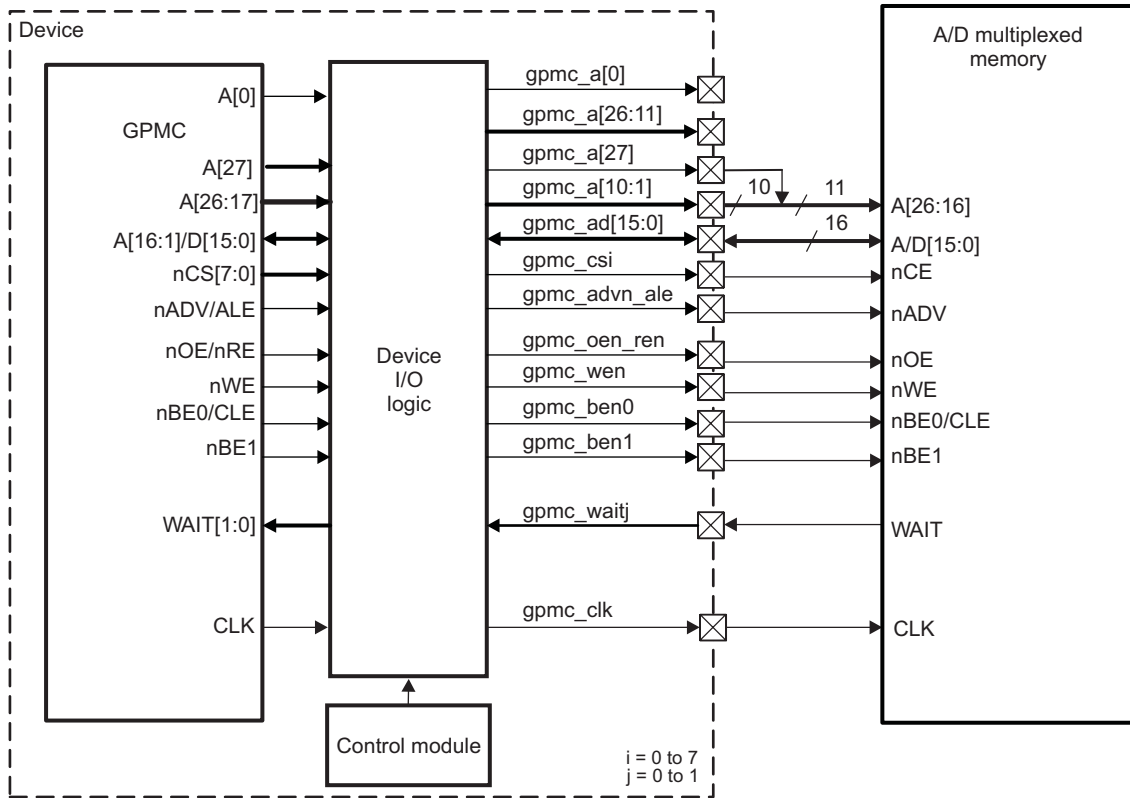

This section describes the GPMC application fields from an environment point of view (external connections). It describes GPMC connectivity options, and gives three possible interfaces.

11.3.2.1 GPMC Modes

This section shows three GPMC external connections options:

- Figure 11-12 shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol uses fewer address pins) external memory device.
- Figure 11-13 shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device.
- Figure 11-14 shows a connection between the GPMC and an 8-bit synchronous non-multiplexed external memory device.
- Figure 11-15 shows a connection between the GPMC and a 8-bit NAND device.

11.3.2.2 GPMC Signals

Table 11-358 lists the GPMC subsystem input/output (I/O) pins.

Table 11-358. GPMC I/O Description

Pin Name	Device Signal	I/O ⁽¹⁾	Description
A[27:0]	gpmc_a[27:0]	O	28-bit output address bus
