

## Corrections to Tiva™ TM4C129x/TM4C123x Data Sheets

### 1 Corrections to All Tiva™ TM4C129x and TM4C123x Data Sheets

This manual update sheet, identifies the changes needed to update the TM4C129x and TMS4C123x data sheets identified, and product folder linked, in [Table 1](#).

#### Change or Add:

In the "Execute-Only Protection" subsection of the data sheet, replace the following paragraph:

Execute-only protection prevents both modification and visibility to a protected flash block. This mode is intended to be used in situations where a device requires debug capability, yet portions of the application space must be protected from external access. An example of this is a company who wishes to sell Tiva™ C Series devices with their proprietary software preprogrammed, yet allow the end user to add custom code to an unprotected region of the flash (such as a motor control module with a customizable motor configuration section in flash).

With this *new* paragraph:

“An application designer can use the execute-only protection to help protect the integrity and confidentiality of software stored in these protected regions, helping prevent, for example, unauthorized software updates or software reverse-engineering. If, however, the attacker has debug access or has malicious code running, the confidentiality of the code in the execute-only region during runtime could be compromised, for example by observing the effect of each instruction on CPU registers. Therefore, an application designer should consider implementing additional security measures such as debug lock, carefully written software update mechanisms, use of the memory protection unit (MPU), and other appropriate security measures to protect valuable software.”
