About This Manual

The C55x™ CPU is a fixed-point digital signal processor (DSP) in the TMS320™ family, and it can use either of two forms of the instruction set: a mnemonic form or an algebraic form. This book is a reference for the mnemonic form of the instruction set. It contains information about the instructions used for all types of operations. For information on the algebraic instruction set, see *C55x v3.1 CPU Algebraic Instruction Set Reference Guide*, SWPU068.

Notational Conventions

This book uses the following conventions.

- In syntax descriptions, the instruction is in a **bold typeface**. Portions of a syntax in **bold** must be entered as shown. Here is an example of an instruction syntax:

  LMS Xmem, Ymem, ACx, ACy

  LMS is the instruction, and it has four operands: *Xmem*, *Ymem*, *ACx*, and *ACy*. When you use **LMS**, the operands should be actual dual data-memory operand values and accumulator values. A comma and a space (optional) must separate the four values.

- Square brackets, [and], identify an optional parameter. If you use an optional parameter, specify the information within the brackets; do not type the brackets themselves.

Related Documentation From Texas Instruments

The following books describe the C55x™ devices and related support tools. To obtain a copy of any of these TI documents, call the Texas Instruments Literature Response Center at (800) 477-8924. When ordering, please identify the book by its title and literature number.

TMS320C55x Technical Overview (SPRU393). This overview is an introduction to the TMS320C55x™ digital signal processor (DSP). The TMS320C55x is the latest generation of fixed-point DSPs in the TMS320C5000™ DSP platform. Like the previous generations, this processor is optimized for high performance and low-power operation. This book describes the CPU architecture, low-power enhancements, and embedded emulation features of the TMS320C55x.

C55x v3.x CPU Reference Guide (literature number SWPU073) describes the architecture, registers, and operation of the v 3.x CPU for the C55x™ .

C55x v3.x CPU Algebraic Instruction Set Reference Guide (literature number SWPU068) describes the algebraic instructions individually. It also includes a summary of the instruction set, a list of the instruction opcodes, and a cross-reference to the mnemonic instruction set.

TMS320C55x Programmer's Guide (literature number SPRU376) describes ways to optimize C and assembly code for the TMS320C55x™ DSPs and explains how to write code that uses special features and instructions of the DSP.

TMS320C55x Optimizing C Compiler User's Guide (literature number SPRU281) describes the TMS320C55x™ C Compiler. This C compiler accepts ANSI standard C source code and produces assembly language source code for TMS320C55x devices.

TMS320C55x Assembly Language Tools User's Guide (literature number SPRU280) describes the assembly language tools (assembler, linker, and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for TMS320C55x™ devices.

Trademarks

TMS320, TMS320C54x, TMS320C55x, C54x, and C55x are trademarks of Texas Instruments.

Chapter 1

Terms, Symbols, and Abbreviations

This chapter lists and defines the terms, symbols, and abbreviations used in the TMS320C55x™ DSP mnemonic instruction set summary and in the individual instruction descriptions. Also provided are instruction set notes and rules and a list of nonrepeatable instructions.

Topic **Page**

1.1 Instruction Set Terms, Symbols, and Abbreviations

Table 1−1 lists the terms, symbols, and abbreviations used and Table 1−2 lists the operators used in the instruction set summary and in the individual instruction descriptions.

Table 1−1. Instruction Set Terms, Symbols, and Abbreviations

Symbol	Meaning
[ ]	Optional operands
40	If the optional 40 keyword is applied to the instruction, the instruction provides the option to locally set M40 to 1 for the execution of the instruction
ACB	Bus that brings D-unit registers to A-unit and P-unit operators
ACOVx	Accumulator overflow status bit: ACOV0, ACOV1, ACOV2, ACOV3
ACw, ACx, ACy, ACz	Accumulator: AC0, AC1, AC2, AC3
ARn_mod	Content of selected auxiliary register (ARn) is premodified or postmodified in the address generation unit.
ARx, ARy	Auxiliary register: AR0, AR1, AR2, AR3, AR4, AR5, AR6, AR7
AU	A unit
Baddr	Register bit address
BitIn	Shifted bit in: Test control flag 2 (TC2) or CARRY status bit
BitOut	Shifted bit out: Test control flag 2 (TC2) or CARRY status bit
BORROW	Logical complement of CARRY status bit
C, Cycles	Execution in cycles. For conditional instructions, x/y field means: x cycle, if the condition is true. y cycle, if the condition is false.
CA	Coefficient address generation unit
CARRY	Value of CARRY status bit
Cmem	Coefficient indirect operand referencing a 16-bit or 32-bit value in data space
cond	Condition based on accumulator (ACx) value, auxiliary register (ARx) value, temporary register (Tx) value, test control (TCx) flag, or CARRY status bit. See section 1.2.
CR	Coefficient Read bus

Table 1−1. Instruction Set Terms, Symbols, and Abbreviations (Continued)

Symbol	Meaning
CSR	Computed single-repeat register
DA	Data address generation unit
DR	Data Read bus
dst	Destination accumulator (ACx), lower 16 bits of auxiliary register (ARx), or temporary register (Tx): AC0, AC1, AC2, AC3 AR0, AR1, AR2, AR3, AR4, AR5, AR6, AR7 T0, T1, T2, T3
DU	D unit
DW	Data Write bus
Dx	Data address label coded on x bits (absolute address)
E	Indicates if the instruction contains a parallel enable bit.
kx	Unsigned constant coded on x bits
Kx	Signed constant coded on x bits
Lmem	Long-word single data memory access (32-bit data access). Same legal inputs as Smem.
lx	Program address label coded on x bits (unsigned offset relative to program counter register)
Lx	Program address label coded on x bits (signed offset relative to program counter register)
Operator	Operator(s) used by an instruction.
Pipe, Pipeline	Pipeline phase in which the instruction executes: AD Address D Decode R Read X Execute
pmad	Program memory address
Px	Program or data address label coded on x bits (absolute address)
RELOP	Relational operators: == equal to < less than >= greater than or equal to != not equal to

Table 1−1. Instruction Set Terms, Symbols, and Abbreviations (Continued)

Symbol	Meaning
R or rnd	If the optional R or rnd keyword is applied to the instruction, rounding is performed in the instruction
RPTC	Single-repeat counter register
S, Size	Instruction size in bytes.
SA	Stack address generation unit
saturate	If the optional saturate keyword is applied to the input operand, the 40-bit output of the operation is saturated
SHFT	4-bit immediate shift value, 0 to 15
SHIFTW	6-bit immediate shift value, −32 to +31
Smem	Word single data memory access (16-bit data access)
SP	Data stack pointer
src	Source accumulator (ACx), lower 16 bits of auxiliary register (ARx), or temporary register (Tx): AC0, AC1, AC2, AC3 AR0, AR1, AR2, AR3, AR4, AR5, AR6, AR7 T0, T1, T2, T3
SSP	System stack pointer
STx	Status register: ST0, ST1, ST2, ST3
TAx, TAy	Auxiliary register (ARx) or temporary register (Tx): AR0, AR1, AR2, AR3, AR4, AR5, AR6, AR7 T0, T1, T2, T3
TCx, TCy	Test control flag: TC1, TC2
TRNx	Transition register: TRN0, TRN1
Tx, Ty	Temporary register: T0, T1, T2, T3
U or uns	If the optional U or uns keyword is applied to the input operand, the operand is zero extended

Table 1−1. Instruction Set Terms, Symbols, and Abbreviations (Continued)

Symbol	Meaning
XACdst	Destination extended register: All 23 bits of coefficient data pointer (XCDP), and extended auxiliary register (XARx): XAR0, XAR1, XAR2, XAR3, XAR4, XAR5, XAR6, XAR7
XACsrc	Source extended register: All 23 bits of coefficient data pointer (XCDP), and extended auxiliary register (XARx): XAR0, XAR1, XAR2, XAR3, XAR4, XAR5, XAR6, XAR7
XAdst	Destination extended register: All 23 bits of data stack pointer (XSP), system stack pointer (XSSP), data page pointer (XDP), coefficient data pointer (XCDP), and extended auxiliary register (XARx): XAR0, XAR1, XAR2, XAR3, XAR4, XAR5, XAR6, XAR7
XARx	All 23 bits of extended auxiliary register: XAR0, XAR1, XAR2, XAR3, XAR4, XAR5, XAR6, XAR7
XAsrc	Source extended register: All 23 bits of data stack pointer (XSP), system stack pointer (XSSP), data page pointer (XDP), coefficient data pointer (XCDP), and extended auxiliary register (XARx): XAR0, XAR1, XAR2, XAR3, XAR4, XAR5, XAR6, XAR7
xdst	Accumulator: AC0, AC1, AC2, AC3
	Destination extended register: All 23 bits of data stack pointer (XSP), system stack pointer (XSSP), data page pointer (XDP), coefficient data pointer (XCDP), and extended auxiliary register (XARx): XAR0, XAR1, XAR2, XAR3, XAR4, XAR5, XAR6, XAR7
xsrc	Accumulator: AC0, AC1, AC2, AC3
	Source extended register: All 23 bits of data stack pointer (XSP), system stack pointer (XSSP), data page pointer (XDP), coefficient data pointer (XCDP), and extended auxiliary register (XARx): XAR0, XAR1, XAR2, XAR3, XAR4, XAR5, XAR6, XAR7
Xmem, Ymem	Indirect dual data memory access (two data accesses)

Table 1−2. Operators Used in Instruction Set

Symbols	Operators	Evaluation
+ − ~	Unary plus, minus, 1s complement	Right to left
* / %	Multiplication, division, modulo	Left to right
+ −	Addition, subtraction	Left to right
<< >>	Signed left shift, right shift	Left to right
< < < >>>	Logical left shift, logical right shift	Left to right
< <=	Less than, less than or equal to	Left to right
> >=	Greater than, greater than or equal to	Left to right
== !=	Equal to, not equal to	Left to right
&	Bitwise AND	Left to right
|	Bitwise OR	Left to right
^	Bitwise exclusive OR (XOR)	Left to right

Note: Unary +, −, and * have higher precedence than the binary forms.

1.2 Instruction Set Conditional (cond) Fields

Table 1−3 lists the testing conditions available in the cond field of the conditional instructions.

Table 1−3. Instruction Set Conditional (cond) Field

Bit or Register	Condition (cond) Field	For Condition to be True ...
Accumulator	Tests the accumulator (ACx) content against 0. The comparison against 0 depends on M40 status bit: ❑ If M40 = 0, ACx(31–0) is compared to 0. ❑ If M40 = 1, ACx(39–0) is compared to 0.	
	ACx == #0	ACx content is equal to 0
	ACx < #0	ACx content is less than 0
	ACx > #0	ACx content is greater than 0
	ACx != #0	ACx content is not equal to 0
	ACx <= #0	ACx content is less than or equal to 0
	ACx >= #0	ACx content is greater than or equal to 0
Accumulator Overflow Status Bit	Tests the accumulator overflow status bit (ACOVx) against 1; when the optional ! symbol is used before the bit designation, the bit can be tested against 0. When this condition is used, the corresponding ACOVx is cleared to 0.	
	overflow(ACx)	ACOVx bit is set to 1
	!overflow(ACx)	ACOVx bit is cleared to 0
Auxiliary Register	Tests the auxiliary register (ARx) content against 0.	
	ARx == #0	ARx content is equal to 0
	ARx < #0	ARx content is less than 0
	ARx > #0	ARx content is greater than 0
	ARx != #0	ARx content is not equal to 0
	ARx <= #0	ARx content is less than or equal to 0
	ARx >= #0	ARx content is greater than or equal to 0
CARRY Status Bit	Tests the CARRY status bit against 1; when the optional ! symbol is used before the bit designation, the bit can be tested against 0.	
	CARRY	CARRY bit is set to 1
	!CARRY	CARRY bit is cleared to 0

Table 1−3. Instruction Set Conditional (cond) Field (Continued)

Bit or Register	Condition (cond) Field	For Condition to be True ...
Temporary Register	Tests the temporary register (Tx) content against 0.	
	Tx == #0	Tx content is equal to 0
	Tx < #0	Tx content is less than 0
	Tx > #0	Tx content is greater than 0
	Tx != #0	Tx content is not equal to 0
	Tx <= #0	Tx content is less than or equal to 0
	Tx >= #0	Tx content is greater than or equal to 0
Test Control Flags	Tests the test control flags (TC1 and TC2) independently against 1; when the optional ! symbol is used before the flag designation, the flag can be tested independently against 0.	
	TCx	TCx flag is set to 1
	!TCx	TCx flag is cleared to 0
	TC1 and TC2 can be combined with an AND (&), OR (|), and XOR (^) logical bit combinations:	
	TC1 & TC2	TC1 AND TC2 is equal to 1
	!TC1 & TC2	$\overline{TC1}$ AND TC2 is equal to 1
	TC1 & !TC2	TC1 AND $\overline{TC2}$ is equal to 1
	!TC1 & !TC2	$\overline{TC1}$ AND $\overline{TC2}$ is equal to 1
	TC1 | TC2	TC1 OR TC2 is equal to 1
	!TC1 | TC2	$\overline{TC1}$ OR TC2 is equal to 1
	TC1 | !TC2	TC1 OR $\overline{TC2}$ is equal to 1
	!TC1 | !TC2	$\overline{TC1}$ OR $\overline{TC2}$ is equal to 1
	TC1 ^ TC2	TC1 XOR TC2 is equal to 1
	!TC1 ^ TC2	$\overline{TC1}$ XOR TC2 is equal to 1
	TC1 ^ !TC2	TC1 XOR $\overline{TC2}$ is equal to 1
	!TC1 ^ !TC2	$\overline{TC1}$ XOR $\overline{TC2}$ is equal to 1

1.3 Affect of Status Bits

1.3.1 Accumulator Overflow Status Bit (ACOVx)

The ACOV[0−3] depends on M40:

- When M40 = 0, overflow is detected at bit position 31
- When M40 = 1, overflow is detected at bit position 39

If an overflow is detected, the destination accumulator overflow status bit is set to 1.

1.3.2 C54CM Status Bit

- When C54CM = 0, the enhanced mode, the CPU supports code originally developed for a TMS320C55x™ DSP.
- When C54CM = 1, the compatible mode, all the C55x CPU resources remain available; therefore, as you translate code, you can take advantage of the additional features on the C55x DSP to optimize your code. This mode must be set when you are porting code that was originally developed for a TMS320C54x™ DSP.

1.3.3 CARRY Status Bit

- When M40 = 0, the carry/borrow is detected at bit position 31
- When M40 = 1, the carry/borrow is detected at bit position 39

When performing a logical shift or signed shift that affects the CARRY status bit and the shift count is zero, the CARRY status bit is cleared to 0.

1.3.4 FRCT Status Bit

- When FRCT = 0, the fractional mode is OFF and results of multiply operations are not shifted.
- When FRCT = 1, the fractional mode is ON and results of multiply operations are shifted left by 1 bit to eliminate an extra sign bit.

1.3.5 INTM Status Bit

The INTM bit globally enables or disables the maskable interrupts. This bit has no effect on nonmaskable interrupts (those that cannot be blocked by software).

- When INTM = 0, all unmasked interrupts are enabled.
- When INTM = 1, all maskable interrupts are disabled.

1.3.6 M40 Status Bit

- When M40 = 0:
  - overflow is detected at bit position 31
  - the carry/borrow is detected at bit position 31
  - saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow)
  - TMS320C54x™ DSP compatibility mode
  - for conditional instructions, the comparison against 0 (zero) is performed on 32 bits, ACx(31−0)
- When M40 = 1:
  - overflow is detected at bit position 39
  - the carry/borrow is detected at bit position 39
  - saturation values are 7F FFFF FFFFh (positive overflow) or 80 0000 0000h (negative overflow)
  - for conditional instructions, the comparison against 0 (zero) is performed on 40 bits, ACx(39−0)

1.3.6.1 M40 Status Bit When Sign Shifting

In D-unit shifter:

- When shifting to the LSBs:
  - when M40 = 0, the input to the shifter is modified according to SXMD and then the modified input is shifted according to the shift quantity:
    - if SXMD = 0, 0 is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
    - if SXMD = 1, bit 31 of the source operand is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
  - bit 39 is extended according to SXMD
  - the shifted-out bit is extracted at bit position 0
- When shifting to the MSBs:
  - 0 is inserted at bit position 0
  - if M40 = 0, the shifted-out bit is extracted at bit position 31
  - if M40 = 1, the shifted-out bit is extracted at bit position 39

- After shifting, unless otherwise noted, when M40 = 0:
  - overflow is detected at bit position 31 (if an overflow is detected, the destination ACOVx bit is set)
  - the carry/borrow is detected at bit position 31
  - if SATD = 1, when an overflow is detected, ACx saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow)
  - TMS320C54x™ DSP compatibility mode
- After shifting, unless otherwise noted, when M40 = 1:
  - overflow is detected at bit position 39 (if an overflow is detected, the destination ACOVx bit is set)
  - the carry/borrow is detected at bit position 39
  - if SATD = 1, when an overflow is detected, ACx saturation values are 7F FFFF FFFFh (positive overflow) or 80 0000 0000h (negative overflow)

In A-unit ALU:

- When shifting to the LSBs, bit 15 is sign extended
- When shifting to the MSBs, 0 is inserted at bit position 0
- After shifting, unless otherwise noted:
  - overflow is detected at bit position 15 (if an overflow is detected, the destination ACOVx bit is set)
  - if SATA = 1, when an overflow is detected, register saturation values are 7FFFh (positive overflow) or 8000h (negative overflow)

1.3.6.2 M40 Status Bit When Logically Shifting

In D-unit shifter:

- When shifting to the LSBs:
  - if M40 = 0, 0 is inserted at bit position 31 and the guard bits (39−32) of the destination accumulator are cleared
  - if M40 = 1, 0 is inserted at bit position 39
  - the shifted-out bit is extracted at bit position 0 and stored in the CARRY status bit

- When shifting to the MSBs:
  - 0 is inserted at bit position 0
  - if M40 = 0, the shifted-out bit is extracted at bit position 31 and stored in the CARRY status bit, and the guard bits (39−32) of the destination accumulator are cleared
  - if M40 = 1, the shifted-out bit is extracted at bit position 39 and stored in the CARRY status bit

In A-unit ALU:

- When shifting to the LSBs:
  - 0 is inserted at bit position 15
  - the shifted-out bit is extracted at bit position 0 and stored in the CARRY status bit
- When shifting to the MSBs:
  - 0 is inserted at bit position 0
  - the shifted-out bit is extracted at bit position 15 and stored in the CARRY status bit

1.3.7 RDM Status Bit

When the optional rnd or R keyword is applied to the instruction, then rounding is performed in the D-unit shifter. This is done according to RDM:

- When RDM = 0, the biased rounding to the infinite is performed. 8000h (2^{15}) is added to the 40-bit result of the shift result.
- When RDM = 1, the unbiased rounding to the nearest is performed. According to the value of the 17 LSBs of the 40-bit result of the shift result, 8000h (2^{15}) is added:

```
if( 8000h < bit(15-0) < 10000h)
   add 8000h to the 40-bit result of the shift result.
else if( bit(15-0) == 8000h)
   if( bit(16) == 1)
   add 8000h to the 40-bit result of the shift result.
```

If a rounding has been performed, the 16 lowest bits of the result are cleared to 0.

1.3.8 SATA Status Bit

This status bit controls operations performed in the A unit.

- When SATA = 0, no saturation is performed.
- When SATA = 1 and an overflow is detected, the destination register is saturated to 7FFFh (positive overflow) or 8000h (negative overflow).

1.3.9 SATD Status Bit

This status bit controls operations performed in the D unit.

- When SATD = 0, no saturation is performed.
- When SATD = 1 and an overflow is detected, the destination register is saturated.

1.3.10 SMUL Status Bit

- When SMUL = 0, the saturation mode is OFF.
- When SMUL = 1, the saturation mode is ON. When SMUL = 1, FRCT = 1, and SATD = 1, the result of 18000h $\times$ 18000h is saturated to 00 7FFF FFFFh (regardless of the value of the M40 bit). This forces the product of the two negative numbers to be a positive number. For multiply-and-accumulate/subtract instructions, the saturation is performed after the multiplication and before the addition/subtraction.

1.3.11 SXMD Status Bit

This status bit controls operations performed in the D unit.

- When SXMD = 0, input operands are zero extended.
- When SXMD = 1, input operands are sign extended.

1.3.12 Test Control Status Bit (TCx)

The test control status bits (TC1 or TC2) hold the result of a test performed by the instruction.

1.4 Instruction Set Notes and Rules

1.4.1 Notes

- Mnemonic syntax keywords and operand modifiers are case insensitive. You can write:

  ```
  ABDST *AR0, *ar1, AC0, ac1
  ```

  or

  ```
  aBdST *ar0, *aR1, aC0, Ac1
  ```

- Operands for commutative operations (+, *, &, |, ^) can be arranged in any order.

1.4.2 Rules

- Simple instructions are not allowed to span multiple lines. One exception, single instructions that use the double colons, ::, notation to imply parallelism. These instructions may be split up following the :: notation.

  The following example shows a single instruction (dual multiply) occupying two lines:

  ```
  MPYR40 uns(Xmem), uns(Cmem), ACx
  :: MPYR40 uns(Ymem), uns(Cmem), ACy
  ```

- User-defined parallelism instructions (using || notation) are allowed to span multiple lines. For example, all of the following instructions are legal:

  ```
  MOV AC0, AC1 || MOV AC2, AC3
  ```

  ```
  MOV AC0, AC1 ||
  MOV AC2, AC3
  ```

  ```
  MOV AC0, AC1
  || MOV AC2, AC3
  ```

  ```
  MOV AC0, AC1
  ||
  MOV AC2, AC3
  ```

1.4.2.1 Reserved Words

Register names are reserved and they may not be used as names of identifiers, labels, etc. Mnemonic syntax names are not reserved.

1.4.2.2 Mnemonic Syntax Roots

The following root words are used in the mnemonic syntax.

Root	Meaning
ABS	Absolute value
ADD	Addition
AND	Bitwise AND
B	Branch
CALL	Function call
CLR	Assign the value to 0
CMP	Compare
CNT	Count
EXP	Exponent
MAC	Multiply and accumulate
MAR	Modify auxiliary register content
MAS	Multiply and subtract
MAX	Maximum
MIN	Minimum
MOV	Move data
MPY	Multiply
NEG	Negate (2s complement)
NOT	Bitwise complement (1s complement)
OR	Bitwise OR
POP	Pop from top of the stack
PSH	Push to top of the stack
RET	Return
ROL	Rotate left
ROR	Rotate right
RPT	Repeat
SAT	Saturate
SET	Assign the value to 1
SFT	Shift (left or right depending on sign of shift count)
SQA	Square and add
SQR	Square
SQS	Square and subtract
SUB	Subtraction

SWAP	Swap register contents
TST	Test bit
XOR	Bitwise exclusive-OR (XOR)
XPA	Expand
XTR	Extract

1.4.2.3 Mnemonic Syntax Prefixes

The following prefixes are used in the mnemonic syntax.

Prefix	Meaning
A	Instruction happens in address phase and is subject to circular addressing effects. Also, it occurs in the DAGEN functional unit and cannot be placed in parallel with any instruction that uses dual addressing mode.
B	Bit instruction. Note that B is also a root (branch), suffix (borrow), and prefix (bit). The differences in context should prevent any confusion.

1.4.2.4 Mnemonic Syntax Suffixes

Suffixes can be combined. For the multiply variant instructions, the combination order is: M K R {40, A, Z, or U}. This list does not imply that all of the suffixes will ever be combined at once; but, when they are combined, they will be in this order.

Suffix	Meaning
40	Enables the M40 mode (all 40 bits of the accumulator count)
B	Borrow
C	Carry
CC	Conditional
I	Enable interrupts
K	Multiply has a constant operand
L	Logical shift (left or right depending on sign of shift count)
M	This instruction has the option of assigning a memory operand to T3; regardless of whether that assignment actually occurs.
R	Round
S	Signed shift (left or right depending on sign of shift count)
U	Unsigned
V	Absolute value
Z	Delay on the memory operand

1.4.2.5 Literal and Address Operands

Literals in the mnemonic strings are denoted as K or k fields. In the Smem address modes that require an offset, the offset is also a literal (K16 or k3). 8-bit and 16-bit literals are allowed to be linktime-relocatable; for other literals, the value must be known at assembly time.

Addresses are the elements of the mnemonic strings denoted by P, L, and l. Further, 16-bit and 24-bit absolute address Smem modes are addresses, as is the dma Smem mode, denoted by the @ syntax. Addresses may be assembly-time constants or symbolic linktime-known constants or expressions.

Both literals and addresses follow syntax rule 1. For addresses only, rules 2 and 3 also apply.

Rule 1

A valid address or literal is a # followed by one of the following:

- a number `(#123)`
- an identifier `(#FOO)`
- a parenthesized expression `(#(FOO + 2))`

  Note that # is not used inside the expression.

Rule 2

When an address is used in a dma, the address does not need to have a leading #, be it a number, a symbol or an expression. These are all legal:

```
@#123
@123
@#foo
@foo
@#(foo+2)
@(foo+2)
```

Rule 3

When used in contexts other than dma (such as branch targets or Smem-absolute address), addresses generally need a leading #. As a convenience, the # may be omitted in front of an identifier. These are all legal:

Branch	Absolute Address
`B #123`	`*(#123)`
`B #foo`	`*(#foo)`
`B foo`	`*(foo)`
`B #(foo+2)`	`*(#(foo+2))`

These are illegal:

`B 123`	`*(123)`
`B (foo+2)`	`*((foo+2))`

1.4.2.6 Memory Operands

- Syntax of Smem is the same as that of Lmem or Baddr.
- In the following instruction syntaxes, Smem **cannot** reference to a memory-mapped register (MMR). No instruction can access a byte within a memory-mapped register. If Smem is an MMR in one of the following syntaxes, the DSP sends a hardware bus-error interrupt (BERRINT) request to the CPU.

```
MOV [uns()high_byte(Smem)[)], dst
MOV [uns()low_byte(Smem)[)], dst
MOV high_byte(Smem) << #SHIFTW, ACx
MOV low_byte(Smem) << #SHIFTW, ACx
MOV src, high_byte(Smem)
MOV src, low_byte(Smem)
```

- Syntax of Xmem is the same as that of Ymem.
- Syntax of coefficient operands, Cmem:

  `*CDP`
  `*CDP+`
  `*CDP–`
  `*(CDP + T0)`, when C54CM = 0
  `*(CDP + AR0)`, when C54CM = 1

  When an instruction uses a Cmem operand with paralleled instructions, the pointer modification of the Cmem operand must be the same for both instructions of the paralleled pair or the assembler generates an error. For example:

```
MAC *AR2+, *CDP+, AC0
:: MAC *AR3+, *CDP+, AC1
```

- An optional mmr prefix is allowed to be specified for indirect memory operands, for example, `mmr(*AR0)`. This is an assertion by you that this is an access to a memory-mapped register. The assembler checks whether such access is legal in given circumstances.

  The mmr prefix is supported for Xmem, Ymem, indirect Smem, indirect Lmem, and Cmem operands. It is not supported for direct memory operands; it is expected that an explicit mmap() instruction is used in conjunction with direct memory operands to indicate MMR access.

  Note that the mmr prefix is part of the syntax. It is an implementation restriction that mmr cannot exchange positions with other prefixes around the memory operand, such as dbl or uns. If several prefixes are specified, mmr must be the innermost prefix. Thus, `uns(mmr(*AR0))` is legal, but `mmr(uns(*AR0))` is not legal.

- The following indirect operands **cannot** be used for accesses to I/O space. An instruction using one of these operands requires a 2-byte extension for the constant. This extension would prevent the use of the port() qualifier needed to indicate an I/O-space access.

  ```
  *ARn(#K16)
  *+ARn(#K16)
  *CDP(#K16)
  *+CDP(#K16)
  ```

  Also, the following instructions that include the delay operation cannot be used for accesses to I/O space:

  ```
  DELAY Smem
  MACM[R]Z [T3 = ] Smem, Cmem, ACx
  ```

  Any illegal access to I/O space will generate a hardware bus-error interrupt (BERRINT) to be handled by the CPU.

1.4.2.7 Operand Modifiers

Operand modifiers look like function calls on operands. Note that uns is an operand modifier meaning unsigned and that the instruction suffix U also means unsigned. The operand modifier uns is used when the operand is modified on the way to the rest of the operation (MAC). The instruction suffix U is used when the whole operation is affected (MPYMU, CMPU, BCCU).

Modifier	Meaning
dbl	Access a true 32-bit memory operand
dual	Access a 32-bit memory operand for use as two independent 16-bit halves of the given operation
HI	Access upper 16 bits of the accumulator
high_byte	Access the high byte of the memory location
LO	Access lower 16 bits of the accumulator
low_byte	Access the low byte of the memory location
pair	Dual register access
rnd	Round
saturate	Saturate
uns	Unsigned operand (not used in MOV instructions)

When an instruction uses a Cmem operand with paralleled instructions and the Cmem operand is defined as unsigned (uns), both Cmem operands of the paralleled pair must be defined as unsigned (and reciprocally).

When an instruction uses both Xmem and Ymem operands with paralleled instructions and the Xmem operand is defined as unsigned (uns), Ymem operand must also be defined as unsigned (and reciprocally).

1.5 Nonrepeatable Instructions

Table 1−4 lists the instructions that cannot be used in a repeatable instruction.

Table 1−4. Nonrepeatable Instructions

Instruction Description	Mnemonic Syntax That Cannot Be Repeated
B: Branch Unconditionally	B ACx B L7 B L16 B P24
BCC: Branch Conditionally	BCC l4, cond BCC L8, cond BCC L16, cond BCC P24, cond
BCC: Branch on Auxiliary Register Not Zero	BCC L16, ARn_mod != #0
BCC: Compare and Branch	BCC[U] L8, src RELOP K8
BCLR: Clear Status Register Bit	BCLR k4, STx_55 BCLR f−name
BSET: Set Status Register Bit	BSET k4, STx_55 BSET f−name
CALL: Call Unconditionally	CALL ACx CALL L16 CALL P24
CALLCC: Call Conditionally	CALLCC L16, cond CALLCC P24, cond
IDLE	IDLE
INTR: Software Interrupt	INTR k5
MOV: Load CPU Register from Memory	MOV Smem, DP MOV dbl(Lmem), RETA
MOV: Load CPU Register with Immediate Value	MOV k16, DP
MOV: Move CPU Register Content to Auxiliary or Temporary Register	MOV RPTC, TAx

Table 1−4. Nonrepeatable Instructions (Continued)

Instruction Description	Mnemonic Syntax That Cannot Be Repeated
MOV: Store CPU Register Content to Memory	MOV RETA, dbl(Lmem)
RESET: Software Reset	RESET
RET: Return Unconditionally	RET
RETCC: Return Conditionally	RETCC cond
RETI: Return from Interrupt	RETI
ROUND: Round Accumulator Content	ROUND [ACx,] ACy
RPT: Repeat Single Instruction Unconditionally	RPT k8 RPT k16 RPT CSR
RPTADD: Repeat Single Instruction Unconditionally and Increment CSR	RPTADD CSR, TAx RPTADD CSR, k4
RPTB: Repeat Block of Instructions Unconditionally	RPTBLOCAL pmad RPTB pmad
RPTCC: Repeat Single Instruction Conditionally	RPTCC k8, cond
RPTSUB: Repeat Single Instruction Unconditionally and Decrement CSR	RPTSUB CSR, k4
TRAP: Software Trap	TRAP k5
XCC: Execute Conditionally	XCC [label,]cond XCCPART [label,]cond

Chapter 2

Parallelism Features and Rules

This chapter describes the parallelism features and rules of the TMS320C55x™ DSP mnemonic instruction set.

Topic **Page**

2.1 Parallelism Features

The C55x™ DSP architecture enables you to execute two instructions in parallel within the same cycle of execution. The types of parallelism are:

- Built-in parallelism within a single instruction.

  Some instructions perform two different operations in parallel. Double colons, ::, are used to separate the two operations. This type of parallelism is also called implied parallelism. For example:

  ```
  MPY *AR0, *CDP, AC0
  :: MPY *AR1, *CDP, AC1
  ```

  This is a single instruction. The data referenced by AR0 is multiplied by the coefficient referenced by CDP. At the same time, the data referenced by AR1 is multiplied by the same coefficient (CDP).

- User-defined parallelism between two instructions.

  Two instructions may be paralleled by you or the C compiler. The parallel bars, ||, are used to separate the two instructions to be executed in parallel. For example:

  ```
  MPYM *AR1–, *CDP, AC1
  || XOR AR2, T1
  ```

  The first instruction performs a multiplication in the D-unit. The second instruction performs a logical operation in the A-unit ALU.

- Built-in parallelism can be combined with user-defined parallelism. For example:

  ```
  MPYM T3=*AR3+, AC1, AC2
  || MOV #5, AR1
  ```

  The first instruction includes implied parallelism. The second instruction is paralleled by you.

2.2 Parallelism Basics

In the parallel pair, all of these constraints must be met:

- ❑ Total size of both instructions may not exceed 6 bytes.
- ❑ No resource conflicts as detailed in section 2.3.
- ❑ One instruction must have a parallel enable bit or the pair must qualify for soft-dual parallelism as detailed in section 2.4.
- ❑ No memory operand may use an addressing mode that requires a constant that is 16 bits or larger:
  - *abs16(#k16)
  - *(#k23)
  - port(#k16)
  - *ARn(K16)
  - *+ARn(K16)
  - *CDP(K16)
  - *+CDP(K16)
- ❑ The following instructions cannot be in parallel:
  - `BCC P24,cond`
  - `CALLCC P24, cond`
  - `IDLE`
  - `INTR k5`
  - `RESET`
  - `TRAP k5`
- ❑ Neither instruction in the parallel pair can use any of these instruction or operand modifiers:
  - `mmap()`
  - `port()`
  - <instruction>`.CR`
  - <instruction>`.LR`
- ❑ A particular register or memory location can only be written once per pipeline phase. Violations of this rule take many forms. Loading the same register twice is a simple case. Other cases include:
  - Conflicting address mode modifications (for example, *AR2+ versus *AR2−)
  - Combining a SWAP instruction (modifies all of its registers) with any other instruction that writes one of the same registers

- Data stack pointer (XSP) or system stack pointer (XSSP) modifications cannot be combined with any of the following instructions:
  - Call Conditionally, (if (cond) call instructions)
  - Call Unconditionally, (call instructions)
  - Push to top of Stack (push instructions)
  - Pop from top of Stack (pop instructions)
  - Return Conditionally, (if (cond) return instructions)
  - Return Unconditionally, (return instructions)
  - Return from Interrupt, (return_int, instructions)
  - trap or intr instructions
- When both instructions in a parallel pair modify a status bit, the value of that status bit becomes undefined.

2.3 Resource Conflicts

Every instruction uses some set of operators, address generation units, and buses, collectively called resources, while executing. To determine which resources are used by a specific instruction, see Table 4−1. Two instructions in parallel use all the resources of the individual instructions. A resource conflict occurs when two instructions use a combination of resources that is not supported on the C55x device. This section details the resource conflicts.

2.3.1 Operators

You may use each of these operators only once:

- D Unit ALU
- D Unit Shift
- D Unit Swap
- A Unit Swap
- A Unit ALU
- P Unit

For an instruction that uses multiple operators, any other instruction that uses one or more of those same operators may not be placed in parallel.

2.3.2 Address Generation Units

You may use no more than the indicated number of data address generation units:

- 2 Data Address (DA) Generation Units
- 1 Coefficient Address (CA) Generation Unit
- 1 Stack Address (SA) Generation Unit

2.3.3 Buses

You may use no more than the indicated number of buses:

- 2 Data Read (DR) Buses
- 1 Coefficient Read (CR) Bus
- 2 Data Write (DW) Buses
- 1 ACB Bus − brings D-unit registers to A-unit and P-unit operators
- 1 KAB Bus − Constant Bus
- 1 KDB Bus − Constant Bus

2.4 Soft-Dual Parallelism

Instructions that reference memory operands do not have parallel enable bits. Two such instructions may still be combined with a type of parallelism called soft-dual parallelism. The constraints of soft-dual parallelism are:

- Both memory operands must meet the constraints of the dual AR indirect addressing mode (Xmem and Ymem), as described in section 3.4.2. The operands available for the dual AR indirect addressing mode are:
  - *ARn
  - *ARn+
  - *ARn–
  - *(ARn + AR0)
  - *(ARn + T0)
  - *(ARn – AR0)
  - *(ARn – T0)
  - *ARn(AR0)
  - *ARn(T0)
  - *(ARn + T1)
  - *(ARn – T1)
- Neither instruction can contain any of the following:
  - Instructions embedding high_byte(Smem) and low_byte(Smem):
    - `MOV [uns()high_byte(Smem)()], dst`
    - `MOV [uns()low_byte(Smem)()], dst`
    - `MOV low_byte(Smem) << #SHIFTW, ACx`
    - `MOV high_byte(Smem) << #SHIFTW, ACx`
    - `MOV src, high_byte(Smem)`
    - `MOV src, low_byte(Smem)`

- These instructions that read and write the same memory location:
  - `BCLR src, Smem`
  - `BNOT src, Smem`
  - `BSET src, Smem`
  - `BTSTCLR k4, Smem, TCx`
  - `BTSTNOT k4, Smem, TCx`
  - `BTSTSET k4, Smem, TCx`

❑ With regard to soft-dual parallelism, the `AMAR Smem` instruction has the same properties as any memory reference instruction.

2.4.1 Soft-Dual Parallelism of MAR Instructions

Although the following modify auxiliary register (MAR) instructions do not reference memory and do not have parallel enable bits, they may be combined together or with any other memory reference instructions (not limited to Xmem/ Ymem) to form soft-dual parallelism.

❑ `AADD TAx, TAy`
❑ `AADD k8, TAx`
❑ `AMOV TAx, TAy`
❑ `AMOV k8, TAx`
❑ `ASUB TAx, TAy`
❑ `ASUB k8, TAx`

Note that this is not the full list of MAR instructions; instructions `AMOV D16, TAx` and `AMAR Smem` are not included.

2.5 Execute Conditionally Instructions

The parallelization of the execute conditionally (XCC) instructions does not adhere to the descriptions in this chapter. All of the specific instances of legal XCC parallelism are covered in the XCC descriptions in Chapter 5.

2.6 Other Exceptions

The following are other exceptions not covered elsewhere in this chapter.

- An instruction that reads the repeat counter register (RPTC) may not be combined with any single-repeat instruction:
  - RPT
  - RPTADD
  - RPTSUB
  - RPTCC

Chapter 3

Introduction to Addressing Modes

This chapter provides an introduction to the addressing modes of the TMS320C55x™ DSP.

Topic **Page**

3.1 Introduction to the Addressing Modes

The TMS320C55x DSP supports three types of addressing modes that enable flexible access to data memory, to memory-mapped registers, to register bits, and to I/O space:

- The absolute addressing mode allows you to reference a location by supplying all or part of an address as a constant in an instruction.
- The direct addressing mode allows you to reference a location using an address offset.
- The indirect addressing mode allows you to reference a location using a pointer.

Each addressing mode provides one or more types of operands. An instruction that supports an addressing-mode operand has one of the following syntax elements listed in Table 3−1.

Table 3−1. Addressing-Mode Operands

Syntax Element(s)	Description
Baddr	When an instruction contains Baddr, that instruction can access one or two bits in an accumulator (AC0–AC3), an auxiliary register (AR0–AR7), or a temporary register (T0–T3). Only the register bit test/set/clear/complement instructions support Baddr. As you write one of these instructions, replace Baddr with a compatible operand.
Cmem	When an instruction contains Cmem, that instruction can access a single word (16 bits) of data from data memory. As you write the instruction, replace Cmem with a compatible operand.
Lmem	When an instruction contains Lmem, that instruction can access a long word (32 bits) of data from data memory or from a memory-mapped registers. As you write the instruction, replace Lmem with a compatible operand.
Smem	When an instruction contains Smem, that instruction can access a single word (16 bits) of data from data memory, from I/O space, or from a memory-mapped register. As you write the instruction, replace Smem with a compatible operand.
Xmem and Ymem	When an instruction contains Xmem and Ymem, that instruction can perform two simultaneous 16-bit accesses to data memory. As you write the instruction, replace Xmem and Ymem with compatible operands.

3.2 Absolute Addressing Modes

Table 3−2 lists the absolute addressing modes available.

Table 3−2. Absolute Addressing Modes

Addressing Mode	Description
k16 absolute	This mode uses the 7-bit register called DPH (high part of the extended data page register) and a 16-bit unsigned constant to form a 23-bit data-space address. This mode is used to access a memory location or a memory-mapped register.
k23 absolute	This mode enables you to specify a full address as a 23-bit unsigned constant. This mode is used to access a memory location or a memory-mapped register.
I/O absolute	This mode enables you to specify an I/O address as a 16-bit unsigned constant. This mode is used to access a location in I/O space.

3.2.1 k16 Absolute Addressing Mode

The k16 absolute addressing mode uses the operand *abs16(#k16), where k16 is a 16-bit unsigned constant. DPH (the high part of the extended data page register) and k16 are concatenated to form a 23-bit data-space address.

An instruction using this addressing mode encodes the constant as a 2-byte extension to the instruction. Because of the extension, an instruction using this mode cannot be executed in parallel with another instruction.

3.2.2 k23 Absolute Addressing Mode

The k23 absolute addressing mode uses the operand *(#k23), where k23 is a 23-bit unsigned constant. An instruction using this addressing mode encodes the constant as a 3-byte extension to the instruction (the most-significant bit of this 3-byte extension is discarded). Because of the extension, an instruction using this mode cannot be executed in parallel with another instruction.

Instructions using the operand *(#k23) to access the memory operand Smem cannot be used in a repeatable instruction. See Table 1−4 for a list of these instructions.

3.2.3 I/O Absolute Addressing Mode

The I/O absolute addressing mode uses the port() operand qualifier. Enclose a 16-bit unsigned constant in the parentheses of the port() qualifier, port(#k16); there is no preceding asterisk, *, in this operand.

An instruction using this addressing mode encodes the constant as a 2-byte extension to the instruction. Because of the extension, an instruction using this mode cannot be executed in parallel with another instruction. The `DELAY` and `MACMZ` instructions cannot use this mode.

3.3 Direct Addressing Modes

Table 3−3 lists the direct addressing modes available.

Table 3−3. Direct Addressing Modes

Addressing Mode	Description
DP direct	This mode uses the main data page specified by DPH (high part of the extended data page register) in conjunction with the data page register (DP). This mode is used to access a memory location or a memory-mapped register.
SP direct	This mode uses the main data page specified by SPH (high part of the extended stack pointers) in conjunction with the data stack pointer (SP). This mode is used to access stack values in data memory.
Register-bit direct	This mode uses an offset to specify a bit address. This mode is used to access one register bit or two adjacent register bits.
PDP direct	This mode uses the peripheral data page register (PDP) and an offset to specify an I/O address. This mode is used to access a location in I/O space.

The DP direct and SP direct addressing modes are mutually exclusive. The mode selected depends on the CPL bit in status register ST1_55:

CPL	Addressing Mode Selected
0	DP direct addressing mode
1	SP direct addressing mode

The register-bit and PDP direct addressing modes are independent of the CPL bit.

3.3.1 DP Direct Addressing Mode

When an instruction uses the DP direct addressing mode, a 23-bit address is formed. The 7 MSBs are taken from DPH that selects one of the 128 main data pages (0 through 127). The 16 LSBs are the sum of two values:

- The value in the data page register (DP). DP identifies the start address of a 128-word local data page within the main data page. This start address can be any address within the selected main data page.
- A 7-bit offset (Doffset) calculated by the assembler. The calculation depends on whether you are accessing data memory or a memory-mapped register (using the mmap() qualifier).

The concatenation of DPH and DP is called the extended data page register (XDP). You can load DPH and DP individually, or you can use an instruction that loads XDP.

3.3.2 SP Direct Addressing Mode

When an instruction uses the SP direct addressing mode, a 23-bit address is formed. The 7 MSBs are taken from SPH. The 16 LSBs are the sum of the SP value and a 7-bit offset that you specify in the instruction. The offset can be a value from 0 to 127. The concatenation of SPH and SP is called the extended data stack pointer (XSP). You can load SPH and SP individually, or you can use an instruction that loads XSP.

On the first main data page, addresses 00 0000h–00 005Fh are reserved for the memory-mapped registers. If any of your data stack is in main data page 0, make sure it uses only addresses 00 0060h–00 FFFFh on that page.

3.3.3 Register-Bit Direct Addressing Mode

In the register-bit direct addressing mode, the offset you supply in the operand, @bitoffset, is an offset from the LSB of the register. For example, if bitoffset is 0, you are addressing the LSB of a register. If bitoffset is 3, you are addressing bit 3 of the register.

Only the register bit test/set/clear/complement instructions support this mode. These instructions enable you to access bits in the following registers only: the accumulators (AC0–AC3), the auxiliary registers (AR0–AR7), and the temporary registers (T0–T3).

3.3.4 PDP Direct Addressing Mode

When an instruction uses the PDP direct addressing mode, a 16-bit I/O address is formed. The 9 MSBs are taken from the 9-bit peripheral data page register (PDP) that selects one of the 512 peripheral data pages (0 through 511). Each page has 128 words (0 to 127). You select a particular word by specifying a 7-bit offset (Poffset) in the instruction. For example, to access the first word on a page, use an offset of 0.

You must use a port() qualifier to indicate that you are accessing an I/O-space location rather than a data-memory location. The port() qualifier must enclose the qualified read or write operand.

3.4 Indirect Addressing Modes

Table 3−4 list the indirect addressing modes available. You may use these modes for linear addressing or circular addressing.

Table 3−4. Indirect Addressing Modes

Addressing Mode	Description
AR indirect	This mode uses one of eight auxiliary registers (AR0–AR7) to point to data. The way the CPU uses the auxiliary register to generate an address depends on whether you are accessing data space (memory or memory-mapped registers), individual register bits, or I/O space.
Dual AR indirect	This mode uses the same address-generation process as the AR indirect addressing mode. This mode is used with instructions that access two or more data-memory locations.
CDP indirect	This mode uses the coefficient data pointer (CDP) to point to data. The way the CPU uses CDP to generate an address depends on whether you are accessing data space (memory or memory-mapped registers), individual register bits, or I/O space.
Coefficient indirect	This mode uses the same address-generation process as the CDP indirect addressing mode. This mode is available to support instructions that can access a coefficient in data memory at the same time they access two other data-memory values using the dual AR indirect addressing mode.

3.4.1 AR Indirect Addressing Mode

The AR indirect addressing mode uses an auxiliary register ARn (n = 0, 1, 2, 3, 4, 5, 6, or 7) to point to data. The way the CPU uses ARn to generate an address depends on the access type:

For An Access To ...	ARn Contains ...
Data space (memory or registers)	The 16 least significant bits (LSBs) of a 23-bit address. The 7 most significant bits (MSBs) are supplied by ARnH, which is the high part of extended auxiliary register XARn. For accesses to data space, use an instruction that loads XARn; ARn can be individually loaded, but ARnH cannot be loaded.
A register bit (or bit pair)	A bit number. Only the register bit test/set/clear/complement instructions support AR indirect accesses to register bits. These instructions enable you to access bits in the following registers only: the accumulators (AC0–AC3), the auxiliary registers (AR0–AR7), and the temporary registers (T0–T3).
I/O space	A 16-bit I/O address.

The AR indirect addressing-mode operand available depends on the ARMS bit of status register ST2_55:

ARMS	DSP Mode or Control Mode
0	DSP mode. The CPU can use the list of DSP mode operands (Table 3−5), which provide efficient execution of DSP-intensive applications.
1	Control mode. The CPU can use the list of control mode operands (Table 3−6), which enable optimized code size for control system applications.

Table 3−5 (page 3-8) introduces the DSP operands available for the AR indirect addressing mode. Table 3−6 (page 3-12) introduces the control mode operands. When using the tables, keep in mind that:

- Both pointer modification and address generation are linear or circular according to the pointer configuration in status register ST2_55. The content of the appropriate 16-bit buffer start address register (BSA01, BSA23, BSA45, or BSA67) is added only if circular addressing is activated for the chosen pointer.
- All additions to and subtractions from the pointers are done modulo 64K. You cannot address data across main data pages without changing the value in the extended auxiliary register (XARn).

Table 3−5. DSP Mode Operands for the AR Indirect Addressing Mode

Operand	Pointer Modification	Supported Access Types
*ARn	ARn is not modified.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*ARn+	ARn is incremented after the address is generated: If 16-bit/1-bit operation: ARn = ARn + 1 If 32-bit/2-bit operation: ARn = ARn + 2	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*ARn–	ARn is decremented after the address is generated: If 16-bit/1-bit operation: ARn = ARn – 1 If 32-bit/2-bit operation: ARn = ARn – 2	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*+ARn	ARn is incremented before the address is generated: If 16-bit/1-bit operation: ARn = ARn + 1 If 32-bit/2-bit operation: ARn = ARn + 2	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*–ARn	ARn is decremented before the address is generated: If 16-bit/1-bit operation: ARn = ARn – 1 If 32-bit/2-bit operation: ARn = ARn – 2	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*(ARn + AR0)	The 16-bit signed constant in AR0 is added to ARn after the address is generated: ARn = ARn + AR0 This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)

Table 3−5. DSP Mode Operands for the AR Indirect Addressing Mode (Continued)

Operand	Pointer Modification	Supported Access Types
*(ARn + T0)	The 16-bit signed constant in T0 is added to ARn after the address is generated: ARn = ARn + T0 This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*(ARn – AR0)	The 16-bit signed constant in AR0 is subtracted from ARn after the address is generated: ARn = ARn – AR0 This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*(ARn – T0)	The 16-bit signed constant in T0 is subtracted from ARn after the address is generated: ARn = ARn – T0 This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*ARn(AR0)	ARn is not modified. ARn is used as a base pointer. The 16-bit signed constant in AR0 is used as an offset from that base pointer. This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*ARn(T0)	ARn is not modified. ARn is used as a base pointer. The 16-bit signed constant in T0 is used as an offset from that base pointer. This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*ARn(T1)	ARn is not modified. ARn is used as a base pointer. The 16-bit signed constant in T1 is used as an offset from that base pointer.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)

Table 3−5. DSP Mode Operands for the AR Indirect Addressing Mode (Continued)

Operand	Pointer Modification	Supported Access Types
*(ARn + T1)	The 16-bit signed constant in T1 is added to ARn after the address is generated: ARn = ARn + T1	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*(ARn – T1)	The 16-bit signed constant in T1 is subtracted from ARn after the address is generated: ARn = ARn – T1	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*(ARn + AR0B)	The 16-bit signed constant in AR0 is added to ARn after the address is generated: ARn = ARn + AR0 (The addition is done with reverse carry propagation) This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time. Note: When this bit-reverse operand is used, ARn cannot be used as a circular pointer. If ARn is configured in ST2_55 for circular addressing, the corresponding buffer start address register value (BSAxx) is added to ARn, but ARn is not modified so as to remain inside a circular buffer.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*(ARn + T0B)	The 16-bit signed constant in T0 is added to ARn after the address is generated: ARn = ARn + T0 (The addition is done with reverse carry propagation) This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time. Note: When this bit-reverse operand is used, ARn cannot be used as a circular pointer. If ARn is configured in ST2_55 for circular addressing, the corresponding buffer start address register value (BSAxx) is added to ARn, but ARn is not modified so as to remain inside a circular buffer.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)

Table 3−5. DSP Mode Operands for the AR Indirect Addressing Mode (Continued)

Operand	Pointer Modification	Supported Access Types
*(ARn – AR0B)	The 16-bit signed constant in AR0 is subtracted from ARn after the address is generated: ARn = ARn – AR0 (The subtraction is done with reverse carry propagation) This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time. Note: When this bit-reverse operand is used, ARn cannot be used as a circular pointer. If ARn is configured in ST2_55 for circular addressing, the corresponding buffer start address register value (BSAxx) is added to ARn, but ARn is not modified so as to remain inside a circular buffer.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*(ARn – T0B)	The 16-bit signed constant in T0 is subtracted from ARn after the address is generated: ARn = ARn – T0 (The subtraction is done with reverse carry propagation) This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time. Note: When this bit-reverse operand is used, ARn cannot be used as a circular pointer. If ARn is configured in ST2_55 for circular addressing, the corresponding buffer start address register value (BSAxx) is added to ARn, but ARn is not modified so as to remain inside a circular buffer.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)
*ARn(#K16)	ARn is not modified. ARn is used as a base pointer. The 16-bit signed constant (K16) is used as an offset from that base pointer. Note: When an instruction uses this operand, the constant is encoded in a 2-byte extension to the instruction. Because of the extension, an instruction using this operand cannot be executed in parallel with another instruction.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr)
*+ARn(#K16)	The 16-bit signed constant (K16) is added to ARn before the address is generated: ARn = ARn + K16 Note: When an instruction uses this operand, the constant is encoded in a 2-byte extension to the instruction. Because of the extension, an instruction using this operand cannot be executed in parallel with another instruction.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr)

Because of the extension, an instruction using this operand cannot be executed in parallel with another instruction.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr)
*ARn(short(#k3))	ARn is not modified. ARn is used as a base pointer. The 3-bit unsigned constant (k3) is used as an offset from that base pointer. k3 is in the range 1 to 7.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register bit (Baddr) I/O-space (Smem)

3.4.2 Dual AR Indirect Addressing Mode

The dual AR indirect addressing mode enables you to make two data-memory accesses through the eight auxiliary registers, AR0–AR7. As with single AR indirect accesses to data space, the CPU uses an extended auxiliary register to create each 23-bit address. You can use linear addressing or circular addressing for each of the two accesses.

You may use the dual AR indirect addressing mode for:

- Executing an instruction that makes two 16-bit data-memory accesses. In this case, the two data-memory operands are designated in the instruction syntax as Xmem and Ymem. For example:

  ```
  ADD Xmem, Ymem, ACx
  ```

- Executing two instructions in parallel. In this case, both instructions must each access a single memory value, designated in the instruction syntaxes as Smem or Lmem. For example:

  ```
  MOV Smem, dst
  || AND Smem, src, dst
  ```

  The operand of the first instruction is treated as an Xmem operand, and the operand of the second instruction is treated as a Ymem operand.

The available dual AR indirect operands are a subset of the AR indirect operands. The ARMS status bit does not affect the set of dual AR indirect operands available.

Note:

The assembler rejects code in which dual operands use the same auxiliary register with two different auxiliary register modifications. You can use the same ARn for both operands, if one of the operands is *ARn or *ARn(T0); neither modifies ARn.

Table 3−7 (page 3-15) introduces the operands available for the dual AR indirect addressing mode. Note that:

- Both pointer modification and address generation are linear or circular according to the pointer configuration in status register ST2_55. The content of the appropriate 16-bit buffer start address register (BSA01, BSA23, BSA45, or BSA67) is added only if circular addressing is activated for the chosen pointer.
- All additions to and subtractions from the pointers are done modulo 64K. You cannot address data across main data pages without changing the value in the extended auxiliary register (XARn).

Table 3−7. Dual AR Indirect Operands

Operand	Pointer Modification	Supported Access Types
*ARn	ARn is not modified.	Data-memory (Smem, Lmem, Xmem, Ymem)
*ARn+	ARn is incremented after the address is generated: If 16-bit operation: ARn = ARn + 1 If 32-bit operation: ARn = ARn + 2	Data-memory (Smem, Lmem, Xmem, Ymem)
*ARn–	ARn is decremented after the address is generated: If 16-bit operation: ARn = ARn – 1 If 32-bit operation: ARn = ARn – 2	Data-memory (Smem, Lmem, Xmem, Ymem)
*(ARn + AR0)	The 16-bit signed constant in AR0 is added to ARn after the address is generated: ARn = ARn + AR0 This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time.	Data-memory (Smem, Lmem, Xmem, Ymem)
*(ARn + T0)	The 16-bit signed constant in T0 is added to ARn after the address is generated: ARn = ARn + T0 This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time.	Data-memory (Smem, Lmem, Xmem, Ymem)

Table 3−7. Dual AR Indirect Operands (Continued)

Operand	Pointer Modification	Supported Access Types
*(ARn – AR0)	The 16-bit signed constant in AR0 is subtracted from ARn after the address is generated: ARn = ARn – AR0 This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time.	Data-memory (Smem, Lmem, Xmem, Ymem)
*(ARn – T0)	The 16-bit signed constant in T0 is subtracted from ARn after the address is generated: ARn = ARn – T0 This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time.	Data-memory (Smem, Lmem, Xmem, Ymem)
*ARn(AR0)	ARn is not modified. ARn is used as a base pointer. The 16-bit signed constant in AR0 is used as an offset from that base pointer. This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time.	Data-memory (Smem, Lmem, Xmem, Ymem)
*ARn(T0)	ARn is not modified. ARn is used as a base pointer. The 16-bit signed constant in T0 is used as an offset from that base pointer. This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time.	Data-memory (Smem, Lmem, Xmem, Ymem)
*(ARn + T1)	The 16-bit signed constant in T1 is added to ARn after the address is generated: ARn = ARn + T1	Data-memory (Smem, Lmem, Xmem, Ymem)
*(ARn – T1)	The 16-bit signed constant in T1 is subtracted from ARn after the address is generated: ARn = ARn – T1	Data-memory (Smem, Lmem, Xmem, Ymem)

3.4.3 CDP Indirect Addressing Mode

The CDP indirect addressing mode uses the coefficient data pointer (CDP) to point to data. The way the CPU uses CDP to generate an address depends on the access type:

For An Access To ...	CDP Contains ...
Data space (memory or registers)	The 16 least significant bits (LSBs) of a 23-bit address. The 7 most significant bits (MSBs) are supplied by CDPH, the high part of the extended coefficient data pointer (XCDP).
A register bit (or bit pair)	A bit number. Only the register bit test/set/clear/complement instructions support CDP indirect accesses to register bits. These instructions enable you to access bits in the following registers only: the accumulators (AC0–AC3), the auxiliary registers (AR0–AR7), and the temporary registers (T0–T3).
I/O space	A 16-bit I/O address.

Table 3−8 (page 3-17) introduces the operands available for the CDP indirect addressing mode. Note that:

- Both pointer modification and address generation are linear or circular according to the pointer configuration in status register ST2_55. The content of the 16-bit buffer start address register BSAC is added only if circular addressing is activated for CDP.
- All additions to and subtractions from CDP are done modulo 64K. You cannot address data across main data pages without changing the value of CDPH (the high part of the extended coefficient data pointer).

Table 3−8. CDP Indirect Operands

Operand	Pointer Modification	Supported Access Types
*CDP	CDP is not modified.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register-bit (Baddr) I/O-space (Smem)
*CDP+	CDP is incremented after the address is generated: If 16-bit/1-bit operation: CDP = CDP + 1 If 32-bit/2-bit operation: CDP = CDP + 2	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register-bit (Baddr) I/O-space (Smem)

Table 3−8. CDP Indirect Operands (Continued)

Operand	Pointer Modification	Supported Access Types
*CDP–	CDP is decremented after the address is generated: If 16-bit/1-bit operation: CDP = CDP – 1 If 32-bit/2-bit operation: CDP = CDP – 2	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register-bit (Baddr) I/O-space (Smem)
*CDP(#K16)	CDP is not modified. CDP is used as a base pointer. The 16-bit signed constant (K16) is used as an offset from that base pointer. Note: When an instruction uses this operand, the constant is encoded in a 2-byte extension to the instruction. Because of the extension, an instruction using this operand cannot be executed in parallel with another instruction.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register-bit (Baddr)
*+CDP(#K16)	The 16-bit signed constant (K16) is added to CDP before the address is generated: CDP = CDP + K16 Note: When an instruction uses this operand, the constant is encoded in a 2-byte extension to the instruction. Because of the extension, an instruction using this operand cannot be executed in parallel with another instruction.	Data-memory (Smem, Lmem) Memory-mapped register (Smem, Lmem) Register-bit (Baddr)

3.4.4 Coefficient Indirect Addressing Mode

The coefficient indirect addressing mode uses the same address-generation process as the CDP indirect addressing mode for data-space accesses. The coefficient indirect addressing mode is supported by select memory-to-memory move and memory initialization instructions and by the following arithmetical instructions:

- ❏ Dual multiply (accumulate/subtract)
- ❏ Finite impulse response filter
- ❏ Multiply
- ❏ Multiply and accumulate
- ❏ Multiply and subtract

Instructions using the coefficient indirect addressing mode to access data are mainly instructions performing operations with three memory operands per cycle. Two of these operands (Xmem and Ymem) are accessed with the dual AR indirect addressing mode. The third operand (Cmem) is accessed with the coefficient indirect addressing mode. The Cmem operand is carried on the BB bus.

Keep the following facts about the BB bus in mind as you use the coefficient indirect addressing mode:

- ❏ The BB bus is not connected to external memory. If a Cmem operand is accessed through the BB bus, the operand must be in internal memory.

- ❏ Although the following instructions access Cmem operands, they do not use the BB bus to fetch the 16-bit or 32-bit Cmem operand.

Instruction Syntax	Description of Cmem Access	Bus Used to Access Cmem
MOV Cmem, Smem	16-bit read from Cmem	DB
MOV Smem, Cmem	16-bit write to Cmem	EB
MOV Cmem, dbl(Lmem)	32-bit read from Cmem	CB for most significant word (MSW) DB for least significant word (LSW)
MOV dbl(Lmem), Cmem	32-bit write to Cmem	FB for MSW EB for LSW

Consider the following instruction syntax. In one cycle, two multiplications can be performed in parallel. One memory operand (Cmem) is common to both multiplications, while dual AR indirect operands (Xmem and Ymem) are used for the other values in the multiplication.

```
MPY Xmem, Cmem, ACx
:: MPY Ymem, Cmem, ACy
```

To access three memory values (as in the above example) in a single cycle, the value referenced by Cmem must be located in a memory bank different from the one containing the Xmem and Ymem values.

Table 3−9 introduces the operands available for the coefficient indirect addressing mode. Note that:

- Both pointer modification and address generation are linear or circular according to the pointer configuration in status register ST2_55. The content of the 16-bit buffer start address register BSAC is added only if circular addressing is activated for CDP.
- All additions to and subtractions from CDP are done modulo 64K. You cannot address data across main data pages without changing the value of CDPH (the high part of the extended coefficient data pointer).

Table 3−9. Coefficient Indirect Operands

Operand	Pointer Modification	Supported Access Type
*CDP	CDP is not modified.1	Data-memory
*CDP+	CDP is incremented after the address is generated: If 16-bit operation: CDP = CDP + 1 If 32-bit operation: CDP = CDP + 2	Data-memory
*CDP–	CDP is decremented after the address is generated: If 16-bit operation: CDP = CDP – 1 If 32-bit operation: CDP = CDP – 2	Data-memory
*(CDP + AR0)	The 16-bit signed constant in AR0 is added to CDP after the address is generated: CDP = CDP + AR0 This operand is available when C54CM = 1. This operand is usable when .c54cm_on is active at assembly time.	Data-memory
*(CDP + T0)	The 16-bit signed constant in T0 is added to CDP after the address is generated: CDP = CDP + T0 This operand is available when C54CM = 0. This operand is usable when .c54cm_off is active at assembly time.	Data-memory

3.5 Circular Addressing

Circular addressing can be used with any of the indirect addressing modes. Each of the eight auxiliary registers (AR0–AR7) and the coefficient data pointer (CDP) can be independently configured to be linearly or circularly modified as they act as pointers to data or to register bits, see Table 3−10. This configuration is done with a bit (ARnLC) in status register ST2_55. To choose circular modification, set the bit.

Table 3−10. Circular Addressing Pointers

Pointer	Linear/Circular Configuration Bit	Supplier of Main Data Page	Buffer Start Address Register	Buffer Size Register
AR0	ST2_55(0) = AR0LC	AR0H	BSA01	BK03
AR1	ST2_55(1) = AR1LC	AR1H	BSA01	BK03
AR2	ST2_55(2) = AR2LC	AR2H	BSA23	BK03
AR3	ST2_55(3) = AR3LC	AR3H	BSA23	BK03
AR4	ST2_55(4) = AR4LC	AR4H	BSA45	BK47
AR5	ST2_55(5) = AR5LC	AR5H	BSA45	BK47
AR6	ST2_55(6) = AR6LC	AR6H	BSA67	BK47
AR7	ST2_55(7) = AR7LC	AR7H	BSA67	BK47
CDP	ST2_55(8) = CDPLC	CDPH	BSAC	BKC

Each auxiliary register ARn has its own linear/circular configuration bit in ST2_55:

ARnLC	ARn Is Used For ...
0	Linear addressing
1	Circular addressing

The CDPLC bit in status register ST2_55 configures the DSP to use CDP for linear addressing or circular addressing:

CDPLC	CDP Is Used For ...
0	Linear addressing
1	Circular addressing

You can use the circular addressing instruction qualifier, .CR, if you want every pointer used by the instruction to be modified circularly, just add .CR to the end of the instruction mnemonic (for example, ADD.CR). The circular addressing instruction qualifier overrides the linear/circular configuration in ST2_55.

Chapter 4

Instruction Set Summary

This chapter provides a summary of the TMS320C55x™ DSP mnemonic instruction set (Table 4−1). With each instruction, you will find the availability of a parallel enable bit, word count (size), cycle time, what pipeline phase the instruction executes, in what operator unit the instruction executes, how many of each address generation unit is used, and how many of each bus is used.

Table 4−1 does not list all of the resources that may be used by an instruction, it only lists those that may result in a resource conflict, and thus prevent two instructions from being in parallel. If an instruction lists nothing in a particular column, it means that particular resource will never be in conflict for that instruction.

The column heads of Table 4−1 are:

- Instruction: In cases where the resource usage of an instruction varies with the kinds of registers, you see the notation <name>-AU for A-unit registers and <name>-DU for D-unit registers. So, dst-AU is a destination that is an A-unit register and src-DU is a source that is a D-unit register. In the few cases where that notation is insufficient, you see the cases listed in the Notes column.
- E: Whether that instruction has a parallel enable bit
- S: The size of the instruction in bytes
- C: Number of cycles required for the instruction
- Pipe: The pipeline phase in which the instruction executes:

Name	Phase
AD	Address
D	Decode
R	Read
X	Execute

- Operator: Which operator(s) are used by this instruction. When an instruction uses multiple operators, any other instruction that uses one or more of those same operators may not be placed in parallel.

- Address Generation Unit: How many of each address generation unit is used. The address generation units are:

Name	Unit
DA	Data Address Generation Unit
CA	Coefficient Address Generation Unit
SA	Stack Address Generation Unit

- Buses: How many of each bus is used. The buses are:

Name	Bus
DR	Data Read
CR	Coefficient Read
DW	Data Write
ACB	Brings D-unit registers to A-unit and P-unit operators

Chapter 5

Instruction Set Descriptions

This chapter provides detailed information on the TMS320C55x™ DSP mnemonic instruction set.

See section 1.1, *Instruction Set Terms, Symbols, and Abbreviations*, for definitions of symbols and abbreviations used in the description of each instruction. See Chapter 4 for a summary of the instruction set.

AADD *Modify Auxiliary or Temporary Register Content by Addition*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AADD** TAx, TAy	No	3	1	AD
[2]	**AADD** P8, TAx	No	3	1	AD

Description

These instructions perform, in the A-unit address generation units:

- ❑ an addition between two auxiliary or temporary registers, TAx and TAy, and stores the result in TAy
- ❑ an addition between the auxiliary or temporary registers TAx and a program address defined by a program address label assembled into unsigned P8, and stores the result in TAx

The operation is performed in the address phase of the pipeline, however data memory is not accessed.

If the destination register is an auxiliary register and the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management controls the result stored in the destination register.

Status Bits

Affected by ST2_55

Affects none

See Also

See the following other related instructions:

- ❑ AADD (Modify Extended Auxiliary Register Content by Addition)
- ❑ AMAR (Modify Auxiliary Register Content)
- ❑ AMAR (Modify Extended Auxiliary Register Content)
- ❑ AMOV (Modify Auxiliary or Temporary Register Content)
- ❑ ASUB (Modify Auxiliary or Temporary Register Content by Subtraction)

Modify Auxiliary or Temporary Register Content by Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AADD** TAx, TAy	No	3	1	AD

Opcode

0001 010E	FSSS xxxx	FDDD 0000
0001 010E	FSSS xxxx	FDDD 1000

The assembler selects the opcode depending on the instruction position in a paralleled pair.

Operands TAx, TAy

Description This instruction performs, in the A-unit address generation units, an addition between two auxiliary or temporary registers, TAy and TAx, and stores the result in TAy. The content of TAx is considered signed:

```
TAy = TAy + TAx
```

The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

If the destination register is an auxiliary register and the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management controls the result stored in the destination register.

Compatibility with C54x devices (C54CM = 1)

In the translated code section, the AADD instruction must be executed with C54CM set to 1.

When circular modification is selected for the destination auxiliary register, this instruction modifies the selected destination auxiliary register by using BK03 as the circular buffer size register; BK47 is not used.

Status Bits Affected by ST2_55

Affects none

Repeat This instruction can be repeated.

Example 1

Syntax	Description
AADD T0, AR0	The content of AR0 is added to the signed content of T0 and the result is stored in AR0.

Before		**After**	
XAR0	01 0000	XAR0	00 8000
T0	8000	T0	8000

Example 2

Syntax	Description
AADD T1, T0	The content of T0 is added to the content of T1 and the result is stored in T0.

Modify Auxiliary or Temporary Register Content by Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**AADD** P8, TAx	No	3	1	AD

Opcode

```
| 0001 010E | PPPP PPPP | FDDD 0100
| 0001 010E | PPPP PPPP | FDDD 1100
```

The assembler selects the opcode depending on the instruction position in a paralleled pair.

Operands TAx, P8

Description This instruction performs, in the A-unit address generation units, an addition between the auxiliary or temporary register TAx and a program address defined by a program address label assembled into unsigned P8, and stores the result in TAx:

```
TAx = TAx + P8
```

The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

If the destination register is an auxiliary register and the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management controls the result stored in the destination register.

Compatibility with C54x devices (C54CM = 1)

In the translated code section, the AADD instruction must be executed with C54CM set to 1.

When circular modification is selected for the destination auxiliary register, this instruction modifies the selected destination auxiliary register by using BK03 as the circular buffer size register; BK47 is not used.

Status Bits Affected by ST2_55

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AADD #255, T0	The unsigned 8-bit value (255) is added to the content of T0 and the result is stored in T0.

AADD *Modify Data Stack Pointer*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AADD** K8**, SP**	Yes	2	1	AD

Opcode

0100 111E	KKKK KKKK

Operands K8

Description This instruction performs an addition in the A-unit data-address generation unit (DAGEN) in the address phase of the pipeline. The 8-bit signed constant, K8, is sign extended to 16 bits and added to the data stack pointer (SP):

```
SP = SP + K8
```

When in 32-bit stack configuration, the system stack pointer (SSP) is also modified. Updates of the SP and SSP (depending on the stack configuration) should not be executed in parallel with this instruction.

Status Bits Affected by none

Affects none

Repeat Repeat

This instruction can be repeated.

Example

Syntax	Description
AADD #127, SP	The 8-bit value (127) is sign extended to 16 bits and added to the stack pointer (SP).

AADD *Modify Extended Auxiliary Register Content by Addition*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AADD** XACsrc, XACdst	Yes	3	1	AD

Opcode

DAG_X:	0001	010E	XACS	0001	XACD	0000
DAG_Y:	0001	010E	XACS	0001	XACD	1000

Operands XARx, XARy, XCDP

Description This instruction performs, in the A-unit address generation units, a full 23-bit unsigned addition between two auxiliary or other addressing registers, XACdst and XACsrc, and stores the result in XACdst. The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

Since the operation performed is an unsigned operation, if a destination register is an auxiliary register, it is not allowed to use the circular addressing mode; that is, the result of setting the corresponding bit (ARnLC) in status register ST2_55 to 1 is undefined and using the circular addressing qualifier operating in parallel is not allowed.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits Affected by

Affects

Repeat This instruction can be repeated.

Example 1

Syntax	Description
AADD XAR0, XAR1	The content of XAR0 is added to XAR1 and stored in XAR1.

```
Before                      After
XAR0            12 3456     XAR0            12 3456
XAR1            43 5634     XAR1            55 8A8A
```

Example 2

Syntax	Description
AADD XAR7, XCDP	The content of XAR7 is added to XCDP and stored in XCDP.

```
Before                      After
XCDP            00 8000     XCDP            01 0080
XAR7            00 8080     XAR7            00 8080

Execution
(XACdst) + (XACsrc)  -> XACdst
```

ABDST *Absolute Distance*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ABDST** Xmem, Ymem, ACx, ACy	No	4	1	X

Opcode

1000 0110	XXXM MMYY	YMMM DDDD	1111 xxn%

Operands ACx, ACy, Xmem, Ymem

Description This instruction executes two operations in parallel: one in the D-unit MAC and one in the D-unit ALU:

```
ACy = ACy + |HI(ACx)|
:: ACx = (Xmem << #16) - (Ymem << #16)
```

The absolute value of accumulator ACx content is computed and added to accumulator ACy content through the D-unit MAC. When an overflow is detected according to M40:

- ❏ the destination accumulator overflow status bit (ACOVy) is set
- ❏ the destination register (ACy) is saturated according to SATD

The Ymem content shifted left 16 bits is subtracted from the Xmem content shifted left 16 bits in the D-unit ALU.

- ❏ Input operands (Xmem and Ymem) are sign extended to 40 bits according to SXMD.
- ❏ CARRY status bit depends on M40. Subtraction borrow bit is reported in CARRY status bit. It is the logical complement of CARRY status bit.
- ❏ When an overflow is detected according to M40:
  - ■ the destination accumulator overflow status bit (ACOVx) is set
  - ■ the destination register (ACx) is saturated according to SATD

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, the subtract operation does not have any overflow detection, report, and saturation after the shifting operation.

Status Bits Affected by C54CM, FRCT, M40, SATD, SXMD

Affects ACOVx, ACOVy, CARRY

Repeat This instruction can be repeated.

- SQDST (Square Distance)

Example

Syntax	Description
ABDST *AR0+, *AR1, AC0, AC1	The absolute value of the content of AC0 is added to the content of AC1 and the result is stored in AC1. The content addressed by AR1 is subtracted from the content addressed by AR0 and the result is stored in AC0. The content of AR0 is incremented by 1.

Before		**After**	
AC0	00 0000 0000	AC0	00 4500 0000
AC1	00 E800 0000	AC1	00 E800 0000
AR0	202	AR0	203
AR1	302	AR1	302
202	3400	202	3400
302	EF00	302	EF00
ACOV0	0	ACOV0	0
ACOV1	0	ACOV1	0
CARRY	0	CARRY	0
M40	1	M40	1
SXMD	1	SXMD	1

ABS *Absolute Value*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ABS** [src,] dst	Yes	2	1	X

Opcode

0011 001E	FSSS FDDD

Operands dst, src

Description This instruction computes the absolute value of the source register (src):

```
dst = |src|
```

- When the destination register (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - If an auxiliary or temporary register is the source operand of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended to 40 bits according to SXMD.
  - If M40 = 0, the sign of the source register is extracted at bit position 31. If src(31) = 1, the source register content is negated. If src(31) = 0, the source register content is moved to the destination accumulator.
  - If M40 = 1, the sign of the source register is extracted at bit position 39. If src(39) = 1, the source register content is negated. If src(39) = 0, the source register content is moved to the destination accumulator.
  - During the 40-bit move operation, an overflow and CARRY bit status are detected according to M40:
    - The destination accumulator overflow status bit (ACOVx) is set.
    - The destination register is saturated according to SATD.
    - The CARRY status bit is updated as follows: If the result of the operation stored in the destination register is 0, CARRY is set; otherwise, CARRY is cleared.
- When the destination register (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - The sign of the source register is extracted at bit position 15. If src(15) = 1, the source register content is negated. If src(15) = 0, the source register content is moved to the destination register. Overflow is detected at bit position 15.
  - The destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if M40 status bit was locally set to 1. To ensure compatibility versus overflow detection and saturation of destination accumulator, this instruction must be executed with M40 = 0.

Status Bits Affected by C54CM, M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

- ADDV (Addition with Absolute Value)

Example 1

Syntax	Description
ABS AC0, AC1	The absolute value of the content of AC0 is stored in AC1.

Before		After	
AC1	00 0000 2000	AC1	7D FFFF EDCC
AC0	82 0000 1234	AC0	82 0000 1234
M40	1	M40	1

Example 2

Syntax	Description
ABS AR1, AC1	The absolute value of the content of AR1 is stored in AC1.

Before		After	
AC1	00 0000 2000	AC1	00 0000 0000
AR1	0000	AR1	0000
CARRY	0	CARRY	1

Example 3

Syntax	Description
ABS AR1, AC1	The absolute value of the content of AR1 is stored in AC1. Since SXMD = 1, AR1 content is sign extended. The resulting 40-bit data is negated since M40 = 0 and AR1(31) = 1.

Before		After	
AC1	00 0000 2000	AC1	00 0000 7900
AR1	8700	AR1	8700
M40	0	M40	0
SXMD	1	SXMD	1

Example 4

Syntax	Description
ABS AC0, T1	The absolute value of the content of AC0(15−0) is stored in T1. The sign bit is extracted at AC0(15). Since AC0(15) = 0, T1 = AC0(15−0).

```
Before                      After
T1                  2000    T1                  1234
AC0          80 0002 1234   AC0          80 0002 1234
```

Example 5

Syntax	Description
ABS AC0, T1	The absolute value of the content of AC0(15−0) is stored in T1. The sign bit is extracted at AC0(15). Since AC0(15) = 1, T1 equals the negated value of AC0(15−0).

```
Before                      After
T1                  2000    T1                  6DCC
AC0          80 0002 9234   AC0          80 0002 9234
```

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADD** [src,] dst	Yes	2	1	X

Opcode

0010 010E	FSSS FDDD

Operands dst, src

Description This instruction performs an addition operation between two registers:

```
dst = dst + src
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are sign extended to 40 bits according to SXMD.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended according to SXMD.
  - Overflow detection and CARRY status bit depends on M40.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - Addition overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD AC1, AC0	The content of AC1 is added to the content of AC0 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**ADD** k4, dst	Yes	2	1	X

Opcode

0100 000E	kkkk FDDD

Operands dst, k4

Description This instruction performs an addition operation between a register content and a 4-bit unsigned constant, k4:

```
dst = dst + k4
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Overflow detection and CARRY status bit depends on M40.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - Addition overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATA, SATD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD #15, AC0	The content of AC0 is added to an unsigned 4-bit value (15) and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**ADD** K16, [src,] dst	No	4	1	X

Opcode

0111 1011	KKKK KKKK	KKKK KKKK	FDDD FSSS

Operands dst, K16, src

Description This instruction performs an addition operation between a register content and a 16-bit signed constant, K16.

```
dst = src + K16
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended according to SXMD.
  - The 16-bit constant, K16, is sign extended to 40 bits according to SXMD.
  - Overflow detection and CARRY status bit depends on M40.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - Addition overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits

Affected by M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD #2E00h, AC0, AC1	The content of AC0 is added to the signed 16-bit value (2E00h) and the result is stored in AC1.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**ADD** Smem, [src,] dst	No	3	1	X

Opcode

1101 0110	AAAA AAAI	FDDD FSSS

Operands dst, Smem, src

Description This instruction performs an addition operation between a register content and the content of a memory (Smem) location.

```
dst = src + Smem
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended according to SXMD.
  - The content of the memory location is sign extended to 40 bits according to SXMD.
  - Overflow detection and CARRY status bit depends on M40.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - Addition overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits

Affected by M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD *AR3+, T0, T1	The content of T0 is added to the content addressed by AR3 and the result is stored in T1. AR3 is incremented by 1.

Before		**After**	
AR3	0302	AR3	0303
302	EF00	302	EF00
T0	3300	T0	3300
T1	0	T1	2200
CARRY	0	CARRY	1

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**ADD** ACx **<<** Tx, ACy	Yes	2	1	X

Opcode

0101 101E	DDSS ss00

Operands ACx, ACy, Tx

Description This instruction performs an addition operation between an accumulator content ACy and an accumulator content ACx shifted by the content of Tx:

```
ACy = ACy + (ACx << Tx)
```

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1:

- ❏ An intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.
- ❏ The 6 LSBs of Tx are used to determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD AC1 << T0, AC0	The content of AC1 shifted by the content of T0 is added to the content of AC0 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**ADD** ACx **<<** #SHIFTW, ACy	Yes	3	1	X

Opcode

0001 000E	DDSS 0011	xxSH IFTW

Operands ACx, ACy, SHIFTW

Description This instruction performs an addition operation between an accumulator content ACy and an accumulator content ACx shifted by the 6-bit value, SHIFTW:

```
ACy = ACy + (ACx << #SHIFTW)
```

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD AC1 << #31, AC0	The content of AC1 shifted left by 31 bits is added to the content of AC0 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[7]	**ADD** K16 **<< #16,** [ACx,] ACy	No	4	1	X

Opcode

0111 1010	KKKK KKKK	KKKK KKKK	SSDD 000x

Operands ACx, ACy, K16

Description This instruction performs an addition operation between an accumulator content ACx and a 16-bit signed constant, K16, shifted left by 16 bits:

```
ACy = ACx + (K16 << #16)
```

- ❑ The operation is performed on 40 bits in the D-unit ALU.
- ❑ Input operands are sign extended to 40 bits according to SXMD.
- ❑ The shift operation is equivalent to the signed shift instruction.
- ❑ Overflow detection and CARRY status bit depends on M40.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD #FFFFh << #16, AC1, AC0	A signed 16-bit value (FFFFh) shifted left by 16 bits is added to the content of AC1 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[8]	**ADD** K16 **<<** #SHFT, [ACx,] ACy	No	4	1	X

Opcode

0111 0000	KKKK KKKK	KKKK KKKK	SSDD SHFT

Operands ACx, ACy, K16, SHFT

Description This instruction performs an addition operation between an accumulator content ACx and a 16-bit signed constant, K16, shifted left by the 4-bit value, SHFT:

```
ACy = ACx + (K16 << #SHFT)
```

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD #FFFFh << #15, AC1, AC0	A signed 16-bit value (FFFFh) shifted left by 15 bits is added to the content of AC1 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[9]	**ADD** Smem **<<** Tx, [ACx,] ACy	No	3	1	X

Opcode

1101 1101	AAAA AAAI	SSDD ss00

Operands ACx, ACy, Tx, Smem

Description This instruction performs an addition operation between an accumulator content ACx and the content of a memory (Smem) location shifted by the content of Tx:

```
ACy = ACx + (Smem << Tx)
```

- ❑ The operation is performed on 40 bits in the D-unit shifter.
- ❑ Input operands are sign extended to 40 bits according to SXMD.
- ❑ The shift operation is equivalent to the signed shift instruction.
- ❑ Overflow detection and CARRY status bit depends on M40.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1:

- ❑ An intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.
- ❑ The 6 LSBs of Tx are used to determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

AR1	0200	AR1	0200
200	0300	200	0300
SXMD	0	SXMD	0
M40	0	M40	0
ACOV0	0	ACOV0	0
CARRY	0	CARRY	1

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[10]	**ADD** Smem **<< #16,** [ACx,] ACy	No	3	1	X

Opcode

1101 1110	AAAA AAAI	SSDD 0100

Operands ACx, ACy, Smem

Description This instruction performs an addition operation between an accumulator content ACx and the content of a memory (Smem) location shifted left by 16 bits:

```
ACy = ACx + (Smem << #16)
```

- ❑ The operation is performed on 40 bits in the D-unit ALU.
- ❑ Input operands are sign extended to 40 bits according to SXMD.
- ❑ The shift operation is equivalent to the signed shift instruction.
- ❑ Overflow detection and CARRY status bit depends on M40. If the result of the addition generates a carry, the CARRY status bit is set; otherwise, the CARRY status bit is not affected.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD *AR3 << #16, AC1, AC0	The content addressed by AR3 shifted left by 16 bits is added to the content of AC1 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[11]	**ADD** [uns(]Smem[)], **CARRY,** [ACx,] ACy	No	3	1	X

Opcode

1101 1111	AAAA AAAI	SSDD 100u

Operands ACx, ACy, Smem

Description This instruction performs an addition operation of the accumulator content ACx, the content of a memory (Smem) location, and the value of the CARRY status bit:

```
ACy = ACx + Smem + CARRY
```

- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are extended to 40 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
- Overflow detection and CARRY status bit depends on M40.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by CARRY, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD uns(*AR3), CARRY, AC1, AC0	The CARRY status bit and the unsigned content addressed by AR3 are added to the content of AC1 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[12]	**ADD** [uns(]Smem[)], [ACx,] ACy	No	3	1	X

Opcode

1101 1111	AAAA AAAI	SSDD 110u

Operands ACx, ACy, Smem

Description This instruction performs an addition operation between an accumulator content ACx and the content of a memory (Smem) location:

```
ACy = ACx + uns(Smem)
```

- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are extended to 40 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
- Overflow detection and CARRY status bit depends on M40.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD uns(*AR3), AC1, AC0	The unsigned content addressed by AR3 is added to the content of AC1 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[13]	**ADD** [uns(]Smem[)] **<<** #SHIFTW, [ACx,] ACy	No	4	1	X

Opcode

1111 1001	AAAA AAAI	uxSH IFTW	SSDD 00xx

Operands ACx, ACy, SHIFTW, Smem

Description This instruction performs an addition operation between an accumulator content ACx and the content of a memory (Smem) location shifted by the 6-bit value, SHIFTW:

```
ACy = ACx + (uns(Smem) << #SHIFTW)
```

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ Input operands are extended to 40 bits according to uns.
  - ■ If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
  - ■ If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD uns(*AR3) << #31, AC1, AC0	The unsigned content addressed by AR3 shifted left by 31 bits is added to the content of AC1 and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[14]	**ADD dbl(**Lmem**),** [ACx,] ACy	No	3	1	X

Opcode

1110 1101	AAAA AAAI	SSDD 000n

Operands ACx, ACy, Lmem

Description This instruction performs an addition operation between an accumulator content ACx and the content of data memory operand dbl(Lmem):

```
ACy = ACx + dbl(Lmem)
```

- The data memory operand dbl(Lmem) addresses are aligned:
  - if Lmem address is even: most significant word = Lmem, least significant word = Lmem + 1
  - if Lmem address is odd: most significant word = Lmem, least significant word = Lmem − 1
- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are sign extended to 40 bits according to SXMD.
- Overflow detection and CARRY status bit depends on M40.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD dbl(*AR3+), AC1, AC0	The content (long word) addressed by AR3 and AR3 + 1 is added to the content of AC1 and the result is stored in AC0. Because this instruction is a long-operand instruction, AR3 is incremented by 2 after the execution.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[15]	**ADD** Xmem, Ymem, ACx	No	3	1	X

Opcode

1000 0001	XXXM MMYY	YMMM 00DD

Operands ACx, Xmem, Ymem

Description This instruction performs an addition operation between the content of data memory operand Xmem shifted left 16 bits, and the content of data memory operand Ymem shifted left 16 bits:

```
ACx = (Xmem << #16) + (Ymem << #16)
```

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD *AR3, *AR4, AC0	The content addressed by AR3 shifted left by 16 bits is added to the content addressed by AR4 shifted left by 16 bits and the result is stored in AC0.

Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[16]	**ADD** K16, Smem	No	4	1	X

Opcode

1111 0111	AAAA AAAI	KKKK KKKK	KKKK KKKK

Operands K16, Smem

Description This instruction performs an addition operation between a 16-bit signed constant, K16, and the content of a memory (Smem) location:

```
Smem = Smem + K16
```

- ❑ The operation is performed on 40 bits in the D-unit ALU.
- ❑ Input operands are sign extended to 40 bits according to SXMD and shifted by 16 bits to the MSBs before being added.
- ❑ Addition overflow is detected at bit position 31. If an overflow is detected, accumulator 0 overflow status bit (ACOV0) is set.
- ❑ Addition carry report in CARRY status bit is extracted at bit position 31.
- ❑ If SATD is 1 when an overflow is detected, the result is saturated before being stored in memory. Saturation values are 7FFFh or 8000h.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by SATD, SXMD

Affects ACOV0, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD #FFFFh, *AR3	The content addressed by AR3 is added to a signed 16-bit value and the result is stored back into the location addressed by AR3.

ADD *Dual 16-Bit Additions*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADD dual(**Lmem**),** [ACx,]ACy	No	3	1	X
[2]	**ADD dual(**Lmem**),** Tx, ACx	No	3	1	X

Description

These instructions perform two paralleled addition operations in one cycle.

The operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulator are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit datapath).

Status Bits

Affected by C54CM, SATD, SXMD

Affects ACOVx, ACOVy, CARRY

Dual 16-Bit Additions

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADD dual(**Lmem**),** [ACx,]ACy	No	3	1	X

Opcode

1110 1110	AAAA AAAI	SSDD 000x

Operands ACx, ACy, Lmem

Description This instruction performs two paralleled addition operations in one cycle:

```
HI(ACy) = HI(Lmem) + HI(ACx)
:: LO(ACy) = LO(Lmem) + LO(ACx)
```

The operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulator are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit datapath).

- The data memory operand dbl(Lmem) is divided into two 16-bit parts:
  - the lower part is used as one of the 16-bit operands of the ALU low part
  - the higher part is sign extended to 24 bits according to SXMD and is used in the ALU high part
- The data memory operand dbl(Lmem) addresses are aligned:
  - if Lmem address is even: most significant word = Lmem, least significant word = Lmem + 1
  - if Lmem address is odd: most significant word = Lmem, least significant word = Lmem − 1
- For each of the two computations performed in the ALU, an overflow detection is made. If an overflow is detected on any of the data paths, the destination accumulator overflow status bit (ACOVy) is set.
  - For the operations performed in the ALU low part, overflow is detected at bit position 15.
  - For the operations performed in the ALU high part, overflow is detected at bit position 31.
- For all instructions, the carry of the operation performed in the ALU high part is reported in the CARRY status bit. The CARRY status bit is always extracted at bit position 31.

- Independently on each data path, if SATD = 1 when an overflow is detected on the data path, a saturation is performed:
  - For the operations performed in the ALU low part, saturation values are 7FFFh and 8000h.
  - For the operations performed in the ALU high part, saturation values are 00 7FFFh and FF 8000h.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if SATD is locally cleared to 0. Overflow is only detected and reported for the computation performed in the higher 24-bit datapath (overflow is detected at bit position 31).

- When C54CM = 1 and C16 = 1, the instruction behaves like a dual 16-bit instruction and the carry is not propagated to bit 15 in the D-unit ALU.
- When C54CM = 1 and C16 = 0, the instruction behaves like a single arithmetic instruction and the carry is propagated to bit 15 in the D-unit ALU.

Status Bits Affected by C16, C54CM, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD dual(*AR3), AC1, AC0	Both instructions are performed in parallel. When the Lmem address is even (AR3 = even): The content of AC1(39–16) is added to the content addressed by AR3 and the result is stored in AC0(39–16). The content of AC1(15–0) is added to the content addressed by AR3 + 1 and the result is stored in AC0(15–0).

Dual 16-Bit Additions

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**ADD dual(**Lmem**),** Tx, ACx	No	3	1	X

Opcode

1110 1110	AAAA AAAI	ssDD 100x

Operands ACx, Lmem, Tx

Description This instruction performs two paralleled addition operations in one cycle:

```
HI(ACx) = HI(Lmem) + Tx
:: LO(ACx) = LO(Lmem) + Tx
```

The operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulator are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit datapath).

- The temporary register Tx:
  - is used as one of the 16-bit operands of the ALU low part
  - is duplicated and, according to SXMD, sign extended to 24 bits to be used in the ALU high part
- The data memory operand dbl(Lmem) is divided into two 16-bit parts:
  - the lower part is used as one of the 16-bit operands of the ALU low part
  - the higher part is sign extended to 24 bits according to SXMD and is used in the ALU high part
- The data memory operand dbl(Lmem) addresses are aligned:
  - if Lmem address is even: most significant word = Lmem, least significant word = Lmem + 1
  - if Lmem address is odd: most significant word = Lmem, least significant word = Lmem − 1
- For each of the two computations performed in the ALU, an overflow detection is made. If an overflow is detected on any of the data paths, the destination accumulator overflow status bit (ACOVx) is set.
  - For the operations performed in the ALU low part, overflow is detected at bit position 15.
  - For the operations performed in the ALU high part, overflow is detected at bit position 31.

- For all instructions, the carry of the operation performed in the ALU high part is reported in the CARRY status bit. The CARRY status bit is always extracted at bit position 31.
- Independently on each data path, if SATD = 1 when an overflow is detected on the data path, a saturation is performed:
  - For the operations performed in the ALU low part, saturation values are 7FFFh and 8000h.
  - For the operations performed in the ALU high part, saturation values are 00 7FFFh and FF 8000h.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if SATD is locally cleared to 0. Overflow is only detected and reported for the computation performed in the higher 24-bit datapath (overflow is detected at bit position 31).

Status Bits Affected by C54CM, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADD dual(*AR3), T0, AC0	Both instructions are performed in parallel. When the Lmem address is even (AR3 = even): The content of T0 is added to the content addressed by AR3 and the result is stored in AC0(39–16). The duplicated content of T0 is added to the content addressed by AR3 + 1 and the result is stored in AC0(15–0).

ADD::MOV *Addition with Parallel Store Accumulator Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADD** Xmem **<< #16,** ACx, ACy **:: MOV HI(**ACy **<< T2),** Ymem	No	4	1	X

Opcode

1000 0111	XXXM MMYY	YMMM SSDD	100x xxxx

Operands ACx, ACy, T2, Xmem, Ymem

Description This instruction performs two operations in parallel, addition and store:

```
ACy = ACx + (Xmem << #16)
:: Ymem = HI(ACy << T2)
```

The first operation performs an addition between an accumulator content ACx and the content of data memory operand Xmem shifted left by 16 bits.

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

The second operation shifts the accumulator ACy by the content of T2 and stores ACy(31−16) to data memory operand Ymem. If the 16-bit value in T2 is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value.

- ❏ The input operand is shifted in the D-unit shifter according to SXMD.
- ❏ After the shift, the high part of the accumulator, ACy(31−16), is stored to the memory location.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When this instruction is executed with C54CM = 1, the 6 LSBs of T2 are used to determine the shift quantity. The 6 LSBs of T2 define a shift quantity within –32 to +31. When the 16-bit value in T2 is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = ACx + (Xmem << #16)
  Ymem = HI(saturate(uns(ACy << T2)))

- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = ACx + (Xmem << #16)
  Ymem = HI(saturate(ACy << T2))

Status Bits Affected by C54CM, M40, RDM, SATD, SST, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- ADD (Addition)
- MOV (Store Accumulator Content to Memory)
- SUB::MOV (Subtraction with Parallel Store Accumulator Content to Memory)

Example

Syntax	Description
ADD *AR3 << #16, AC1, AC0 :: MOV HI(AC0 << T2), *AR4	Both instructions are performed in parallel. The content addressed by AR3 shifted left by 16 bits is added to the content of AC1 and the result is stored in AC0. The content of AC0 is shifted by the content of T2, and AC0(31−16) is stored at the address of AR4.

ADDSUB *Dual 16-Bit Addition and Subtraction*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADDSUB** Tx, Smem, ACx	No	3	1	X
[2]	**ADDSUB** Tx, **dual(**Lmem**),** ACx	No	3	1	X

Description

These instructions performs two paralleled arithmetical operations in one cycle, an addition and subtraction.

The operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulator are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit datapath).

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
ADDSUB T0, dual(*AR3), AC0	Both instructions are performed in parallel. When the Lmem address is even (AR3 = even): The content of T0 is added to the content addressed by AR3 and the result is stored in AC0(39–16). The duplicated content of T0 is subtracted from the content addressed by AR3 + 1 and the result is stored in AC0(15–0).

ADDSUBCC *Addition or Subtraction Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADDSUBCC** Smem, ACx**, TC1,** ACy	No	3	1	X
[2]	**ADDSUBCC** Smem, ACx**, TC2,** ACy	No	3	1	X

Opcode

TC1	1101 1110	AAAA AAAI	SSDD	0000
TC2	1101 1110	AAAA AAAI	SSDD	0001

Operands ACx, ACy, Smem, TCx

Description This instruction evaluates the selected TCx status bit and based on the result of the test, either an addition or a subtraction is performed. Evaluation of the condition on the TCx status bit is performed during the Execute phase of the instruction.

TC1 or TC2	Operation
0	ACy = ACx − (Smem << #16)
1	ACy = ACx + (Smem << #16)

❑ **TCx = 0**, then ACy = ACx − (Smem << #16):

This instruction subtracts the content of a memory (Smem) location shifted left by 16 bits from accumulator ACx and stores the result in accumulator ACy.

- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are sign extended to 40 bits according to SXMD.
- The shift operation is equivalent to the signed shift instruction.
- Overflow detection and CARRY status bit depends on M40.
- When an overflow is detected, the accumulator is saturated according to SATD.

❑ **TCx = 1**, then ACy = ACx + (Smem << #16):

This instruction performs an addition operation between accumulator ACx and the content of a memory (Smem) location shifted left by 16 bits and stores the result in accumulator ACy.

- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are sign extended to 40 bits according to SXMD.

- The shift operation is equivalent to the signed shift instruction.
- Overflow detection and CARRY status bit depends on M40.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits

Affected by C54CM, M40, SATD, SXMD, TCx

Affects ACOVy, CARRY

Repeat

This instruction can be repeated.

M40	0	M40	0
ACOV1	0	ACOV1	1
CARRY	0	CARRY	1

ADDSUBCC *Addition, Subtraction, or Move Accumulator Content Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADDSUBCC** Smem, ACx**, TC1, TC2,** ACy	No	3	1	X

Opcode

1101 1110	AAAA AAAI	SSDD 0010

Operands ACx, ACy, Smem, TC1, TC2

Description This instruction evaluates the TCx status bits and based on the result of the test, an addition, a subtraction, or a move is performed. Evaluation of the condition on the TCx status bits is performed during the Execute phase of the instruction.

TC1	TC2	Operation
0	0	ACy = ACx − (Smem << #16)
0	1	ACy = ACx
1	0	ACy = ACx + (Smem << #16)
1	1	ACy = ACx

- **TC2 = 1**, then ACy = ACx:

  This instruction moves the content of ACx to ACy.

  - The 40-bit move operation is performed in the D-unit ALU.
  - During the 40-bit move operation, an overflow is detected according to M40:
    - the destination accumulator overflow status bit (ACOVy) is set.
    - the destination register (ACy) is saturated according to SATD.

- **TC1 = 0 and TC2 = 0**, then ACy = ACx − (Smem << #16):

  This instruction subtracts the content of a memory (Smem) location shifted left by 16 bits from accumulator ACx and stores the result in accumulator ACy.

  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are sign extended to 40 bits according to SXMD.
  - The shift operation is equivalent to the signed shift instruction.
  - Overflow detection and CARRY status bit depends on M40.
  - When an overflow is detected, the accumulator is saturated according to SATD.

❑ **TC1 = 1 and TC2 = 0**, then ACy = ACx + (Smem << #16):

This instruction performs an addition operation between accumulator ACx and the content of a memory (Smem) location shifted left by 16 bits and stores the result in accumulator ACy.

- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are sign extended to 40 bits according to SXMD.
- The shift operation is equivalent to the signed shift instruction.
- Overflow detection and CARRY status bit depends on M40.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits

Affected by C54CM, M40, SATD, SXMD, TC1, TC2

Affects ACOVy, CARRY

Repeat

This instruction can be repeated.

❑ ADDSUBCC (Addition or Subtraction Conditionally)

❑ ADDSUB2CC (Addition or Subtraction Conditionally with Shift)

Example

Syntax	Description
ADDSUBCC *AR3, AC1, TC1, TC2, AC0	If TC2 = 1, the content of AC1 is stored in AC0. If TC2 = 0 and TC1 = 1, the content addressed by AR3 shifted left by 16 bits is added to the content of AC1 and the result is stored in AC0. If TC2 = 0 and TC1 = 0, the content addressed by AR3 shifted left by 16 bits is subtracted from the content of AC1 and the result is stored in AC0.

ADDSUB2CC *Addition or Subtraction Conditionally with Shift*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADDSUB2CC** Smem, ACx, Tx**, TC1, TC2,** ACy	No	3	1	X

Opcode

1101 1101	AAAA AAAI	SSDD ss10

Operands ACx, ACy, Tx, Smem, TC1, TC2

Description This instruction evaluates the TC1 status bit and based on the result of the test, either an addition or a subtraction is performed; this instruction evaluates the TC2 status bit and based on the result of the test, either a shift left by 16 bits or the content of Tx is performed. Evaluation of the condition on the TCx status bits is performed during the Execute phase of the instruction.

TC1	TC2	Operation
0	0	ACy = ACx − (Smem << Tx)
0	1	ACy = ACx − (Smem << #16)
1	0	ACy = ACx + (Smem << Tx)
1	1	ACy = ACx + (Smem << #16)

❑ **TC1 = 0 and TC2 = 0**, then ACy = ACx − (Smem << Tx):

This instruction subtracts the content of a memory (Smem) location shifted left by the content of Tx from an accumulator ACx and stores the result in accumulator ACy.

❑ **TC1 = 0 and TC2 = 1**, then ACy = ACx − (Smem << #16):

This instruction subtracts the content of a memory (Smem) location shifted left by 16 bits from an accumulator ACx and stores the result in accumulator ACy.

- The operation is performed on 40 bits in the D-unit shifter.
- Input operands are sign extended to 40 bits according to SXMD.
- The shift operation is equivalent to the signed shift instruction.
- Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- When an overflow is detected, the accumulator is saturated according to SATD.

❑ **TC1 = 1 and TC2 = 0**, then ACy = ACx + (Smem << Tx):

This instruction performs an addition operation between an accumulator ACx and the content of a memory (Smem) location shifted left by the content of Tx and stores the result in accumulator ACy.

❑ **TC1 = 1 and TC2 = 1**, then ACy = ACx + (Smem << #16):

This instruction performs an addition operation between an accumulator ACx and the content of a memory (Smem) location shifted left by 16 bits and stores the result in accumulator ACy.

- The operation is performed on 40 bits in the D-unit shifter.
- Input operands are sign extended to 40 bits according to SXMD.
- The shift operation is equivalent to the signed shift instruction.
- Overflow detection and CARRY status bit depends on M40.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1:

❑ An intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

❑ The 6 LSBs of Tx are used to determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits

Affected by C54CM, M40, SATD, SXMD, TC1, TC2

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

ADDV *Addition with Absolute Value*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ADD**[R]**V** [ACx,] ACy	Yes	2	1	X

Opcode

0101 010E	DDSS 000%

Operands ACx, ACy

Description This instruction computes the absolute value of accumulator ACx and adds the result to accumulator ACy. This instruction is performed in the D-unit MAC:

```
ACy = (ACy + |ACx|)
```

- The absolute value of accumulator ACx is computed by multiplying ACx(32–16) by 00001h or 1FFFFh depending on bit 32 of the source accumulator.
- If FRCT = 1, the absolute value is multiplied by 2.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an addition overflow is detected, the accumulator is saturated according to SATD.
- The result of the absolute value of the higher part of ACx is in the lower part of ACy.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVy

AMAR *Modify Auxiliary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AMAR** Smem	No	2	1	AD

Opcode

1011 0100	AAAA AAAI

Operands Smem

Description This instruction performs, in the A-unit address generation units, the auxiliary register modification specified by Smem as if a word single data memory operand access was made. The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

If the destination register is an auxiliary register and the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management controls the result stored in the destination register.

Compatibility with C54x devices (C54CM = 1)

In the translated code section, the AMAR() instruction must be executed with C54CM set to 1.

When circular modification is selected for the destination auxiliary register, this instruction modifies the selected destination auxiliary register by using BK03 as the circular buffer size register; BK47 is not used.

Status Bits Affected by ST2_55

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AMAR *AR3+	The content of AR3 is incremented by 1.

AMAR *Modify Extended Auxiliary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AMAR** Smem, XAdst	No	3	1	AD

Opcode

1110 1100	AAAA AAAI	XDDD 1110

Operands Smem, XAdst

Description This instruction computes the effective address specified by the Smem operand field and modifies the 23-bit destination register (XARx, XSP, XSSP, XDP, or XCDP). This operation is completed in the address phase of the pipeline by the A-unit address generator. Data memory is not accessed.

The premodification or postmodification of the auxiliary register (ARx), the use of port(#K), and the use of the port(Smem) qualifier is not supported for this instruction. The use of auxiliary register offset operations is supported. If the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management also controls the result stored in XAdst.

Status Bits Affected by ST2_55

Affects none

Repeat This instruction can be repeated.

Modify Auxiliary Register Content with Parallel Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AMAR** Xmem **:: MAC**[R][40] [uns(]Ymem[)], [uns(]Cmem[)], ACx	No	4	1	X

Opcode

1000 0011	XXXM MMYY	YMMM 11mm	uuxx DDg%

Operands ACx, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: modify auxiliary register (MAR), and multiply and accumulate (MAC):

```
mar(Xmem)
:: ACx = ACx + (Ymem * Cmem)
```

The operations are executed in the two D-unit MACs. The first operation performs an auxiliary register modification. The auxiliary register modification is specified by the content of data memory operand Xmem.

The second operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode, extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.

- When an overflow is detected, the accumulator is saturated according to SATD.
- This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.
- For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
AMAR *AR3+ :: MAC uns(*AR4), uns(*CDP), AC0	Both instructions are performed in parallel. AR3 is incremented by 1. The unsigned content addressed by AR4 multiplied by the unsigned content addressed by the coefficient data pointer register (CDP) is added to the content of AC0 and the result is stored in AC0.

Modify Auxiliary Register Content with Parallel Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**AMAR** Xmem **:: MAC**[R][40] [uns(]Ymem[)], [uns(]Cmem[)], ACx **>> #16**	No	4	1	X

Opcode

1000 0100	XXXM MMYY	YMMM 01mm	uuxx DDg%

Operands ACx, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: modify auxiliary register (MAR), and multiply and accumulate (MAC):

```
mar(Xmem)
:: ACx = (ACx >> #16) + (Ymem * Cmem)
```

The operations are executed in the two D-unit MACs. The first operation performs an auxiliary register modification. The auxiliary register modification is specified by the content of data memory operand Xmem.

The second operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode, extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx shifted right by 16 bits. The shifting operation is performed with a sign extension of source accumulator ACx(39).
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.

- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.
- ❏ For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

AMAR::MAS *Modify Auxiliary Register Content with Parallel Multiply and Subtract*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AMAR** Xmem **:: MAS**[R][40] [uns()]Ymem[)], [uns()]Cmem[)], ACx	No	4	1	X

Opcode

1000 0101	XXXM MMYY	YMMM 00mm	uuxx DDg%

Operands ACx, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: modify auxiliary register (MAR), and multiply and subtract (MAS):

```
mar(Xmem)
:: ACx = ACx – (Ymem * Cmem)
```

The operations are executed in the two D-unit MACs. The first operation performs an auxiliary register modification. The auxiliary register modification is specified by the content of data memory operand Xmem.

The second operation performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode, extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.

- When an overflow is detected, the accumulator is saturated according to SATD.
- This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.
- For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

[1]	**AMAR** Xmem **:: MPY**[R][40] [uns()]Ymem[)], [uns()]Cmem[)], ACx	No	4	1	X

Opcode

1000 0010	XXXM MMYY	YMMM 11mm	uuxx DDg%

Operands ACx, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: modify auxiliary register (MAR) and multiply:

```
mar(Xmem)
:: ACx = Ymem * Cmem
```

The operations are executed in the two D-unit MACs. The first operation performs an auxiliary register modification. The auxiliary register modification is specified by the content of data memory operand Xmem.

The second operation performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode, extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

- This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.
- For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

Status Bits

Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx

Repeat

This instruction can be repeated.

See the following other related instructions:

- AMAR (Modify Auxiliary Register Content)
- AMAR::MAC (Modify Auxiliary Register Content with Parallel Multiply and Accumulate)
- AMAR::MAS (Modify Auxiliary Register Content with Parallel Multiply and Subtract)
- MPY (Multiply)

Example

Syntax	Description
AMAR *AR3+ :: MPY uns(*AR4), uns(*CDP), AC0	Both instructions are performed in parallel. AR3 is incremented by 1. The unsigned content addressed by AR4 is multiplied by the unsigned content addressed by the coefficient data pointer register (CDP) and the result is stored in AC0.

AMOV *Load Extended Auxiliary Register with Immediate Value*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AMOV** k23, XAdst	No	6	1	AD

Opcode

1110 1100	AAAA AAAI	0DDD 1110

Operands k23, XAdst

Description This instruction loads a 23-bit unsigned constant (k23) into the 23-bit destination register (XARx, XSP, XSSP, XDP, or XCDP):

```
XAdst = k23
```

This operation is completed in the address phase of the pipeline by the A-unit address generator. Data memory is not accessed.

The premodification or postmodification of the auxiliary register (ARx), the use of port(#K), and the use of the port(Smem) qualifier is not supported for this instruction. The use of auxiliary register offset operations is supported. If the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management also controls the result stored in XAdst.

Status Bits Affected by ST2_55

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- ❏ AMAR (Modify Extended Auxiliary Register Content)
- ❏ MOV (Load Extended Auxiliary Register from Memory)
- ❏ MOV (Move Extended Auxiliary Register Content)
- ❏ MOV (Store Extended Auxiliary Register Content to Memory)

Example

Syntax	Description
AMOV #7FFFFFh, XAR0	The 23-bit value (7FFFFFh) is loaded into XAR0.

AMOV *Modify Auxiliary or Temporary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AMOV** TAx, TAy	No	3	1	AD
[2]	**AMOV** P8, TAx	No	3	1	AD
[3]	**AMOV** D16, TAx	No	4	1	AD

Description

These instructions perform, in the A-unit address generation units:

- ❑ a move from auxiliary or temporary register TAx to auxiliary or temporary register TAy
- ❑ a load in the auxiliary or temporary registers TAx of a program address defined by a program address label assembled into P8
- ❑ a load in the auxiliary or temporary registers TAx of the absolute data address signed constant D16

The operation is performed in the address phase of the pipeline, however data memory is not accessed.

Status Bits

Affected by none

Affects none

- ❑ MOV (Load Auxiliary or Temporary Register from Memory)

Modify Auxiliary or Temporary Register Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AMOV** TAx, TAy	No	3	1	AD

Opcode

0001 010E	FSSS xxxx	FDDD 0001
0001 010E	FSSS xxxx	FDDD 1001

The assembler selects the opcode depending on the instruction position in a paralleled pair.

Operands TAx, TAy

Description This instruction performs, in the A-unit address generation units, a move from the auxiliary or temporary register TAx to auxiliary or temporary register TAy. The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example 1

Syntax	Description
AMOV AR1, AR0	The content of AR1 is copied to AR0.

Example 2

Syntax	Description
AMOV T1, T0	The content of T1 is copied to T0.

Modify Auxiliary or Temporary Register Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**AMOV** P8, TAx	No	3	1	AD

Opcode

```
| 0001 010E | PPPP PPPP | FDDD 0101
| 0001 010E | PPPP PPPP | FDDD 1101
```

The assembler selects the opcode depending on the instruction position in a paralleled pair.

Operands TAx, P8

Description This instruction performs, in the A-unit address generation units, a load in the auxiliary or temporary registers TAx of a program address defined by a program address label assembled into P8. The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example 1

Syntax	Description
AMOV #255, AR0	The unsigned 8-bit value (255) is copied to AR0.

Example 2

Syntax	Description
AMOV #255, T0	The unsigned 8-bit value (255) is copied to T0.

Modify Auxiliary or Temporary Register Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**AMOV** D16, TAx	No	4	1	AD

Opcode

0111 0111	DDDD DDDD	DDDD DDDD	FDDD xxxx

Operands TAx, D16

Description This instruction performs, in the A-unit address generation units, a load in the auxiliary or temporary registers TAx of the absolute data address signed constant D16. The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AMOV #FFFFh, T1	The address FFFFh is copied to T1.

AMOV *Modify Extended Auxiliary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**mar(**XACdst = XACsrc**)**	Yes	3	1	AD

Opcode

DAG_X:	0001	010E	XACS	0001	XACD	0001
DAG_Y:	0001	010E	XACS	0001	XACD	1001

Operands XARx, XARy, XCDP

Description This instruction performs, in the A-unit address generation units, a full 23-bit move from one addressing register to another addressing register, from XACsrc to XACdst, and stores the result in XACdst. The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits Affected by

Affects

Repeat This instruction can be repeated.

- ❏ Modify Auxiliary Register Content
- ❏ Move Extended Auxiliary Register Content
- ❏ Store Extended Auxiliary Register Content to Memory
- ❏ Modify Extended Auxiliary Register Content by Addition
- ❏ Modify Extended Auxiliary Register Content by Subtraction

Example 1

Syntax	Description
mar(XAR1 = XAR0)	The content of XAR0 is copied to XAR1.

```
Before                      After
XAR0            12 3456     XAR0            12 3456
XAR1            43 5634     XAR1            12 3456
```

Example 2

Syntax	Description
mar(XCDP = XAR7)	The content of XAR7 is copied to XCDP.

```
Before                      After
XCDP            00 8000     XCDP            01 4000
XAR7            01 4000     XAR7            01 4000
```

Execution

```
(XACsrc)  -> XACdst
```

AND *Bitwise AND*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AND** src, dst	Yes	2	1	X
[2]	**AND** k8, src, dst	Yes	3	1	X
[3]	**AND** k16, src, dst	No	4	1	X
[4]	**AND** Smem, src, dst	No	3	1	X
[5]	**AND** ACx **<<** #SHIFTW[, ACy]	Yes	3	1	X
[6]	**AND** k16 **<< #16,** [ACx,] ACy	No	4	1	X
[7]	**AND** k16 **<<** #SHFT, [ACx,] ACy	No	4	1	X
[8]	**AND** k16, Smem	No	4	1	X

Description These instructions perform a bitwise AND operation:

- ❑ In the D-unit, if the destination operand is an accumulator.
- ❑ In the A-unit ALU, if the destination operand is an auxiliary or temporary register.
- ❑ In the A-unit ALU, if the destination operand is the memory.

Status Bits Affected by C54CM

Affects none

See Also See the following other related instructions:

- ❑ BAND (Bitwise AND Memory with Immediate Value and Compare to Zero)
- ❑ OR (Bitwise OR)
- ❑ XOR (Bitwise Exclusive OR)

Bitwise AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**AND** src, dst	Yes	2	1	X

Opcode

0010 100E	FSSS FDDD

Operands dst, src

Description This instruction performs a bitwise AND operation between two registers:

```
dst = dst & src
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AND AC0, AC1	The content of AC0 is ANDed with the content of AC1 and the result is stored in AC1.

```
Before                          After
AC0          7E 2355 4FC0       AC0          7E 2355 4FC0
AC1          0F E340 5678       AC1          0E 2340 4640
```

Bitwise AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**AND** k8, src, dst	Yes	3	1	X

Opcode

0001 100E	kkkk kkkk	FDDD FSSS

Operands dst, k8, src

Description This instruction performs a bitwise AND operation between a source (src) register content and an 8-bit value, k8:

```
dst = src & k8
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AND #FFh, AC1, AC0	The content of AC1 is ANDed with the unsigned 8-bit value (FFh) and the result is stored in AC0.

Bitwise AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**AND** k16, src, dst	No	4	1	X

Opcode

0111 1101	kkkk kkkk	kkkk kkkk	FDDD FSSS

Operands dst, k16, src

Description This instruction performs a bitwise AND operation between a source (src) register content and a 16-bit unsigned constant, k16:

```
dst = src & k16
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AND #FFFFh, AC1, AC0	The content of AC1 is ANDed with the unsigned 16-bit value (FFFFh) and the result is stored in AC0.

Bitwise AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**AND** Smem, src, dst	No	3	1	X

Opcode

1101 1001	AAAA AAAI	FDDD FSSS

Operands dst, Smem, src

Description This instruction performs a bitwise AND operation between a source (src) register content and a memory (Smem) location:

```
dst = src & Smem
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AND *AR3, AC1, AC0	The content of AC1 is ANDed with the content addressed by AR3 and the result is stored in AC0.

Bitwise AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**AND** ACx **<<** #SHIFTW[, ACy]	Yes	3	1	X

Opcode

0001 000E	DDSS 0000	xxSH IFTW

Operands ACx, ACy, SHIFTW

Description This instruction performs a bitwise AND operation between an accumulator (ACy) content and an accumulator (ACx) content shifted by the 6-bit value, SHIFTW:

```
ACy = ACy & (ACx <<< #SHIFTW)
```

- The shift and AND operations are performed in one cycle in the D-unit shifter.
- When M40 = 0 and C54CM = 0, input operands ACx(31−0) are zero extended to 40 bits. Otherwise, ACx(39−0) is used as is.
- The input operand (ACx) is shifted by a 6-bit immediate value in the D-unit shifter.
- The CARRY status bit is not affected by the logical shift operation.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the intermediary logical shift is performed as if M40 is locally set to 1. The 8 upper bits of the 40-bit intermediary result are not cleared.

Status Bits Affected by C54CM, M40

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AND AC1 << #30, AC0	The content of AC0 is ANDed with the content of AC1 logically shifted left by 30 bits and the result is stored in AC0.

Bitwise AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**AND** k16 **<< #16,** [ACx,] ACy	No	4	1	X

Opcode

0111 1010	kkkk kkkk	kkkk kkkk	SSDD 010x

Operands ACx, ACy, k16

Description This instruction performs a bitwise AND operation between an accumulator (ACx) content and a 16-bit unsigned constant, k16, shifted left by 16 bits:

```
ACy = ACx & (k16 <<< #16)
```

- ❑ The operation is performed on 40 bits in the D-unit ALU.
- ❑ Input operands are zero extended to 40 bits.
- ❑ The input operand (k16) is shifted 16 bits to the MSBs.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AND #FFFFh << #16, AC1, AC0	The content of AC1 is ANDed with the unsigned 16-bit value (FFFFh) logically shifted left by 16 bits and the result is stored in AC0.

Bitwise AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[7]	**AND** k16 **<<** #SHFT, [ACx,] ACy	No	4	1	X

Opcode

0111 0010	kkkk kkkk	kkkk kkkk	SSDD SHFT

Operands ACx, ACy, k16, SHFT

Description This instruction performs a bitwise AND operation between an accumulator (ACx) content and a 16-bit unsigned constant, k16, shifted left by the 4-bit value, SHFT:

```
ACy = ACx & (k16 <<< #SHFT)
```

- The shift and AND operations are performed in one cycle in the D-unit shifter.
- When M40 = 0 and C54CM = 0, input operands ACx(31−0) are zero extended to 40 bits. Otherwise, ACx(39−0) is used as is.
- The input operand (k16) is shifted by a 4-bit immediate value in the D-unit shifter.
- The CARRY status bit is not affected by the logical shift operation.

Status Bits Affected by C54CM, M40

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AND #FFFFh << #15, AC1, AC0	The content of AC1 is ANDed with the unsigned 16-bit value (FFFFh) logically shifted left by 15 bits and the result is stored in AC0.

Bitwise AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[8]	**AND** k16, Smem	No	4	1	X

Opcode

1111 0100	AAAA AAAI	kkkk kkkk	kkkk kkkk

Operands k16, Smem

Description This instruction performs a bitwise AND operation between a memory (Smem) location and a 16-bit unsigned constant, k16.

```
Smem = Smem & k16
```

- ❑ The operation is performed on 16 bits in the A-unit ALU.
- ❑ The result is stored in memory.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
AND #0FC0, *AR1	The content addressed by AR1 is ANDed with the unsigned 16-bit value (FC0h) and the result is stored in the location addressed by AR1.

```
Before                  After
*AR1          5678      *AR1          0640
```

ASUB *Modify Auxiliary or Temporary Register Content by Subtraction*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ASUB** TAx, TAy	No	3	1	AD
[2]	**ASUB** P8, TAx	No	3	1	AD

Description

These instructions perform, in the A-unit address generation units:

- ❑ a subtraction between two auxiliary or temporary registers, TAy and TAx, and stores the result in TAy
- ❑ a subtraction between the auxiliary or temporary registers TAx and a program address defined by a program address label assembled into unsigned P8, and stores the result in TAx

The operation is performed in the address phase of the pipeline, however data memory is not accessed.

If the destination register is an auxiliary register and the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management controls the result stored in the destination register.

Status Bits

Affected by ST2_55

Affects none

See Also

See the following other related instructions:

- ❑ AADD (Modify Auxiliary or Temporary Register Content by Addition)
- ❑ AMAR (Modify Auxiliary Register Content)
- ❑ AMAR (Modify Extended Auxiliary Register Content)
- ❑ AMOV (Modify Auxiliary or Temporary Register Content)

Modify Auxiliary or Temporary Register Content by Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ASUB** TAx, TAy	No	3	1	AD

Opcode

```
| 0001 010E | FSSS xxxx | FDDD 0010
| 0001 010E | FSSS xxxx | FDDD 1010
```

The assembler selects the opcode depending on the instruction position in a paralleled pair.

Operands TAx, TAy

Description This instruction performs, in the A-unit address generation units, a subtraction between two auxiliary or temporary registers, TAy and TAx, and stores the result in TAy. The content of TAx is considered signed:

```
TAy = TAy – TAx
```

The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

If the destination register is an auxiliary register and the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management controls the result stored in the destination register.

Compatibility with C54x devices (C54CM = 1)

In the translated code section, the ASUB instruction must be executed with C54CM set to 1.

When circular modification is selected for the destination auxiliary register, this instruction modifies the selected destination auxiliary register by using BK03 as the circular buffer size register; BK47 is not used.

Status Bits Affected by ST2_55

Affects none

Repeat This instruction can be repeated.

Example 1

Syntax	Description
ASUB T0, AR0	The signed content of T0 is subtracted from the content of AR0 and the result is stored in AR0.

```
Before                    After
XAR0          01 8000     XAR0          01 0000
T0               8000     T0               8000
```

Example 2

Syntax	Description
ASUB T1, T0	The content of T1 is subtracted from the content of T0 and the result is stored in T0.

Modify Auxiliary or Temporary Register Content by Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**ASUB** P8, TAx	No	3	1	AD

Opcode

```
| 0001 010E | PPPP PPPP | FDDD 0110
| 0001 010E | PPPP PPPP | FDDD 1110
```

The assembler selects the opcode depending on the instruction position in a paralleled pair.

Operands TAx, P8

Description This instruction performs, in the A-unit address generation units, a subtraction between the auxiliary or temporary register TAx and a program address defined by a program address label assembled into unsigned P8, and stores the result in TAx:

```
TAx = TAx – P8
```

The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

If the destination register is an auxiliary register and the corresponding bit (ARnLC) in status register ST2_55 is set to 1, the circular buffer management controls the result stored in the destination register.

Compatibility with C54x devices (C54CM = 1)

In the translated code section, the ASUB instruction must be executed with C54CM set to 1.

When circular modification is selected for the destination auxiliary register, this instruction modifies the selected destination auxiliary register by using BK03 as the circular buffer size register; BK47 is not used.

Status Bits Affected by ST2_55

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
ASUB #255, AR0	The unsigned 8-bit value (255) is subtracted from the signed content of AR0 and the result is stored in AR0.

ASUB *Modify Extended Auxiliary Register Content by Subtraction*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ASUB** XACsrc, XACdst	Yes	3	1	AD

Opcode

DAG_X:	0001	010E	XACS	0001	XACD	0010
DAG_Y:	0001	010E	XACS	0001	XACD	1010

Operands XARx, XARy, XCDP

Description This instruction performs, in the A-unit address generation units, a full 23-bit subtraction between two auxiliary or other addressing registers, XACdst and XACsrc, and stores the result in XACdst. The operation is performed in the address phase of the pipeline; however, data memory is not accessed.

If the destination register is an auxiliary register and the corresponding bit (ARnLC) in status register ST2_55 is set to 1 or the circular addressing qualifier is in paralleled, the circular buffer management does not control the result stored in the destination register.

Compatibility with C54x devices (C54CM = 1)

None.

Example 1

Syntax	Description
ASUB XAR0, XAR1	The content of XAR0 is subtracted from XAR1 and stored in XAR1.

```
Before                      After
XAR0            12 3456     XAR0            12 3456
XAR1            43 5634     XAR1            31 21DE
```

Example 2

Syntax	Description
ASUB XAR7, XCDP	The content of XAR7 is subtracted from XCDP and stored in XCDP.

```
Before                      After
XCDP            00 8000     XCDP            00 7000
XAR7            00 1000     XAR7            00 1000

Execution
(XACdst) – (XACsrc)  -> XACdst
```

B *Branch Unconditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**B** ACx	No	2	10	X
[2]	**B** L7	Yes	2	6†	AD
[3]	**B** L16	Yes	3	6†	AD
[4]	**B** P24	No	4	5	D

† This instruction executes in 3 cycles if the addressed instruction is in the instruction buffer unit.

Description

This instruction branches to a 24-bit program address defined by the content of the 24 lowest bits of an accumulator (ACx), or to a program address defined by the program address label assembled into Lx or P24.

These instructions cannot be repeated.

```

BCC *Branch Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles†	Pipeline
[1]	**BCC** l4, cond	No	2	6/5	R
[2]	**BCC** L8, cond	Yes	3	6/5	R
[3]	**BCC** L16, cond	No	4	6/5	R
[4]	**BCC** P24, cond	No	5	5/5	R

† x/y cycles: x cycles = condition true, y cycles = condition false

Description

These instructions evaluate a single condition defined by the cond field in the read phase of the pipeline. If the condition is true, a branch occurs to the program address label assembled into l4, Lx, or P24. There is a 1-cycle latency on the condition setting. A single condition can be tested as determined by the cond field of the instruction. See Table 1−3 for a list of conditions.

The instruction selection depends on the branch offset between the current PC value and the program branch address specified by the label.

These instructions cannot be repeated.

Status Bits

Affected by ACOVx, CARRY, C54CM, M40, TCx

Affects ACOVx

BCC *Branch on Auxiliary Register Not Zero*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles†	Pipeline
[1]	**BCC** L16, ARn_mod **!= #0**	No	4	6/5	AD

† x/y cycles: x cycles = condition true, y cycles = condition false

Opcode

1111 1100	AAAA AAAI	LLLL LLLL	LLLL LLLL

Operands ARn_mod, L16

Description This instruction performs a conditional branch (selected auxiliary register content not equal to 0) of the program counter (PC). The program branch address is specified as a 16-bit signed offset, L16, relative to PC. Use this instruction to branch within a 64K-byte window centered on the current PC value.

The possible addressing operands can be grouped into three categories:

- ARx not modified (ARx as base pointer), some examples:
  *AR1; No modification or offset
  *AR1(#15); Use 16-bit immediate value (15) as offset
  *AR1(T0); Use content of T0 as offset
  *AR1(short(#4)); Use 3-bit immediate value (4) as offset
- ARx modified before being compared to 0, some examples:
  *−AR1; Decrement by 1 before comparison
  *+AR1(#20); Add 16-bit immediate value (20) before comparison
- ARx modified after being compared to 0, some examples:
  *AR1+; Increment by 1 after comparison
  *(AR1 − T1); Subtract content of T1 after comparison

1) The content of the selected auxiliary register (ARn) is premodified in the address generation unit.
2) The (premodified) content of ARn is compared to 0 and sets the condition in the address phase of the pipeline.
3) If the condition is not true, a branch occurs. If the condition is true, the instructions are executed in sequence.
4) The content of ARn is postmodified in the address generation unit.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1:

The premodifier *ARn(T0) is not available; *ARn(AR0) is available.

The postmodifiers *(ARn + T0) and *(ARn − T0) are not available; *(ARn + AR0) and *(ARn − AR0) are available.

The legality of the modifier usage is checked by the assembler when using the .c54cm_on and .c54cm_off assembler directives.

Status Bits Affected by C54CM

Affects none

Repeat This instruction cannot be repeated.

BCC *Compare and Branch*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles†	Pipeline
[1]	**BCC**[U] L8, src RELOP K8	No	4	7/6	X

† x/y cycles: x cycles = condition true, y cycles = condition false

Opcode

0110 1111	FSSS ccxu	KKKK KKKK	LLLL LLLL

Operands K8, L8, RELOP, src

Description This instruction performs a comparison operation between a source (src) register content and an 8-bit signed value, K8. The instruction performs a comparison in the D-unit ALU or in the A-unit ALU. The comparison is performed in the execute phase of the pipeline. If the result of the comparison is true, a branch occurs.

The program branch address is specified as an 8-bit signed offset, L8, relative to the program counter (PC). Use this instruction to branch within a 256-byte window centered on the current PC value.

The comparison depends on the optional U keyword and, for accumulator comparisons, on M40.

- In the case of an unsigned comparison, the 8-bit constant, K8, is zero extended to:
  - 16 bits, if the source (src) operand is an auxiliary or temporary register.
  - 40 bits, if the source (src) operand is an accumulator.
- In the case of a signed comparison, the 8-bit constant, K8, is sign extended to:
  - 16 bits, if the source (src) operand is an auxiliary or temporary register.
  - 40 bits, if the source (src) operand is an accumulator.

As the following table shows, the U keyword specifies an unsigned comparison; M40 defines the comparison bit width of the accumulator.

U	src	Comparison Type
no	TAx	16-bit signed comparison in A-unit ALU
no	ACx	if M40 = 0, 32-bit signed comparison in D-unit ALU if M40 = 1, 40-bit signed comparison in D-unit ALU
yes	TAx	16-bit unsigned comparison in A-unit ALU
yes	ACx	if M40 = 0, 32-bit unsigned comparison in D-unit ALU if M40 = 1, 40-bit unsigned comparison in D-unit ALU

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the conditions testing the accumulator contents are all performed as if M40 was set to 1.

Status Bits

Affected by C54CM, M40

Affects none

Repeat

This instruction cannot be repeated.

BCLR *Clear Accumulator, Auxiliary, or Temporary Register Bit*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BCLR** Baddr, src	No	3	1	X

Opcode

1110 1100	AAAA AAAI	FSSS 001x

Operands Baddr, src

Description This instruction performs a bit manipulation:

- In the D-unit ALU, if the source (src) register operand is an accumulator.
- In the A-unit ALU, if the source (src) register operand is an auxiliary or temporary register.

The instruction clears to 0 a single bit, as defined by the bit addressing mode, Baddr, of the source register.

The generated bit address must be within:

- 0–39 when accessing accumulator bits (only the 6 LSBs of the generated bit address are used to determine the bit position). If the generated bit address is not within 0–39, the selected register bit value does not change.
- 0–15 when accessing auxiliary or temporary register bits (only the 4 LSBs of the generated address are used to determine the bit position).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- BCLR (Clear Memory Bit)
- BCLR (Clear Status Register Bit)
- BNOT (Complement Accumulator, Auxiliary, or Temporary Register Bit)
- BSET (Set Accumulator, Auxiliary, or Temporary Register Bit)

Example

Syntax	Description
BCLR AR3, AC0	The bit at the position defined by the content of AR3(4–0) in AC0 is cleared to 0.

BCLR *Clear Memory Bit*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BCLR** src, Smem	No	3	1	X

Opcode

1110 0011	AAAA AAAI	FSSS 1101

Operands Smem, src

Description This instruction performs a bit manipulation in the A-unit ALU. The instruction clears to 0 a single bit, as defined by the content of the source (src) operand, of a memory (Smem) location.

The generated bit address must be within 0–15 (only the 4 LSBs of the register are used to determine the bit position).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

ST3	0100 011E	kkkk	0110

Operands f-name, k4, STx_55

Description These instructions perform a bit manipulation in the A-unit ALU.

These instructions clear to 0 a single bit, as defined by a 4-bit immediate value, k4, or the one-bit-wide status bit field name, f-name, in the selected status register (ST0_55, ST1_55, ST2_55, or ST3_55).

It is not allowed to access DP register mapped in ST0 register with BCLR k4, ST0_55 instruction. Therefore k4 cannot have a value of 0−8.

It is not allowed to access ASM bit field in ST1 with BCLR k4, ST1_55 instruction. Therefore k4 cannot have a value of 0−4.

Compatibility with C54x devices (C54CM = 1)

C55x DSP status registers bit mapping (Figure 5−1, page 5-110) does not correspond to C54x DSP status registers bits.

Status Bits Affected by none

Affects Selected status bits

Repeat This instruction cannot be repeated.

See Also See the following other related instructions:

- ❏ BCLR (Clear Accumulator, Auxiliary, or Temporary Register Bit)
- ❏ BCLR (Clear Memory Bit)
- ❏ BSET (Set Status Register Bit)

Example 1

Syntax	Description
BCLR AR2LC, ST2_55	The ST2_55 bit position defined by the label (AR2LC, bit 2) is cleared to 0.

```
Before                  After
ST2_55          0006    ST2_55          0002
```

Example 2

Syntax	Description
BCLR AR2LC	The ST2_55 AR2LC (bit 2) is cleared to 0.

```
Before                  After
ST2_55          0006    ST2_55          0002
```

† Highlighted bit: If you write to the protected address of the status register, a write to this bit has no effect, and the bit always appears as a 0 during read operations.

‡ The HINT bit is not used for all C55x host port interfaces (HPIs). Consult the documentation for the specific C55x DSP.

§ The reset value of MPNMC may be dependent on the state of predefined pins at reset. To check this for a particular C55x DSP, see the boot loader section of its data sheet.

BCNT *Count Accumulator Bits*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BCNT** ACx, ACy**, TC1,** Tx	Yes	3	1	X
[2]	**BCNT** ACx, ACy**, TC2,** Tx	Yes	3	1	X

Opcode

TC1	0001 000E	xxSS 1010	SSdd xxx0
TC2	0001 000E	XXSS 1010	SSdd xxx1

Operands ACx, ACy, Tx, TCx

Description This instruction performs bit field manipulation in the D-unit shifter. The result is stored in the selected temporary register (Tx). The A-unit ALU is used to make the move operation.

Accumulator ACx is ANDed with accumulator ACy. The number of bits set to 1 in the intermediary result is evaluated and stored in the selected temporary register (Tx). If the number of bits is even, the selected TCx status bit is cleared to 0. If the number of bits is odd, the selected TCx status bit is set to 1.

Status Bits Affected by none

Affects TCx

Repeat This instruction can be repeated.

Example

Syntax	Description
BCNT AC1, AC2, TC1, T1	The content of AC1 is ANDed with the content of AC2, the number of bits set to 1 in the result is evaluated and stored in T1. The number of bits set to 1 is odd, TC1 is set to 1.

Before		**After**	
AC1	7E 2355 4FC0	AC1	7E 2355 4FC0

TC1	0	TC1	1

BFXPA *Expand Accumulator Bit Field*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BFXPA** k16, ACx, dst	No	4	1	X

Opcode

0111 0110	kkkk kkkk	kkkk kkkk	FDDD 01SS

Operands ACx, dst, k16

Description This instruction performs a bit field manipulation in the D-unit shifter. When the destination register (dst) is an A-unit register (ARx or Tx), a dedicated bus carries the output of the D-unit shifter directly into dst.

The 16-bit field mask, k16, is scanned from the least significant bits (LSBs) to the most significant bits (MSBs). According to the bit set to 1 in the bit field mask, the 16 LSBs of the source accumulator (ACx) bits are extracted and separated with 0 toward the MSBs. The result is stored in dst.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- BFXTR (Extract Accumulator Bit Field)

Example

Syntax	Description
BFXPA #8024h, AC0, T2	Each bit of the unsigned 16-bit value (8024h) is scanned from the LSB to the MSB to test for a 1. If the bit is set to 1, the bit in AC0 is extracted and separated with 0 toward the MSB in T2; otherwise, the corresponding bit in AC0 is not extracted. The result is stored in T2.

```
Execution
#k16 (8024h)          1000 0000 0010 0100
AC0(15-0)             0010 1011 0110 0101

```

BFXTR *Extract Accumulator Bit Field*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BFXTR** k16, ACx, dst	No	4	1	X

Opcode

0111 0110	kkkk kkkk	kkkk kkkk	FDDD 00SS

Operands ACx, dst, k16

Description This instruction performs a bit field manipulation in the D-unit shifter. When the destination register (dst) is an A-unit register (ARx or Tx), a dedicated bus carries the output of the D-unit shifter directly into dst.

The 16-bit field mask, k16, is scanned from the least significant bits (LSBs) to the most significant bits (MSBs). According to the bit set to 1 in the bit field mask, the corresponding 16 LSBs of the source accumulator (ACx) bits are extracted and packed toward the LSBs. The result is stored in dst.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- BFXPA (Expand Accumulator Bit Field)

Example

Syntax	Description
BFXTR #8024h, AC0, T2	Each bit of the unsigned 16-bit value (8024h) is scanned from the LSB to the MSB to test for a 1. If the bit is set to 1, the corresponding bit in AC0 is extracted and packed toward the LSB in T2; otherwise, the corresponding bit in AC0 is not extracted. The result is stored in T2.

```
Execution

```

BNOT *Complement Accumulator, Auxiliary, or Temporary Register Bit*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BNOT** Baddr, src	No	3	1	X

Opcode

1110 1100	AAAA AAAI	FSSS 011x

Operands Baddr, src

Description This instruction performs a bit manipulation:

- In the D-unit ALU, if the source (src) register operand is an accumulator.
- In the A-unit ALU, if the source (src) register operand is an auxiliary or temporary register.

The instruction complements a single bit, as defined by the bit addressing mode, Baddr, of the source register.

The generated bit address must be within:

- 0–39 when accessing accumulator bits (only the 6 LSBs of the generated bit address are used to determine the bit position). If the generated bit address is not within 0–39, the selected register bit value does not change.
- 0–15 when accessing auxiliary or temporary register bits (only the 4 LSBs of the generated address are used to determine the bit position).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- BNOT (Complement Memory Bit)
- NOT (Complement Accumulator, Auxiliary, or Temporary Register Content)

Example

Syntax	Description
BNOT AR1, T0	The bit at the position defined by the content of AR1(3−0) in T0 is complemented.

```
Before                  After
T0          E000        T0          F000
AR1         000C        AR1         000C
```

BNOT *Complement Memory Bit*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BNOT** src, Smem	No	3	1	X

Opcode

1110 0011	AAAA AAAI	FSSS 111x

Operands Smem, src

Description This instruction performs a bit manipulation in the A-unit ALU. The instruction complements a single bit, as defined by the content of the source (src) operand, of a memory (Smem) location.

The generated bit address must be within 0–15 (only the 4 LSBs of the register are used to determine the bit position).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- ❏ BCLR (Clear Memory Bit)
- ❏ BNOT (Complement Accumulator, Auxiliary, or Temporary Register Bit)
- ❏ BSET (Set Memory Bit)
- ❏ NOT (Complement Accumulator, Auxiliary, or Temporary Register Content)

Example

Syntax	Description
BNOT AC0, *AR3	The bit at the position defined by AC0(3–0) in the content addressed by AR3 is complemented.

BSET *Set Accumulator, Auxiliary, or Temporary Register Bit*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BSET** Baddr, src	No	3	1	X

Opcode

1110 1100	AAAA AAAI	FSSS 000x

Operands Baddr, src

Description This instruction performs a bit manipulation:

- In the D-unit ALU, if the source (src) register operand is an accumulator.
- In the A-unit ALU, if the source (src) register operand is an auxiliary or temporary register.

The instruction sets to 1 a single bit, as defined by the bit addressing mode, Baddr, of the source register.

The generated bit address must be within:

- 0–39 when accessing accumulator bits (only the 6 LSBs of the generated bit address are used to determine the bit position). If the generated bit address is not within 0–39, the selected register bit value does not change.
- 0–15 when accessing auxiliary or temporary register bits (only the 4 LSBs of the generated address are used to determine the bit position).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- BCLR (Clear Accumulator, Auxiliary, or Temporary Register Bit)
- BNOT (Complement Accumulator, Auxiliary, or Temporary Register Bit)
- BSET (Set Memory Bit)
- BSET (Set Status Register Bit)

Example

Syntax	Description
BSET AR3, AC0	The bit at the position defined by the content of AR3(4–0) in AC0 is set to 1.

BSET *Set Memory Bit*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BSET** src, Smem	No	3	1	X

Opcode

1110 0011	AAAA AAAI	FSSS 1100

Operands Smem, src

Description This instruction performs a bit manipulation in the A-unit ALU. The instruction sets to 1 a single bit, as defined by the content of the source (src) operand, of a memory (Smem) location.

The generated bit address must be within 0–15 (only the 4 LSBs of the register are used to determine the bit position).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- ❏ BCLR (Clear Memory Bit)
- ❏ BNOT (Complement Memory Bit)
- ❏ BSET (Set Accumulator, Auxiliary, or Temporary Register Bit)
- ❏ BSET (Set Status Register Bit)

Example

Syntax	Description
BSET AC0, *AR3	The bit at the position defined by AC0(3–0) in the content addressed by AR3 is set to 1.

BSET *Set Status Register Bit*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BSET** k4, **ST0_55**	Yes	2	1	X
[2]	**BSET** k4, **ST1_55**	Yes	2	1	X
[3]	**BSET** k4, **ST2_55**	Yes	2	1	X
[4]	**BSET** k4, **ST3_55**	Yes	2	1†	X
[5]	**BSET** f-name	Yes	2	1†	X

† When this instruction is decoded to modify status bit CAFRZ (15), CAEN (14), or CACLR (13), the CPU pipeline is flushed and the instruction is executed in 5 cycles regardless of the instruction context.

Opcode

ST0	0100 011E	kkkk	0001
ST1	0100 011E	kkkk	0011
ST2	0100 011E	kkkk	0101
ST3	0100 011E	kkkk	0111

Operands k4, f-name, STx_55

Description These instructions perform a bit manipulation in the A-unit ALU.

These instructions set to 1 a single bit, as defined by a 4-bit immediate value, k4, or the one-bit-wide status bit field name, f-name, in the selected status register (ST0_55, ST1_55, ST2_55, or ST3_55).

It is not allowed to access DP register mapped in ST0 register with BSET k4, ST0_55 instruction. Therefore k4 cannot have a value of 0−8.

It is not allowed to access ASM bit field in ST1 with BSET k4, ST1_55 instruction. Therefore k4 cannot have a value of 0−4.

Compatibility with C54x devices (C54CM = 1)

C55x DSP status registers bit mapping (Figure 5−2, page 5-120) does not correspond to C54x DSP status register bits.

Status Bits Affected by none

Affects Selected status bits

Repeat This instruction cannot be repeated.

See Also See the following other related instructions:

- ❏ BCLR (Clear Status Register Bit)
- ❏ BSET (Set Accumulator, Auxiliary, or Temporary Register Bit)
- ❏ BSET (Set Memory Bit)

Example 1

Syntax	Description
BSET CARRY, ST0_55	The ST0_55 bit position defined by the label (CARRY, bit 11) is set to 1.

```
Before                  After
ST0_55          0000    ST0_55          0800
```

Example 2

Syntax	Description

§ The reset value of MPNMC may be dependent on the state of predefined pins at reset. To check this for a particular C55x DSP, see the boot loader section of its data sheet.

BTST *Test Accumulator, Auxiliary, or Temporary Register Bit*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BTST** Baddr, src**, TC1**	No	3	1	X
[2]	**BTST** Baddr, src**, TC2**	No	3	1	X

Opcode

TC1	1110 1100	AAAA AAAI	FSSS 1000
TC2	1110 1100	AAAA AAAI	FSSS 1001

Operands Baddr, src, TCx

Description This instruction performs a bit manipulation:

- In the D-unit ALU, if the source (src) register operand is an accumulator.
- In the A-unit ALU, if the source (src) register operand is an auxiliary or temporary register.

The instruction tests a single bit of the source register location as defined by the bit addressing mode, Baddr. The tested bit is copied into the selected TCx status bit. The generated bit address must be within:

- 0–39 when accessing accumulator bits (only the 6 LSBs of the generated bit address are used to determine the bit position). If the generated bit address is not within 0–39, 0 is stored into the selected TCx status bit.
- 0–15 when accessing auxiliary or temporary register bits (only the 4 LSBs of the generated address are used to determine the bit position).

Status Bits Affected by none

Affects TCx

Repeat This instruction can be repeated.

See Also See the following other related instructions:

TC1	1110 0011	AAAA AAAI	kkkk	010x
TC2	1110 0011	AAAA AAAI	kkkk	011x

Operands k4, Smem, TCx

Description This instruction performs a bit manipulation in the A-unit ALU. The instruction tests a single bit, as defined by a 4-bit immediate value, k4, of a memory (Smem) location. The tested bit is copied into status bit TCx and is cleared to 0 in Smem.

Status Bits Affected by none

Affects TCx

Repeat This instruction can be repeated.

- ❏ BTSTCLR (Test and Clear Memory Bit)
- ❏ BTSTSET (Test and Set Memory Bit)

Example

Syntax	Description
BTSTNOT #12, *AR0, TC1	The bit at the position defined by the unsigned 4-bit value (12) in the content addressed by AR0 is tested and the tested bit is copied into TC1. The selected bit (12) in the content addressed by AR0 is complemented.

```
Before                  After
*AR0          0040      *AR0          1040
TC1              0      TC1              0
```

BTSTP *Test Accumulator, Auxiliary, or Temporary Register Bit Pair*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**BTSTP** Baddr, src	No	3	1	X

Opcode

1110 1100	AAAA AAAI	FSSS 010x

Operands Baddr, src

Description This instruction performs a bit manipulation:

- In the D-unit ALU, if the source (src) register operand is an accumulator.
- In the A-unit ALU, if the source (src) register operand is an auxiliary or temporary register.

The instruction tests two consecutive bits of the source register location as defined by the bit addressing mode, Baddr and Baddr + 1. The tested bits are copied into status bits TC1 and TC2:

- TC1 tests the bit that is defined by Baddr
- TC2 tests the bit defined by Baddr + 1

The generated bit address must be within:

- 0–38 when accessing accumulator bits (only the 6 LSBs of the generated bit address are used to determine the bit position). If the generated bit address is not within 0–38:
  - If the generated bit address is 39, bit 39 of the register is stored into TC1 and 0 is stored into TC2.
  - In all other cases, 0 is stored into TC1 and TC2.
- 0–14 when accessing auxiliary or temporary register bits (only the 4 LSBs of the generated address are used to determine the bit position). If the generated bit address is not within 0–14:
  - If the generated bit address is 15, bit 15 of the register is stored into TC1 and 0 is stored into TC2.
  - In all other cases, 0 is stored into TC1 and TC2.

Status Bits Affected by none

Affects TC1, TC2

Repeat This instruction can be repeated.

- ❑ BSET (Set Memory Bit)
- ❑ BTST (Test Memory Bit)
- ❑ BTSTCLR (Test and Clear Memory Bit)
- ❑ BTSTNOT (Test and Complement Memory Bit)

Example

Syntax	Description
BTSTSET #12, *AR3, TC1	The bit at the position defined by the unsigned 4-bit value (12) in the content addressed by AR3 is tested and the tested bit is copied into TC1. The selected bit (12) in the content addressed by AR3 is set to 1.

CALL *Call Unconditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**CALL** ACx	No	2	10	X
[2]	**CALL** L16	Yes	3	6	AD
[3]	**CALL** P24	No	4	5	D

Description

This instruction passes control to a specified subroutine program address defined by the content of the 24 lowest bits of the accumulator, ACx, or a program address label assembled into L16 or P24.

Before beginning a called subroutine, the CPU automatically saves the value of two internal registers: the program counter (PC) and a loop context register. The CPU can use these values to re-establish the context of the interrupted program sequence when the subroutine is done.

In the slow-return process (default), the return address (from the PC) and the loop context bits are stored to the stacks (in memory). When the CPU returns from a subroutine, the speed at which these values are restored is dependent on the speed of the memory accesses.

In the fast-return process, the return address (from the PC) and the loop context bits are saved to registers, so that these values can always be restored quickly. These special registers are the return address register (RETA) and the control-flow context register (CFCT). You can read from or write to RETA and CFCT as a pair with dedicated, 32-bit load and store instructions.

These instructions cannot be repeated.

Call Unconditionally

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**CALL** ACx	No	2	10	X

Opcode

1001 0010	xxxx xxSS

Operands ACx

Description This instruction passes control to a specified subroutine program address defined by the content of the 24 lowest bits of the accumulator, ACx.

In the slow-return process (default), the return address (from the PC) and the loop context bits are stored to the stacks. For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

- The data stack pointer (SP) is decremented by 1 word in the address phase of the pipeline. The 16 LSBs of the return address, from the program counter (PC), of the called subroutine are pushed to the top of SP.
- The system stack pointer (SSP) is decremented by 1 word in the address phase of the pipeline. The loop context bits concatenated with the 8 MSBs of the return address are pushed to the top of SSP.
- The PC is loaded with the subroutine program address. The active control flow execution context flags are cleared.

		System Stack (SSP)
After Save	SSP = x − 1	(Loop bits):PC(23−16)
Before Save	SSP = x	Previously saved data

		Data Stack (SP)
After Save	SP = y − 1	PC(15−0)
Before Save	SP = y	Previously saved data

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

Example

Syntax	Description
CALL AC0	Program control is passed to the program address defined by the content of AC0(23–0).

Call Unconditionally

Syntax Characteristics

Example

Syntax	Description
CALL FOO	Program control is passed to the program address label (FOO) assembled into the signed 16-bit offset value relative to the program counter register.

Call Unconditionally

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**CALL** P24	No	4	5	D

Opcode

0110 1100	PPPP PPPP	PPPP PPPP	PPPP PPPP

Operands P24

Description This instruction passes control to a specified subroutine program address defined by a program address label assembled into P24.

In the slow-return process (default), the return address (from the PC) and the loop context bits are stored to the stacks. For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

- The data stack pointer (SP) is decremented by 1 word in the address phase of the pipeline. The 16 LSBs of the return address, from the program counter (PC), of the called subroutine are pushed to the top of SP.
- The system stack pointer (SSP) is decremented by 1 word in the address phase of the pipeline. The loop context bits concatenated with the 8 MSBs of the return address are pushed to the top of SSP.
- The PC is loaded with the subroutine program address. The active control flow execution context flags are cleared.

		System Stack (SSP)
After Save	SSP = x − 1	(Loop bits):PC(23−16)
Before Save	SSP = x	Previously saved data

		Data Stack (SP)
After Save	SP = y − 1	PC(15−0)
Before Save	SP = y	Previously saved data

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

Example

Syntax	Description
CALL FOO	Program control is passed to the program address label (FOO) assembled into an absolute address defined by the 24-bit value.

CALLCC *Call Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles†	Pipeline
[1]	**CALLCC** L16, cond	No	4	6/5	R
[2]	**CALLCC** P24, cond	No	5	5/5	R

† x/y cycles: x cycles = condition true, y cycles = condition false

Description

These instructions evaluate a single condition defined by the cond field in the read phase of the pipeline. If the condition is true, a subroutine call occurs to the program address defined by the program address label assembled into L16 or P24. There is a 1-cycle latency on the condition setting. A single condition can be tested as determined by the cond field of the instruction. See Table 1−3 for a list of conditions.

Before beginning a called subroutine, the CPU automatically saves the value of two internal registers: the program counter (PC) and a loop context register. The CPU can use these values to re-establish the context of the interrupted program sequence when the subroutine is done.

In the slow-return process (default), the return address (from the PC) and the loop context bits are stored to the stacks (in memory). When the CPU returns from a subroutine, the speed at which these values are restored is dependent on the speed of the memory accesses.

In the fast-return process, the return address (from the PC) and the loop context bits are saved to registers, so that these values can always be restored quickly. These special registers are the return address register (RETA) and the control-flow context register (CFCT). You can read from or write to RETA and CFCT as a pair with dedicated, 32-bit load and store instructions.

The instruction selection depends on the branch offset between the current PC value and program subroutine address specified by the label.

These instructions cannot be repeated.

Status Bits

† x/y cycles: x cycles = condition true, y cycles = condition false

Opcode

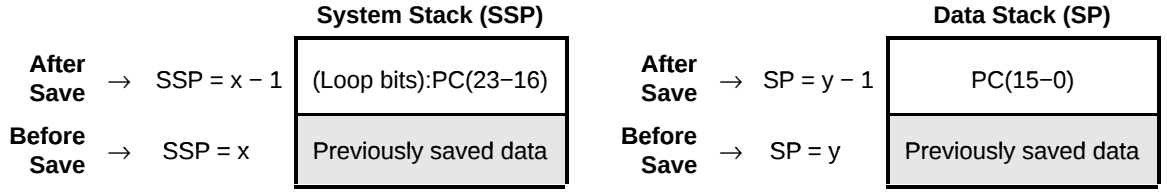
0110 1110	xCCC CCCC	LLLL LLLL	LLLL LLLL

Operands cond, L16

Description This instruction evaluates a single condition defined by the cond field in the read phase of the pipeline. If the condition is true, a subroutine call occurs to the program address defined by the program address label assembled into L16. There is a 1-cycle latency on the condition setting. A single condition can be tested as determined by the cond field of the instruction. See Table 1−3 for a list of conditions.

When a subroutine call occurs in the slow-return process (default), the return address (from the PC) and the loop context bits are stored to the stacks. For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

- ❏ The data stack pointer (SP) is decremented by 1 word in the read phase of the pipeline. The 16 LSBs of the return address, from the program counter (PC), of the called subroutine are pushed to the top of SP.
- ❏ The system stack pointer (SSP) is decremented by 1 word in the read phase of the pipeline. The loop context bits concatenated with the 8 MSBs of the return address are pushed to the top of SSP.
- ❏ The PC is loaded with the subroutine program address. The active control flow execution context flags are cleared.



Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the comparison of accumulators to 0 is performed as if M40 was set to 1.

Status Bits Affected by ACOVx, CARRY, C54CM, M40, TCx

Affects ACOVx

Repeat This instruction cannot be repeated.

Example

Syntax	Description
CALLCC (subroutine), AC1 >= #2000h	The content of AC1 is equal to or greater than 2000h, control is passed to the program address label, subroutine. The program counter (PC) is loaded with the subroutine program address.

Call Conditionally

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles†	Pipeline
[2]	**CALLCC** P24, cond	No	5	5/5	R

† x/y cycles: x cycles = condition true, y cycles = condition false

Opcode

0110 1001	xCCC CCCC	PPPP PPPP	PPPP PPPP	PPPP PPPP

Operands

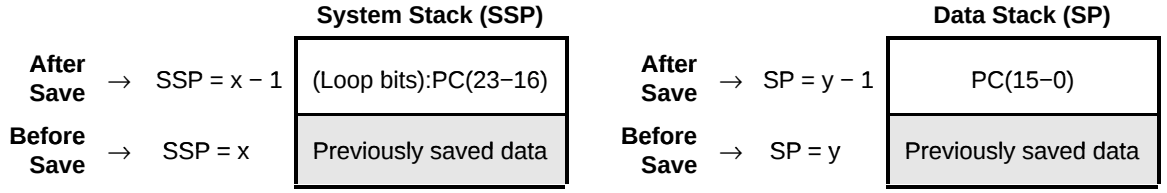
cond, P24

Description

This instruction evaluates a single condition defined by the cond field in the read phase of the pipeline. If the condition is true, a subroutine call occurs to the program address defined by the program address label assembled into P24. There is a 1-cycle latency on the condition setting. A single condition can be tested as determined by the cond field of the instruction. See Table 1−3 for a list of conditions.

When a subroutine call occurs in the slow-return process (default), the return address (from the PC) and the loop context bits are stored to the stacks. For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

- ❏ The data stack pointer (SP) is decremented by 1 word in the read phase of the pipeline. The 16 LSBs of the return address, from the program counter (PC), of the called subroutine are pushed to the top of SP.
- ❏ The system stack pointer (SSP) is decremented by 1 word in the read phase of the pipeline. The loop context bits concatenated with the 8 MSBs of the return address are pushed to the top of SSP.
- ❏ The PC is loaded with the subroutine program address. The active control flow execution context flags are cleared.



Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the comparison of accumulators to 0 is performed as if M40 was set to 1.

Status Bits Affected by ACOVx, CARRY, C54CM, M40, TCx

Affects ACOVx

Repeat This instruction cannot be repeated.

Example

Syntax	Description
CALLCC FOO, TC1	If TC1 is set to 1, control is passed to the program address label (FOO) assembled into an absolute address defined by the 24-bit value. If TC1 is cleared to 0, the program counter is incremented by 6 and the next instruction is executed.

CMP *Compare Memory with Immediate Value*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**CMP** Smem **==** K16**, TC1**	No	4	1	X
[2]	**CMP** Smem **==** K16**, TC2**	No	4	1	X

Opcode

TC1	1111 0000	AAAA AAAI	KKKK KKKK	KKKK KKKK
TC2	1111 0001	AAAA AAAI	KKKK KKKK	KKKK KKKK

Operands K16, Smem, TCx

Description This instruction performs a comparison in the A-unit ALU. The data memory operand Smem is compared to the 16-bit signed constant, K16. If they are equal, the TCx status bit is set to 1; otherwise, it is cleared to 0.

```
if((Smem) == K16)
   TCx = 1
else
   TCx = 0
```

Status Bits Affected by none

Affects TCx

Repeat This instruction can be repeated.

- CMP (Compare Accumulator, Auxiliary, or Temporary Register Content)

Example 1

Syntax	Description
CMP *AR1+ == #400h, TC1	The content addressed by AR1 is compared to the signed 16-bit value (400h). Because they are equal, TC1 is set to 1. AR1 is incremented by 1.

Before		**After**	
AR1	0285	AR1	0286
0285	0400	0285	0400
TC1	0	TC1	1

Example 2

Syntax	Description
CMP *AR1 == #400h, TC2	The content addressed by AR1 is compared to the signed 16-bit value (400h). Because they are not equal, TC2 is cleared to 0.

Before		**After**	
AR1	0285	AR1	0285
0285	0000	0285	0000
TC2	0	TC2	0

CMP *Compare Accumulator, Auxiliary, or Temporary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**CMP**[U] src RELOP dst**, TC1**	Yes	3	1	X
[2]	**CMP**[U] src RELOP dst**, TC2**	Yes	3	1	X

Opcode

TC1	0001 001E	FSSS	cc00	FDDD	xux0
TC2	0001 001E	FSSS	cc00	FDDD	xux1

Operands dst, RELOP, src, TCx

Description This instruction performs a comparison in the D-unit ALU or in the A-unit ALU. Two accumulator, auxiliary registers, and temporary registers contents are compared. When an accumulator ACx is compared with an auxiliary or temporary register TAx, the 16 lowest bits of ACx are compared with TAx in the A-unit ALU. If the comparison is true, the TCx status bit is set to 1; otherwise, it is cleared to 0.

The comparison depends on the optional U keyword and on M40 for accumulator comparisons. As the following table shows, the U keyword specifies an unsigned comparison and M40 defines the comparison bit width for accumulator comparisons

U	src	dst	Comparison Type
no	TAx	TAy	16-bit signed comparison in A-unit ALU
no	TAx	ACy	16-bit signed comparison in A-unit ALU
no	ACx	TAy	16-bit signed comparison in A-unit ALU
no	ACx	ACy	if M40 = 0, 32-bit signed comparison in D-unit ALU if M40 = 1, 40-bit signed comparison in D-unit ALU
yes	TAx	TAy	16-bit unsigned comparison in A-unit ALU
yes	TAx	ACy	16-bit unsigned comparison in A-unit ALU
yes	ACx	TAy	16-bit unsigned comparison in A-unit ALU
yes	ACx	ACy	if M40 = 0, 32-bit unsigned comparison in D-unit ALU if M40 = 1, 40-bit unsigned comparison in D-unit ALU

Compatibility with C54x devices (C54CM = 1)

Contrary to the corresponding C54x instruction, the C55x register comparison instruction is performed in execute phase of the pipeline.

When C54CM = 1, the conditions testing the accumulators content are all performed as if M40 was set to 1.

Status Bits Affected by C54CM, M40

Affects TCx

Repeat This instruction can be repeated.

Compare Accumulator, Auxiliary, or Temporary Register Content with AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
	CMPAND[U] src RELOP dst, TCy, TCx				
[1a]	**CMPAND**[U] src RELOP dst**, TC2, TC1**	Yes	3	1	X
[1b]	**CMPAND**[U] src RELOP dst**, TC1, TC2**	Yes	3	1	X

Opcode

Operands dst, RELOP, src, TC1, TC2

Description This instruction performs a comparison in the D-unit ALU or in the A-unit ALU. Two accumulator, auxiliary registers, and temporary registers contents are compared. When an accumulator ACx is compared with an auxiliary or temporary register TAx, the 16 lowest bits of ACx are compared with TAx in the A-unit ALU. If the comparison is true, the TCx status bit is set to 1; otherwise, it is cleared to 0. The result of the comparison is ANDed with TCy; TCx is updated with this operation.

The comparison depends on the optional U keyword and on M40 for accumulator comparisons. As the following table shows, the U keyword specifies an unsigned comparison and M40 defines the comparison bit width for accumulator comparisons

U	src	dst	Comparison Type
no	TAx	TAy	16-bit signed comparison in A-unit ALU
no	TAx	ACy	16-bit signed comparison in A-unit ALU
no	ACx	TAy	16-bit signed comparison in A-unit ALU
no	ACx	ACy	if M40 = 0, 32-bit signed comparison in D-unit ALU if M40 = 1, 40-bit signed comparison in D-unit ALU
yes	TAx	TAy	16-bit unsigned comparison in A-unit ALU
yes	TAx	ACy	16-bit unsigned comparison in A-unit ALU
yes	ACx	TAy	16-bit unsigned comparison in A-unit ALU
yes	ACx	ACy	if M40 = 0, 32-bit unsigned comparison in D-unit ALU if M40 = 1, 40-bit unsigned comparison in D-unit ALU

Compatibility with C54x devices (C54CM = 1)

Contrary to the corresponding C54x instruction, the C55x register comparison instruction is performed in execute phase of the pipeline.

When C54CM = 1, the conditions testing the accumulators content are all performed as if M40 was set to 1.

Status Bits Affected by C54CM, M40, TCy

Affects TCx

Repeat This instruction can be repeated.

Example

Syntax	Description
CMPAND AC1 == AC2, TC1, TC2	The content of AC1(31−0) is compared to the content of AC2(31−0). The contents are equal (true), TC2 = TC1 & 1.

Before		**After**	
AC1	80 0028 0400	AC1	80 0028 0400
AC2	00 0028 0400	AC2	00 0028 0400
M40	0	M40	0
TC1	1	TC1	1
TC2	0	TC2	1

Compare Accumulator, Auxiliary, or Temporary Register Content with AND

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
	CMPAND[U] src RELOP dst, **!**TCy, TCx				
[2a]	**CMPAND**[U] src RELOP dst**, !TC2, TC1**	Yes	3	1	X
[2b]	**CMPAND**[U] src RELOP dst**, !TC1, TC2**	Yes	3	1	X

Opcode

0001 001E	FSSS cc01	FDDD 1utt

Operands dst, RELOP, src, TC1, TC2

Description This instruction performs a comparison in the D-unit ALU or in the A-unit ALU. Two accumulator, auxiliary registers, and temporary registers contents are compared. When an accumulator ACx is compared with an auxiliary or temporary register TAx, the 16 lowest bits of ACx are compared with TAx in the A-unit ALU. If the comparison is true, the TCx status bit is set to 1; otherwise, it is cleared to 0. The result of the comparison is ANDed with the complement of TCy; TCx is updated with this operation.

The comparison depends on the optional U keyword and on M40 for accumulator comparisons. As the following table shows, the U keyword specifies an unsigned comparison and M40 defines the comparison bit width for accumulator comparisons

U	src	dst	Comparison Type
no	TAx	TAy	16-bit signed comparison in A-unit ALU
no	TAx	ACy	16-bit signed comparison in A-unit ALU
no	ACx	TAy	16-bit signed comparison in A-unit ALU
no	ACx	ACy	if M40 = 0, 32-bit signed comparison in D-unit ALU if M40 = 1, 40-bit signed comparison in D-unit ALU
yes	TAx	TAy	16-bit unsigned comparison in A-unit ALU
yes	TAx	ACy	16-bit unsigned comparison in A-unit ALU
yes	ACx	TAy	16-bit unsigned comparison in A-unit ALU
yes	ACx	ACy	if M40 = 0, 32-bit unsigned comparison in D-unit ALU if M40 = 1, 40-bit unsigned comparison in D-unit ALU

Compatibility with C54x devices (C54CM = 1)

Contrary to the corresponding C54x instruction, the C55x register comparison instruction is performed in execute phase of the pipeline.

When C54CM = 1, the conditions testing the accumulators content are all performed as if M40 was set to 1.

Status Bits Affected by C54CM, M40, TCy

Affects TCx

Repeat This instruction can be repeated.

Example

Syntax	Description
CMPAND AC1 == AC2, !TC1, TC2	The content of AC1(31−0) is compared to the content of AC2(31−0). The contents are equal (true), TC2 = !TC1 & 1.

Before		**After**	
AC1	80 0028 0400	AC1	80 0028 0400
AC2	00 0028 0400	AC2	00 0028 0400
M40	0	M40	0
TC1	1	TC1	1
TC2	0	TC2	0

CMPOR *Compare Accumulator, Auxiliary, or Temporary Register Content with OR*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**CMPOR**[U] src RELOP dst, TCy, TCx	Yes	3	1	X
[2]	**CMPOR**[U] src RELOP dst, **!**TCy, TCx	Yes	3	1	X

Description

These instructions perform a comparison in the D-unit ALU or in the A-unit ALU. Two accumulator, auxiliary registers, and temporary registers contents are compared. When an accumulator ACx is compared with an auxiliary or temporary register TAx, the 16 lowest bits of ACx are compared with TAx in the A-unit ALU.

.CR *Circular Addressing Qualifier*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	<instruction>**.CR**	No	1	1	AD

Opcode

```
1001 1101
```

Operands none

Description This instruction is an instruction qualifier that can be paralleled only with any instruction making an indirect Smem, Xmem, Ymem, Lmem, Baddr, or Cmem addressing. This instruction cannot be executed in parallel with any other types of instructions and it cannot be executed as a stand-alone instruction (assembler generates an error message).

When this instruction is used in parallel, all modifications of ARx and CDP pointer registers used in the indirect addressing mode are done circularly (as if ST2_55 register bits 0 to 8 were set to 1).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

DELAY *Memory Delay*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**DELAY** Smem	No	2	1	X

Opcode

1011 0110	AAAA AAAI

Operands Smem

Description This instruction copies the content of the memory (Smem) location into the next higher address (Smem + 1). When the data is copied, the content of the addressed location remains the same. A dedicated datapath is used to make this memory move.

When this instruction is executed, the two address register arithmetic units ARAU X and Y, of the A-unit data address generator unit, are used to compute the two addresses Smem and Smem + 1. The address generation is not affected by circular addressing; if Smem points to the end of a circular buffer, Smem + 1 will point to an address outside the circular buffer.

The soft dual memory addressing mode mechanism cannot be applied to this instruction. This instruction cannot use the port(#k16) addressing mode or be paralleled with the port() operand qualifier.

This instruction cannot be used for accesses to I/O space. Any illegal access to I/O space generates a hardware bus-error interrupt (BERRINT) to be handled by the CPU.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
DELAY *AR1+	The content addressed by AR1 is copied to the next higher address, AR1 + 1. AR1 is incremented by 1.

Before		After	
AR1	0200	AR1	0201
200	3400	200	3400
201	0D80	201	3400
202	2030	202	2030

EXP *Compute Exponent of Accumulator Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**EXP** ACx, Tx	Yes	3	1	X

Opcode

0001 000E	xxSS 1000	xxdd xxxx

Operands ACx, Tx

Description This instruction computes the exponent of the source accumulator ACx in the D-unit shifter. The result of the operation is stored in the temporary register Tx. The A-unit ALU is used to make the move operation.

This exponent is a signed 2s-complement value in the –8 to 31 range. The exponent is computed by calculating the number of leading bits in ACx and subtracting 8 from this value. The number of leading bits is the number of shifts to the MSBs needed to align the accumulator content on a signed 40-bit representation.

ACx is not modified after the execution of this instruction. If ACx is equal to 0, Tx is loaded with 0.

This instruction produces in Tx the opposite result than computed by the Compute Mantissa and Exponent of Accumulator Content instruction (page 5-272).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- MANT::EXP (Compute Mantissa and Exponent of Accumulator Content)

Example

Syntax	Description
EXP AC0, T1	The exponent is computed by subtracting 8 from the number of leading bits in the content of AC0. The exponent value is a signed 2s-complement value in the –8 to 31 range and is stored in T1.

```
Before                      After
AC0        FF FFFF FFCB     AC0        FF FFFF FFCB
T1                 0000     T1                 0019
```

FIRSADD *Symmetrical Finite Impulse Response Filter*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**FIRSADD** Xmem, Ymem, Cmem, ACx, ACy	No	4	1	X

Opcode

1000 0101	XXXM MMYY	YMMM 11mm	DDx0 DDU%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations: multiply and accumulate (MAC), and addition. The operation is executed:

```
ACy = ACy + (ACx * Cmem)
:: ACx = (Xmem << #16) + (Ymem << #16)
```

The first operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of ACx(32−16) and the content of a data memory operand Cmem, addressed using the coefficient addressing mode, sign extended to 17 bits.

- ❏ If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- ❏ When an addition overflow is detected, the accumulator is saturated according to SATD.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

The second operation performs an addition operation between the content of data memory operand Xmem, shifted left 16 bits, and the content of data memory operand Ymem, shifted left 16 bits.

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.

- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, FRCT, M40, SATD, SMUL, SXMD

Affects ACOVx, ACOVy, CARRY

Repeat This instruction can be repeated.

```

FIRSSUB *Antisymmetrical Finite Impulse Response Filter*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**FIRSSUB** Xmem, Ymem, Cmem, ACx, ACy	No	4	1	X

Opcode

1000 0101	XXXM MMYY	YMMM 11mm	DDx1 DDU%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations: multiply and accumulate (MAC), and subtraction. The operation is executed:

```
ACy = ACy + (ACx * Cmem)
:: ACx = (Xmem << #16) – (Ymem << #16)
```

The first operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of ACx(32−16) and the content of a data memory operand Cmem, addressed using the coefficient addressing mode, sign extended to 17 bits.

- ❏ If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- ❏ When an addition overflow is detected, the accumulator is saturated according to SATD.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

The second operation subtracts the content of data memory operand Ymem, shifted left 16 bits, from the content of data memory operand Xmem, shifted left 16 bits.

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.

- ❑ The shift operation is equivalent to the signed shift instruction.
- ❑ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, no overflow detection, report, and saturation is done after the shifting operation.

Status Bits

Affected by C54CM, FRCT, M40, SATD, SMUL, SXMD

Affects ACOVx, ACOVy, CARRY

IDLE *Idle*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**IDLE**	No	4	?	D

Opcode

0111 1010	xxxx xxxx	xxxx xxxx	xxxx 110x

Operands none

Description This instruction forces the program being executed to wait until an interrupt or a reset occurs. The power-down mode that the processor operates in depends on a configuration register accessible through the peripheral access mechanism.

Status Bits Affected by INTM

Affects none

Repeat This instruction cannot be repeated.

INTR *Software Interrupt*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**INTR** k5	No	2	3	D

Opcode

1001 0101	0xxk kkkk

Operands k5

Description This instruction passes control to a specified interrupt service routine (ISR) and interrupts are globally disabled (INTM bit is set to 1 after ST1_55 content is pushed onto the data stack pointer). The ISR address is stored at the interrupt vector address defined by the content of an interrupt vector pointer (IVPD or IVPH) combined with the 5-bit constant, k5. This instruction is executed regardless of the value of INTM bit.

Note:

DBSTAT (the debug status register) holds debug context information used during emulation. Make sure the ISR does not modify the value that will be returned to DBSTAT.

Before beginning an ISR, the CPU automatically saves the value of some CPU registers and two internal registers: the program counter (PC) and a loop context register. The CPU can use these values to re-establish the context of the interrupted program sequence when the ISR is done.

In the slow-return process (default), the return address (from the PC), the loop context bits, and some CPU registers are stored to the stacks (in memory). When the CPU returns from an ISR, the speed at which these values are restored is dependent on the speed of the memory accesses.

In the fast-return process, the return address (from the PC) and the loop context bits are saved to registers, so that these values can always be restored quickly. These special registers are the return address register (RETA) and the control-flow context register (CFCT). You can read from or write to RETA and CFCT as a pair with dedicated, 32-bit load and store instructions. Some CPU registers are saved to the stacks (in memory). For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

When control is passed to the ISR:

- ❑ The data stack pointer (SP) is decremented by 1 word in the address phase of the pipeline. The status register 2 (ST2_55) content is pushed to the top of SP.
- ❑ The system stack pointer (SSP) is decremented by 1 word in the address phase of the pipeline. The 7 higher bits of status register 0 (ST0_55) concatenated with 9 zeroes are pushed to the top of SSP.
- ❑ The SP is decremented by 1 word in the access phase of the pipeline. The status register 1 (ST1_55) content is pushed to the top of SP.
- ❑ The SSP is decremented by 1 word in the access phase of the pipeline. The debug status register (DBSTAT) content is pushed to the top of SSP.
- ❑ The SP is decremented by 1 word in the read phase of the pipeline. The 16 LSBs of the return address, from the program counter (PC), of the called subroutine are pushed to the top of SP.
- ❑ The SSP is decremented by 1 word in the read phase of the pipeline. The loop context bits concatenated with the 8 MSBs of the return address are pushed to the top of SSP.
- ❑ The PC is loaded with the ISR program address. The active control flow execution context flags are cleared.

When the software interrupt is acknowledged, the corresponding bits in IFR0 and IFR1 are cleared.

System Stack (SSP)

After Save	→	SSP = x − 3	(Loop bits):PC(23−16)
		SSP = x − 2	DBSTAT
		SSP = x − 1	ST0_55(15−9)
Before Save	→	SSP = x	Previously saved data

Data Stack (SP)

After Save	→	SP = y − 3	PC(15−0)
		SP = y − 2	ST1_55
		SP = y − 1	ST2_55
Before Save	→	SP = y	Previously saved data

Status Bits Affected by none

Affects INTM, IFR0, IFR1

Repeat This instruction cannot be repeated.

Example

Syntax	Description
INTR #3	Program control is passed to the specified interrupt service routine. The interrupt vector address is defined by the content of an interrupt vector pointer (IVPD) combined with the unsigned 5-bit value (3).

.LK *Lock Access Qualifier*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	.LK	No	2	1	D

Opcode

	0100 0101	1111 0010

Operands none

Description This is an operand qualifier that can be paralleled with any of 13 instructions (listed below) which execute a read-modify-write operation to a specific memory operand. If the .LK qualifier is applied to any of 13 instructions, the lock signal is activated at the same cycle with the read request and the corresponding write request follows this read request. This means any memory request issued by other instructions cannot be located between this locked read and write request due to stall generation. This also provides a suitable interface with the OCP.

This operand qualifier cannot be executed:

- ❏ Alone
- ❏ In parallel with instructions except the 13 lock instructions

Any of the 13 instructions using the .LK qualifier cannot be combined with any other user-defined parallelism instruction.

The 13 lock instructions which can be paralleled with the .LK qualifier are listed in the table below.

Number	Algebraic	Mnemonic
1	TC1 = bit(Smem, k4), bit(Smem, k4) = #1	BTSTSET k4, Smem, TC1
2	TC2 = bit(Smem, k4), bit(Smem, k4) = #1	BTSTSET k4, Smem, TC2
3	TC1 = bit(Smem, k4), bit(Smem, k4) = #0	BTSTCLR k4, Smem, TC1
4	TC2 = bit(Smem, k4), bit(Smem, k4) = #0	BTSTCLR k4, Smem, TC2
5	TC1 = bit(Smem, k4), cbit(Smem, k4)	BTSTNOT k4, Smem, TC1
6	TC2 = bit(Smem, k4), cbit(Smem, k4)	BTSTNOT k4, Smem, TC2
7	bit(Smem, src) = #1	BSET src, Smem
8	bit(Smem, src) = #0	BCLR src, Smem
9	cbit(Smem, src)	BNOT src, Smem
10	Smem = Smem & k16	AND k16, Smem
11	Smem = Smem | k16	OR k16, Smem
12	Smem = Smem ^ k16	XOR k16, Smem
13	Smem = Smem + k16	ADD k16, Smem

Any of the 13 instructions with the .LK qualifier is not allowed in the conditional execution context which is applied by “if(cond) execute(D_unit)” instruction due to OCP compliance. The cases below are illegal and rejected by the code-gen tools:

```
if(cond execute(D_unit)
TC1=bit(*ar2+, #2), bit(*ar2+, #2)=#1 || lock()

instruction || if(cond) execute(D_unit)
TC1=bit(*ar2+, #2), bit(*ar2+, #2)=#1 || lock()
```

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

```
TC1=bit(*ar2+, #2), bit(*ar2+, #2)=#1 || lock()
```

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**LMS** Xmem, Ymem, ACx, ACy	No	4	1	X

Opcode

1000 0110	XXXM MMYY	YMMM DDDD	110x xxx%

Operands ACx, ACy, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and accumulate (MAC), and addition. The instruction is executed:

```
ACy = ACy + (Xmem * Ymem)
:: ACx = round(ACx + (Xmem << #16))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, sign extended to 17 bits, and the content of data memory operand Ymem, sign extended to 17 bits.

- ❏ If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- ❏ When an addition overflow is detected, the accumulator is saturated according to SATD.

The second operation performs an addition between an accumulator content and the content of data memory operand Xmem shifted left by 16 bits.

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ Rounding is performed according to RDM.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, the rounding is performed without clearing the 16 lowest bits of ACx. The addition operation has no overflow detection, report, and saturation after the shifting operation.

Status Bits

Affected by C54CM, FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx, ACOVy, CARRY

Repeat

This instruction can be repeated.

LMSF *Least Mean Square (LMSF)*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**LMSF** Xmem, Ymem, ACx, ACy	No	4	1	X

Opcode

1000 0111	XXXM MMYY	YMMM SSDD	0110 0001

Operands ACx, ACy, Xem, Ymem, T3

Description This instruction performs three parallel operations in one cycle. The operations are executed in the D-unit MAC and D-unit ALU. The instruction is executed :

```
ACx = T3 * (Ymem)
ACy = ACy + (Xmem) * (Ymem)
Xmem = HI(rnd(ACx + (Xmem)<<#16))
```

The first operation performs a multiplication in D-unit MAC1. The input operands of the multiplier are the content of data register T3 and the content of data memory operand Ymem. The implied T3 operand is sign extended to 17 bits in the MAC1. The data memory operand Ymem is addressed by DAGEN path Y by using Ymem addressing mode, driven on the CDB bus, and sign extended to 17 bits in the MAC1.

- ❏ If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

The second operation performs a multiplication and an addition in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Xmem and the content of data memory operand Ymem. The data memory operand Xmem is addressed by DAGEN path X by using Xmem addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2. The other data memory operand Ymem is addressed by DAGEN path Y by using the Ymem addressing mode, driven on data bus CDB, and sign extended to 17 bits in the MAC2.

- If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

The third operation performs an addition between an accumulator content and the content of data memory operand Xmem in the D-unit ALU. The data memory operand Xmem is driven on the DDB bus as described in the above second operation, sign extended to 40 bits according to SXMD, shifted to the left by 16 bits, and supplied to D-unit ALU.

- The shift operation is identical to the arithmetic shift instruction. Therefore, an overflow detection, report and saturation is done after the shifting operation.
- Overflow and CARRY detection are operated as M40 bit is locally set to 0.
- Addition overflow is always detected at bit position 31.
- Addition carry report in CARRY status bit is always extracted at bit position 31.
- A rounding is always performed on the result of the addition. The rounding operation depends on RDM status value.
- When RDM is 0, the biased rounding to the infinite is performed. 2^15 is added to the 40-bit result of the accumulation.
- When RDM is 1, the unbiased rounding to the nearest is performed. According to the value of the 17 LSB of the 40-bit result of accumulation, 2^15 is added as following pseudo code description.

```
if(2^15 < bit(15-0) < 2^16)
  add 2^15 to the 40-bit result of the accumulation
else if(bit(15-0) == 2^15)
  if(bit(16) == 1)
    add 2^15 to the 40-bit result of the accumulation
```

- When an overflow is detected on the result of the rounding, the accumulator is saturated according to SATD. Note that no overflow

detection is performed on the intermediate result after the addition but before the rounding.

- ❏ If an overflow resulting from the shift, or the addition/the rounding is detected, accumulator 0 overflow status bit is set (ACOV0). (In the exceptional case, even if the result of addition is overflowed, the rounding operation may suppress the overflow report.)
- ❏ When an overflow is detected, the result is saturated according to SATD, before being stored in memory. Saturation values are 7FFFh or 8000h.
- ❏ The result of the third operation, high part of ACx is stored into the data memory location addressed by Xmem via the Ebus.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40=0 and C54CM=1, compatibility is ensured due to following the implementation of lms instruction.

- ❏ The rounding is performed without clearing the 16 lowest bits of ACx.
- ❏ The addition operation has no overflow detection, report, and saturation after the shifting operation.

Status Bits Affected by C54CM, FRCT, M40, RDM, SATD, SMUL, SXMD,

.LR *Linear Addressing Qualifier*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	<instruction>**.LR**	No	1	1	AD

Opcode

```
1001 1100
```

Operands none

Description This instruction is an instruction qualifier that can be paralleled only with any instruction making an indirect Smem, Xmem, Ymem, Lmem, Baddr, or Cmem addressing. This instruction cannot be executed in parallel with any other types of instructions and it cannot be executed as a stand-alone instruction (assembler generates an error message).

When this instruction is used in parallel, all modifications of ARx and CDP pointer registers used in the indirect addressing mode are done linearly (as if ST2_55 register bits 0 to 8 were cleared to 0).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**MACM**[R] [T3 =]Smem, Cmem, ACx	No	3	1	X

Opcode

1101 0001	AAAA AAAI	U%DD 01mm

Description ACx, Cmem, Smem

Description This instruction performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of a memory location (Smem), sign extended to 17 bits, and the content of a data memory operand (Cmem), addressed using the coefficient addressing mode and sign extended to 17 bits:

```
ACx = ACx + (Smem * Cmem)
```

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- When an addition overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Description This instruction performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of a memory location (Smem), sign extended to 17 bits, and the 8-bit signed constant, K8, sign extended to 17 bits:

```
ACy = ACx + (Smem * K8)
```

- ❑ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❑ The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- ❑ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❑ Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- ❑ When an addition overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MACMK *AR3, #FFh, AC1, AC0	The product of the content addressed by AR3 and a signed 8-bit value (FFh) is added to the content of AC1. The result is stored in AC0.

Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[9]	**MACM**[R][40] [T3 =][uns()]Xmem[)], [uns()]Ymem[)], [ACx,] ACy	No	4	1	X

Opcode

1000 0110	XXXM MMYY	YMMM SSDD	001g uuU%

Operands ACx, ACy, Xmem, Ymem

Description

This instruction performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of data memory operand Ymem, extended to 17 bits:

```
ACy = ACx + (Xmem * Ymem)
```

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an addition overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

This instruction provides the option to store the 16-bit data memory operand Xmem in temporary register T3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MACMR uns(*AR2+), uns(*AR3+), AC3	The product of the unsigned content addressed by AR2 and the unsigned content addressed by AR3 is added to the content of AC3. The result is rounded and stored in AC3. The result generated an overflow. AR2 and AR3 are both incremented by 1.

Before		**After**	
AC3	00 2300 EC00	AC3	00 9221 0000
AR2	302	AR2	303
AR3	202	AR3	203
ACOV3	0	ACOV3	1

Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[10]	**MACM**[R][40] [T3 =][uns()]Xmem[)], [uns()]Ymem[)], ACx **>> #16**[, ACy]	No	4	1	X

Opcode

1000 0110	XXXM MMYY	YMMM SSDD	010g uuU%

Operands ACx, ACy, Xmem, Ymem

Description This instruction performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of data memory operand Ymem, extended to 17 bits:

```
ACy = (ACx >> #16) + (Xmem * Ymem)
```

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx, which has been shifted to the right by 16 bits. The shifting operation is performed with a sign extension of source accumulator ACx(39).
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an addition overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

This instruction provides the option to store the 16-bit data memory operand Xmem in temporary register T3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MACM uns(*AR3), uns(*AR4), AC1 >> #16, AC0	The product of the unsigned content addressed by AR3 and the unsigned content addressed by AR4 is added to the content of AC1, which has been shifted to the right by 16 bits. The result is stored in AC0.

Multiply and Accumulate (MAC)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[11]	**MAC**[R] Smem, uns(Cmem), ACx	No	3	1	X

Opcode

1101 0000	AAAA AAAI	0%DD 10mm

Operands ACx, Cmem, Smem

Description This instruction performs a multiplication and an accumulation in the D-unit MAC1. The input operands of the multiplier are the content of a data memory location (Smem) and the content of a data memory operand (Cmem).

> **Note:**
>
> The uns keyword is mandatory for this instruction.

The data memory operand Smem is addressed by DAGEN path X by using the Smem addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The another data memory operand Cmem is addressed by DAGEN path C by using the coefficient addressing mode, driven on data bus BDB, and extended to 17 bits with filling zeros in the MAC1:

```
ACx = ACx + (Smem * Cmem)
```

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB

buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

This instruction can be applied to compute the intermediate multiplication result and accumulation to the other partial result of double precision multiplication and to free up one DAGEN operator (DAGEN path Y) for storing an instruction with enabling parallelism.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits

Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx

Repeat

This instruction can be repeated.

Example

Syntax	Description
MAC *AR3−, uns(*CDP+), AC0	The product of the content addressed by AR3 and the content addressed by the coefficient data pointer register (CDP) is added to the content of AC0. The result is stored in AC0. AR3 is decremented by 1 and CDP is incremented by 1.

Execution

MACMZ *Multiply and Accumulate with Parallel Delay*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MACM**[R]**Z** [T3 =]Smem, Cmem, ACx	No	3	1	X

Opcode

1101 0000	AAAA AAAI	U%DD xxmm

Operands ACx, Cmem, Smem

Description This instruction performs a multiplication and an accumulation in the D-unit MAC in parallel with the delay memory instruction. The input operands of the multiplier are the content of a memory location (Smem), sign extended to 17 bits, and the content of a data memory operand (Cmem), addressed using the coefficient addressing mode and sign extended to 17 bits.

```
ACx = ACx + (Smem * Cmem)
:: delay(Smem)
```

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❏ Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- ❏ When an addition overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

The soft dual memory addressing mode mechanism cannot be applied to this instruction. This instruction cannot use the port(#k16) addressing mode or be paralleled with the port() operand qualifier.

This instruction cannot be used for accesses to I/O space. Any illegal access to I/O space generates a hardware bus-error interrupt (BERRINT) to be handled by the CPU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits

Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx

Parallel Multiply and Accumulates

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MAC**[R][40] [uns(]Xmem[)], [uns(]Cmem[)], ACx **::** **MAC**[R][40] [uns(]Ymem[)], [uns(]Cmem[)], ACy	No	4	1	X

Opcode

1000 0011	XXXM MMYY	YMMM 00mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel multiply and accumulate (MAC) operations in one cycle:

```
ACx = ACx + (Xmem * Cmem)
:: ACy = ACy + (Ymem * Cmem)
```

The first operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

The second operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.

- ❑ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MAC uns(*AR3), uns(*CDP), AC0 :: MAC uns(*AR4), uns(*CDP), AC1	Both instructions are performed in parallel. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the coefficient data pointer register (CDP) is added to the content of AC0. The result is stored in AC0. The product of the unsigned content addressed by AR4 and the unsigned content addressed by CDP is added to the content of AC1. The result is stored in AC1.

Parallel Multiply and Accumulates

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**MAC**[R][40] [uns(]Smem[)], [uns(]HI(Cmem)[)], ACy **:: MAC**[R][40] [uns(]Smem[)], [uns(]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0001 01mm	DDDD uug%

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel multiply and accumulate (MAC) operations in one cycle. The operations are executed in the two D-unit MACs:

```
ACy = ACy + (Smem * HI(Cmem))
:: ACx = ACx + (Smem * LO(Cmem))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and an accumulation in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.

- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator.
- Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel multiply and accumulate (MAC) operations in one cycle. The operations are executed in the two D-unit MACs:

```
ACy = ACy + (Smem * HI(Cmem))
:: ACx = (ACx >> #16) + (Smem * LO(Cmem))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and an accumulation in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx, which has been shifted to the right by 16 bits. The shifting operation is performed with a sign extension of source accumulator ACx(39).
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Parallel Multiply and Accumulates

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[10]	**MAC**[R][40] [uns()]Ymem[])], [uns()]HI(Cmem)[])], ACy **:: MAC**[R][40] [uns()]Xmem[])], [uns()]LO(Cmem)[])], ACx	No	5 (*)	1	X

(*) 1 LSB is allocated to instruction slot #2.

Opcode

1001 0011	XXXM MMYY	YMMM 00mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel multiply and accumulate (MAC) operations in one cycle. The operations are executed in the two D-unit MACs:

```
ACy = ACy + (Ymem * HI(Cmem))
:: ACx = ACx + (Xmem * LO(Cmem))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the contents of data memory operand Ymem, extended to 17 bits, and the content of data memory operand HI(Cmem) which is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and an accumulation in the D-unit MAC1. The input operands of the multiplier are the contents of data memory operand Xmem, extended to 17 bits, and the content of data memory operand LO(Cmem) which is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ Because this instruction occupies both instruction slots #1 and #2, this can not be executed in parallel with other instructions.
- ❏ The Xmem operand can access the MMRs but the Ymem operand can not.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MAC uns(*AR3−), uns(HI(*CDP+)), AC1 :: MAC uns(*AR2−), uns(LO(*CDP+)), AC0	Both instructions are performed in parallel. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the higher part of the coefficient data pointer register (CDP) is added to the content of AC1. The result is stored in AC1. The product of the unsigned content addressed by AR2 and the unsigned content addressed by the lower part of the CDP is added to the content of AC0. The result is stored in AC0. AR3 and AR2 are decremented by 1. When CDP+ is used with HI/LO, CDP is incremented by 2.

Execution

```
M40(rnd(ACx + uns(Xmem)[16:0] * uns(LO(Cmem))[16:0])) -> ACx

Multiply and Accumulate With Parallel Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MAC**[R][40] [uns(]Smem[)], [uns(]HI(Cmem)[)], ACy **:: MAS**[R][40] [uns(]Smem[)], [uns(]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0001 10mm	DDDD uug%

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel operations in one cycle: multiply and accumulate (MAC) and multiply and subtract (MAS). The operations are executed in the two D-unit MACs:

```
ACy = ACy + (Smem * HI(Cmem))
:: ACx = ACx - (Smem * LO(Cmem))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Multiply and Accumulate With Parallel Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MAC**[R][40] [uns(]Smem[)], [uns(]HI(Cmem)[)], ACy **>> #16** **:: MAS**[R][40] [uns(]Smem[)], [uns(]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0010 01mm	DDDD uug%

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel operations in one cycle: multiply and accumulate (MAC) and multiply and subtract (MAS). The operations are executed in the two D-unit MACs:

```
ACy = (ACy >> #16) + (Smem * HI(Cmem))
:: ACx = ACx – (Smem * LO(Cmem))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy, which has been shifted to the right by 16 bits. The shifting operation is performed with a sign extension of source accumulator ACy(39).
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Multiply and Accumulate With Parallel Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MAC**[R][40] [uns()]HI(Lmem)[])], [uns()]HI(Cmem)[])], ACy **:: MAS**[R][40] [uns()]LO(Lmem)[])], [uns()]LO(Cmem)[])], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0101 10mm	DDDD uug%

Operands ACx, ACy, Cmem, Lmem

Description This instruction performs two parallel operations in one cycle: multiply and accumulate (MAC) and multiply and subtract (MAS). The operations are executed in the two D-unit MACs:

```
ACy = ACy + (HI(Lmem) * HI(Cmem))
:: ACx = ACx - (LO(Lmem) * LO(Cmem))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand HI(Lmem) and the content of data memory operand HI(Cmem). The data memory operand HI(Lmem) is addressed by DAGEN path X with the EA (effective address); the data, which can be assumed to be the higher part of long word memory data, is driven on data bus CDB and sign extended to 17 bits in the MAC2. The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA; the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand LO(Lmem) and the content of data memory operand LO(Cmem). The data memory operand LO(Lmem) is addressed by DAGEN path X with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word memory data, is driven on data bus DDB and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MAC uns(HI(*AR3−)), uns(HI(*CDP+)), AC1 :: MAS uns(LO(*AR3−)), uns(LO(*CDP+)), AC0	Both instructions are performed in parallel. The product of the unsigned content addressed by the higher part of AR3 and the unsigned content addressed by the higher part of the coefficient data pointer register (CDP) is added to the content of AC1. The result is stored in AC1. The product of the unsigned content addressed by lower part of AR3 and the unsigned content addressed by the lower part of CDP is subtracted from the content of AC0. The result is stored in AC0. When AR3− is used with HI/LO, AR3 is decremented by 2. When CDP+ is used with HI/LO, CDP is incremented by 2.

Execution

```
ACy+M40(rnd(uns(HI(Lmem))[16:0]*uns(HI(Cmem))[16:0])) -> ACy
ACx-M40(rnd(uns(LO(Lmem))[16:0]*uns(LO(Cmem))[16:0])) -> ACx
```

Multiply and Accumulate With Parallel Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**MAC**[R][40] [uns(]HI(Lmem)[)], [uns(]HI(Cmem)[)], ACy **>> #16** **:: MAS**[R][40] [uns(]LO(Lmem)[)], [uns(]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0110 01mm	DDDD uug%

Operands ACx, ACy, Cmem, Lmem

Description This instruction performs two parallel operations in one cycle: multiply and accumulate (MAC) and multiply and subtract (MAS). The operations are executed in the two D-unit MACs:

```
ACy = (ACy >> #16) + (HI(Lmem) * HI(Cmem))
:: ACx = ACx - (LO(Lmem) * LO(Cmem))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand HI(Lmem) and the content of data memory operand HI(Cmem). The data memory operand HI(Lmem) is addressed by DAGEN path X with the EA (effective address); the data, which can be assumed to be the higher part of long word memory data, is driven on data bus CDB and sign extended to 17 bits in the MAC2. The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA; the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand LO(Lmem) and the content of data memory operand LO(Cmem). The data memory operand LO(Lmem) is addressed by DAGEN path X with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word memory data, is driven on data bus DDB and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy, which has been shifted to the right by 16 bits. The shifting operation is performed with a sign extension of source accumulator ACy(39).
- For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

Multiply and Accumulate With Parallel Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**MAC**[R][40] [uns(]Ymem[)], [uns(]HI(Cmem)[)], ACy **:: MAS**[R][40] [uns(]Xmem[)], [uns(]LO(Cmem)[)], ACx	No	5 (*)	1	X

(*) 1 LSB is allocated to instruction slot #2.

Opcode

1001 0011	XXXM MMYY	YMMM 01mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and accumulate (MAC) and multiply and subtract (MAS). The operations are executed in the two D-unit MACs:

```
ACy = ACy + (Ymem * HI(Cmem))
:: ACx = ACx - (Xmem * LO(Cmem))
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the contents of data memory operand Ymem, extended to 17 bits, and the content of data memory operand HI(Cmem) which is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the contents of data memory operand Xmem, extended to 17 bits, and the content of data memory operand LO(Cmem) which is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ Because this instruction occupies both instruction slots #1 and #2, this can not be executed in parallel with other instructions.
- ❏ The Xmem operand can access the MMRs but the Ymem operand can not.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

Multiply and Accumulate With Parallel Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MAC**[R][40] [uns()]Xmem[)], [uns()]Cmem[)], ACx **:: MPY**[R][40] [uns()]Ymem[)], [uns()]Cmem[)], ACy	No	4	1	X

Opcode

1000 0010	XXXM MMYY	YMMM 01mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and accumulate (MAC) and multiply. The operations are executed in the two D-unit MACs:

```
ACx = ACx + (Xmem * Cmem)
:: ACy = Ymem * Cmem
```

The first operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

This second operation performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.

- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

```
ACy = ACy + (Smem * HI(Cmem))
:: ACx = Smem * LO(Cmem)
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.

- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

[6]	**MAC**[R][40] [uns(]HI(Ymem)[)], [uns(]HI(Cmem)[)], ACy **>> #16** **:: MPY**[R][40] [uns(]LO(Xmem)[)], [uns(]LO(Cmem)[)], ACx	No	5 (*)	1	X

(*) 1 LSB is allocated to instruction slot #2.

Opcode

```
| 1001 0100 | XXXM MMYY | YMMM 10mm | uuDD DDg% |
```

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and accumulate (MAC) and multiply. The operations are executed in the two D-unit MACs:

```
ACy = (ACy >> #16) + (HI(Ymem) * HI(Cmem))
:: ACx = LO(Xmem) * LO(Cmem)
```

The first operation performs a multiplication and an accumulation in the D-unit MAC2. The input operands of the multiplier are the contents of data memory operand Ymem, extended to 17 bits, and the content of data memory operand HI(Cmem) which is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication in the D-unit MAC1. The input operands of the multiplier are the contents of data memory operand Xmem, extended to 17 bits, and the content of data memory operand LO(Cmem) which is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ Because this instruction occupies both instruction slots #1 and #2, this can not be executed in parallel with other instructions.
- ❏ The Xmem operand can access the MMRs but the Ymem operand can not.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

MACM::MOV *Multiply and Accumulate with Parallel Load Accumulator from Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MACM**[R] [T3 =]Xmem, Tx, ACx **:: MOV** Ymem **<< #16**, ACy	No	4	1	X

Opcode

1000 0110	XXXM MMYY	YMMM DDDD	101x ssU%

Operands ACx, ACy, Tx, Xmem, Ymem

Description This instruction performs two operations in parallel: multiply and accumulate (MAC) and load:

```
ACx = ACx + (Tx * Xmem)
:: ACy = Ymem << #16
```

The first operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of Tx, sign extended to 17 bits, and the content of data memory operand Xmem, sign extended to 17 bits.

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❏ Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- ❏ When an addition overflow is detected, the accumulator is saturated according to SATD.
- ❏ This instruction provides the option to store the 16-bit data memory operand Xmem in temporary register T3.

The second operation loads the content of data memory operand Ymem, which has been shifted to the left by 16 bits, to accumulator ACy.

- ❏ The input operand is sign extended to 40 bits according to SXMD.

- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ The input operand is shifted to the left by 16 bits according to M40.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits

Opcode

1000 0111	XXXM MMYY	YMMM SSDD	001x ssU%

Operands ACx, ACy, Tx, Xmem, Ymem

Description This instruction performs two operations in parallel: multiply and accumulate (MAC) and store:

```
ACy = rnd(ACy + (Tx * Xmem)),
:: Ymem = HI(ACx << T2) [,T3 = Xmem]
```

The first operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of Tx, sign extended to 17 bits, and the content of data memory operand Xmem, sign extended to 17 bits.

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❏ Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- ❏ When an addition overflow is detected, the accumulator is saturated according to SATD.
- ❏ This instruction provides the option to store the 16-bit data memory operand Xmem in temporary register T3.

The second operation shifts the accumulator ACx by the content of T2 and stores ACx(31−16) to data memory operand Ymem. If the 16-bit value in T2 is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value.

- ❏ The input operand is shifted in the D-unit shifter according to SXMD.
- ❏ After the shift, the high part of the accumulator, ACx(31−16), is stored to the memory location.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When this instruction is executed with C54CM = 1, the 6 LSBs of T2 determine the shift quantity. The 6 LSBs of T2 define a shift quantity within –32 to +31. When the 16-bit value in T2 is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = rnd(ACy + (Tx * Xmem)),
  Ymem = HI(saturate(uns(ACx << T2))) [,T3 = Xmem]

- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = rnd(ACy + (Tx * Xmem)),
  Ymem = HI(saturate(ACx << T2)) [,T3 = Xmem]

Status Bits

Affected by C54CM, FRCT, M40, RDM, SATD, SMUL, SST, SXMD

Affects ACOVy

Repeat

This instruction can be repeated.

Example

Syntax	Description
MACM *AR3, T0, AC0 :: MOV HI(AC1 << T2), *AR4	Both instructions are performed in parallel. The product of the content addressed by AR3 and the content of T0 is added to the content of AC0. The result is stored in AC0. The content of AC1 is shifted by the content of T2, and AC1(31−16) is stored at the address of AR4.

MANT::NEXP *Compute Mantissa and Exponent of Accumulator Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MANT** ACx, ACy **:: NEXP** ACx, Tx	Yes	3	1	X2

Opcode

0001 000E	DDSS 1001	xxdd xxxx

Operands ACx, ACy, Tx

Description This instruction computes the exponent and mantissa of the source accumulator ACx. The computation of the exponent and the mantissa is executed in the D-unit shifter. The exponent is computed and stored in the temporary register Tx. The A-unit is used to make the move operation. The mantissa is stored in the accumulator ACy.

The exponent is a signed 2s-complement value in the –31 to 8 range. The exponent is computed by calculating the number of leading bits in ACx and subtracting this value from 8. The number of leading bits is the number of shifts to the MSBs needed to align the accumulator content on a signed 40-bit representation.

The mantissa is obtained by aligning the ACx content on a signed 32-bit representation. The mantissa is computed and stored in ACy.

- The shift operation is performed on 40 bits.
  - When shifting to the LSBs, bit 39 of ACx is extended to bit 31.
  - When shifting to the MSBs, 0 is inserted at bit position 0.
- If ACx is equal to 0, Tx is loaded with 8000h.

This instruction produces in Tx the opposite result than computed by the Compute Exponent of Accumulator Content instruction (page 5-157).

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

```

Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MASM**[R] [T3 =]Smem, Cmem, ACx	No	3	1	X

Opcode

1101 0001	AAAA AAAI	U%DD 10mm

Operands ACx, Cmem, Smem

Description This instruction performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of a memory location (Smem), sign extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and sign extended to 17 bits:

```
ACx = ACx – (Smem * Cmem)
```

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

FRCT	0	FRCT	0

Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**MAS**[R] Smem, uns(Cmem), ACx	No	3	1	X

Opcode

1101 0000	AAAA AAAI	0%DD 11mm

Operands ACx, Cmem, Smem

Description This instruction performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the content of a data memory location (Smem) and the content of a data memory operand (Cmem):

```
ACx = ACx – (Smem * uns(Cmem))
```

Note:

The uns keyword is mandatory for this instruction.

The data memory operand Smem is addressed by DAGEN path X by using the Smem addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The another data memory operand Cmem is addressed by DAGEN path C by using the coefficient addressing mode, driven on data bus BDB, and extended to 17 bits with filling zeros in the MAC1.

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB

buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

This instruction can be applied to compute the intermediate multiplication result and subtraction from the other partial result of double precision arithmetic and to free up one DAGEN operator (DAGEN path Y) for store instruction with enabling parallelism.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MAS *AR3−, uns(*CDP+), AC0	The product of the content addressed by AR3 and the unsigned content addressed by the coefficient data pointer register (CDP) is subtracted from the content of AC0. The result is stored in AC0. AR3 is decremented by 1 and CDP is incremented by 1.

Multiply and Subtract with Parallel Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MAS**[R][40] [uns()]Xmem[])], [uns()]Cmem[])], ACx **:: MAC**[R][40] [uns()]Ymem[])], [uns()]Cmem[])], ACy	No	4	1	X

Opcode

1000 0011	XXXM MMYY	YMMM 01mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and subtract (MAS) and multiply and accumulate (MAC). The operations are executed in the two D-unit MACs:

```
ACx = ACx – (Xmem * Cmem)
:: ACy = ACy + (Ymem * Cmem)
```

The first operation performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

The second operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.

- ❏ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- ■ AMAR Xmem
- ■ AMAR Ymem
- ■ AMAR Cmem

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MASR40 uns(*AR0), uns(*CDP), AC0 :: MACR40 uns(*AR1), uns(*CDP), AC1	Both instructions are performed in parallel. The product of the unsigned content addressed by AR0 and the unsigned content addressed by the coefficient data pointer register (CDP) is subtracted from the content of AC0. The result is rounded and stored in AC0. The product of the unsigned content addressed by AR1 and the unsigned content addressed by CDP is added to the content of AC1. The result is rounded and stored in AC1.

Multiply and Subtract with Parallel Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MAS**[R][40] [uns()]Xmem[)], [uns()]Cmem[)], ACx **:: MAC**[R][40] [uns()]Ymem[)], [uns()]Cmem[)], ACy **>> #16**	No	4	1	X

Opcode

1000 0100	XXXM MMYY	YMMM 00mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and subtract (MAS) and multiply and accumulate (MAC). The operations are executed in the two D-unit MACs:

```
ACx = ACx – (Xmem * Cmem)
:: ACy = (ACy >> #16) + (Ymem * Cmem)
```

The first operation performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

The second operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.

- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy, which has been shifted to the right by 16 bits. The shifting operation is performed with a sign extension of source accumulator ACy(39).
- ❏ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MAS uns(*AR3), uns(*CDP), AC0 :: MAC uns(*AR4), uns(*CDP), AC1 >> #16	Both instructions are performed in parallel. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the coefficient data pointer register (CDP) is subtracted from the content of AC0. The result is stored in AC0. The product of the unsigned content addressed by AR4 and the unsigned content addressed by CDP is added to the content of AC1, which has been shifted to the right by 16 bits. The result is stored in AC1.

Multiply and Subtract with Parallel Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MAS**[R][40] [uns(]Smem[)], [uns(]HI(Cmem)[)], ACy **:: MAC**[R][40] [uns(]Smem[)], [uns(]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0001 11mm	DDDD uug%

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel operations in one cycle: multiply and subtract (MAS) and multiply and accumulate (MAC). The operations are executed in the two D-unit MACs:

```
ACy = ACy – (Smem * HI(Cmem))
:: ACx = ACx + (Smem * LO(Cmem))
```

The first operation performs a multiplication and a subtraction in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and an accumulation in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACy.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits

Multiply and Subtract with Parallel Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**MAS**[R][40] [uns()]HI(Lmem)[)], [uns()]HI(Cmem)[)], ACy **:: MAC**[R][40] [uns()]LO(Lmem)[)], [uns()]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0101 11mm	DDDD uug%

Operands ACx, ACy, Cmem, Lmem

Description This instruction performs two parallel operations in one cycle: multiply and subtract (MAS) and multiply and accumulate (MAC). The operations are executed in the two D-unit MACs:

```
ACy = ACy - (HI(Lmem) * HI(Cmem))
:: ACx = ACx + (LO(Lmem) * LO(Cmem))
```

The first operation performs a multiplication and a subtraction in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand HI(Lmem) and the content of data memory operand HI(Cmem). The data memory operand HI(Lmem) is addressed by DAGEN path X with the EA (effective address); the data, which can be assumed to be the higher part of long word memory data, is driven on data bus CDB and sign extended to 17 bits in the MAC2. The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA; the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and an accumulation in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand LO(Lmem) and the content of data memory operand LO(Cmem). The data memory operand LO(Lmem) is addressed by DAGEN path X with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word memory data, is driven on data bus DDB and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACy.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Parallel Multiply and Subtracts

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MAS**[R][40] [uns()]Xmem[)], [uns()]Cmem[)], ACx **:: MAS**[R][40] [uns()]Ymem[)], [uns()]Cmem[)], ACy	No	4	1	X

Opcode

1000 0101	XXXM MMYY	YMMM 01mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel multiply and subtract (MAS) operations in one cycle. The operations are executed in the two D-unit MACs:

```
ACx = ACx – (Xmem * Cmem)
:: ACy = ACy – (Ymem * Cmem)
```

The first operation performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

The second operation performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.

- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

The input operands of the multiplier are the content of data memory operand LO(Lmem) and the content of data memory operand LO(Cmem). The data memory operand LO(Lmem) is addressed by DAGEN path X with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word memory data, is driven on data bus DDB and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

(*) 1 LSB is allocated to instruction slot #2.

Opcode

1001 0101	XXXM MMYY	YMMM 01mm	uuDD DDg%

Operands

ACx, ACy, Cmem, Xmem, Ymem

Description

This instruction performs two parallel multiply and subtraction (MAS) operations in one cycle. The operations are executed in the two D-unit MACs:

```
ACy = ACy - (HI(Ymem) * HI(Cmem))
:: ACx = ACx - (LO(Xmem) * LO(Cmem))
```

The first operation performs a multiplication and a subtraction in the D-unit MAC2. The input operands of the multiplier are the contents of data memory operand Ymem, extended to 17 bits, and the content of data memory operand HI(Cmem) which is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the contents of data memory operand Xmem, extended to 17 bits, and the content of data memory operand LO(Cmem) which is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ Because this instruction occupies both instruction slots #1 and #2, this can not be executed in parallel with other instructions.
- ❏ The Xmem operand can access the MMRs but the Ymem operand can not.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

Multiply and Subtract With Parallel Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MAS**[R][40] [uns()]Xmem[)], [uns()]Cmem[)], ACx **:: MPY**[R][40] [uns()]Ymem[)], [uns()]Cmem[)], ACy	No	4	1	X

Opcode

1000 0010	XXXM MMYY	YMMM 10mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and subtract (MAS) and multiply. The operations are executed in the two D-unit MACs:

```
ACx = ACx – (Xmem * Cmem)
:: ACy = Ymem * Cmem
```

The first operation performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

The second operation performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.

- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MAS uns(*AR3), uns(*CDP), AC0 :: MPY uns(*AR4), uns(*CDP), AC1	Both instructions are performed in parallel. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the coefficient data pointer register (CDP) is subtracted from the content of AC0. The result is stored in AC0. The product of the unsigned content addressed by AR4 and the unsigned content addressed by CDP is stored in AC1.

Opcode

1111 1101	AAAA AAAI	0001 00mm	DDDD uug%

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel operations in one cycle: multiply and subtract (MAS) and multiply. The operations are executed in the two D-unit MACs:

```
ACy = ACy – (Smem * HI(Cmem))
:: ACx = Smem * LO(Cmem)
```

The first operation performs a multiplication and a subtraction in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.

- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACy.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

MASM::MOV *Multiply and Subtract with Parallel Load Accumulator from Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MASM**[R] [T3 =]Xmem, Tx, ACx **:: MOV** Ymem **<< #16,** ACy	No	4	1	X

Opcode

1000 0110	XXXM MMYY	YMMM DDDD	100x ssU%

Operands ACx, ACy, Tx, Xmem, Ymem

Description This instruction performs two operations in parallel: multiply and subtract (MAS) and load:

```
ACx = ACx – (Tx * Xmem)
:: ACy = Ymem << #16
```

The first operation performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of Tx, sign extended to 17 bits, and the content of data memory operand Xmem, sign extended to 17 bits.

- ❑ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❑ Multiplication overflow detection depends on SMUL.
- ❑ The 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- ❑ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❑ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.
- ❑ This instruction provides the option to store the 16-bit data memory operand Xmem in temporary register T3.

The second operation loads the content of data memory operand Ymem, which has been shifted to the left by 16 bits, into the accumulator ACy.

- ❑ The input operand is sign extended to 40 bits according to SXMD.

- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ The input operand is shifted to the left by 16 bits according to M40.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MASM *AR3, T0, AC0 :: MOV *AR4 << #16, AC1	Both instructions are performed in parallel. The product of the content addressed by AR3 and the content of T0 is subtracted from the content of AC0. The result is stored in AC0. The content addressed by AR4, which has been shifted to the left by 16 bits, is stored in AC1.

MASM::MOV *Multiply and Subtract with Parallel Store Accumulator Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MASM**[R] [T3 =]Xmem, Tx, ACy **:: MOV HI(**ACx **<< T2),** Ymem	No	4	1	X

Opcode

1000 0111	XXXM MMYY	YMMM SSDD	010x ssU%

Operands ACx, ACy, Tx, Xmem, Ymem

Description This instruction performs two operations in parallel: multiply and subtract (MAS) and store:

```
ACy = rnd(ACy – (Tx * Xmem))
:: Ymem = HI(ACx << T2) [,T3 = Xmem]
```

The first operation performs a multiplication and a subtraction in the D-unit MAC. The input operands of the multiplier are the content of Tx, sign extended to 17 bits, and the content of data memory operand Xmem, sign extended to 17 bits.

- ❑ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❑ Multiplication overflow detection depends on SMUL.
- ❑ The 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACy.
- ❑ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❑ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.
- ❑ This instruction provides the option to store the 16-bit data memory operand Xmem in temporary register T3.

The second operation shifts the accumulator ACx by the content of T2 and stores ACx(31−16) to data memory operand Ymem. If the 16-bit value in T2 is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value.

- ❑ The input operand is shifted in the D-unit shifter according to SXMD.
- ❑ After the shift, the high part of the accumulator, ACx(31−16), is stored to the memory location.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When this instruction is executed with C54CM = 1, the 6 LSBs of T2 determine the shift quantity. The 6 LSBs of T2 define a shift quantity within –32 to +31. When the 16-bit value in T2 is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = rnd(ACy – (Tx * Xmem))
  Ymem = HI(saturate(uns(ACx << T2))) [,T3 = Xmem]
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = rnd(ACy – (Tx * Xmem))
  Ymem = HI(saturate(ACx << T2)) [,T3 = Xmem]

Example

Syntax	Description
MASM *AR3, T0, AC0, :: MOV HI(AC1 << T2), *AR4	Both instructions are performed in parallel. The product of the content addressed by AR3 and the content of T0 is subtracted from the content of AC0. The result is stored in AC0. The content of AC1 is shifted by the content of T2, and AC1(31−16) is stored at the address of AR4.

MAX *Compare Accumulator, Auxiliary, or Temporary Register Content Maximum*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MAX** [src,] dst	Yes	2	1	X

Opcode

0010 111E	FSSS FDDD

Operands dst, src

Description This instruction performs a maximum comparison in the D-unit ALU or in the A-unit ALU. Two accumulator, auxiliary registers, and temporary registers contents are compared. When an accumulator ACx is compared with an auxiliary or temporary register TAx, the 16 lowest bits of ACx are compared with TAx in the A-unit ALU. If the comparison is true, the TCx status bit is set to 1; otherwise, it is cleared to 0.

- When the destination operand (dst) is an accumulator:
  - If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended to 40 bits according to SXMD.
  - The operation is performed on 40 bits in the D-unit ALU:

    If M40 = 0, src(31–0) content is compared to dst(31–0) content. The extremum value is stored in dst. If the extremum value is the src content, the CARRY status bit is cleared to 0; otherwise, it is set to 1.

```
step1: if (src(31-0) > dst(31-0))
step2: { CARRY = 0; dst(39-0) = src(39-0) }
   else
step3: CARRY = 1
```

    If M40 = 1, src(39–0) content is compared to dst(39–0) content. The extremum value is stored in dst. If the extremum value is the src content, the CARRY status bit is cleared to 0; otherwise, it is set to 1.

```
step1: if (src(39-0) > dst(39-0))
step2: { CARRY = 0; dst(39-0) = src(39-0) }
   else
step3: CARRY = 1
```

  - There is no overflow detection, overflow report, and saturation.

❑ When the destination operand (dst) is an auxiliary or temporary register:

- If an accumulator is the source operand (src) of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
- The operation is performed on 16 bits in the A-unit ALU:

  The src(15–0) content is compared to the dst(15–0) content. The extremum value is stored in dst.

```
step1: if (src(15–0) > dst(15–0))
step2: dst = src
```

- There is no overflow detection and saturation.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if M40 status bit was locally set to 1. When the destination operand (dst) is an auxiliary or temporary register, the instruction execution is not impacted by the C54CM status bit. When the destination operand (dst) is an accumulator, this instruction always compares the source operand (src) with AC1 as follows:

- If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended to 40 bits according to SXMD
- The operation is performed on 40 bits in the D-unit ALU:

  The src(39–0) content is compared to AC1(39–0) content. The extremum value is stored in dst. If the extremum value is the src content, the CARRY status bit is cleared to 0; otherwise, it is set to 1.

```
step1: if (src(39–0) > AC1(39–0))
step2: { CARRY = 0; dst(39–0) = src(39–0) }
   else
step3: { CARRY = 1; dst(39–0) = AC1(39–0) }
```

- There is no overflow detection, overflow report, and saturation.

Compare and Select Accumulator Content Maximum

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MAXDIFF** ACx, ACy, ACz, ACw	Yes	3	1	X

Opcode

0001 000E	DDSS 1100	SSDD nnnn

Operands ACw, ACx, ACy, ACz

Description This instruction performs two paralleled 16-bit extremum selections in the D-unit ALU in one cycle. This instruction performs a dual maximum search.

The two operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulators are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit data path).

For each datapath (high and low):

- ACx and ACy are the source accumulators.
- The differences are stored in accumulator ACw.
- The subtraction computation is equivalent to the dual 16-bit subtractions instruction.
- For each of the two computations performed in the ALU, an overflow detection is made. If an overflow is detected on any of the data paths, the destination accumulator overflow status bit (ACOVw) is set.
  - For the operations performed in the ALU low part, overflow is detected at bit position 15.
  - For the operations performed in the ALU high part, overflow is detected at bit position 31.
- For all instructions, the carry of the operation performed in the ALU high part is reported in the CARRY status bit. The CARRY status bit is always extracted at bit position 31.
- Independently on each data path, if SATD = 1 when an overflow is detected on the data path, a saturation is performed:
  - For the operations performed in the ALU low part, saturation values are 7FFFh (positive) and 8000h (negative).
  - For the operations performed in the ALU high part, saturation values are 00 7FFFh (positive) and FF 8000h (negative).

- ❏ The extremum is stored in accumulator ACz.
- ❏ The extremum is searched considering the selected bit width of the accumulators:
  - for the lower 16-bit data path, the sign bit is extracted at bit position 15
  - for the higher 24-bit data path, the sign bit is extracted at bit position 31
- ❏ According to the extremum found, a decision bit is shifted in TRNx from the MSBs to the LSBs:
  - TRN0 tracks the decision for the high part data path
  - TRN1 tracks the decision for the low part data path

    If the extremum value is the ACx high or low part, the decision bit is cleared to 0; otherwise, it is set to 1:

```
TRN0 = TRN0 >> #1
TRN1 = TRN1 >> #1
ACw(39-16) = ACy(39-16) - ACx(39-16)
ACw(15-0) = ACy(15-0) - ACx(15-0)
if (ACx(31-16) > ACy(31-16))
   { bit(TRN0, 15) = #0 ; ACz(39-16) = ACx(39-16) }
else
   { bit(TRN0, 15) = #1 ; ACz(39-16) = ACy(39-16) }
if (ACx(15-0) > ACy(15-0))
   { bit(TRN1, 15) = #0 ; ACz(15-0) = ACx(15-0) }
else
   { bit(TRN1, 15) = #1 ; ACz(15-0) = ACy(15-0) }
```

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if SATD is locally cleared to 0. Overflow is only detected and reported for the computation performed in the higher 24-bit data path (overflow is detected at bit position 31).

Status Bits Affected by C54CM, SATD

Affects ACOVw, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
MAXDIFF AC0, AC1, AC2, AC1	The difference is stored in AC1. The content of AC0(39–16) is subtracted from the content of AC1(39–16) and the result is stored in AC1(39–16). Since SATD = 1 and an overflow is detected, AC1(39−16) = FF 8000h (saturation). The content of AC0(15–0) is subtracted from the content of AC1(15–0) and the result is stored in AC1(15–0). The maximum is stored in AC2. The content of TRN0 and TRN1 is shifted to the right by 1 bit. AC0(31–16) is greater than AC1(31–16), AC0(39–16) is stored in AC2(39–16) and TRN0(15) is cleared to 0. AC0(15–0) is greater than AC1(15–0), AC0(15–0) is stored in AC2(15–0) and TRN1(15) is cleared to 0.

Before		**After**	
AC0	10 2400 2222	AC0	10 2400 2222

Opcode

TRN0	0001 000E	DDSS 1101	SSDD xxx0
TRN1	0001 000E	DDSS 1101	SSDD xxx1

Operands ACw, ACx, ACy, ACz, TRNx

Description This instruction performs a single 40-bit extremum selection in the D-unit ALU. This instruction performs a maximum search.

- ACx and ACy are the two source accumulators.
- The difference between the source accumulators is stored in accumulator ACw.
- The subtraction computation is equivalent to the subtraction instruction.
- Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- When an overflow is detected, the accumulator is saturated according to SATD.
- The extremum between the source accumulators is stored in accumulator ACz.
- The extremum computation is similar to the compare register content maximum instruction. However, the CARRY status bit is not updated by the extremum search but by the subtraction instruction.
- According to the extremum found, a decision bit is shifted in TRNx from the MSBs to the LSBs. If the extremum value is ACx, the decision bit is cleared to 0; otherwise, it is set to 1.

If M40 = 0:

```
TRNx = TRNx >> #1
ACw(39-0) = ACy(39-0) - ACx(39-0)
if (ACx(31-0) > ACy(31-0))
   { bit(TRNx, 15) = #0 ; ACz(39-0) = ACx(39-0) }
else
   { bit(TRNx, 15) = #1 ; ACz(39-0) = ACy(39-0) }
```

If M40 = 1:

```
TRNx = TRNx >> #1
ACw(39-0) = ACy(39-0) - ACx(39-0)
if (ACx(39-0) > ACy(39-0))
   { bit(TRNx, 15) = #0 ; ACz(39-0) = ACx(39-0) }
else
   { bit(TRNx, 15) = #1 ; ACz(39-0) = ACy(39-0) }
```

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if M40 status bit was locally set to 1. However to ensure compatibility versus overflow detection and saturation of the destination accumulator, this instruction must be executed with M40 = 0.

Status Bits Affected by C54CM, M40, SATD

Affects ACOVw, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
DMAXDIFF AC0, AC1, AC2, AC3, TRN1	The difference is stored in AC3. The content of AC0 is subtracted from the content of AC1 and the result is stored in AC3. The maximum is stored in AC2. The content of TRN1 is shifted to the right by 1 bit. AC0 is greater than AC1, AC0 is stored in AC2 and TRN1(15) is cleared to 0.

Before		**After**

SATD	1	SATD	1
TRN1	0080	TRN1	0040
ACOV3	0	ACOV3	0
CARRY	0	CARRY	0

MIN *Compare Accumulator, Auxiliary, or Temporary Register Content Minimum*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MIN** [src,] dst	Yes	2	1	X

Opcode

0011 000E	FSSS FDDD

Operands dst, src

Description This instruction performs a minimum comparison in the D-unit ALU or in the A-unit ALU. Two accumulator, auxiliary registers, and temporary registers contents are compared. When an accumulator ACx is compared with an auxiliary or temporary register TAx, the 16 lowest bits of ACx are compared with TAx in the A-unit ALU. If the comparison is true, the TCx status bit is set to 1; otherwise, it is cleared to 0.

- When the destination operand (dst) is an accumulator:
  - If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended to 40 bits according to SXMD.
  - The operation is performed on 40 bits in the D-unit ALU:

    If M40 = 0, src(31–0) content is compared to dst(31–0) content. The extremum value is stored in dst. If the extremum value is the src content, the CARRY status bit is cleared to 0; otherwise, it is set to 1.

```
step1: if (src(31-0) < dst(31-0))
step2: { CARRY = 0; dst(39-0) = src(39-0) }
   else
step3: CARRY = 1
```

    If M40 = 1, src(39–0) content is compared to dst(39–0) content. The extremum value is stored in dst. If the extremum value is the src content, the CARRY status bit is cleared to 0; otherwise, it is set to 1.

```
step1: if (src(39-0) < dst(39-0))
step2: { CARRY = 0; dst(39-0) = src(39-0) }
   else
step3: CARRY = 1
```

  - There is no overflow detection, overflow report, and saturation.

❑ When the destination operand (dst) is an auxiliary or temporary register:

- If an accumulator is the source operand (src) of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
- The operation is performed on 16 bits in the A-unit ALU:

  The src(15–0) content is compared to the dst(15–0) content. The extremum value is stored in dst.

```
step1: if (src(15-0) < dst(15-0))
step2: dst = src
```

- There is no overflow detection and saturation.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if M40 status bit was locally set to 1. When the destination operand (dst) is an auxiliary or temporary register, the instruction execution is not impacted by the C54CM status bit. When the destination operand (dst) is an accumulator, this instruction always compares the source operand (src) with AC1 as follows:

- If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended to 40 bits according to SXMD
- The operation is performed on 40 bits in the D-unit ALU:

  The src(39–0) content is compared to AC1(39–0) content. The extremum value is stored in dst. If the extremum value is the src content, the CARRY status bit is cleared to 0; otherwise, it is set to 1.

```
step1: if (src(39-0) < AC1(39-0))
step2: { CARRY = 0; dst(39-0) = src(39-0) }
   else
step3: { CARRY = 1; dst(39-0) = AC1(39-0) }
```

- There is no overflow detection, overflow report, and saturation.

Opcode

0001 000E	DDSS 1110	SSDD xxxx

Operands ACw, ACx, ACy, ACz

Description This instruction performs two paralleled 16-bit extremum selections in the D-unit ALU in one cycle. This instruction performs a dual minimum search.

The two operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulators are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit data path).

For each datapath (high and low):

- ACx and ACy are the source accumulators.
- The differences are stored in accumulator ACw.
- The subtraction computation is equivalent to the dual 16-bit subtractions instruction.
- For each of the two computations performed in the ALU, an overflow detection is made. If an overflow is detected on any of the data paths, the destination accumulator overflow status bit (ACOVw) is set.
  - For the operations performed in the ALU low part, overflow is detected at bit position 15.
  - For the operations performed in the ALU high part, overflow is detected at bit position 31.
- For all instructions, the carry of the operation performed in the ALU high part is reported in the CARRY status bit. The CARRY status bit is always extracted at bit position 31.
- Independently on each data path, if SATD = 1 when an overflow is detected on the data path, a saturation is performed:
  - For the operations performed in the ALU low part, saturation values are 7FFFh (positive) and 8000h (negative).
  - For the operations performed in the ALU high part, saturation values are 00 7FFFh (positive) and FF 8000h (negative).

- The extremum is stored in accumulator ACz.
- The extremum is searched considering the selected bit width of the accumulators:
  - for the lower 16-bit data path, the sign bit is extracted at bit position 15
  - for the higher 24-bit data path, the sign bit is extracted at bit position 31
- According to the extremum found, a decision bit is shifted in TRNx from the MSBs to the LSBs:
  - TRN0 tracks the decision for the high part data path
  - TRN1 tracks the decision for the low part data path

    If the extremum value is the ACx high or low part, the decision bit is cleared to 0; otherwise, it is set to 1:

```
TRN0 = TRN0 >> #1
TRN1 = TRN1 >> #1
ACw(39-16) = ACy(39-16) - ACx(39-16)
ACw(15-0) = ACy(15-0) - ACx(15-0)
if (ACx(31-16) < ACy(31-16))
   { bit(TRN0, 15) = #0 ; ACz(39-16) = ACx(39-16) }
else
   { bit(TRN0, 15) = #1 ; ACz(39-16) = ACy(39-16) }
if (ACx(15-0) < ACy(15-0))
   { bit(TRN1, 15) = #0 ; ACz(15-0) = ACx(15-0) }
else
   { bit(TRN1, 15) = #1 ; ACz(15-0) = ACy(15-0) }
```

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if SATD is locally cleared to 0. Overflow is only detected and reported for the computation performed in the higher 24-bit data path (overflow is detected at bit position 31).

Status Bits Affected by C54CM, SATD

Affects ACOVw, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
MINDIFF AC0, AC1, AC2, AC1	The difference is stored in AC1. The content of AC0(39–16) is subtracted from the content of AC1(39–16) and the result is stored in AC1(39–16). Since SATD = 1 and an overflow is detected, AC1(39−16) = FF 8000h (saturation). The content of AC0(15–0) is subtracted from the content of AC1(15–0) and the result is stored in AC1(15–0). The minimum is stored in AC2 (sign bit extracted at bits 31 and 15). The content of TRN0 and TRN1 is shifted to the right by 1 bit. AC0(31–16) is greater than or equal to AC1(31–16), AC1(39–16) is stored in AC2(39–16) and TRN0(15) is set to 1. AC0(15–0) is greater than or equal to AC1(15–0), AC1(15–0) is stored in AC2(15–0) and TRN1(15) is set to 1.

Before		**After**	
AC0	10 2400 2222	AC0	10 2400 2222
AC1	00 8000 DDDE	AC1	FF 8000 BBBC
AC2	10 2400 2222	AC2	00 8000 DDDE
SATD	1	SATD	1
TRN0	0800	TRN0	8400
TRN1	0040	TRN1	8020
ACOV1	0	ACOV1	1
CARRY	0	CARRY	1

Compare and Select Accumulator Content Minimum

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2a]	**DMINDIFF** ACx, ACy, ACz, ACw**, TRN0**	Yes	3	1	X
[2b]	**DMINDIFF** ACx, ACy, ACz, ACw**, TRN1**	Yes	3	1	X

Opcode

TRN0	0001	000E	DDSS	1111	SSDD	xxx0
TRN1	0001	000E	DDSS	1111	SSDD	xxx1

Operands ACw, ACx, ACy, ACz, TRNx

Description This instruction performs a single 40-bit extremum selection in the D-unit ALU. This instruction performs a minimum search.

- ACx and ACy are the two source accumulators.
- The difference between the source accumulators is stored in accumulator ACw.
- The subtraction computation is equivalent to the subtraction instruction.
- Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- When an overflow is detected, the accumulator is saturated according to SATD.
- The extremum between the source accumulators is stored in accumulator ACz.
- The extremum computation is similar to the compare register content maximum instruction. However, the CARRY status bit is not updated by the extremum search but by the subtraction instruction.
- According to the extremum found, a decision bit is shifted in TRNx from the MSBs to the LSBs. If the extremum value is ACx, the decision bit is cleared to 0; otherwise, it is set to 1.

If M40 = 0:

```
TRNx = TRNx >> #1
ACw(39–0) = ACy(39–0) – ACx(39–0)
if (ACx(31–0) < ACy(31–0))
   { bit(TRNx, 15) = #0 ; ACz(39–0) = ACx(39–0) }
else
   { bit(TRNx, 15) = #1 ; ACz(39–0) = ACy(39–0) }
```

If M40 = 1:

```
TRNx = TRNx >> #1
ACw(39–0) = ACy(39–0) – ACx(39–0)
if (ACx(39–0) < ACy(39–0))
   { bit(TRNx, 15) = #0 ; ACz(39–0) = ACx(39–0) }
else
   { bit(TRNx, 15) = #1 ; ACz(39–0) = ACy(39–0) }
```

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if M40 status bit was locally set to 1. However to ensure compatibility versus overflow detection and saturation of the destination accumulator, this instruction must be executed with M40 = 0.

Status Bits Affected by C54CM, M40, SATD

Affects ACOVw, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
DMINDIFF AC0, AC1, AC2, AC3, TRN0	The difference is stored in AC3. The content of AC0 is subtracted from the content of AC1 and the result is stored in AC3. The minimum is stored in AC2. The content of TRN0 is shifted to the right by 1 bit. If AC0 is less than AC1, AC0 is stored in AC2 and TRN0(15) is cleared to 0; otherwise, AC1 is stored in AC2 and TRN0(15) is set to 1.

mmap — *Memory-Mapped Register Access Qualifier*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**mmap**	No	1	1	D

Opcode | 1001 1000

Operands none

Description This is an operand qualifier that can be paralleled with any instruction making a Smem or Lmem direct memory access (dma). This operand qualifier allows you to locally prevent the dma access from being relative to the data stack pointer (SP) or the local data page register (DP). It forces the dma access to be relative to the memory-mapped register (MMR) data page start address, 00 0000h.

This operand qualifier cannot be executed:

- ❏ as a stand-alone instruction (assembler generates an error message)
- ❏ in parallel with instructions not embedding an Smem or Lmem data memory operand
- ❏ in parallel with instructions loading or storing a byte to a register (see Load Accumulator, Auxiliary, or Temporary Register from Memory instructions [2] and [3]; Load Accumulator from Memory instructions [2] and [3]; and Store Accumulator, Auxiliary, or Temporary Register Content to Memory instructions [2] and [3])

The MMRs are mapped as 16-bit data entities between addresses 0h and 5Fh. The scratch-pad memory that is mapped between addresses 60h and 7Fh of each main data pages of 64K words cannot be accessed through this mechanism.

Any instruction using the mmap modifier cannot be combined with any other user-defined parallelism instruction. The following instruction is not valid:

```
MOV AR1, MMAP(@BSAC)
|| RSBT CDPLC
```

The following instruction is valid:

```
MOV AR1, MMAP(@BSAC)
```

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC0, T2 || mmap	The content of AC0(15–0) is copied into T2.

MOV *Load Accumulator from Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** [rnd(]Smem **<<** Tx[)], ACx	No	3	1	X
[2]	**MOV low_byte(**Smem**) <<** #SHIFTW, ACx	No	3	1	X
[3]	**MOV high_byte(**Smem**) <<** #SHIFTW, ACx	No	3	1	X
[4]	**MOV** Smem **<< #16,** ACx	No	2	1	X
[5]	**MOV** [uns(]Smem[)], ACx	No	3	1	X
[6]	**MOV** [uns(]Smem[)] **<<** #SHIFTW, ACx	No	4	1	X
[7]	**MOV**[40] **dbl(**Lmem**),** ACx	No	3	1	X
[8]	**MOV** Xmem, Ymem, ACx	No	3	1	X

Description This instruction loads a 16-bit signed constant, K16, the content of a memory (Smem) location, the content of a data memory operand (Lmem), or the content of dual data memory operands (Xmem and Ymem) to a selected accumulator (ACx).

Status Bits

Affected by C54CM, M40, RDM, SATD, SXMD

Affects ACOVx

See Also See the following other related instructions:

- MACM::MOV (Multiply and Accumulate with Parallel Load Accumulator from Memory)
- MASM::MOV (Multiply and Subtract with Parallel Load Accumulator from Memory)

Load Accumulator from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** [rnd()]Smem **<<** Tx[)], ACx	No	3	1	X

Opcode

1101 1101	AAAA AAAI	x%DD ss11

Operands ACx, Smem, Tx

Description This instruction loads the content of a memory (Smem) location shifted by the content of Tx to the accumulator (ACx):

```
ACx = Smem << Tx
```

- The input operand is sign extended to 40 bits according to SXMD.
- The input operand is shifted by the 4-bit value in the D-unit shifter. The shift operation is equivalent to the signed shift instruction.
- Rounding is performed in the D-unit shifter according to RDM, if the optional rnd keyword is applied to the input operand.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, no overflow detection, report, and saturation is done after the shifting operation. The 6 LSBs of Tx determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits Affected by C54CM, M40, RDM, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV *AR3 << T0, AC0	AC0 is loaded with the content addressed by AR3 shifted by the content of T0.

Load Accumulator from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MOV low_byte(**Smem**) <<** #SHIFTW, ACx	No	3	1	X

Opcode

1110 0001	AAAA AAAI	DDSH IFTW

Operands ACx, SHIFTW, Smem

Description This instruction loads the low-byte content of a memory (Smem) location shifted by the 6-bit value, SHIFTW, to the accumulator (ACx):

```
ACx = low_byte(Smem) << #SHIFTW
```

- ❏ The content of the memory location is sign extended to 40 bits according to SXMD.
- ❏ The input operand is shifted by the 6-bit value in the D-unit shifter. The shift operation is equivalent to the signed shift instruction.
- ❏ In this instruction, Smem **cannot** reference to a memory-mapped register (MMR). This instruction cannot access a byte within an MMR. If Smem is an MMR, the DSP sends a hardware bus-error interrupt (BERRINT) request to the CPU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV low_byte(*AR3) << #31, AC0	The low-byte content addressed by AR3 is shifted left by 31 bits and loaded into AC0.

Load Accumulator from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MOV high_byte(**Smem**) <<** #SHIFTW, ACx	No	3	1	X

Opcode

1110 0010	AAAA AAAI	DDSH IFTW

Operands ACx, SHIFTW, Smem

Description This instruction loads the high-byte content of a memory (Smem) location shifted by the 6-bit value, SHIFTW, to the accumulator (ACx):

```
ACx = high_byte(Smem) << #SHIFTW
```

- ❏ The content of the memory location is sign extended to 40 bits according to SXMD.
- ❏ The input operand is shifted by the 6-bit value in the D-unit shifter. The shift operation is equivalent to the signed shift instruction.
- ❏ In this instruction, Smem **cannot** reference to a memory-mapped register (MMR). This instruction cannot access a byte within an MMR. If Smem is an MMR, the DSP sends a hardware bus-error interrupt (BERRINT) request to the CPU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV high_byte(*AR3) << #31, AC0	The high-byte content addressed by AR3 is shifted left by 31 bits and loaded into AC0.

Load Accumulator from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**MOV** Smem **<< #16,** ACx	No	2	1	X

Opcode

1011 00DD	AAAA AAAI

Operands ACx, Smem

Description This instruction loads the content of a memory (Smem) location shifted left by 16 bits to the accumulator (ACx):

```
ACx = Smem << #16
```

- ❏ The input operand is sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ The input operand is shifted left by 16 bits according to M40.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV *AR3+ << #16, AC1	The content addressed by AR3 shifted left by 16 bits is loaded into AC1. AR3 is incremented by 1.

```
Before                          After
AC1          00 0200 FC00       AC1          00 3400 0000
AR3                  0200       AR3                  0201
200                  3400       200                  3400
```

Load Accumulator from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**MOV** [uns(]Smem[)], ACx	No	3	1	X

Opcode

1101 1111	AAAA AAAI	xxDD 010u

Operands ACx, Smem

Description This instruction loads the content of a memory (Smem) location to the accumulator (ACx):

```
ACx = Smem
```

- The memory operand is extended to 40 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
- The load operation in the accumulator uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV uns(*AR3), AC0	The content addressed by AR3 is zero extended to 40 bits and loaded into AC0.

Load Accumulator from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**MOV** [uns(]Smem[)] **<<** #SHIFTW, ACx	No	4	1	X

Opcode

1111 1001	AAAA AAAI	uxSH IFTW	xxDD 10xx

Operands ACx, SHIFTW, Smem

Description This instruction loads the content of a memory (Smem) location, shifted by the 6-bit value, SHIFTW, to the accumulator (ACx):

```
ACx = Smem << #SHIFTW
```

- The memory operand is extended to 40 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
- The input operand is shifted by the 6-bit value in the D-unit shifter. The shift operation is equivalent to the signed shift instruction.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV uns(*AR3) << #31, AC0	The content addressed by AR3 is zero extended to 40 bits, shifted left by 31 bits, and loaded into AC0.

Load Accumulator from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[7]	**MOV**[40] **dbl(**Lmem**),** ACx	No	3	1	X

Opcode

1110 1101	AAAA AAAI	xxDD 100g

Operands ACx, Lmem

Description This instruction loads the content of data memory operand (Lmem) to the accumulator (ACx):

```
ACx = dbl(Lmem)
```

- The input operand is sign extended to 40 bits according to SXMD.
- The load operation in the accumulator uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- Status bit M40 is locally set to 1, if the optional 40 keyword is applied to the input operand.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV40 dbl(*AR3–), AC0	The content (long word) addressed by AR3 and AR3 + 1 is loaded into AC0. Because this instruction is a long-operand instruction, AR3 is decremented by 2 after the execution.

Load Accumulator from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[8]	**MOV** Xmem, Ymem, ACx	No	3	1	X

Opcode

1000 0001	XXXM MMYY	YMMM 10DD

Operands ACx, Xmem, Ymem

Description This instruction performs a dual 16-bit load of accumulator high and low parts:

```
LO(ACx) = Xmem
:: HI(ACx) = Ymem
```

The operation is executed in dual 16-bit mode; however, it is independent of the 40-bit D-unit ALU. The 16 lower bits of the accumulator are separated from the higher 24 bits and the 8 guard bits are attached to the higher 16-bit datapath.

- The data memory operand Xmem is loaded as a 16-bit operand to the destination accumulator (ACx) low part. And, according to SXMD the data memory operand Ymem is sign extended to 24 bits and is loaded to the destination accumulator (ACx) high part.
- For the load operations in higher accumulator bits, overflow detection is performed at bit position 31. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- If SATD is 1 when an overflow is detected on the higher data path, a saturation is performed with saturation value of 00 7FFFh.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, this instruction is executed as if SATD was locally cleared to 0.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV *AR3, *AR4, AC0	The content at the location addressed by AR4, sign extended to 24 bits, is loaded into AC0(39–16) and the content at the location addressed by AR3 is loaded into AC0(15–0).

MOV *Load Accumulator Pair from Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV dbl(**Lmem**), pair(HI(**ACx**))**	No	3	1	X
[2]	**MOV dbl(**Lmem**), pair(LO(**ACx**))**	No	3	1	X

Description This instruction loads the content of a data memory operand (Lmem) to the selected accumulator pair, ACx and AC(x + 1).

Status Bits

Affected by C54CM, M40, SATD, SXMD

Affects ACOVx, ACOV(x + 1)

See Also See the following other related instructions:

Load Accumulator Pair from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV dbl(**Lmem**), pair(HI(**ACx**))**	No	3	1	X

Opcode

1110 1101	AAAA AAAI	xxDD 101x

Operands ACx, Lmem

Description This instruction loads the 16 highest bits of data memory operand (Lmem) to the 16 highest bits of the accumulator (ACx) and loads the 16 lowest bits of data memory operand (Lmem) to the 16 highest bits of accumulator AC(x + 1):

```
pair(HI(ACx)) = Lmem
```

- The load operation in the accumulator uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- The valid combination of source accumulators are AC0/AC1 and AC2/AC3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, overflow detection, report, and saturation is done after the operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx, ACOV(x + 1)

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV dbl(*AR3+), pair(HI(AC2))	The 16 highest bits of the content at the location addressed by AR3 are loaded into AC2(31–16) and the 16 lowest bits of the content at the location addressed by AR3 + 1 are loaded into AC3(31–16). AR3 is incremented by 1.

Before		**After**	
AC2	00 0200 FC00	AC2	00 3400 0000
AC3	00 0000 0000	AC3	00 0FD3 0000
AR3	0200	AR3	0201
200	3400	200	3400
201	0FD3	201	0FD3

Load Accumulator Pair from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MOV dbl(**Lmem**)**, **pair(LO(**ACx**))**	No	3	1	X

Opcode

1110 1101	AAAA AAAI	xxDD 110x

Operands ACx, Lmem

Description This instruction loads the 16 highest bits of data memory operand (Lmem) to the 16 lowest bits of the accumulator (ACx) and loads the 16 lowest bits of data memory operand (Lmem) to the 16 lowest bits of accumulator AC(x + 1):

```
pair(LO(ACx)) = Lmem
```

- The load operation in the accumulator uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- The valid combination of source accumulators are AC0/AC1 and AC2/AC3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV dbl(*AR3), pair(LO(AC0))	The 16 highest bits of the content at the location addressed by AR3 are loaded into AC0(15–0) and the 16 lowest bits of the content at the location addressed by AR3 + 1 are loaded into AC1(15–0).

MOV *Load Accumulator with Immediate Value*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** K16 **<< #16,** ACx	No	4	1	X
[2]	**MOV** K16 **<<** #SHFT, ACx	No	4	1	X

Description This instruction loads a 16-bit signed constant, K16, to a selected accumulator (ACx).

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx

See Also See the following other related instructions:

Load Accumulator with Immediate Value

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** K16 **<< #16,** ACx	No	4	1	X

Opcode

0111 1010	KKKK KKKK	KKKK KKKK	xxDD 101x

Operands ACx, K16

Description This instruction loads the 16-bit signed constant, K16, shifted left by 16 bits to the accumulator (ACx):

```
ACx = K16 << #16
```

- ❏ The 16-bit constant, K16, is sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ The input operand is shifted left by 16 bits according to M40.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV #−2 << #16, AC0	AC0 is loaded with the signed 16-bit value (−2) shifted left by 16 bits.

Load Accumulator with Immediate Value

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MOV** K16 **<<** #SHFT, ACx	No	4	1	X

Opcode

0111 0101	KKKK KKKK	KKKK KKKK	xxDD SHFT

Operands ACx, K16, SHFT

Description This instruction loads the 16-bit signed constant, K16, shifted left by the 4-bit value, SHFT, to the accumulator (ACx):

```
ACx = K16 << #SHFT
```

- ❑ The 16-bit constant, K16, is sign extended to 40 bits according to SXMD.
- ❑ The input operand is shifted by the 4-bit value in the D-unit shifter. The shift operation is equivalent to the signed shift instruction.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV #−2 << #15, AC0	AC0 is loaded with the signed 16-bit value (−2) shifted left by 15 bits.

MOV *Load Accumulator, Auxiliary, or Temporary Register from Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** Smem, dst	No	2	1	X
[2]	**MOV** [uns()]**high_byte(**Smem**)**[)], dst	No	3	1	X
[3]	**MOV** [uns()]**low_byte(**Smem**)**[)], dst	No	3	1	X

Description This instruction loads the content of a memory (Smem) location to a selected destination (dst) register.

Status Bits

Load Accumulator, Auxiliary, or Temporary Register from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** Smem, dst	No	2	1	X

Opcode

1010 FDDD	AAAA AAAI

Operands dst, Smem

Description This instruction loads the content of a memory (Smem) location to the destination (dst) register.

```
dst = Smem
```

- When the destination register is an accumulator:
  - The content of the memory location is sign extended to 40 bits according to SXMD.
  - The load operation in the destination register uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- When the destination register is an auxiliary or temporary register:
  - The content of the memory location is sign extended to 16 bits.
  - The load operation in the destination register uses a dedicated path independent of the A-unit ALU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV *AR3+, AR1	AR1 is loaded with the content addressed by AR3. AR3 is incremented by 1.

```
Before                  After
AR1        FC00         AR1        3400
AR3        0200         AR3        0201
200        3400         200        3400
```

Load Accumulator, Auxiliary, or Temporary Register from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MOV** [uns()]**high_byte(**Smem**)**[)], dst	No	3	1	X

Opcode

1101 1111	AAAA AAAI	FDDD 000u

Operands dst, Smem

Description This instruction loads the high-byte content of a memory (Smem) location to the destination (dst) register:

```
dst = high_byte(Smem)
```

- When the destination register is an accumulator:
  - The memory operand is extended to 40 bits according to uns.
    - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
    - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
  - The load operation in the destination register uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- When the destination register is an auxiliary or temporary register:
  - The memory operand is extended to 16 bits according to uns.
    - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 16 bits.
    - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 16 bits regardless of SXMD.
  - The load operation in the destination register uses a dedicated path independent of the A-unit ALU.
- In this instruction, Smem **cannot** reference to a memory-mapped register (MMR). This instruction cannot access a byte within an MMR. If Smem is an MMR, the DSP sends a hardware bus-error interrupt (BERRINT) request to the CPU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV uns(high_byte(*AR3)), AC0	The high-byte content addressed by AR3 is zero extended to 40 bits and loaded into AC0.

Load Accumulator, Auxiliary, or Temporary Register from Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MOV** [uns()**low_byte(**Smem**)**()], dst	No	3	1	X

Opcode

1101 1111	AAAA AAAI	FDDD 001u

Operands dst, Smem

Description This instruction loads the low-byte content of a memory (Smem) location to the destination (dst) register:

```
dst = low_byte(Smem)
```

- When the destination register is an accumulator:
  - The memory operand is extended to 40 bits according to uns.
    - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
    - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
  - The load operation in the destination register uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- When the destination register is an auxiliary or temporary register:
  - The memory operand is extended to 16 bits according to uns.
    - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 16 bits.
    - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 16 bits regardless of SXMD.
  - The load operation in the destination register uses a dedicated path independent of the A-unit ALU.
- In this instruction, Smem **cannot** reference to a memory-mapped register (MMR). This instruction cannot access a byte within an MMR. If Smem is an MMR, the DSP sends a hardware bus-error interrupt (BERRINT) request to the CPU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV uns(low_byte(*AR3)), AC0	The low-byte content addressed by AR3 is zero extended to 40 bits and loaded into AC0.

MOV — *Load Accumulator, Auxiliary, or Temporary Register with Immediate Value*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** k4, dst	Yes	2	1	X
[2]	**MOV** −k4, dst	Yes	2	1	X
[3]	**MOV** K16, dst	No	4	1	X

Description This instruction loads a 4-bit unsigned constant, k4; the 2s complement representation of the 4-bit unsigned constant; or a 16-bit signed constant, K16, to a selected destination (dst) register.

Status Bits

Affected by M40, SXMD

Affects none

- ❏ MOV (Load Accumulator with Immediate Value)
- ❏ MOV (Load Accumulator, Auxiliary, or Temporary Register from Memory)
- ❏ MOV (Load Auxiliary or Temporary Register Pair from Memory)
- ❏ MOV::MOV (Load Accumulator from Memory with Parallel Store Accumulator Content to Memory)

Load Accumulator, Auxiliary, or Temporary Register with Immediate Value

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** k4, dst	Yes	2	1	X

Opcode

0011 110E	kkkk FDDD

Operands dst, k4

Description This instruction loads the 4-bit unsigned constant, k4, to the destination (dst) register:

```
dst = k4
```

- When the destination register is an accumulator:
  - The 4-bit constant, k4, is zero extended to 40 bits.
  - The load operation in the destination register uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- When the destination register is an auxiliary or temporary register:
  - The 4-bit constant, k4, is zero extended to 16 bits.
  - The load operation in the destination register uses a dedicated path independent of the A-unit ALU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV #2, AC0	AC0 is loaded with the unsigned 4-bit value (2).

Load Accumulator, Auxiliary, or Temporary Register with Immediate Value

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MOV** −k4, dst	Yes	2	1	X

Opcode

0011 111E	kkkk FDDD

Operands dst, k4

Description This instruction loads the 2s complement representation of the 4-bit unsigned constant, k4, to the destination (dst) register:

```
dst = −k4
```

- When the destination register is an accumulator:
  - The 4-bit constant, k4, is negated in the I-unit, loaded into the accumulator, and sign extended to 40 bits before being processed by the D-unit as a signed constant.
  - The load operation in the destination register uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- When the destination register is an auxiliary or temporary register:
  - The 4-bit constant, k4, is zero extended to 16 bits and negated in the I-unit before being processed by the A-unit as a signed K16 constant.
  - The load operation in the destination register uses a dedicated path independent of the A-unit ALU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV #−2, AC0	AC0 is loaded with a 2s complement representation of the unsigned 4-bit value (2).

Load Accumulator, Auxiliary, or Temporary Register with Immediate Value

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MOV** K16, dst	No	4	1	X

Opcode

0111 0110	KKKK KKKK	KKKK KKKK	FDDD 10xx

Operands dst, K16

Description This instruction loads the 16-bit signed constant, K16, to the destination (dst) register:

```
dst = K16
```

- When the destination register is an accumulator, the 16-bit constant, K16, is sign extended to 40 bits according to SXMD.
- When the destination register is an auxiliary or temporary register, the load operation in the destination register uses a dedicated path independent of the A-unit ALU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV #248, AC1	AC1 is loaded with the signed 16-bit value (248).

```
Before                      After
AC1         00 0200 FC00    AC1         00 0000 00F8
```

MOV *Load Auxiliary or Temporary Register Pair from Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV dbl(**Lmem**), pair(**TAx**)**	No	3	1	X

Opcode

1110 1101	AAAA AAAI	FDDD 111x

Operands Lmem, TAx

Description This instruction loads the 16 highest bits of data memory operand (Lmem) to the temporary or auxiliary register (TAx) and loads the 16 lowest bits of data memory operand (Lmem) to temporary or auxiliary register TA(x + 1):

```
pair(TAx) = Lmem
```

- ❏ The load operation in the temporary or auxiliary register uses a dedicated path independent of the A-unit ALU.
- ❏ Valid auxiliary registers are AR0, AR2, AR4, and AR6.
- ❏ Valid temporary registers are T0 and T2.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40

Affects none

Repeat This instruction can be repeated.

[20]	**MOV dbl(**Lmem**), RETA**	No	3	5	X

Opcode See Table 5−1 (page 5-370).

Operands Lmem, Smem

Description

Instructions [1] through [19] load the content of a memory (Smem) location to the destination CPU register. This instruction uses a dedicated datapath independent of the A-unit ALU and the D-unit operators to perform the operation. The content of the memory location is zero extended to the bitwidth of the destination CPU register.

The operation is performed in the execute phase of the pipeline. There is a 3-cycle latency between PDP, DP, SP, SSP, CDP, BSAx, BKx, BRCx, and CSR loads and their use in the address phase by the A-unit address generator units or by the P-unit loop control management.

For instruction [10], when BRC1 is loaded, the block repeat save register (BRS1) is also loaded with the same value.

Instruction [20] loads the content of data memory operand (Lmem) to the 24-bit RETA register (the return address of the calling subroutine) and to the 8-bit CFCT register (active control flow execution context flags of the calling subroutine):

- The 16 highest bits of Lmem are loaded into the CFCT register and into the 8 highest bits of the RETA register.
- The 16 lowest bits of Lmem are loaded into the 16 lowest bits of the RETA register.

  When instruction [20] is decoded, the CPU pipeline is flushed and the instruction is executed in 5 cycles, regardless of the instruction context.

Status Bits

Affected by none

Affects none

Repeat

Instructions [13] and [20] cannot be repeated; all other instructions can be repeated.

Opcode

K8								1110	0110	AAAA	AAAI	KKKK	KKKK		
K16	1111	1011	AAAA	AAAI	KKKK	KKKK	KKKK	KKKK							

Operands Kx, Smem

Description These instructions initialize a data memory location. These instructions store an 8-bit signed constant, K8, or a 16-bit signed constant, K16, to a memory (Smem) location. They use a dedicated datapath to perform the operation.

For instruction [1], the immediate value is always signed extended to 16 bits before being stored in memory.

Status Bits Affected by none

Affects none

Repeat Both instructions [1] and [2] can be repeated.

See Also See the following other related instructions:

- MOV (Move Memory to Memory)

Example

Syntax	Description
MOV #248, *(#0501h)	The signed 16-bit value (248) is loaded to address 501h.

```
Before                  After
0501          FC00      0501          F800
```

MOV *Move Accumulator Content to Auxiliary or Temporary Register*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV HI(**ACx**),** TAx	Yes	2	1	X

Opcode

0100 010E	00SS FDDD

Operands ACx, TAx

Description This instruction moves the high part of the accumulator, ACx(31−16), to the destination auxiliary or temporary register (TAx):

```
TAx = HI(ACx)
```

The 16-bit move operation is performed in the A-unit ALU.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- ❏ MOV (Move Accumulator, Auxiliary, or Temporary Register Content)
- ❏ MOV (Move Auxiliary or Temporary Register Content to Accumulator)

Example

Syntax	Description
MOV HI(AC0), AR2	The content of AC0(31–16) is copied to AR2.

```
Before                      After
AC0        01 E500 0030     AC0        01 E500 0030
AR2                0200     AR2                E500
```

MOV *Move Accumulator, Auxiliary, or Temporary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** src, dst	Yes	2	1	X

Opcode

0010 001E	FSSS FDDD

Operands dst, src

Description This instruction moves the content of the source (src) register to the destination (dst) register:

```
dst = src
```

- When the destination (dst) register is an accumulator:
  - The 40-bit move operation is performed in the D-unit ALU.
  - During the 40-bit move operation, an overflow is detected according to M40:
    - the destination accumulator overflow status bit (ACOVx) is set.
    - the destination register (ACx) is saturated according to SATD.
  - If the source (src) register is an auxiliary or temporary register, the 16 LSBs of the source register are sign extended to 40 bits according to SXMD.
- When the destination (dst) register is an auxiliary or temporary register:
  - The 16-bit move operation is performed in the A-unit ALU.
  - If the source (src) register is an accumulator, the 16 LSBs of the accumulator are used to perform the operation.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- MOV (Move Accumulator Content to Auxiliary or Temporary Register)
- MOV (Move Auxiliary or Temporary Register Content to Accumulator)
- MOV (Move Auxiliary or Temporary Register Content to CPU Register)
- MOV (Move Extended Auxiliary Register Content)

Example

Syntax	Description
MOV AC0, AC1	The content of AC0 is copied to AC1. Because an overflow occurred, ACOV1 is set to 1.

```
Before                          After
AC0          01 E500 0030       AC0          01 E500 0030
AC1          00 2800 0200       AC1          01 E500 0030
M40                     0       M40                     0
SATD                    0       SATD                    0
ACOV1                   0       ACOV1                   1
```

MOV *Move Auxiliary or Temporary Register Content to Accumulator*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** TAx, **HI(**ACx**)**	Yes	2	1	X

Opcode

0101 001E	FSSS 00DD

Operands ACx, TAx

Description This instruction moves the content of the auxiliary or temporary register (TAx) to the high part of the accumulator, ACx(31−16):

```
HI(ACx) = TAx
```

- The 16-bit move operation is performed in the D-unit ALU.
- During the 16-bit move operation, an overflow is detected according to M40:
  - the destination accumulator overflow status bit (ACOVx) is set.
  - the destination accumulator (ACx) is saturated according to SATD.
- If the source (src) register is an auxiliary or temporary register, the 16 LSBs of the source register are sign extended to 40 bits according to SXMD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- MOV (Move Accumulator Content to Auxiliary or Temporary Register)
- MOV (Move Accumulator, Auxiliary, or Temporary Register Content)
- MOV (Move Auxiliary or Temporary Register Content to CPU Register)
- MOV (Move Extended Auxiliary Register Content)

Example

Syntax	Description
MOV T0, HI(AC0)	The content of T0 is copied to AC0(31–16).

MOV *Move Auxiliary or Temporary Register Content to CPU Register*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** TAx, **BRC0**	Yes	2	1	X
[2]	**MOV** TAx, **BRC1**	Yes	2	1	X
[3]	**MOV** TAx, **CDP**	Yes	2	1	X
[4]	**MOV** TAx, **CSR**	Yes	2	1	X
[5]	**MOV** TAx, **SP**	Yes	2	1	X
[6]	**MOV** TAx, **SSP**	Yes	2	1	X

Opcode See Table 5−3 (page 5-380).

Operands TAx

Description This instruction moves the content of the auxiliary or temporary register (TAx) to the selected CPU register. All the move operations are performed in the execute phase of the pipeline and the A-unit ALU is used to transfer the content of the registers.

There is a 3-cycle latency between SP, SSP, CDP, TAx, CSR, and BRCx update and their use in the address phase by the A-unit address generator units or by the P-unit loop control management.

For instruction [2] when BRC1 is loaded with the content of TAx, the block repeat save register (BRS1) is also loaded with the same value.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

MOV *Move CPU Register Content to Auxiliary or Temporary Register*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV BRC0,** TAx	Yes	2	1	X
[2]	**MOV BRC1,** TAx	Yes	2	1	X
[3]	**MOV CDP,** TAx	Yes	2	1	X
[4]	**MOV SP,** TAx	Yes	2	1	X
[5]	**MOV SSP,** TAx	Yes	2	1	X
[6]	**MOV RPTC,** TAx	Yes	2	1	X

Opcode See Table 5−4 (page 5-382).

Operands TAx

Description This instruction moves the content of the selected CPU register to the auxiliary or temporary register (TAx). All the move operations are performed in the execute phase of the pipeline and the A-unit ALU is used to transfer the content of the registers.

For instructions [1] and [2], BRCx is decremented in the address phase of the last instruction of a loop. These instructions have a 3-cycle latency requirement versus the last instruction of a loop.

For instructions [3], [4], and [5], there is a 3-cycle latency between SP, SSP, CDP, and TAx update and their use in the address phase by the A-unit address generator units or by the P-unit loop control management.

Status Bits Affected by none

Affects none

Repeat Instruction [6] cannot be repeated; all other instructions can be repeated.

See Also See the following other related instructions:

- MOV (Move Accumulator Content to Auxiliary or Temporary Register)
- MOV (Move Auxiliary or Temporary Register Content to CPU Register)
- MOV (Store CPU Register Content to Memory)

Example

Syntax	Description
MOV BRC1, T1	The content of block repeat register (BRC1) is copied to T1.

```
Before                  After
T1          0034        T1          00EA
BRC1        00EA        BRC1        00EA
```

Table 5−4. Opcodes for Move CPU Register Content to Auxiliary or Temporary Register Instruction

No.	Syntax	Opcode
[1]	**MOV BRC0,** TAx	0100 010E 1100 FDDD
[2]	**MOV BRC1,** TAx	0100 010E 1101 FDDD
[3]	**MOV CDP,** TAx	0100 010E 1010 FDDD

MOV *Move Extended Auxiliary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** xsrc, xdst	No	2	1	X

Opcode

1001 0000	XSSS XDDD

Operands xdst, xsrc

Description This instruction moves the content of the source register (xsrc) to the destination register (xdst):

```
xdst = xsrc
```

- When the destination register (xdst) is an accumulator (ACx) and the source register (xsrc) is a 23-bit register (XARx, XSP, XSSP, XDP, or XCDP):
  - The 23-bit move operation is performed in the D-unit ALU.
  - The upper bits of ACx are filled with 0.
- When the source register (xsrc) is an accumulator (ACx) and the destination register (xdst) is a 23-bit register (XARx, XSP, XSSP, XDP, or XCDP):
  - The 23-bit move operation is performed in the A-unit ALU.
  - The lower 23 bits of ACx are loaded into xdst.
- When both the source register (xsrc) and the destination register (xdst) are accumulators, the Move Accumulator Content instruction (MOV src, dst) is assembled.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- AMAR (Modify Extended Auxiliary Register Content)
- AMOV (Load Extended Auxiliary Register with Immediate Value)
- MOV (Load Extended Auxiliary Register from Memory)
- MOV (Store Extended Auxiliary Register Content to Memory)

Example

Syntax	Description
MOV AC0, XAR1	The lower 23 bits of AC0 are loaded into XAR1.

MOV *Move Memory to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** Cmem, Smem	No	3	1	X
[2]	**MOV** Smem, Cmem	No	3	1	X
[3]	**MOV** Cmem**, dbl(**Lmem**)**	No	3	1	X
[4]	**MOV dbl(**Lmem**),** Cmem	No	3	1	X
[5]	**MOV dbl(**Xmem**), dbl(**Ymem**)**	No	3	1	X
[6]	**MOV** Xmem, Ymem	No	3	1	X

Description These instructions store the content of a memory location to a memory location. They use a dedicated datapath to perform the operation.

Status Bits Affected by none

Affects none

See Also See the following other related instructions:

- MOV (Store Accumulator, Auxiliary, or Temporary Register Content to Memory)
- MOV (Store Accumulator Content to Memory)
- MOV (Store Auxiliary or Temporary Register Pair Content to Memory)

- MOV (Store Extended Auxiliary Register Content to Memory)

Move Memory to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** Cmem, Smem	No	3	1	X

Opcode

1110 1111	AAAA AAAI	xxxx 00mm

Operands Cmem, Smem

Description This instruction stores the content of a data memory operand Cmem, addressed using the coefficient addressing mode, to a memory (Smem) location:

```
Smem = Cmem
```

For this instruction, the Cmem operand is not accessed through the BB bus. On all C55x-based devices, the Cmem operand may be mapped in external or internal memory space.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV *CDP, *(#0500h)	The content addressed by the coefficient data pointer register (CDP) is copied to address 0500h.

Before		After	
*CDP	3400	*CDP	3400
500	0000	500	3400

Move Memory to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MOV** Smem, Cmem	No	3	1	X

Opcode

1110 1111	AAAA AAAI	xxxx 01mm

Operands Cmem, Smem

Description This instruction stores the content of a memory (Smem) location to a data memory location (Cmem) addressed using the coefficient addressing mode:

```
Cmem = Smem
```

For this instruction, the Cmem operand is not accessed through the BB bus. On all C55x-based devices, the Cmem operand may be mapped in external or internal memory space.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV *AR3, *CDP	The content addressed by AR3 is copied in the location addressed by the coefficient data pointer register (CDP).

Move Memory to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MOV** Cmem**, dbl(**Lmem**)**	No	3	1	X

Opcode

1110 1111	AAAA AAAI	xxxx 10mm

Operands Cmem, Lmem

Description This instruction stores the content of two consecutive data memory (Cmem) locations, addressed using the coefficient addressing mode, to two consecutive data memory (Lmem) locations:

```
Lmem = dbl(Cmem)
```

For this instruction, the Cmem operand is not accessed through the BB bus. On all C55x-based devices, the Cmem operand may be mapped in external or internal memory space.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV *(CDP + T0), dbl(*AR1)	The content (long word) addressed by the coefficient data pointer register (CDP) and CDP + 1 is copied in the location addressed by AR1 and AR1 + 1, respectively. After the memory store, CDP is incremented by the content of T0 (5).

Before		**After**	
T0	0005	T0	0005
CDP	0200	CDP	0205
AR1	0300	AR1	0300
200	3400	200	3400
201	0FD3	201	0FD3
300	0000	300	3400
301	0000	301	0FD3

Move Memory to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**MOV dbl(**Lmem**),** Cmem	No	3	1	X

Opcode

1110 1111	AAAA AAAI	xxxx 11mm

Operands Cmem, Lmem

Description This instruction stores the content of two consecutive data memory (Lmem) locations to two consecutive data memory (Cmem) locations addressed using the coefficient addressing mode:

```
dbl(Cmem) = Lmem
```

For this instruction, the Cmem operand is not accessed through the BB bus. On all C55x-based devices, the Cmem operand may be mapped in external or internal memory space.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV dbl(*AR3+), *CDP	The content (long word) addressed by AR3 and AR3 + 1 is copied in the location addressed by the coefficient data pointer register (CDP) and CDP + 1, respectively. Because this instruction is a long-operand instruction, AR3 is incremented by 2 after the execution.

Move Memory to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**MOV dbl(**Xmem**), dbl(**Ymem**)**	No	3	1	X

Opcode

1000 0000	XXXM MMYY	YMMM 00xx

Operands Xmem, Ymem

Description This instruction stores the content of two consecutive data memory (Xmem) locations, addressed using the dual addressing mode, to two consecutive data memory (Ymem) locations:

```
dbl(Ymem) = dbl(Xmem)
```

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV dbl(*AR0), dbl(*AR1)	The content addressed by AR0 is copied in the location addressed by AR1 and the content addressed by AR0 + 1 is copied in the location addressed by AR1 + 1.

Before		**After**	
AR0	0300	AR0	0300
AR1	0400	AR1	0400
300	3400	300	3400
301	0FD3	301	0FD3
400	0000	400	3400
401	0000	401	0FD3

Move Memory to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**MOV** Xmem, Ymem	No	3	1	X

Opcode

1000 0000	XXXM MMYY	YMMM 01xx

Operands Xmem, Ymem

Description This instruction stores the content of data memory (Xmem) location, addressed using the dual addressing mode, to data memory (Ymem) location:

```
Ymem = Xmem
```

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV *AR5, *AR3	The content addressed by AR5 is copied in the location addressed by AR3.

MOV *Store Accumulator Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV HI(**ACx**),** Smem	No	2	1	X
[2]	**MOV** [rnd()**HI(**ACx**)**])], Smem	No	3	1	X
[3]	**MOV** ACx **<<** Tx, Smem	No	3	1	X
[4]	**MOV** [rnd()**HI(**ACx **<<** Tx**)**])], Smem	No	3	1	X
[5]	**MOV** ACx **<<** #SHIFTW, Smem	No	3	1	X
[6]	**MOV HI(**ACx **<<** #SHIFTW**),** Smem	No	3	1	X
[7]	**MOV** [rnd()**HI(**ACx **<<** #SHIFTW**)**])], Smem	No	4	1	X
[8]	**MOV** [uns()[rnd()**HI**[(saturate]**(**ACx**)**]))], Smem	No	3	1	X
[9]	**MOV** [uns()[rnd()**HI**[(saturate]**(**ACx **<<** Tx**)**]))], Smem	No	3	1	X
[10]	**MOV** [uns()[rnd()**HI**[(saturate]**(**ACx **<<** #SHIFTW**)**]))], Smem	No	4	1	X
[11]	**MOV** ACx**, dbl(**Lmem**)**	No	3	1	X
[12]	**MOV** [uns()**saturate(**ACx**)**])**, dbl(**Lmem**)**	No	3	1	X
[13]	**MOV** ACx **>> #1, dual(**Lmem**)**	No	3	1	X
[14]	**MOV** ACx, Xmem, Ymem	No	3	1	X

Description This instruction stores the content of the selected accumulator (ACx) to a memory (Smem) location, to a data memory operand (Lmem), or to dual data memory operands (Xmem and Ymem).

Status Bits Affected by C54CM, RDM, SXMD

Affects none

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV HI(**ACx**),** Smem	No	2	1	X

Opcode

1011 11SS	AAAA AAAI

Operands ACx, Smem

Description This instruction stores the high part of the accumulator, ACx(31−16), to the memory (Smem) location:

```
Smem = HI(ACx)
```

The store operation to the memory location uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV HI(AC0), *AR3	The content of AC0(31–16) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MOV** [rnd()]**HI(**ACx**)**[)], Smem	No	3	1	X

Opcode

1110 1000	AAAA AAAI	SSxx x0x%

Operands ACx, Smem

Description This instruction stores the high part of the accumulator, ACx(31−16), to the memory (Smem) location:

```
Smem = HI(rnd(ACx))
```

Rounding is performed in the D-unit shifter according to RDM, if the optional rnd keyword is applied to the input operand.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, overflow detection at the output of the shifter consists of checking if the sign of the input operand is identical to the most-significant bits of the 40-bit result of the shift and round operation:

- If the SST bit = 1 and the SXMD bit = 0, then the saturate, rnd, and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(uns(rnd(ACx))))
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate and rnd keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(rnd(ACx)))
- If the optional uns keyword is applied to the input operand, then bits 39–32 of the result are compared to 0.
- If the optional uns keyword is not applied to the input operand, then bits 39–31 of the result are compared to bit 39 of the input operand and SXMD.

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV rnd(HI(AC0)), *AR3	The content of AC0(31–16) is rounded and stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MOV** ACx **<<** Tx, Smem	No	3	1	X

Opcode

1110 0111	AAAA AAAI	SSss 00xx

Operands ACx, Smem, Tx

Description This instruction shifts the accumulator, ACx, by the content of Tx and stores the low part of the accumulator, ACx(15−0), to the memory (Smem) location:

```
Smem = LO(ACx << Tx)
```

If the 16-bit value in Tx is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value. The input operand is shifted in the D-unit shifter according to SXMD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, the 6 LSBs of Tx determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the 16-bit value in Tx is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = LO(saturate(uns(ACx << Tx)))
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = LO(saturate(ACx << Tx))

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC0 << T0, *AR3	The content of AC0 is shifted by the content of T0 and AC0(15−0) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**MOV** [rnd()]**HI(**ACx **<<** Tx**)**[)], Smem	No	3	1	X

Opcode

1110 0111	AAAA AAAI	SSss 10x%

Operands ACx, Smem, Tx

Description This instruction shifts the accumulator, ACx, by the content of Tx and stores high part of the accumulator, ACx(31−16), to the memory (Smem) location:

```
Smem = HI(rnd(ACx << Tx))
```

If the 16-bit value in Tx is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value. The input operand is shifted in the D-unit shifter according to SXMD. Rounding is performed in the D-unit shifter according to RDM, if the optional rnd keyword is applied to the input operand.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, the 6 LSBs of Tx determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the 16-bit value in Tx is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate, rnd, and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(uns(rnd(ACx << Tx))))
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate and rnd keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(rnd(ACx << Tx)))

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV rnd(HI(AC0 << T0)), *AR3	The content of AC0 is shifted by the content of T0, is rounded, and AC0(31−16) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**MOV** ACx **<<** #SHIFTW, Smem	No	3	1	X

Opcode

1110 1001	AAAA AAAI	SSSH IFTW

Operands ACx, SHIFTW, Smem

Description This instruction shifts the accumulator, ACx, by the 6-bit value, SHIFTW, and stores the low part of the accumulator, ACx(15−0), to the memory (Smem) location:

```
Smem = LO(ACx << #SHIFTW)
```

The input operand is shifted by the 6-bit value in the D-unit shifter according to SXMD

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, overflow detection at the output of the shifter consists of checking if the sign of the input operand is identical to the most-significant bits of the 40-bit result of the shift and round operation:

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = LO(saturate(uns(ACx << #SHIFTW)))
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = LO(saturate(ACx << #SHIFTW))
- If the optional uns keyword is applied to the input operand, then bits 39–32 of the result are compared to 0.
- If the optional uns keyword is not applied to the input operand, then bits 39–31 of the result are compared to bit 39 of the input operand and SXMD.

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC0 << #31, *AR3	The content of AC0 is shifted left by 31 bits and AC0(15−0) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**MOV HI(**ACx **<<** #SHIFTW**),** Smem	No	3	1	X

Opcode

1110 1010	AAAA AAAI	SSSH IFTW

Operands ACx, SHIFTW, Smem

Description This instruction shifts the accumulator, ACx, by the 6-bit value, SHIFTW, and stores the high part of the accumulator, ACx(31−16), to the memory (Smem) location:

```
Smem = HI(ACx << #SHIFTW)
```

The input operand is shifted by the 6-bit value in the D-unit shifter according to SXMD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, overflow detection at the output of the shifter consists of checking if the sign of the input operand is identical to the most-significant bits of the 40-bit result of the shift and round operation:

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(uns(ACx << #SHIFTW)))
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(ACx << #SHIFTW)))
- If the optional uns keyword is applied to the input operand, then bits 39–32 of the result are compared to 0.
- If the optional uns keyword is not applied to the input operand, then bits 39–31 of the result are compared to bit 39 of the input operand and SXMD.

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV HI(AC0 << #31), *AR3	The content of AC0 is shifted left by 31 bits and AC0(31−16) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[7]	**MOV** [rnd()]**HI(**ACx **<<** #SHIFTW**)**[)], Smem	No	4	1	X

Opcode

1111 1010	AAAA AAAI	xxSH IFTW	SSxx x0x%

Operands ACx, SHIFTW, Smem

Description This instruction shifts the accumulator, ACx, by the 6-bit value, SHIFTW, and stores the high part of the accumulator, ACx(31−16), to the memory (Smem) location:

```
Smem = HI(rnd(ACx << #SHIFTW))
```

The input operand is shifted by the 6-bit value in the D-unit shifter according to SXMD. Rounding is performed in the D-unit shifter according to RDM, if the optional rnd keyword is applied to the input operand.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, overflow detection at the output of the shifter consists of checking if the sign of the input operand is identical to the most-significant bits of the 40-bit result of the shift and round operation:

- If the SST bit = 1 and the SXMD bit = 0, then the saturate, rnd, and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(uns(rnd(ACx << #SHIFTW))))
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate and rnd keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(rnd(ACx << #SHIFTW)))
- If the optional uns keyword is applied to the input operand, then bits 39–32 of the result are compared to 0.
- If the optional uns keyword is not applied to the input operand, then bits 39–31 of the result are compared to bit 39 of the input operand and SXMD.

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV rnd(HI(AC0 << #31)), *AR3	The content of AC0 is shifted left by 31 bits, is rounded, and AC0(31−16) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[8]	**MOV** [uns()[rnd()**HI**[(saturate)**(**ACx**)**])))], Smem	No	3	1	X

Opcode

1110 1000	AAAA AAAI	SSxx x1u%

Operands ACx, Smem

Description This instruction stores the high part of the accumulator, ACx(31−16), to the memory (Smem) location:

```
Smem = HI(saturate(uns(rnd(ACx))))
```

- When the C54CM bit = 0 or the SST bit = 0, the saturate and uns keywords are optional and can be applied or not.
- Input operands are considered signed or unsigned according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is considered unsigned.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is considered signed.
- If the optional rnd keyword is applied to the input operand, rounding is performed in the D-unit shifter according to RDM.
- When a rounding overflow is detected and if the optional saturate keyword is applied to the input operand, the 40-bit output of the operation is saturated:
  - If the optional uns keyword is applied to the input operand, saturation value is 00 FFFF FFFFh.
  - If the optional uns keyword is not applied, saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow).

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, overflow detection at the output of the shifter consists of checking if the sign of the input operand is identical to the most-significant bits of the 40-bit result of the round operation:

- If the SST bit = 1 and the SXMD bit = 0, then the saturate, rnd, and uns keywords are applied to the instruction regardless of the optional keywords selected by the user.

- If the SST bit = 1 and the SXMD bit = 1, then only the saturate and rnd keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(rnd(ACx)))
- If the optional uns keyword is applied to the input operand, then bits 39–32 of the result are compared to 0.
- If the optional uns keyword is not applied to the input operand, then bits 39–31 of the result are compared to bit 39 of the input operand and SXMD.

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV uns(rnd(HI(saturate(AC0)))), *AR3	The unsigned content of AC0 is rounded, is saturated, and AC0(31−16) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[9]	**MOV** [uns()][rnd()]**HI**[(saturate)**(**ACx **<<** Tx**)**])))], Smem	No	3	1	X

Opcode

1110 0111	AAAA AAAI	SSss 11u%

Operands ACx, Smem, Tx

Description This instruction shifts the accumulator, ACx, by the content of Tx and stores the high part of the accumulator, ACx(31−16), to the memory (Smem) location.

```
Smem = HI(saturate(uns(rnd(ACx << Tx))))
```

If the 16-bit value in Tx is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value.

- When the C54CM bit = 0 or the SST bit = 0, the saturate and uns keywords are optional and can be applied or not.
- Input operands are considered signed or unsigned according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is considered unsigned.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is considered signed.
- The input operand is shifted in the D-unit shifter according to SXMD.
- When shifting, the sign position of the input operand is compared to the shift quantity.
  - If the optional uns keyword is applied to the input operand, this comparison is performed against bit 32 of the shifted operand.
  - If the optional uns keyword is not applied, this comparison is performed against bit 31 of the shifted operand that is considered signed (the sign is defined by bit 39 of the input operand and SXMD).
  - An overflow is generated accordingly.
- If the optional rnd keyword is applied to the input operand, rounding is performed in the D-unit shifter according to RDM.
- When a shift or rounding overflow is detected and if the optional saturate keyword is applied to the input operand, the 40-bit output of the operation is saturated:

- If the optional uns keyword is applied to the input operand, saturation value is 00 FFFF FFFFh.
- If the optional uns keyword is not applied, saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow).

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1:

- If the SST bit = 1 and the SXMD bit = 0, then the saturate, rnd, and uns keywords are applied to the instruction regardless of the optional keywords selected by the user.
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate and rnd keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  Smem = HI(saturate(rnd(ACx << Tx)))
- Overflow detection at the output of the shifter consists of checking if the sign of the input operand is identical to the most-significant bits of the 40-bit result of the shift and round operation.
  - If the optional uns keyword is applied to the input operand, then bits 39–32 of the result are compared to 0.
  - If the optional uns keyword is not applied to the input operand, then bits 39–31 of the result are compared to bit 39 of the input operand and SXMD.
- The 6 LSBs of Tx determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the 16-bit value in Tx is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV uns(rnd(HI(saturate(AC0 << T0)))), *AR3	The unsigned content of AC0 is shifted by the content of T0, is rounded, is saturated, and AC0(31−16) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[10]	**MOV** [uns()][rnd()]**HI**[(saturate]**(**ACx **<<** #SHIFTW**)**[]))], Smem	No	4	1	X

Opcode

1111 1010	AAAA AAAI	uxSH IFTW	SSxx x1x%

Operands ACx, SHIFTW, Smem

Description This instruction shifts the accumulator, ACx, by the 6-bit value, SHIFTW, and stores the high part of the accumulator, ACx(31−16), to the memory (Smem) location:

```
Smem = HI(saturate(uns(rnd(ACx << #SHIFTW))))
```

- ❏ When the C54CM bit = 0 or the SST bit = 0, the saturate and uns keywords are optional and can be applied or not.
- ❏ Input operands are considered signed or unsigned according to uns.
  - ■ If the optional uns keyword is applied to the input operand, the content of the memory location is considered unsigned.
  - ■ If the optional uns keyword is not applied to the input operand, the content of the memory location is considered signed.
- ❏ The input operand is shifted by the 6-bit value in the D-unit shifter according to SXMD.
- ❏ When shifting, the sign position of the input operand is compared to the shift quantity.
  - ■ If the optional uns keyword is applied to the input operand, this comparison is performed against bit 32 of the shifted operand.
  - ■ If the optional uns keyword is not applied, this comparison is performed against bit 31 of the shifted operand that is considered signed (the sign is defined by bit 39 of the input operand and SXMD).
  - ■ An overflow is generated accordingly.
- ❏ If the optional rnd keyword is applied to the input operand, rounding is performed in the D-unit shifter according to RDM.
- ❏ When a shift or rounding overflow is detected and if the optional saturate keyword is applied to the input operand, the 40-bit output of the operation is saturated:

- If the optional uns keyword is applied to the input operand, saturation value is 00 FFFF FFFFh.
- If the optional uns keyword is not applied, saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow).

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, overflow detection at the output of the shifter consists of checking if the sign of the input operand is identical to the most-significant bits of the 40-bit result of the shift and round operation.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate, rnd, and uns keywords are applied to the instruction regardless of the optional keywords selected by the user.

  Smem = HI(saturate(rnd(ACx << #SHIFTW)))
- If the optional uns keyword is applied to the input operand, then bits 39–32 of the result are compared to 0.
- If the optional uns keyword is not applied to the input operand, then bits 39–31 of the result are compared to bit 39 of the input operand and SXMD.

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV uns(rnd(HI(saturate(AC0 << #31)))), *AR3	The unsigned content of AC0 is shifted left by 31 bits, is rounded, is saturated, and AC0(31−16) is stored at the location addressed by AR3.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[11]	**MOV** ACx**, dbl(**Lmem**)**	No	3	1	X

Opcode

1110 1011	AAAA AAAI	xxSS 10x0

Operands ACx, Lmem

Description This instruction stores the content of the accumulator, ACx(31−0), to the data memory operand (Lmem):

```
dbl(Lmem) = ACx
```

The store operation to the memory location uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC0, dbl(*AR3)	The content of AC0 is stored at the locations addressed by AR3 and AR3 + 1.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[12]	**MOV** [uns(]**saturate(**ACx**)**[)]**, dbl(**Lmem**)**	No	3	1	X

Opcode

1110 1011	AAAA AAAI	xxSS 10u1

Operands ACx, Lmem

Description This instruction stores the content of the accumulator, ACx(31−0), to the data memory operand (Lmem):

```
dbl(Lmem) = saturate(uns(ACx))
```

- When the C54CM bit = 0 or the SST bit = 0, the saturate and uns keywords are optional and can be applied or not.
- Input operands are considered signed or unsigned according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is considered unsigned.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is considered signed.
- The 40-bit output of the operation is saturated:
  - If the optional uns keyword is applied to the input operand, saturation value is 00 FFFF FFFFh.
  - If the optional uns keyword is not applied, saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow).
- The store operation to the memory location uses the D-unit shifter.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with C54CM = 1, overflow detection at the output of the shifter consists of checking if the sign of the input operand is identical to the most-significant bits of the 40-bit result of the shift and round operation.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user.

- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user.
- If the optional uns keyword is applied to the input operand, then bits 39–32 of the result are compared to 0.
- If the optional uns keyword is not applied to the input operand, then bits 39–31 of the result are compared to bit 39 of the input operand and SXMD.

Status Bits Affected by C54CM, RDM, SST, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV uns(saturate(AC0)), dbl(*AR3)	The unsigned content of AC0 is saturated and stored at the locations addressed by AR3 and AR3 + 1.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[13]	**MOV** ACx **>> #1, dual(**Lmem**)**	No	3	1	X

Opcode

1110 1011	AAAA AAAI	xxSS 1101

Operands ACx, Lmem

Description This instruction performs two store operations in parallel and is executed in the D-unit shifter:

```
HI(Lmem) = HI(ACx) >> #1
:: LO(Lmem) = LO(ACx) >> #1
```

- The 16 highest bits of the accumulator, ACx(31−16), shifted right by 1 bit (bit 31 is sign extended according to SXMD), are stored to the 16 highest bits of the data memory operand (Lmem).
- The 16 lowest bits, ACx(15−0), shifted right by 1 bit (bit 15 is sign extended according to SXMD), are stored to the 16 lowest bits of the data memory operand (Lmem).

Status Bits Affected by SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC0 >> #1,dual(*AR3)	The content of AC0(31–16), shifted right by 1 bit, is stored at the location addressed by AR1 and the content of AC0(15−0), shifted right by 1 bit, is stored at the location addressed by AR1 + 1.

Store Accumulator Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[14]	**MOV** ACx, Xmem, Ymem	No	3	1	X

Opcode

1000 0000	XXXM MMYY	YMMM 10SS

Operands ACx, Xmem, Ymem

Description This instruction performs two store operations in parallel:

```
Xmem = LO(ACx)
:: Ymem = HI(ACx)
```

- The 16 lowest bits of the accumulator, ACx(15−0), are stored to data memory operand Xmem.
- The 16 highest bits, ACx(31−16), are stored to data memory operand Ymem.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC0, *AR1, *AR2	The content of AC0(15–0) is stored at the location addressed by AR1 and the content of AC0(31–16) is stored at the location addressed by AR2.

Before		After	
AC0	01 4500 0030	AC0	01 4500 0030
AR1	0200	AR1	0200
AR2	0201	AR2	0201
200	3400	200	0030
201	0FD3	201	4500

MOV *Store Accumulator Pair Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV pair(HI(**ACx**)), dbl(**Lmem**)**	No	3	1	X
[2]	**MOV pair(LO(**ACx**)), dbl(**Lmem**)**	No	3	1	X

Description This instruction stores the content of the selected accumulator pair, ACx and AC(x + 1), to a data memory operand (Lmem).

Status Bits Affected by none

Affects none

Store Accumulator, Auxiliary, or Temporary Register Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** src, Smem	No	2	1	X

Opcode

1100 FSSS	AAAA AAAI

Operands Smem, src

Description This instruction stores the content of the source (src) register to a memory (Smem) location:

```
Smem = src
```

- When the source register is an accumulator:
  - The low part of the accumulator, ACx(15−0), is stored to the memory location.
  - The store operation to the memory location uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- When the source register is an auxiliary or temporary register:
  - The content of the auxiliary or temporary register is stored to the memory location.
  - The store operation to the memory location uses a dedicated path independent of the A-unit ALU.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC0, *(#0E10h)	The content of AC0(15–0) is stored at location E10h.

```
Before                          After
AC0          23 0400 6500       AC0          23 0400 6500
0E10                 0000       0E10                 6500
```

Store Accumulator, Auxiliary, or Temporary Register Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**MOV** src, **high_byte(**Smem**)**	No	3	1	X

Opcode

1110 0101	AAAA AAAI	FSSS 01x0

Operands Smem, src

Description This instruction stores the low byte (bits 7−0) of the source (src) register to the high byte (bits 15−8) of the memory (Smem) location. The low byte (bits 7−0) of Smem is unchanged:

```
high_byte(Smem) = src
```

- When the source register is an accumulator:
  - The low part of the accumulator, ACx(7−0), is stored to the high byte of the memory location.
  - The store operation to the memory location uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- When the source register is an auxiliary or temporary register:
  - The low part (bits 7−0) content of the auxiliary or temporary register is stored to the high byte of the memory location.
  - The store operation to the memory location uses a dedicated path independent of the A-unit ALU.
- In this instruction, Smem **cannot** reference to a memory-mapped register (MMR). This instruction cannot access a byte within an MMR. If Smem is an MMR, the DSP sends a hardware bus-error interrupt (BERRINT) request to the CPU.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC1, high_byte(*AR1)	The content of AC1(7–0) is stored in the high byte (bits 15−8) at the location addressed by AR1.

```
Before                          After
AC1          20 FC00 6788       AC1          20 FC00 6788
AR1                0200         AR1                0200
200                6903         200                8803
```

Store Accumulator, Auxiliary, or Temporary Register Content to Memory

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MOV** src, **low_byte(**Smem**)**	No	3	1	X

Opcode

1110 0101	AAAA AAAI	FSSS 01x1

Operands Smem, src

Description This instruction stores the low byte (bits 7−0) of the source (src) register to the low byte (bits 7−0) of the memory (Smem) location. The high byte (bits 15−8) of Smem is unchanged:

```
low_byte(Smem) = src
```

- When the source register is an accumulator:
  - The low part of the accumulator, ACx(7−0), is stored to the low byte of the memory location.
  - The store operation to the memory location uses a dedicated path independent of the D-unit ALU, the D-unit shifter, and the D-unit MACs.
- When the source register is an auxiliary or temporary register:
  - The low part (bits 7−0) content of the auxiliary or temporary register is stored to the low byte of the memory location.
  - The store operation to the memory location uses a dedicated path independent of the A-unit ALU.
- In this instruction, Smem **cannot** reference to a memory-mapped register (MMR). This instruction cannot access a byte within an MMR. If Smem is an MMR, the DSP sends a hardware bus-error interrupt (BERRINT) request to the CPU.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MOV AC0, low_byte(*AR3)	The content of AC0(7–0) is stored in the low byte (bits 7−0) at the location addressed by AR3.

MOV — *Store Auxiliary or Temporary Register Pair Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV pair(**TAx**), dbl(**Lmem**)**	No	3	1	X

Opcode

1110 1011	AAAA AAAI	FSSS 1100

Operands TAx, Lmem

Description This instruction stores the content of the temporary or auxiliary register (TAx) to the 16 highest bits of the data memory operand (Lmem) and stores the content of TA(x + 1) to the 16 lowest bits of data memory operand (Lmem):

- ❏ The store operation to the memory location uses a dedicated path independent of the A-unit ALU.
- ❏ Valid auxiliary registers are AR0, AR2, AR4, and AR6.
- ❏ Valid temporary registers are T0 and T2.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

Opcode See Table 5−5 (page 5-426).

Operands Lmem, Smem

Description

These instructions store the content of the selected source CPU register to a memory (Smem) location or a data memory operand (Lmem).

For instructions [9] and [10], the block repeat register (BRCx) is decremented in the address phase of the last instruction of the loop. These instructions have a 3-cycle latency requirement versus the last instruction of the loop.

For instruction [20], the content of the 24-bit RETA register (the return address of the calling subroutine) and the 8-bit CFCT register (active control flow execution context flags of the calling subroutine) are stored to the data memory operand (Lmem):

- ❏ The content of the CFCT register and the 8 highest bits of the RETA register are stored in the 16 highest bits of Lmem.
- ❏ The 16 lowest bits of the RETA register are stored in the 16 lowest bits of Lmem.

  When instruction [20] is decoded, the CPU pipeline is flushed and the instruction is executed in 5 cycles, regardless of the instruction context.

Status Bits

Affected by none

Affects none

Repeat

Instruction [20] cannot be repeated; all other instructions can be repeated.

Example 1

Syntax	Description
MOV SP, *AR1+	The content of the data stack pointer (SP) is stored in the location addressed by AR1. AR1 is incremented by 1.

Before		After	
AR1	0200	AR1	0201
SP	0200	SP	0200
200	0000	200	0200

Example 2

Syntax	Description
MOV SSP, *AR1+	The content of the system stack pointer (SSP) is stored in the location addressed by AR1. AR1 is incremented by 1.

Before		After	
AR1	0201	AR1	0202
SSP	0000	SSP	0000
201	00FF	201	0000

Example 3

Syntax	Description
MOV TRN0, *AR1+	The content of the transition register (TRN0) is stored in the location addressed by AR1. AR1 is incremented by 1.

Before		After	
AR1	0202	AR1	0203
TRN0	3490	TRN0	3490
202	0000	202	3490

Example 4

Syntax	Description
MOV TRN1, *AR1+	The content of the transition register (TRN1) is stored in the location addressed by AR1. AR1 is incremented by 1.

Before		After	
AR1	0203	AR1	0204
TRN1	0020	TRN1	0020
203	0000	203	0020

Example 5

Syntax	Description
MOV RETA, dbl(*AR3)	The contents of the RETA and CFCT are stored in the location addressed by AR3 and AR3 + 1.

MOV *Store Extended Auxiliary Register Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** XAsrc**, dbl(**Lmem**)**	No	3	1	X

Opcode

1110 1101	AAAA AAAI	XSSS 0101

Operands Lmem, XAsrc

Description This instruction moves the content of the 23-bit source register (XARx, XSP, XSSP, XDP, or XCDP) to the 32-bit data memory location addressed by data memory operand (Lmem). The upper 9 bits of the data memory are filled with 0:

```
dbl(Lmem) = XAsrc
```

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- ❏ AMAR (Modify Extended Auxiliary Register Content)
- ❏ AMOV (Load Extended Auxiliary Register with Immediate Value)
- ❏ MOV (Load Extended Auxiliary Register from Memory)
- ❏ MOV (Move Extended Auxiliary Register Content)

Example

Syntax	Description
MOV XAR1, dbl(*AR3)	The 7 highest bits of XAR1 are moved to the 7 lowest bits of the location addressed by AR3, the 9 highest bits are filled with 0, and the 16 lowest bits of XAR1 are moved to the location addressed by AR3 + 1.

Before		**After**	
XAR1	7F 3492	XAR1	7F 3492
AR3	0200	AR3	0200
200	3765	200	007F
201	0FD3	201	3492

MOV::MOV — *Load Accumulator from Memory with Parallel Store Accumulator Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MOV** Xmem **<< #16**, ACy **:: MOV HI(**ACx **<< T2),** Ymem	No	4	1	X

Opcode

1000 0111	XXXM MMYY	YMMM SSDD	110x xxxx

Operands ACx, ACy, T2, Xmem, Ymem

Description This instruction performs two operations in parallel, load and store:

```
ACy = Xmem << #16
:: Ymem = HI(ACx << T2)
```

The first operation loads the content of data memory operand Xmem shifted left by 16 bits to the accumulator ACy.

- ❏ The input operand is sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ The input operand is shifted left by 16 bits according to M40.

The second operation shifts the accumulator ACx by the content of T2 and stores ACx(31−16) to data memory operand Ymem. If the 16-bit value in T2 is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value.

- ❏ The input operand is shifted in the D-unit shifter according to SXMD.
- ❏ After the shift, the high part of the accumulator, ACx(31−16), is stored to the memory location.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When this instruction is executed with C54CM = 1, the 6 LSBs of T2 determine the shift quantity. The 6 LSBs of T2 define a shift quantity within –32 to +31. When the 16-bit value in T2 is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

- ❏ If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected

by the user, with the following syntax:

ACy = Xmem << #16
Ymem = HI(saturate(uns(ACx << T2)))

- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:

  ACy = Xmem << #16
  Ymem = HI(saturate(ACx << T2))

Status Bits

Affected by C54CM, M40, RDM, SATD, SST, SXMD

Affects ACOVy

Repeat

This instruction can be repeated.

[10]	**MPY**[R] Smem, uns(Cmem), ACx	No	3	1	X

Description

This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are:

- ACx(32−16)
- The content of Tx, sign extended to 17 bits
- The 8-bit signed constant, K8, sign extended to 17 bits
- The 16-bit signed constant, K16, sign extended to 17 bits
- The content of a memory location (Smem), sign extended to 17 bits
- The content of a data memory operand Cmem, addressed using the coefficient addressing mode, sign extended to 17 bits
- The content of data memory operand Xmem, extended to 17 bits, and the content of data memory operand Ymem, extended to 17 bits

Status Bits

Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx, ACOVy

[1]	**MPY**[R] [ACx,] ACy	Yes	2	1	X

Opcode

0101 010E	DDSS 011%

Operands ACx, ACy

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are ACx(32−16) and ACy(32−16):

```
ACy = ACy * ACx
```

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MPY AC1, AC0	The product of the content of AC1 and the content of AC0 is stored in AC1.

```

Opcode

0001 111E	KKKK KKKK	SSDD xx0%

Operands ACx, ACy, K8

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are ACx(32−16) and the 8-bit signed constant, K8, sign extended to 17 bits:

```
ACy = ACx * K8
```

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MPYK #−2, AC1, AC0	The product of the content of AC1 and a signed 8-bit value (−2) is stored in AC0.

Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**MPYK**[R] K16, [ACx,] ACy	No	4	1	X

Opcode

0111 1001	KKKK KKKK	KKKK KKKK	SSDD xx0%

Operands ACx, ACy, K16

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are ACx(32−16) and the 16-bit signed constant, K16, sign extended to 17 bits:

```
ACy = ACx * K16
```

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MPYK #−64, AC1, AC0	The product of the content of AC1 and a signed 16-bit value (−64) is stored in AC0.

Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**MPYM**[R] [T3 =]Smem, Cmem, ACx	No	3	1	X

Opcode

1101 0001	AAAA AAAI	U%DD 00mm

Operands ACx, Cmem, Smem

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of a memory location (Smem), sign extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and sign extended to 17 bits:

```
ACx = Smem * Cmem
```

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MPYM *AR3, *CDP, AC0	The product of the content addressed by AR3 and the content addressed by the coefficient data pointer register (CDP) is stored in AC0.

Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**MPYM**[R] [T3 =]Smem, [ACx,] ACy	No	3	1	X

Opcode

1101 0011	AAAA AAAI	U%DD 00SS

Operands ACx, ACy, Smem

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are ACx(32−16) and the content of a memory location (Smem), sign extended to 17 bits:

```
ACy = Smem * ACx
```

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MPYM *AR3, AC1, AC0	The product of the content addressed by AR3 and the content of AC1 is stored in AC0.

Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[7]	**MPYMK**[R] [T3 =]Smem, K8, ACx	No	4	1	X

Opcode

1111 1000	AAAA AAAI	KKKK KKKK	xxDD x0U%

Operands ACx, K8, Smem

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of a memory location (Smem), sign extended to 17 bits, and the 8-bit signed constant, K8, sign extended to 17 bits:

```
ACx = Smem * K8
```

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
MPYMK *AR3, #−2, AC0	The product of the content addressed by AR3 and a signed 8-bit value (−2) is stored in AC0.

Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[8]	**MPYM**[R][40] [T3 =][uns()]Xmem[)], [uns()]Ymem[)], ACx	No	4	1	X

Opcode

1000 0110	XXXM MMYY	YMMM xxDD	000g uuU%

Operands ACx, Xmem, Ymem

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of data memory operand Ymem, extended to 17 bits:

```
ACx = Xmem * Ymem
```

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

This instruction provides the option to store the 16-bit data memory operand Xmem in temporary register T3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MPYM uns(*AR3), uns(*AR4), AC0	The product of the unsigned content addressed by AR3 and the unsigned content addressed by AR4 is stored in AC0.

Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[9]	**MPYM**[R][U] [T3 =]Smem, Tx, ACx	No	3	1	X

Opcode

1101 0011	AAAA AAAI	U%DD u1ss

Operands ACx, Smem, Tx

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of Tx, sign extended to 17 bits, and the content of a memory location (Smem), sign extended to 17 bits:

```
ACx = Tx * Smem
```

- ❑ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❑ Multiplication overflow detection depends on SMUL.
- ❑ The 32-bit result of the multiplication is extended to 40 bits according to U.
  - ■ If the optional U keyword is applied to the instruction, the 32-bit result is zero extended to 40 bits.
  - ■ If the optional U keyword is not applied to the instruction, the 32-bit result is sign extended to 40 bits.
- ❑ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❑ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVx) is set.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
MPYMU *AR3, T0, AC0	The product of the content addressed by AR3 and the content of T0 is stored as an unsigned result in AC0.

Multiply

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[10]	**MPY**[R] Smem, uns(Cmem), ACx	No	3	1	X

Opcode

1101 0000	AAAA AAAI	0%DD 01mm

Operands ACx, Cmem, Smem

Description This instruction performs a multiplication in the D-unit MAC1. The input operands of the multiplier are the content of a data memory location (Smem) and the content of a data memory operand (Cmem):

```
ACx = Smem * uns(Cmem)
```

> **Note:**
>
> The uns keyword is mandatory for this instruction.

The data memory operand Smem is addressed by DAGEN path X with using the Smem addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The another data memory operand Cmem is addressed by DAGEN path C with using the coefficient addressing mode, driven on data bus BDB, and extended to 17 bits with filling zeros in the MAC1.

- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To

prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

This instruction can be applied to compute the intermediate multiplication result of double precision multiplication and to free up one DAGEN operator (DAGEN path Y) for storing an instruction with enabling parallelism.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits

Multiply With Parallel Multiply and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MPY**[R][40] [uns()]Xmem[)], [uns()]Cmem[)], ACx **:: MAC**[R][40] [uns()]Ymem[)], [uns()]Cmem[)], ACy **>> #16**	No	4	1	X

Opcode

1000 0100	XXXM MMYY	YMMM 10mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and multiply and accumulate (MAC). The operations are executed in the two D-unit MACs:

```
ACx = Xmem * Cmem
:: ACy = (ACy >> #16) + (Ymem * Cmem)
```

The first operation performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

The second operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits.
- For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy shifted right by 16 bits. The shifting operation is performed with a sign extension of source accumulator ACy(39).

- ❏ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- ■ AMAR Xmem
- ■ AMAR Ymem
- ■ AMAR Cmem

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MPY uns(*AR3), uns(*CDP), AC0 :: MAC uns(*AR4), uns(*CDP), AC1 >> #16	Both instructions are performed in parallel. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the coefficient data pointer register (CDP) is stored in AC0. The product of the unsigned content addressed by AR4 and the unsigned content addressed by CDP is added to the content of AC1, which has been shifted to the right by 16 bits. The result is stored in AC1.

Multiply with Parallel Multiply and Accumulate

[2]	**MPY**[R][40] [uns(]Smem[)], [uns(]HI(Cmem)[)], ACy **:: MAC**[R][40] [uns(]Smem[)], [uns(]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0000 01mm	DDDD uug%

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel operations in one cycle: multiply and multiply and accumulate (MAC). The operations are executed in the two D-unit MACs:

```
ACy = Smem * HI(Cmem)
:: ACx = ACx + (Smem * LO(Cmem))
```

The first operation performs a multiplication in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and an accumulation in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.

- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

(*) 1 LSB is allocated to instruction slot #2.

Opcode

1001 0010	XXXM MMYY	YMMM 01mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and multiply and accumulate (MAC). The operations are executed in the two D-unit MACs:

```
ACy = Ymem * HI(Cmem)
:: ACx = ACx + (Xmem * LO(Cmem))
```

The first operation performs a multiplication in the D-unit MAC2. The input operands of the multiplier are the contents of data memory operand Ymem, extended to 17 bits, and the content of data memory operand HI(Cmem) which is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and an accumulation in the D-unit MAC1. The input operands of the multiplier are the contents of data memory operand Xmem, extended to 17 bits, and the content of data memory operand LO(Cmem) which is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ Because this instruction occupies both instruction slots #1 and #2, this can not be executed in parallel with other instructions.
- ❏ The Xmem operand can access the MMRs but the Ymem operand can not.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Multiply with Parallel Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MPY**[R][40] [uns()]Smem[)], [uns()]HI(Cmem)[)], ACy **:: MAS**[R][40] [uns()]Smem[)], [uns()]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0000 11mm	DDDD uug%

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel operations in one cycle: multiply and multiply and subtract (MAS). The operations are executed in the two D-unit MACs:

```
ACy = Smem * HI(Cmem)
:: ACx = ACx – (Smem * LO(Cmem))
```

The first operation performs a multiplication in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.

- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx, ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
MPY uns(*AR3−), uns(HI(*CDP+)), AC1 :: MAS uns(*AR3−), uns(LO(*CDP+)), AC0	Both instructions are performed in parallel. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the higher part of the coefficient data pointer register (CDP) is stored in AC1. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the lower part of the CDP is subtracted from the content of AC0. The result is stored in AC0. AR3 is decremented by 1. When CDP+ is used with HI/LO, CDP is incremented by 2.

Execution

```
M40(rnd(uns(Smem)[16:0]*uns(HI(Cmem))[16:0])) -> ACy
ACx-M40(rnd(uns(Smem)[16:0]*uns(LO(Cmem))[16:0])) -> ACx
```

Multiply with Parallel Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipe-line
[2]	**MPY**[R][40] [uns()]HI(Lmem)[)], [uns()]HI(Cmem)[)], ACy **:: MAS**[R][40] [uns()]LO(Lmem)[)], [uns()]LO(Cmem)[)], ACx	No	4	1	X

Opcode

1111 1101	AAAA AAAI	0100 11mm	DDDD uug%

Operands ACx, ACy, Cmem, Lmem

Description This instruction performs two parallel operations in one cycle: multiply and multiply and subtract (MAS). The operations are executed in the two D-unit MACs:

```
ACy = HI(Lmem) * HI(Cmem)
:: ACx = ACx - (LO(Lmem) * LO(Cmem))
```

The first operation performs a multiplication in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand HI(Lmem) and the content of data memory operand HI(Cmem). The data memory operand HI(Lmem) is addressed by DAGEN path X with the EA (effective address); the data, which can be assumed to be the higher part of long word memory data, is driven on data bus CDB and sign extended to 17 bits in the MAC2. The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA; the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand LO(Lmem) and the content of data memory operand LO(Cmem). The data memory operand LO(Lmem) is addressed by DAGEN path X with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word memory data, is driven on data bus DDB and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ For the first operation, the 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ For the second operation, the 32-bit result of the multiplication is sign extended to 40 bits and subtracted from the source accumulator ACx.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Multiply with Parallel Multiply and Subtract

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**MPY**[R][40] [uns()]Ymem[)], [uns()]HI(Cmem)[)], ACy **:: MAS**[R][40] [uns()]Xmem[)], [uns()]LO(Cmem)[)], ACx	No	5 (*)	1	X

(*) 1 LSB is allocated to instruction slot #2.

Opcode

1001 0010	XXXM MMYY	YMMM 10mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel operations in one cycle: multiply and multiply and subtract (MAS). The operations are executed in the two D-unit MACs:

```
ACy = Ymem * HI(Cmem)
:: ACx = ACx – (Xmem * LO(Cmem))
```

The first operation performs a multiplication in the D-unit MAC2. The input operands of the multiplier are the contents of data memory operand Ymem, extended to 17 bits, and the contents of data memory operand HI(Cmem) which is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication and a subtraction in the D-unit MAC1. The input operands of the multiplier are the contents of data memory operand Xmem, extended to 17 bits, and the content of data memory operand LO(Cmem) which is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC 1.

- The input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ Because this instruction occupies both instruction slots #1 and #2, this can not be executed in parallel with other instructions.
- ❏ The Xmem operand can access the MMRs but the Ymem operand can not.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 key word is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Parallel Multiplies

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MPY**[R][40] [uns()]Xmem[)], [uns()]Cmem[)], ACx **:: MPY**[R][40] [uns()]Ymem[)], [uns()]Cmem[)], ACy	No	4	1	X

Opcode

1000 0010	XXXM MMYY	YMMM 00mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel multiply operations in one cycle:

```
ACx = Xmem * Cmem
:: ACy = Ymem * Cmem
```

The first operation performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Xmem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

This second operation performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of data memory operand Ymem, extended to 17 bits, and the content of a data memory operand Cmem, addressed using the coefficient addressing mode and extended to 17 bits.

- Input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional 40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BB bus; on some C55x-based devices, the BB bus is only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Each data flow can also disable the usage of the corresponding MAC unit, while allowing the modification of auxiliary registers in the three address generation units through the following instructions:

- AMAR Xmem
- AMAR Ymem
- AMAR Cmem

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL, SXMD

Opcode

1111 1101	AAAA AAAI	0000 00mm	DDDD uug%

Operands ACx, ACy, Cmem, Smem

Description This instruction performs two parallel multiply operations in one cycle. The operations are executed in the D-unit MACs:

```
ACy = Smem * HI(Cmem)
:: ACx = Smem * LO(Cmem)
```

The first operation performs a multiplication in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand HI(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand Smem and the content of data memory operand LO(Cmem). The data memory operand Smem is addressed by DAGEN path X with the corresponding addressing mode, driven on data bus DDB, and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.

- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Opcode

1111 1101	AAAA AAAI	0100 00mm	DDDD uug%

Operands ACx, ACy, Cmem, Lmem

Description This instruction performs two parallel multiply operations in one cycle. The operations are executed in the D-unit MACs:

```
ACy = HI(Lmem) * HI(Cmem)
:: ACx = LO(Lmem) * LO(Cmem)
```

The first operation performs a multiplication in the D-unit MAC2. The input operands of the multiplier are the content of data memory operand HI(Lmem) and the content of data memory operand HI(Cmem). The data memory operand HI(Lmem) is addressed by DAGEN path X with the EA (effective address); the data, which can be assumed to be the higher part of long word memory data, is driven on data bus CDB and sign extended to 17 bits in the MAC2 (this data is shared to MAC1 and MAC2). The other data memory operand HI(Cmem) is addressed by DAGEN path C with the EA; the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication in the D-unit MAC1. The input operands of the multiplier are the content of data memory operand LO(Lmem) and the content of data memory operand LO(Cmem). The data memory operand LO(Lmem) is addressed by DAGEN path X with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word memory data, is driven on data bus DDB and sign extended to 17 bits in the MAC1. The other data memory operand LO(Cmem) is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- ❏ The content of the memory location is zero extended to 17 bits, if the optional uns keyword is applied to the input operand.
- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.

- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

Status Bits

Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx, ACOVy

Repeat

This instruction can be repeated.

Example

Syntax	Description
MPY uns(HI(*AR3−)), uns(HI(*CDP+)), AC1 :: MPY uns(LO(*AR3−)), uns(LO(*CDP+)), AC0	Both instructions are performed in parallel. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the higher part of the coefficient data pointer register (CDP) is stored in AC1. The product of the unsigned content addressed by AR3 and the unsigned content addressed by the lower part of CDP is stored in AC0. When AR3− is used with HI/LO, AR3 is decremented by 2. When CDP+ is used with HI/LO, CDP is incremented by 2.

```
Execution
M40(rnd(uns(HI(Lmem))[16:0]*uns(HI(Cmem))[16:0])) -> ACy
M40(rnd(uns(LO(Lmem))[16:0]*uns(LO(Cmem))[16:0])) -> ACx
```

Parallel Multiplies

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**MPY**[R][40] [uns()]Ymem[)], [uns()]HI(Cmem)[)], ACy **:: MPY**[R][40] [uns()]Xmem[)], [uns()]LO(Cmem)[)], ACx	No	5 (*)	1	X

(*) 1 LSB is allocated to instruction slot #2.

Opcode

1001 0010	XXXM MMYY	YMMM 00mm	uuDD DDg%

Operands ACx, ACy, Cmem, Xmem, Ymem

Description This instruction performs two parallel multiply operations in one cycle. The operations are executed in the D-unit MACs:

```
ACy = Ymem * HI(Cmem)
:: ACx = Xmem * LO(Cmem)
```

The first operation performs a multiplication in the D-unit MAC2. The input operands of the multiplier are the contents of data memory operand Ymem, extended to 17 bits, and the content of data memory operand HI(Cmem) which is addressed by DAGEN path C with the EA (effective address); the data, which can be assumed to be the higher part of long word coefficient data, is driven on data bus B2DB and sign extended to 17 bits in the MAC2.

The second operation performs a multiplication in the D-unit MAC1. The input operands of the multiplier are the contents of data memory operand Xmem, extended to 17 bits, and the content of data memory operand LO(Cmem) which is addressed by DAGEN path C with the next address of EA (EA+1 when EA is even, EA−1 when EA is odd); the data, which can be assumed to be the lower part of long word coefficient data, is driven on data bus BDB and sign extended to 17 bits in the MAC1.

- The input operands are extended to 17 bits according to uns.
  - If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 17 bits.
  - If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 17 bits according to SXMD.
- If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- Multiplication overflow detection depends on SMUL.

- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional rnd keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ Because this instruction occupies both instruction slots #1 and #2, this can not be executed in parallel with other instructions.
- ❏ The Xmem operand can access the MMRs but the Ymem operand can not.

This instruction provides the option to locally set M40 to 1 for the execution of the instruction, if the optional M40 keyword is applied to the instruction.

For this instruction, the Cmem operand is accessed through the BAB, BDB, and B2DB buses; on some C55xx-based devices, the BAB, BDB, and B2DB buses are only connected to internal memory and not to external memory. To prevent the generation of a bus error, the Cmem operand must not be mapped on external memory.

Compatibility with C54x devices (C54CM = 1)

None.

MPYM::MOV *Multiply with Parallel Store Accumulator Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**MPYM**[R] [T3 =]Xmem, Tx, ACy **:: MOV HI(**ACx **<< T2),** Ymem	No	4	1	X

Opcode

1000 0111	XXXM MMYY	YMMM SSDD	000x ssU%

Operands ACx, ACy, Tx, Xmem, Ymem

Description This instruction performs two operations in parallel: multiply and store:

```
ACy = rnd(Tx * Xmem)
:: Ymem = HI(ACx << T2) [,T3 = Xmem]
```

The first operation performs a multiplication in the D-unit MAC. The input operands of the multiplier are the content of Tx, sign extended to 17 bits, and the content of data memory operand Xmem, sign extended to 17 bits.

- ❏ If FRCT = 1, the output of the multiplier is shifted to the left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits.
- ❏ Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- ❏ Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.
- ❏ This instruction provides the option to store the 16-bit data memory operand Xmem in temporary register T3.

The second operation shifts the accumulator ACx by the content of T2 and stores ACx(31−16) to data memory operand Ymem. If the 16-bit value in T2 is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value.

- ❏ The input operand is shifted in the D-unit shifter according to SXMD.
- ❏ After the shift, the high part of the accumulator, ACx(31−16), is stored to the memory location.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When this instruction is executed with C54CM = 1, the 6 LSBs of T2 determine the shift quantity. The 6 LSBs of T2 define a shift quantity within –32 to +31. When the 16-bit value in T2 is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = rnd(Tx * Xmem)
  Ymem = HI(saturate(uns(ACx << T2))) [,T3 = Xmem]

- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = rnd(Tx * Xmem)
  Ymem = HI(saturate(ACx << T2)) [,T3 = Xmem]

Status Bits

Affected by C54CM, FRCT, M40, RDM, SATD, SMUL, SST, SXMD

Affects ACOVy

Repeat

This instruction can be repeated.

Example

Syntax	Description
MPYMR *AR0+, T0, AC1 :: MOV HI(AC0 << T2), *AR1+	Both instructions are performed in parallel. The content addressed by AR0 is multiplied by the content of T0. Since FRCT = 1, the result is multiplied by 2, rounded, and stored in AC1. The content of AC0 is shifted by the content of T2, and AC0(31−16) is stored at the address of AR1. AR0 and AR1 are both incremented by 1.

NEG *Negate Accumulator, Auxiliary, or Temporary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**NEG** [src,] dst	Yes	2	1	X

Opcode

0011 010E	FSSS FDDD

Operands dst, src

Description This instruction computes the 2s complement of the content of the source register (src):

```
dst = – src
```

This instruction clears the CARRY status bit to 0 for all nonzero values of src. If src equals 0, the CARRY status bit is set to 1.

- When the destination operand (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are sign extended to 40 bits according to SXMD.
  - If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended according to SXMD.
  - Overflow detection and CARRY status bit depends on M40.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination operand (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source operand (src) of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - Overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Operands dst, src

Description This instruction performs a bitwise OR operation between two registers:

```
dst = dst | src
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
OR AC1, AC0	The content of AC0 is ORed with the content of AC1 and the result is stored in AC0.

Bitwise OR

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**OR** k8, src, dst	Yes	3	1	X

Opcode

0001 101E	kkkk kkkk	FDDD FSSS

Operands dst, k8, src

Description This instruction performs a bitwise OR operation between a source (src) register content and an 8-bit value, k8:

```
dst = src | k8
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
OR #FFh, AC1, AC0	The content of AC1 is ORed with the unsigned 8-bit value (FFh) and the result is stored in AC0.

Bitwise OR

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**OR** k16, src, dst	No	4	1	X

Opcode

0111 1110	kkkk kkkk	kkkk kkkk	FDDD FSSS

Operands dst, k16, src

Description This instruction performs a bitwise OR operation between a source (src) register content and a 16-bit unsigned constant, k16:

```
dst = src | k16
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
OR #FFFFh, AC1, AC0	The content of AC1 is ORed with the unsigned 16-bit value (FFFFh) and the result is stored in AC0.

Bitwise OR

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**OR** Smem, src, dst	No	3	1	X

Opcode

1101 1010	AAAA AAAI	FDDD FSSS

Operands dst, Smem, src

Description This instruction performs a bitwise OR operation between a source (src) register content and a memory location (Smem):

```
dst = src | Smem
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
OR *AR3, AC1, AC0	The content of AC1 is ORed with the content addressed by AR3 and the result is stored in AC0.

Bitwise OR

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**OR** ACx **<<** #SHIFTW[, ACy]	Yes	3	1	X

Opcode

0001 000E	DDSS 0001	xxSH IFTW

Operands ACx, ACy, SHIFTW

Description This instruction performs a bitwise OR operation between an accumulator (ACy) content and and an accumulator (ACx) content shifted by the 6-bit value, SHIFTW:

```
ACy = ACy | (ACx <<< #SHIFTW)
```

- The shift and OR operations are performed in one cycle in the D-unit shifter.
- When M40 = 0 and C54CM = 0, input operands ACx(31−0) are zero extended to 40 bits. Otherwise, ACx(39−0) is used as is.
- The input operand (ACx) is shifted by a 6-bit immediate value in the D-unit shifter.
- The CARRY status bit is not affected by the logical shift operation.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the intermediary logical shift is performed as if M40 is locally set to 1. The 8 upper bits of the 40-bit intermediary result are not cleared.

Status Bits Affected by C54CM, M40

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
OR AC0 << #4, AC1	The content of AC1 is ORed with the content of AC0 logically shifted to the left by 4 bits and the result is stored in AC1.

```
Before                          After
AC0          7E 2355 4FC0       AC0          7E 2355 4FC0
AC1          0F E340 5678       AC1          0F F754 FE78
```

Bitwise OR

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**OR** k16 **<< #16,** [ACx,] ACy	No	4	1	X

Opcode

0111 1010	kkkk kkkk	kkkk kkkk	SSDD 011x

Operands ACx, ACy, k16

Description This instruction performs a bitwise OR operation between an accumulator (ACx) content and a 16-bit unsigned constant, k16, shifted to the left by 16 bits:

```
ACy = ACx | (k16 <<< #16)
```

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are zero extended to 40 bits.
- ❏ The input operand (k16) is shifted 16 bits to the MSBs.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
OR #FFFFh << #16, AC1, AC0	The content of AC1 is ORed with the unsigned 16-bit value (FFFFh) logically shifted to the left by 16 bits and the result is stored in AC0.

Bitwise OR

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[7]	**OR** k16 **<<** #SHFT, [ACx,] ACy	No	4	1	X

Opcode

0111 0011	kkkk kkkk	kkkk kkkk	SSDD SHFT

Operands ACx, ACy, k16, SHFT

Description This instruction performs a bitwise OR operation between an accumulator (ACx) content and a 16-bit unsigned constant, k16, shifted to the left by the 4-bit value, SHFT:

```
ACy = ACx | (k16 <<< #SHFT)
```

- ❑ The shift and OR operations are performed in one cycle in the D-unit shifter.
- ❑ When M40 = 0 and C54CM = 0, input operands ACx(31−0) are zero extended to 40 bits. Otherwise, ACx(39−0) is used as is.
- ❑ The input operand (k16) is shifted by a 4-bit immediate value in the D-unit shifter.
- ❑ The CARRY status bit is not affected by the logical shift operation

Status Bits Affected by C54CM, M40

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
OR #FFFFh << #15, AC1, AC0	The content of AC1 is ORed with the unsigned 16-bit value (FFFFh) logically shifted to the left by 15 bits and the result is stored in AC0.

[5]	**POP** Smem	No	2	1	X
[6]	**POP dbl(**Lmem**)**	No	2	1	X

Description

These instructions move the content of the data memory location addressed by the data stack pointer (SP) to:

- ❑ an accumulator, auxiliary, or temporary register
- ❑ a data memory location

When the destination register is an accumulator, the guard bits and the 16 higher bits of the accumulator, ACx(39−16), are reloaded (unchanged) with the current value and are not modified by these instructions.

The increment operation performed on SP is done by the A-unit address generator dedicated to the stack addressing management.

Status Bits

Affected by none

Affects none

Pop Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**POP** dst1, dst2	Yes	2	1	X

Opcode

0011 101E	FSSS FDDD

Note: FSSS = dst1, FDDD = dst2

Operands dst1, dst2

Description This instruction moves the content of the 16-bit data memory location pointed by SP to destination register dst1 and moves the content of the 16-bit data memory location pointed by SP + 1 to destination register dst2.

When the destination register, dst1 or dst2, is an accumulator, the content of the 16-bit data memory operand is moved to the destination accumulator low part, ACx(15−0). The guard bits and the 16 higher bits of the accumulator, ACx(39−16), are reloaded (unchanged) with the current value and are not modified by this instruction. SP is incremented by 2.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
POP AC0, AC1	The content of the memory location pointed by the data stack pointer (SP) is copied to AC0(15–0) and the content of the memory location pointed by SP + 1 is copied to AC1(15–0). bits 39−16 of the accumulators are unchanged. The SP is incremented by 2.

Before		**After**	
AC0	00 4500 0000	AC0	00 4500 4890
AC1	F7 5678 9432	AC1	F7 5678 2300
SP	0300	SP	0302
300	4890	300	4890
301	2300	301	2300

Pop Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**POP** dst	Yes	2	1	X

Opcode | 0101 000E | FDDD x010

Operands dst

Description This instruction moves the content of the 16-bit data memory location pointed by SP to destination register dst.

When the destination register, dst, is an accumulator, the content of the 16-bit data memory operand is moved to the destination accumulator low part, ACx(15−0). The guard bits and the 16 higher bits of the accumulator, ACx(39−16), are reloaded (unchanged) with the current value and are not modified by this instruction. SP is incremented by 1.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated with a single conditional or unconditional repeat instruction. It can be repeated in other repeat instructions.

Example

Syntax	Description
POP AC0	The content of the memory location pointed by the data stack pointer (SP) is copied to AC0(15–0). bits 39−16 of AC0 are unchanged. The SP is incremented by 1.

Pop Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**POP** dst, Smem	No	3	1	X

Opcode

1110 0100	AAAA AAAI	FDDD x1xx

Operands dst, Smem

Description This instruction moves the content of the 16-bit data memory location pointed by SP to destination register dst and moves the content of the 16-bit data memory location pointed by SP + 1 to data memory (Smem) location.

When the destination register, dst, is an accumulator, the content of the 16-bit data memory operand is moved to the destination accumulator low part, ACx(15−0). The guard bits and the 16 higher bits of the accumulator, ACx(39−16), are reloaded (unchanged) with the current value and are not modified by this instruction. SP is incremented by 2.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
POP AC0, *AR3	The content of the memory location pointed by the data stack pointer (SP) is copied to AC0(15–0) and the content of the memory location pointed by SP + 1 is copied to the location addressed by AR3. bits 39−16 of AC0 are unchanged. The SP is incremented by 2.

Pop Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**POP dbl(**ACx**)**	Yes	2	1	X

Opcode

0101 000E	xxDD x011

Operands ACx

Description This instruction moves the content of the 16-bit data memory location pointed by SP to the accumulator high part ACx(31–16) and moves the content of the 16-bit data memory location pointed by SP + 1 to the accumulator low part ACx(15–0).

The guard bits of the accumulator, ACx(39−32), are reloaded (unchanged) with the current value and are not modified by this instruction. SP is incremented by 2.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated with a single conditional or unconditional repeat instruction. It can be repeated in other repeat instructions.

Example

Syntax	Description
POP dbl(AC1)	The content of the memory location pointed by the data stack pointer (SP) is copied to AC1(31–16) and the content of the memory location pointed by SP + 1 is copied to AC1(15–0). bits 39−32 of AC1 are unchanged. The SP is incremented by 2.

```
Before                      After
AC1        03 3800 FC00     AC1        03 5644 F800
SP                 0304     SP                 0306
304                5644     304                5644
305                F800     305                F800
```

Pop Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**POP** Smem	No	2	1	X

Opcode | 1011 1011 | AAAA AAAI

Operands Smem

Description This instruction moves the content of the 16-bit data memory location pointed by SP to data memory (Smem) location. SP is incremented by 1.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
POP *AR1	The content of the memory location pointed by the data stack pointer (SP) is copied to the location addressed by AR1. The SP is incremented by 1.

Before		**After**	
AR1	0200	AR1	0200
SP	0300	SP	0301
200	3400	200	6903
300	6903	300	6903

Pop Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**POP dbl(**Lmem**)**	No	2	1	X

Opcode

1011 1000	AAAA AAAI

Operands Lmem

Description This instruction moves the content of the 16-bit data memory location pointed by SP to the 16 highest bits of data memory location Lmem and moves the content of the 16-bit data memory location pointed by SP + 1 to the 16 lowest bits of data memory location Lmem.

When Lmem is at an even address, the two 16-bit values popped from the stack are stored at memory location Lmem in the same order. When Lmem is at an odd address, the two 16-bit values popped from the stack are stored at memory location Lmem in the reverse order.

SP is incremented by 2.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
POP dbl(*AR3–)	The content of the memory location pointed by the data stack pointer (SP) is copied to the 16 highest bits of the location addressed by AR3 and the content of the memory location pointed by SP + 1 is copied to the 16 lowest bits of the location addressed by AR3. Because this instruction is a long-operand instruction, AR3 is decremented by 2 after the execution. The SP is incremented by 2.

POPBOTH *Pop Accumulator or Extended Auxiliary Register Content from Stack Pointers*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**POPBOTH** xdst	Yes	2	1	X

Opcode

0101 000E	XDDD 0100

Operands xdst

Description This instruction moves the content of two 16-bit data memory locations addressed by the data stack pointer (SP) and system stack pointer (SSP) to accumulator ACx or to the 23-bit destination register (XARx, XSP, XSSP, XDP, or XCDP).

The content of xdst(15−0) is loaded from the location addressed by SP and the content of xdst(31−16) is loaded from the location addressed by SSP.

When xdst is a 23-bit register, the upper 9 bits of the data memory addressed by SSP are discarded and only the 7 lower bits of the data memory are loaded into the high part of xdst(22−16).

When xdst is an accumulator, the guard bits, ACx(39−32), are reloaded (unchanged) with the current value and are not modified by this instruction.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- POP (Pop Top of Stack)
- PSH (Push to Top of Stack)
- PSHBOTH (Push Accumulator or Extended Auxiliary Register Content to Stack Pointers)

port — *Peripheral Port Register Access Qualifiers*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**port(**Smem**)**	No	1	1	D
[2]	**port(**k16**)**	No	3	1	D

Opcode

```
1001 1001
1001 1010
```

Operands k16, Smem

Description These operand qualifiers allow you to locally disable access toward the data memory and enable access to the 64K-word I/O space. The I/O data location is specified by the Smem, Xmem, or Ymem fields.

- An operand qualifier may be included in any instruction making a word single data memory access Smem or Xmem that is used in a read operation, except the DELAY and MACMZ instructions.
- A readport() operand qualifier cannot be used in any instruction making a dual memory access Xmem or Ymem that is used in a read operation. There is an exception for the instructions making a dual read/write memory access of the type Ymem = Xmem, or Smem = coeff, where readport() qualifier can be used.
- An operand qualifier may be included in any instruction making a word single data memory access Smem or Ymem that is used in a write operation, except the DELAY and MACMZ instructions.
- A writeport() operand qualifier cannot be used in any instruction making a dual memory access Xmem or Ymem that is used in a write operation. There is an exception for the instructions making a dual read/write memory access of the type Ymem = Xmem, or coeff = Smem, where writeport() qualifier can be used.
- An operand qualifier cannot be executed as a stand-alone instruction (assembler generates an error message).

Any instruction making a word single data memory access Smem (except those listed above) can use the port(k16) addressing mode to access the 64K-word I/O space with an immediate address. When an instruction uses

port(k16), the 16-bit unsigned constant, k16, is encoded in a 2-byte extension to the instruction. Because of the extension, an instruction using port(k16) cannot be executed in parallel with another instruction.

The following indirect operands cannot be used for accesses to I/O space. An instruction using one of these operands requires a 2-byte extension to the instruction. Because of the extension, an instruction using one of the following indirect operands cannot be executed with these operand qualifiers.

- ❏ *ARn(#K16)
- ❏ *+ARn(#K16)
- ❏ *CDP(#K16)
- ❏ *+CDP(#K16)

Status Bits Affected by none

Affects none

Repeat An instruction using this operand qualifier can be repeated.

Example 1

Syntax	Description
MOV port(*CDP+), T2	The content addressed by CDP (I/O address) is loaded into T2. After being used for the address, CDP is incremented by 1.

Example 2

Syntax	Description
MOV *CDP, port(#456h)	The content addressed by CDP is written to I/O address 456h.

PSH *Push to Top of Stack*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline

[5]	**PSH** Smem	No	2	1	X
[6]	**PSH dbl(**Lmem**)**	No	2	1	X

Description

These instructions move one or two operands to the data memory location addressed by the data stack pointer (SP). The operands may be:

- ❏ an accumulator, auxiliary, or temporary register
- ❏ a data memory location

The decrement operation performed on SP is done by the A-unit address generator dedicated to the stack addressing management.

Status Bits

Affected by none

Affects none

Push to Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**PSH** src1, src2	Yes	2	1	X

Opcode

0011 100E	FSSS FDDD

Note: FSSS = src1, FDDD = src2

Operands src1, src2

Description This instruction decrements SP by 2, then moves the content of the source register src1 to the 16-bit data memory location pointed by SP and moves the content of the source register src2 to the 16-bit data memory location pointed by SP + 1.

When the source register, src1 or src2, is an accumulator, the source accumulator low part, ACx(15−0), is moved to the 16-bit data memory operand.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
PSH AR0, AC1	The data stack pointer (SP) is decremented by 2. The content of AR0 is copied to the memory location pointed by SP and the content of AC1(15–0) is copied to the memory location pointed by SP + 1.

Before		After	
AR0	0300	AR0	0300
AC1	03 5644 F800	AC1	03 5644 F800
SP	0300	SP	02FE
2FE	0000	2FE	0300
2FF	0000	2FF	F800
300	5890	300	5890

Push to Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**PSH** src	Yes	2	1	X

Opcode

0101 000E	FSSS x110

Operands src

Description This instruction decrements SP by 1, then moves the content of the source register (src) to the 16-bit data memory location pointed by SP. When the source register is an accumulator, the source accumulator low part, ACx(15−0), is moved to the 16-bit data memory operand.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated with a single conditional or unconditional repeat instruction. It can be repeated in other repeat instructions.

Example

Syntax	Description
PSH AC0	The data stack pointer (SP) is decremented by 1. The content of AC0(15–0) is copied to the memory location pointed by SP.

Push to Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**PSH** src, Smem	No	3	1	X

Opcode

1110 0100	AAAA AAAI	FSSS x0xx

Operands Smem, src

Description This instruction decrements SP by 2, then moves the content of the source register (src) to the 16-bit data memory location pointed by SP and moves the content of the data memory (Smem) location to the 16-bit data memory location pointed by SP + 1.

When the source register is an accumulator, the source accumulator low part, ACx(15−0), is moved to the 16-bit data memory operand.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
PSH AC0, *AR3	The data stack pointer (SP) is decremented by 2. The content of AC0(15–0) is copied to the memory location pointed by SP and the content addressed by AR3 is copied to the memory location pointed by SP + 1.

Push to Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**PSH dbl(**ACx**)**	Yes	2	1	X

Opcode

0101 000E	xxSS x111

Operands ACx

Description This instruction decrements SP by 2, then moves the content of the accumulator high part ACx(31–16) to the 16-bit data memory location pointed by SP and moves the content of the accumulator low part ACx(15–0) to the 16-bit data memory location pointed by SP + 1.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated with a single conditional or unconditional repeat instruction. It can be repeated in other repeat instructions.

Example

Syntax	Description
PSH dbl(AC0)	The data stack pointer (SP) is decremented by 2. The content of AC0(31–16) is copied to the memory location pointed by SP and the content of AC0(15–0) is copied to the memory location pointed by SP + 1.

Push to Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**PSH** Smem	No	2	1	X

Opcode | 1011 0101 | AAAA AAAI

Operands Smem

Description This instruction decrements SP by 1, then moves the content of the data memory (Smem) location to the 16-bit data memory location pointed by SP.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
PSH *AR1	The data stack pointer (SP) is decremented by 1. The content addressed by AR1 is copied to the memory location pointed by SP.

Before		**After**	
*AR1	6903	*AR1	6903
SP	0305	SP	0304
304	0000	304	6903
305	0300	305	0300

Push to Top of Stack

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**PSH dbl(**Lmem**)**	No	2	1	X

Opcode

1011 0111	AAAA AAAI

Operands Lmem

Description This instruction decrements SP by 2, then moves the 16 highest bits of data memory location Lmem to the 16-bit data memory location pointed by SP and moves the 16 lowest bits of data memory location Lmem to the 16-bit data memory location pointed by SP + 1.

When Lmem is at an even address, the two 16-bit values pushed onto the stack are stored at memory location Lmem in the same order. When Lmem is at an odd address, the two 16-bit values pushed onto the stack are stored at memory location Lmem in the reverse order.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
PSH dbl(*AR3–)	The data stack pointer (SP) is decremented by 2. The 16 highest bits of the content at the location addressed by AR3 are copied to the memory location pointed by SP and the 16 lowest bits of the content at the location addressed by AR3 are copied to the memory location pointed by SP + 1. Because this instruction is a long-operand instruction, AR3 is decremented by 2 after the execution.

PSHBOTH *Push Accumulator or Extended Auxiliary Register Content to Stack Pointers*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**PSHBOTH** xsrc	Yes	2	1	X

Opcode

0101 000E	XSSS 0101

Operands xsrc

Description This instruction moves the lower 32 bits of ACx or the content of the 23-bit source register (XARx, XSP, XSSP, XDP, or XCDP) to the two 16-bit memory locations addressed by the data stack pointer (SP) and system stack pointer (SSP).

The content of xsrc(15−0) is moved to the location addressed by SP and the content of xsrc(31−16) is moved to the location addressed by SSP.

When xsrc is a 23-bit register, the upper 9 bits of the location addressed by SSP are filled with 0.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- POP (Pop Top of Stack)
- POPBOTH (Pop Accumulator or Extended Auxiliary Register Content from Stack Pointers)
- PSH (Push to Top of Stack)

RESET *Software Reset*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RESET**	No	2	?	D

Opcode

1001 0100	xxxx xxxx

Operands none

Description This instruction performs a nonmaskable software reset that can be used any time to put the device in a known state.

The reset instruction affects ST0_55, ST1_55, ST2_55, IFR0, IFR1, and T2 (Table 5−6 and Figure 5−3); status register ST3_55 and interrupt vectors pointer registers (IVPD and IVPH) are not affected. When the reset instruction is acknowledged, the INTM is set to 1 to disable maskable interrupts. All pending interrupts in IFR0 and IFR1 are cleared. The initialization of the system control register, the interrupt vectors pointer, and the peripheral registers is different from the initialization performed by a hardware reset.

Status Bits Affected by none

Affects IFR0, IFR1, ST0_55, ST1_55, ST2_55

Repeat This instruction cannot be repeated.

Table 5−6. Effects of a Software Reset on DSP Registers

Register	Bit	Reset Value	Comment
T2	All	0	All bits are cleared. To ensure TMS320C54x DSP compatibility, instructions affected by ASM bit will use a shift count of 0 (no shift).
IFR0	All	0	All pending interrupt flags are cleared.
IFR1	All	0	All pending interrupt flags are cleared.
ST0_55	ACOV2	0	AC2 overflow flag is cleared.
	ACOV3	0	AC3 overflow flag is cleared.
	TC1	1	Test control flag 1 is cleared.
	TC2	1	Test control flag 2 is cleared.
	CARRY	1	CARRY bit is cleared.
	ACOV0	0	AC0 overflow flag is cleared.
	ACOV1	0	AC1 overflow flag is cleared.
	DP	0	All bits are cleared, data page 0 is selected.
ST1_55	BRAF	0	This flag is cleared.
	CPL	0	The DP (rather than SP) direct addressing mode is selected. Direct accesses to data space are made relative to the data page register (DP).
	XF	1	External flag is set.
	HM	0	When an active $\overline{\text{HOLD}}$ signal forces the DSP to place its external interface in the high-impedance state, the DSP continues executing code from internal memory.
	INTM	1	Maskable interrupts are globally disabled.
	M40	0	32-bit (rather than 40-bit) computation mode is selected for the D unit.
	SATD	0	CPU will not saturate overflow results in the D unit.
	SXMD	1	Sign-extension mode is on.
	C16	0	Dual 16-bit mode is off. For an instruction that is affected by C16, the D-unit ALU performs one 32-bit operation rather than two parallel 16-bit operations.
	FRCT	0	Results of multiply operations are not shifted.
	C54CM	1	TMS320C54x-compatibility mode is on.
	ASM	0	Instructions affected by ASM will use a shift count of 0 (no shift).

Table 5−6. Effects of a Software Reset on DSP Registers (Continued)

Register	Bit	Reset Value	Comment
ST2_55	ARMS	0	When you use the AR indirect addressing mode, the DSP mode (rather than control mode) operands are available.
	DBGM	1	Debug events are disabled.
	EALLOW	0	A program cannot write to the non-CPU emulation registers.
	RDM	0	When an instruction specifies that an operand should be rounded, the CPU uses rounding to the infinite (rather than rounding to the nearest).
	CDPLC	0	CDP is used for linear addressing (rather than circular addressing).
	AR7LC	0	AR7 is used for linear addressing.
	AR6LC	0	AR6 is used for linear addressing.
	AR5LC	0	AR5 is used for linear addressing.
	AR4LC	0	AR4 is used for linear addressing.
	AR3LC	0	AR3 is used for linear addressing.
	AR2LC	0	AR2 is used for linear addressing.
	AR1LC	0	AR1 is used for linear addressing.
	AR0LC	0	AR0 is used for linear addressing.

RET *Return Unconditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RET**	Yes	2	5	D

Opcode

0100 100E	xxxx x100

Operands none

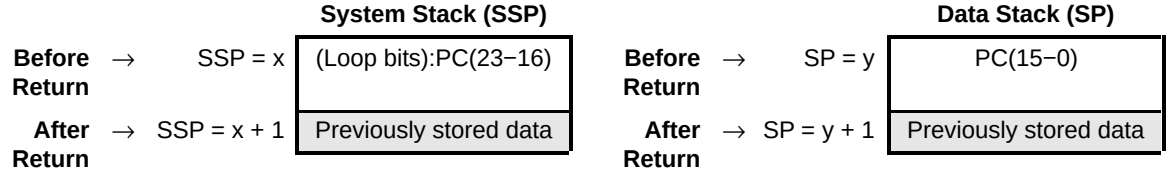
Description This instruction passes control back to the calling subroutine.

After returning from a called subroutine, the CPU restores the value of two internal registers: the program counter (PC) and a loop context register. The CPU uses these values to re-establish the context of the program sequence.

In the slow-return process (default), the return address (from the PC) and the loop context bits are restored from the stacks (in memory). When the CPU returns from a subroutine, the speed at which these values are restored is dependent on the speed of the memory accesses.

In the fast-return process, the return address (from the PC) and the loop context bits are restored from the return address register (RETA) and the control-flow context register (CFCT). You can read from or write to RETA and CFCT as a pair with dedicated, 32-bit load and store instructions. For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

- The loop context bits concatenated with the 8 MSBs of the return address are popped from the top of the system stack pointer (SSP). The SSP is incremented by 1 word in the address phase of the pipeline.
- The 16 LSBs of the return address are popped from the top of the data stack pointer (SP). The SP is incremented by 1 word in the address phase of the pipeline.



Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

RETCC *Return Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles†	Pipeline
[1]	**RETCC** cond	Yes	3	5/5	R

† x/y cycles: x cycles = condition true, y cycles = condition false

Opcode

0000 001E	xCCC CCCC	xxxx xxxx

Operands cond

Description This instructions evaluates a single condition defined by the cond field in the read phase of the pipeline. If the condition is true, a return occurs to the return address of the calling subroutine. There is a 1-cycle latency on the condition setting. A single condition can be tested as determined by the cond field of the instruction. See Table 1−3 for a list of conditions.

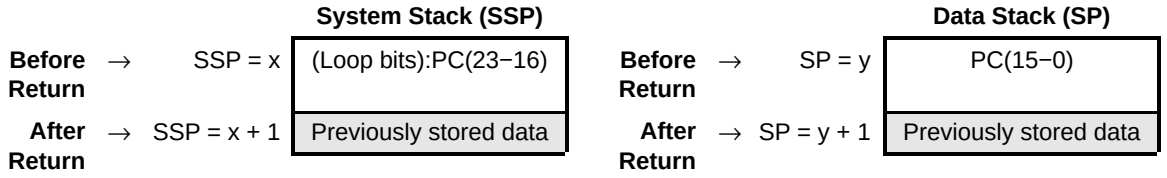
After returning from a called subroutine, the CPU restores the value of two internal registers: the program counter (PC) and a loop context register. The CPU uses these values to re-establish the context of the program sequence.

In the slow-return process (default), the return address (from the PC) and the loop context bits are restored from the stacks (in memory). When the CPU returns from a subroutine, the speed at which these values are restored is dependent on the speed of the memory accesses.

In the fast-return process, the return address (from the PC) and the loop context bits are restored from the return address register (RETA) and the control-flow context register (CFCT). You can read from or write to RETA and CFCT as a pair with dedicated, 32-bit load and store instructions. For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

When a return from a subroutine occurs:

- The loop context bits concatenated with the 8 MSBs of the return address are popped from the top of the system stack pointer (SSP). The SSP is incremented by 1 word in the read phase of the pipeline.
- The 16 LSBs of the return address are popped from the top of the data stack pointer (SP). The SP is incremented by 1 word in the read phase of the pipeline.



Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the comparison of accumulators to 0 is performed as if M40 was set to 1.

Status Bits

Affected by ACOVx, CARRY, C54CM, M40, TCx

Affects ACOVx

Repeat

Example

Syntax	Description
RETCC ACOV0 = #0	The AC0 overflow bit is equal to 0, the program counter (PC) is loaded with the return address of the calling subroutine.

```
Before                    After
ACOV0          0          ACOV0                0
PC                        PC          (return address)
SP                        SP
```

RETI *Return from Interrupt*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RETI**	No	2	5	D

Opcode

0100 100E	xxxx x101

Operands none

Description This instruction passes control back to the interrupted task.

After returning from an interrupt service routine (ISR), the CPU automatically restores the value of some CPU registers and two internal registers: the program counter (PC) and a loop context register. The CPU uses these values to re-establish the context of the program sequence.

In the slow-return process (default), the return address (from the PC), the loop context bits, and some CPU registers are restored from the stacks (in memory). When the CPU returns from an ISR, the speed at which these values are restored is dependent on the speed of the memory accesses.

In the fast-return process, the return address (from the PC) and the loop context bits are restored from the return address register (RETA) and the control-flow context register (CFCT). You can read from or write to RETA and CFCT as a pair with dedicated, 32-bit load and store instructions. Some CPU registers are restored from the stacks (in memory). For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

- The loop context bits concatenated with the 8 MSBs of the return address are popped from the top of the system stack pointer (SSP). The SSP is incremented by 1 word in the address phase of the pipeline.
- The 16 LSBs of the return address are popped from the top of the data stack pointer (SP). The SP is incremented by 1 word in the address phase of the pipeline.
- The debug status register (DBSTAT) content is popped from the top of SSP. The SSP is incremented by 1 word in the access phase of the pipeline.
- The status register 1 (ST1_55) content is popped from the top of SP. The SP is incremented by 1 word in the access phase of the pipeline.
- The 7 higher bits of status register 0 (ST0_55) concatenated with 9 zeroes are popped from the top of SSP. The SSP is incremented by 1 word in the read phase of the pipeline.

- ❏ The status register 2 (ST2_55) content is popped from the top of SP. The SP is incremented by 1 word in the read phase of the pipeline.

Example

Syntax	Description
RETI	The program counter (PC) is loaded with the return address of the interrupted task.

ROL *Rotate Left Accumulator, Auxiliary, or Temporary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
	ROL BitOut, src, BitIn, dst				
[1]	**ROL TC2,** src, **TC2,** dst	Yes	3	1	X
[2]	**ROL TC2,** src, **CARRY,** dst	Yes	3	1	X
[3]	**ROL CARRY,** src, **TC2,** dst	Yes	3	1	X
[4]	**ROL CARRY,** src, **CARRY,** dst	Yes	3	1	X

Opcode

0001 001E	FSSS xx11	FDDD 0xvv

Operands dst, src

Description This instruction performs a bitwise rotation to the MSBs. Both TC2 and CARRY can be used to shift in one bit (BitIn) or to store the shifted out bit (BitOut). The one bit in BitIn is shifted into the source (src) operand and the shifted out bit is stored to BitOut.

- When the destination (dst) operand is an accumulator:
  - if an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the register are zero extended to 40 bits
  - the operation is performed on 40 bits in the D-unit shifter
  - BitIn is inserted at bit position 0
  - BitOut is extracted at a bit position according to M40
- When the destination (dst) operand is an auxiliary or temporary register:
  - if an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation
  - the operation is performed on 16 bits in the A-unit ALU
  - BitIn is inserted at bit position 0
  - BitOut is extracted at bit position 15

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by CARRY, M40, TC2

Affects CARRY, TC2

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- ROR (Rotate Right Accumulator, Auxiliary, or Temporary Register Content)

Example

Syntax	Description
ROL CARRY, AC1, TC2, AC1	The value of TC2 (1) before the execution of the instruction is shifted into the LSB of AC1 and bit 31 shifted out from AC1 is stored in the CARRY status bit. The rotated value is stored in AC1. Because M40 = 0, the guard bits (39−32) are cleared.

```
Before                          After
AC1           0F E340 5678      AC1           00 C680 ACF1
TC2                      1      TC2                      1
CARRY                    1      CARRY                    1
M40                      0      M40                      0
```

ROR *Rotate Right Accumulator, Auxiliary, or Temporary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
	ROR BitIn, src, BitOut, dst				
[1]	**ROR TC2,** src, **TC2,** dst	Yes	3	1	X
[2]	**ROR TC2,** src, **CARRY,** dst	Yes	3	1	X
[3]	**ROR CARRY,** src, **TC2,** dst	Yes	3	1	X
[4]	**ROR CARRY,** src, **CARRY,** dst	Yes	3	1	X

Opcode

0001 001E	FSSS xx11	FDDD 1xvv

Operands dst, src

Description This instruction performs a bitwise rotation to the LSBs. Both TC2 and CARRY can be used to shift in one bit (BitIn) or to store the shifted out bit (BitOut). The one bit in BitIn is shifted into the source (src) operand and the shifted out bit is stored to BitOut.

- When the destination (dst) operand is an accumulator:
  - if an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the register are zero extended to 40 bits
  - the operation is performed on 40 bits in the D-unit shifter
  - BitIn is inserted at a bit position according to M40
  - BitOut is extracted at bit position 0
- When the destination (dst) operand is an auxiliary or temporary register:
  - if an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation
  - the operation is performed on 16 bits in the A-unit ALU
  - BitIn is inserted at bit position 15
  - BitOut is extracted at bit position 0

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by CARRY, M40, TC2

Affects CARRY, TC2

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- ROL (Rotate Left Accumulator, Auxiliary, or Temporary Register Content)

Example

Syntax	Description
ROR TC2, AC0, TC2, AC1	The value of TC2 (1) before the execution of the instruction is shifted into bit 31 of AC0 and the LSB shifted out from AC0 is stored in TC2. The rotated value is stored in AC1. Because M40 = 0, the guard bits (39−32) are cleared.

```
Before                          After
AC0          5F B000 1234       AC0          5F B000 1234
AC1          00 C680 ACF1       AC1          00 D800 091A
TC2                     1       TC2                     0
M40                     0       M40                     0
```

ROUND *Round Accumulator Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**ROUND** [ACx,] ACy	Yes	2	1	X

Opcode

0101 010E	DDSS 101%

Operands ACx, ACy

Description This instruction performs a rounding of the source accumulator ACx in the D-unit:

```
ACy = rnd(ACx)
```

- The rounding operation depends on RDM:
  - When RDM = 0, the biased rounding to the infinite is performed. 8000h (2^{15}) is added to the 40-bit source accumulator ACx.
  - When RDM = 1, the unbiased rounding to the nearest is performed. According to the value of the 17 LSBs of the 40-bit source accumulator ACx, 8000h (2^{15}) is added:

```
if( 8000h < bit(15-0) < 10000h)
   add 8000h to the 40-bit source accumulator ACx
else if( bit(15-0) == 8000h)
   if( bit(16) == 1)
   add 8000h to the 40-bit source accumulator ACx
```

    If a rounding has been performed, the 16 lowest bits of the result are cleared to 0.
- Addition overflow detection depends on M40.
- No addition carry report is stored in CARRY status bit.
- If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, the rounding is performed without clearing the LSBs of accumulator ACx.

Status Bits Affected by C54CM, M40, RDM, SATD

Affects ACOVy

Repeat This instruction cannot be repeated.

Example

Syntax	Description
ROUND AC0, AC1	The content of AC0 is added to 8000h, the 16 LSBs are cleared to 0, and the result is stored in AC1. M40 is cleared to 0, so overflow is detected at bit 31; SATD is cleared to 0, so AC1 is not saturated.

Before		**After**	
AC0	EF 0FF0 8023	AC0	EF 0FF0 8023
AC1	00 0000 0000	AC1	EF 0FF1 0000
RDM	1	RDM	1
M40	0	M40	0
SATD	0	SATD	0
ACOV1	0	ACOV1	1

RPT *Repeat Single Instruction Unconditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RPT** k8	Yes	2	1	AD
[2]	**RPT** k16	Yes	3	1	AD
[3]	**RPT CSR**	Yes	2	1	AD

Description

This instruction repeats the next instruction or the next two paralleled instructions the number of times specified by the content of the computed single repeat register (CSR) + 1 or an immediate value, kx + 1. This value is loaded into the repeat counter register (RPTC). The maximum number of executions of a given instruction or paralleled instructions is 2^{16} –1 (65535).

The repeat single mechanism triggered by these instructions is interruptible.

These instructions cannot be repeated.

These instructions cannot be used as the last instruction in a repeat loop structure.

Two paralleled instructions can be repeated when following the parallelism general rules.

See section 1.5 for a list of instructions that cannot be used in a repeat single mechanism.

Opcode

k8	0100 110E	kkkk kkkk	
k16	0000 110E	kkkk kkkk	kkkk kkkk

Operands kx

Description This instruction repeats the next instruction or the next two paralleled instructions the number of times specified by an immediate value, kx + 1. The repeat counter register (RPTC):

- ❏ Is loaded with the immediate value in the address phase of the pipeline.
- ❏ Is decremented by 1 in the decode phase of the repeated instruction.
- ❏ Contains 0 at the end of the repeat single mechanism.
- ❏ Must not be accessed when it is being decremented in the repeat single mechanism.

The repeat single mechanism triggered by this instruction is interruptible.

Two paralleled instructions can be repeated when following the parallelism general rules.

This instruction cannot be used as the last instruction in a repeat loop structure.

See section 1.5 for a list of instructions that cannot be used in a repeat single mechanism.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

Example 1

Syntax	Description
RPT #3 MACM *AR3+, *AR4+, AC1	The single instruction following the repeat instruction is repeated four times.

Before		**After**	
AC1	00 0000 0000	AC1	00 3376 AD10
AR3	0200	AR3	0204

RPTADD *Repeat Single Instruction Unconditionally and Increment CSR*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RPTADD CSR,** TAx	Yes	2	1	X
[2]	**RPTADD CSR,** k4	Yes	2	1	X

Description

These instructions repeat the next instruction or the next two paralleled instructions the number of times specified by the content of the computed single repeat register (CSR) + 1. This value is loaded into the repeat counter register (RPTC). The maximum number of executions of a given instruction or paralleled instructions is 2^{16} –1 (65535).

With the A-unit ALU, these instructions allow the content of CSR to be incremented. The CSR modification is performed in the execute phase of the pipeline; there is a 3-cycle latency between the CSR modification and its usage in the address phase.

The repeat single mechanism triggered by these instructions is interruptible.

Two paralleled instructions can be repeated when following the parallelism general rules.

These instructions cannot be repeated.

These instructions cannot be used as the last instruction in a repeat loop structure.

See section 1.5 for a list of instructions that cannot be used in a repeat single mechanism.

Status Bits

Affected by none

Affects none

See Also

See the following other related instructions:

Repeat Single Instruction Unconditionally and Increment CSR

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RPTADD CSR,** TAx	Yes	2	1	X

Opcode

0100 100E	FSSS x001

Operands TAx

Description This instruction repeats the next instruction or the next two paralleled instructions the number of times specified by the content of the computed single repeat register (CSR) + 1. The repeat counter register (RPTC):

- ❏ Is loaded with CSR content in the address phase of the pipeline.
- ❏ Is decremented by 1 in the decode phase of the repeated instruction.
- ❏ Contains 0 at the end of the repeat single mechanism.
- ❏ Must not be accessed when it is being decremented in the repeat single mechanism.

With the A-unit ALU, this instruction allows the content of CSR to be incremented by the content of TAx. The CSR modification is performed in the execute phase of the pipeline; there is a 3-cycle latency between the CSR modification and its usage in the address phase.

The repeat single mechanism triggered by this instruction is interruptible.

Two paralleled instructions can be repeated when following the parallelism general rules.

This instruction cannot be used as the last instruction in a repeat loop structure.

See section 1.5 for a list of instructions that cannot be used in a repeat single mechanism.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

Example

Syntax	Description
RPTADD CSR, T1	A single instruction is repeated as defined by the content of CSR + 1. The content of CSR is incremented by the content of temporary register T1.

Repeat Single Instruction Unconditionally and Increment CSR

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**RPTADD CSR,** k4	Yes	2	1	X

Opcode

0100 100E	kkkk x010

Operands k4

Description This instruction repeats the next instruction or the next two paralleled instructions the number of times specified by the content of the computed single repeat register (CSR) + 1. The repeat counter register (RPTC):

- ❏ Is loaded with CSR content in the address phase of the pipeline.
- ❏ Is decremented by 1 in the decode phase of the repeated instruction.
- ❏ Contains 0 at the end of the repeat single mechanism.
- ❏ Must not be accessed when it is being decremented in the repeat single mechanism.

With the A-unit ALU, this instruction allows the content of CSR to be incremented by k4. The CSR modification is performed in the execute phase of the pipeline; there is a 3-cycle latency between the CSR modification and its usage in the address phase.

The repeat single mechanism triggered by this instruction is interruptible.

Two paralleled instructions can be repeated when following the parallelism general rules.

This instruction cannot be used as the last instruction in a repeat loop structure.

See section 1.5 for a list of instructions that cannot be used in a repeat single mechanism.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

Example

Syntax	Description
RPTADD CSR, #2	A single instruction is repeated as defined by the content of CSR + 1. The content of CSR is incremented by the unsigned 4-bit value (2).

RPTB *Repeat Block of Instructions Unconditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RPTBLOCAL** pmad	Yes	2	1	AD
[2]	**RPTB** pmad	Yes	3	1	AD

Description

These instructions repeat a block of instructions the number of times specified by:

- The content of BRC0 + 1, if no loop has already been detected.
- The content of BRS1 + 1, if one level of the loop has already been detected.

Loop structures defined by these instructions must have the following characteristics:

- The minimum number of instructions executed within one loop iteration is 2.
- The minimum number of cycles executed within one loop iteration is 2.
- Since the result of updating BRCx (and BRAF in C54CM = 1) within 3 instruction cycles from the end of the loop is uncertain (effective in the same iteration or the next iteration depending on the pipeline state), this operation is prohibited.
- The block-repeat operation can only be cleared by branching to a destination address outside the active block-repeat loop.
- C54CM bit in ST1_55 cannot be modified within a block-repeat loop.

These instructions cannot be repeated.

See section 1.5 for a list of instructions that cannot be used in a repeat block mechanism.

Status Bits

Affected by none

Affects none

See Also

See the following other related instructions:

- RPT (Repeat Single Instruction Unconditionally)
- RPTADD (Repeat Single Instruction Unconditionally and Increment CSR)
- RPTCC (Repeat Single Instruction Conditionally)
- RPTSUB (Repeat Single Instruction Unconditionally and Decrement CSR)

Repeat Block of Instructions Unconditionally

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RPTBLOCAL** pmad	Yes	2	1	AD

Opcode

0100 101E	1111 1111

Operands pmad

Description This instruction repeats a block of instructions the number of times specified by:

- the content of BRC0 + 1, if no loop has already been detected. In this case:
  - In the address phase of the pipeline, RSA0 is loaded with the program address of the first instruction of the loop.
  - The program address (pmad) of the last instruction of the loop (that may be two parallel instructions) is computed in the address phase of the pipeline and stored in REA0.
  - BRC0 is decremented at the address phase of the last instruction of the loop when its content is not equal to 0.
  - BRC0 contains 0 after the block-repeat operation has ended.
- the content of BRS1 + 1, if one level of the loop has already been detected. In this case:
  - BRC1 is loaded with the content of BRS1 in the address phase of the repeat block instruction.
  - In the address phase of the pipeline, RSA1 is loaded with the program address of the first instruction of the loop.
  - The program address of the last instruction of the loop (that may be two parallel instructions) is computed in the address phase of the pipeline and stored in REA1.
  - BRC1 is decremented at the address phase of the last instruction of the loop when its content is not equal to 0.
  - BRC1 contains 0 after the block-repeat operation has ended.
  - BRS1 content is not impacted by the block-repeat operation.

Loop structures defined by this instruction must have the following characteristics:

- The minimum number of instructions executed within one loop iteration is 2.
- The minimum number of cycles executed within one loop iteration is 2.
- The maximum loop size is 128 bytes.
- Since the result of updating BRCx (and BRAF in C54CM = 1) within 3 instruction cycles from the end of the loop is uncertain (effective in the same iteration or the next iteration depending on the pipeline state), this operation is prohibited.
- C54CM bit in ST1_55 cannot be modified within a block-repeat loop.
- The following instructions cannot be used as the last instruction in the loop structure:

RPT	RPTCC	RPTADD
RPTSUB	XCC	XCCPART

Note:

Instructions if (cond) execute (AD_Unit), or if (cond) execute (D_Unit) must be replaced with their mnemonic ID: XCC and XCCPART as the last instruction in the loop structure if the instruction is executed with the instruction with which it is paralleled (if (cond) execute (AD_Unit) || instruction_executes conditionally)

A local loop is defined as when all the code of the loop is repeatedly executed from within the instruction buffer queue (IBQ):

- All the code of the local loop must fit within the 128-byte, 4-byte-aligned IBQ; therefore, local repeat blocks are limited to 128 bytes minus the 0 to 3 bytes of first-instruction misalignment. The 128th byte of the IBQ can only occur in a paralleled instruction. See Figure 5−4 for legal uses of the RPTBLOCAL instruction.
- The following instructions cannot be used in any form in a local loop code:

BCC	CALL	IDLE
INTR	RESET	RET
RPTB	TRAP	

- Nested local repeat block (RPTBLOCAL) instructions are allowed.

- The only branch instructions allowed in a RPTBLOCAL structure are the branch instructions with a target branch address pointing to an instruction included within the loop code and being at a higher address than the branching instruction. In this case, the branch conditionally (BCC) instruction is executed in 3 cycles and the condition is evaluated in the address phase of the pipeline (there is a 3-cycle latency on the condition setting).

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1:

- This instruction only uses block-repeat level 0; block-repeat level 1 is disabled.
- The block-repeat active flag (BRAF) is set to 1. BRAF is cleared to 0 at the end of the block-repeat operation when BRC0 contains 0.
- You can stop an active block-repeat operation by clearing BRAF to 0.
- Block-repeat control registers for level 1 are not used. Nested block-repeat operations are supported using the C54x convention with context save/restore and BRAF. When an interrupt is acknowledged, unlike the C54x device, BRAF is captured into the control-flow context register (CFCT), and saved to the stack. You can use a block/local loop instruction in an interrupt without preserving BRAF (while preserving BRC0, RSA0, and REA0).
- BRAF is automatically cleared to 0 when a far branch (FB) or far call (FCALL) instruction is executed.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

Example

Syntax	Description
RPTBLOCAL	A block of instructions is repeated as defined by the content of BRC0 + 1.

	Address	BRC0	RSA0	REA0	BRS1
MOV #3, BRC0		0003	0000	0000	0000
RPTBLOCAL {	004003	?*	4005	400D	?
… …	004005	?	?	?	?
… …	00400D	DTZ**	?	?	?
}		0000	4005	400D	0000

*?: Unchanged
**DTZ: Decrease till zero

Figure 5−4. Legal Uses of Repeat Block of Instructions Unconditionally (RPTBLOCAL) Instruction

(a) 128-Byte Unaligned Loop—Legal Use

```
        … …                          ; no alignment directive
RPTBLOCAL {
              1st instruction
        … …                          } 128-byte loop body
              Last instruction
          }
 next instruction
        … …
```

The entire local repeat block and the *next instruction* reside in the IBQ, this code is accepted by the assembler.

(b) 129-Byte Unaligned Loop with Single Instruction at End of Loop—Illegal Use

```
        … …                          ; no alignment directive
RPTBLOCAL {
              1st instruction
        … …                          } 129-byte loop body
              Last instruction
              (nonparalleled = single)
          }
 next instruction
        … …
```

The RPTBLOCAL instruction is not aligned; the *next instruction* may not be fetched in the IBQ. Because the last instruction of the local repeat block is a nonparalleled (single) instruction, the CPU must confirm that the *next instruction* does not have a parallel enable bit; therefore, this code is rejected by the assembler.

Figure 5−4. Legal Uses of Repeat Block of Instructions Unconditionally (RPTBLOCAL) Instruction (Continued)

(c) 129-Byte Unaligned Loop with Paralleled Instruction at End of Loop—Legal Use

```
… …                                 ; no alignment directive
RPTBLOCAL {
        1st instruction
… …                                 } 129-byte loop body
        Last instruction (paralleled)
    }
next instruction
… …
```

The RPTBLOCAL instruction is not aligned; the *next instruction* may not be fetched in the IBQ. Because the last instruction of the local repeat block is a paralleled instruction, the CPU does not need to confirm that the *next instruction* does not have a parallel enable bit; therefore, this code is accepted by the assembler.

(d) 129-Byte Aligned Loop with Single Instruction at End of Loop—Legal Use

```
align 4                             ; alignment directive
RPTBLOCAL {
        1st instruction
… …                                 } 129-byte loop body
        Last instruction
        (nonparalleled = single)
    }
next instruction
… …
```

The RPTBLOCAL instruction is aligned, so the entire local repeat block and the *next instruction* reside in the IBQ. Because the *next instruction* is in the IBQ, the CPU can confirm that the *next instruction* does not have a parallel enable bit; therefore, this code is accepted by the assembler.

Figure 5−4. Legal Uses of Repeat Block of Instructions Unconditionally (RPTBLOCAL) Instruction (Continued)

(e) 130-Byte Unaligned Loop—Illegal Use

```
… …                                  ; no alignment directive
RPTBLOCAL {
                1st instruction
… …                                  } 130-byte loop body
                Last instruction
        }
next instruction
… …
```

The RPTBLOCAL instruction is not aligned; the entire local repeat block may not reside in the IBQ. Because the last instruction of the local repeat block may not reside in the IBQ, this code is rejected by the assembler.

(f) 130-Byte Aligned Loop with Single Instruction at End of Loop—Legal Use

```
align 4                              ; alignment directive
NOP_16||NOP                          ; 3-byte instruction
RPTBLOCAL {
                1st instruction
… …                                  } 130-byte loop body
                Last instruction
                (nonparalleled = single)
        }
next instruction
… …
```

The NOP instructions are aligned so the RPTBLOCAL instruction, the entire local repeat block, and the *next instruction* reside in the IBQ. Because the *next instruction* is in the IBQ, the CPU can confirm that the *next instruction* does not have a parallel enable bit; therefore, this code is accepted by the assembler.

Figure 5−4. Legal Uses of Repeat Block of Instructions Unconditionally (RPTBLOCAL) Instruction (Continued)

(g) 132-Byte Aligned Loop with Paralleled Instruction at End of Loop—Legal Use

```
        align 4                          ; alignment directive
        NOP_16                           ; 2-byte instruction
RPTBLOCAL {
                 1st instruction
        … …                              } 132-byte loop body
                 Last instruction (paralleled)
          }
next instruction
        … …
```

The NOP instruction is aligned, so the RPTBLOCAL instruction and the entire local repeat block reside in the IBQ; the *next instruction* is not fetched in the IBQ. Because the last instruction of the local repeat block is a paralleled instruction, the CPU does not need to confirm that the *next instruction* does not have a parallel enable bit; therefore, this code is accepted by the assembler.

Repeat Block of Instructions Unconditionally

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**RPTB** pmad	Yes	3	1	AD

Opcode

0000 111E	llll llll	llll llll

Operands pmad

Description This instruction repeats a block of instructions the number of times specified by:

- the content of BRC0 + 1, if no loop has already been detected. In this case:
  - In the address phase of the pipeline, RSA0 is loaded with the program address of the first instruction of the loop.
  - The program address (pmad) of the last instruction of the loop (that may be two parallel instructions) is computed in the address phase of the pipeline and stored in REA0.
  - BRC0 is decremented at the address phase of the last instruction of the loop when its content is not equal to 0.
  - BRC0 contains 0 after the block-repeat operation has ended.
- the content of BRS1 + 1, if one level of the loop has already been detected. In this case:
  - BRC1 is loaded with the content of BRS1 in the address phase of the repeat block instruction.
  - In the address phase of the pipeline, RSA1 is loaded with the program address of the first instruction of the loop.
  - The program address of the last instruction of the loop (that may be two parallel instructions) is computed in the address phase of the pipeline and stored in REA1.
  - BRC1 is decremented at the address phase of the last instruction of the loop when its content is not equal to 0.
  - BRC1 contains 0 after the block-repeat operation has ended.
  - BRS1 content is not impacted by the block-repeat operation.

Loop structures defined by these instructions must have the following characteristics:

- The minimum number of instructions executed within one loop iteration is 2.
- The minimum number of cycles executed within one loop iteration is 2.
- The maximum loop size is 64 Kbytes.
- The block-repeat operation can only be cleared by branching to a destination address outside the active block-repeat loop.
- Since the result of updating BRCx (and BRAF in C54CM = 1) within 3 instruction cycles from the end of the loop is uncertain (effective in the same iteration or the next iteration depending on the pipeline state), this operation is prohibited.
- C54CM bit in ST1_55 cannot be modified within a block-repeat loop.
- The following instructions cannot be used as the last instruction in the loop structure:

  RPT RPTCC RPTADD

  RPTSUB XCC

- See section 1.5 for a list of instructions that cannot be used in the block-repeat loop code.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1:

- This instruction only uses block-repeat level 0; block-repeat level 1 is disabled.
- The block-repeat active flag (BRAF) is set to 1. BRAF is cleared to 0 at the end of the block-repeat operation when BRC0 contains 0.
- You can stop an active block-repeat operation by clearing BRAF to 0.
- Block-repeat control registers for level 1 are not used. Nested block-repeat operations are supported using the C54x convention with context save/restore and BRAF. The control-flow context register (CFCT) values are not used.
- BRAF is automatically cleared to 0 when a far branch (FB) or far call (FCALL) instruction is executed.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

Example

Syntax	Description
RPTB	A block of instructions is repeated as defined by the content of BRC0 + 1. A second loop of instructions is repeated as defined by the content of BRS1 + 1 (BRC1 is loaded with the content of BRS1).

	Address	BRC0	RSA0	REA0	BRS1	BRC1	RSA1	REA1
MOV #3, BRC0		0003	0000	0000	0000	0000	0000	0000
MOV #1, BRC1		?*	?	?	0001	0001	?	?
RPTB {	004006	?	4009	4017	?	?	?	?
… …	004009	?	?	?	?	?	?	?
RPTBLOCAL {	00400B	?	?	?	?	(BRS1)	400D	4015
… …	00400D	?	?	?	?	?	?	?
… …	004015	?	?	?	?	DTZ**	?	?
}								
… …	004017	DTZ**	?	?	?	?	?	?
}		0000	4009	4017	0001	0000	400D	4015

*?: Unchanged
**DTZ: Decrease till zero

RPTCC *Repeat Single Instruction Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RPTCC** k8, cond	Yes	3	1	AD

Opcode

0000 000E	xCCC CCCC	kkkk kkkk

Operands cond, k8

Description This instruction evaluates a single condition defined by the cond field and as long as the condition is true, the next instruction or the next two paralleled instructions is repeated the number of times specified by an 8-bit immediate value, k8 + 1. The maximum number of executions of a given instruction or paralleled instructions is 2^8 –1 (255). See Table 1−3 for a list of conditions.

The 8 LSBs of the repeat counter register (RPTC):

- Are loaded with the immediate value at the address phase of the pipeline.
- Are decremented by 1 in the decode phase of the repeated instruction.

The 8 MSBs of RPTC:

- Are loaded with the cond code at the address phase of the pipeline.
- Are untouched during the instruction execution.

At each step of the iteration, the condition defined by the cond field is tested in the execute phase of the pipeline. When the condition becomes false, the instruction repetition stops.

- If the condition becomes false at any execution of the repeated instruction, the 8 LSBs of RPTC are corrected to indicate exactly how many iterations were not performed.
- Since the condition is evaluated in the execute phase of the repeated instruction, when the condition is tested false, some of the succeeding iterations of that repeated instruction may have gone through the address, access, and read phases of the pipeline. Therefore, they may have modified the pointer registers used in the DAGEN units to generate data memory operands addresses in the address phase.

  When the instruction structure is exited, reading the computed single-repeat register (CSR) content enables you to determine how many instructions have gone through the address phase of the pipeline. You may then use the Repeat Single Instruction Unconditionally instruction [3] to rewind the pointer registers. Note that this must only be performed when a false condition has been met inside the instruction structure.

- The following table provides the 8 LSBs of RPTC and CSR once the instruction structure is exited.

If the condition is not met	RPTC[7:0] content after exiting loop	CSR content after exiting loop
At 1st iteration	RPTCinit + 1	4
At 2nd iteration	RPTCinit	4
At 3rd iteration	RPTC – 1	4
…	…	…
At RPTCinit – 2 iteration	4	3
At RPTCinit – 1 iteration	3	2
At RPTCinit iteration	2	1
At RPTCinit + 1 iteration	1	0
Never	0	0

RPTCinit is the number of requested iterations minus 1.

The repeat single mechanism triggered by this instruction is interruptible. Saving and restoring the RPTC content in ISRs enables you to preserve the instruction structure context.

Instead of programming a number of iterations (minus 1) equal to 0, it is recommended that you use the conditional execute() structure.

This instruction cannot be used as the last or the second to last instruction in a repeat loop structure.

See section 1.5 for a list of instructions that cannot be used in a repeat single mechanism.

In addition, any store−to−memory instruction including push instructions cannot be used in a conditional repeat single mechanism.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the comparison of accumulators to 0 is performed as if M40 was set to 1.

Status Bits

Affected by ACOVx, CARRY, C54CM, M40, TCx

Affects ACOVx

Repeat

This instruction cannot be repeated.

See Also

See the following other related instructions:

- ❏ RPT (Repeat Single Instruction Unconditionally)
- ❏ RPTADD (Repeat Single Instruction Unconditionally and Increment CSR)
- ❏ RPTB (Repeat Block of Instructions Unconditionally)
- ❏ RPTSUB (Repeat Single Instruction Unconditionally and Decrement CSR)

Example

Syntax	Description
RPTCC #7, AC1 > #0	As long as the content of AC1 is greater than 0 and the repeat counter is not equal to 0, the next single instruction is repeated as defined by the unsigned 8-bit value (7) + 1. At the address phase of the pipeline, RPTC is automatically initialized to 4107h and then is immediately decreased to 4106h.

```
RPTCC #7, AC1 > #0          address:  004004
                                      004008

... ...                               00400B
```

Before		After	
AC1	00 2359 0340	AC1	00 1FC2 7B40
T0	0340	T0	0340
*AR1	2354	*AR1	2354
RPTC	4106*	RPTC	0000

* At the address phase of the pipeline, RPTC is automatically initialized to 4107h and then is immediately decreased to 4106h.

RPTSUB *Repeat Single Instruction Unconditionally and Decrement CSR*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**RPTSUB CSR,** k4	Yes	2	1	X

Opcode

0100 100E	kkkk x011

Operands k4

Description This instruction repeats the next instruction or the next two paralleled instructions the number of times specified by the content of the computed single repeat register (CSR) + 1. The repeat counter register (RPTC):

- ❏ Is loaded with CSR content in the address phase of the pipeline.
- ❏ Is decremented by 1 in the decode phase of the repeated instruction.
- ❏ Contains 0 at the end of the repeat single mechanism.
- ❏ Must not be accessed when it is being decremented in the repeat single mechanism.

With the A-unit ALU, this instruction allows the content of CSR to be decremented by k4. The CSR modification is performed in the execute phase of the pipeline; there is a 3-cycle latency between the CSR modification and its usage in the address phase.

The repeat single mechanism triggered by this instruction is interruptible.

Two paralleled instructions can be repeated when following the parallelism general rules.

This instruction cannot be used as the last instruction in a repeat loop structure.

See section 1.5 for a list of instructions that cannot be used in a repeat single mechanism.

Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

See Also

See the following other related instructions:

- RPT (Repeat Single Instruction Unconditionally)
- RPTADD (Repeat Single Instruction Unconditionally and Increment CSR)
- RPTB (Repeat Block of Instructions Unconditionally)
- RPTCC (Repeat Single Instruction Conditionally)

Example

Syntax	Description
RPTSUB CSR, #2	A single instruction is repeated as defined by the content of CSR + 1. The content of CSR is decremented by the unsigned 4-bit value (2).

SAT *Saturate Accumulator Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SAT**[R] [ACx,] ACy	Yes	2	1	X

Opcode

0101 010E	DDSS 110%

Operands ACx, ACy

Description This instruction performs a saturation of the source accumulator ACx to the 32-bit width frame in the D-unit ALU.

- A rounding is performed if the optional R keyword is applied to the instruction. The rounding operation depends on RDM:
  - When RDM = 0, the biased rounding to the infinite is performed. 8000h (2^{15}) is added to the 40-bit source accumulator ACx.
  - When RDM = 1, the unbiased rounding to the nearest is performed. According to the value of the 17 LSBs of the 40-bit source accumulator ACx, 8000h (2^{15}) is added:

```
if( 8000h < bit(15-0) < 10000h)
   add 8000h to the 40-bit source accumulator ACx
else if( bit(15-0) == 8000h)
   if( bit(16) == 1)
   add 8000h to the 40-bit source accumulator ACx
```

    If a rounding has been performed, the 16 lowest bits of the result are cleared to 0.
- An overflow is detected at bit position 31.
- No addition carry report is stored in CARRY status bit.
- If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an overflow is detected, the destination register is saturated. Saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow).

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, the rounding is performed without clearing the LSBs of accumulator ACx.

Status Bits Affected by C54CM, RDM

Affects ACOVy

Repeat This instruction can be repeated.

Example 1

Syntax	Description
SAT AC0, AC1	The 32-bit width content of AC0 is saturated and the saturated value, FF 8000 0000, is stored in AC1.

Before		**After**	
AC0	EF 0FF0 8023	AC0	EF 0FF0 8023
AC1	00 0000 0000	AC1	FF 8000 0000
ACOV1	0	ACOV1	1

Example 2

Syntax	Description
SATR AC0, AC1	The 32-bit width content of AC0 is saturated. The saturated value, 00 7FFF FFFFh, is rounded, 16 LSBs are cleared, and stored in AC1.

Before		**After**	
AC0	00 7FFF 8000	AC0	00 7FFF 8000
AC1	00 0000 0000	AC1	00 7FFF 0000
RDM	0	RDM	0
ACOV1	0	ACOV1	1

SFTCC *Shift Accumulator Content Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTCC** ACx**, TC1**	Yes	2	1	X
[2]	**SFTCC** ACx**, TC2**	Yes	2	1	X

Opcode

TC1	0101 101E	DDxx	xx10
TC2	0101 101E	DDxx	xx11

Operands ACx, TCx

Description If the source accumulator ACx(39–0) is equal to 0, this instruction sets the TCx status bit to 1.

If the source accumulator ACx(31–0) has two sign bits:

- this instruction shifts left the 32-bit accumulator ACx by 1 bit
- the TCx status bit is cleared to 0

If the source accumulator ACx(31–0) does not have two sign bits, this instruction sets the TCx status bit to 1.

The sign bits are extracted at bit positions 31 and 30.

Status Bits Affected by none

Affects TCx

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- SFTL (Shift Accumulator Content Logically)
- SFTL (Shift Accumulator, Auxiliary, or Temporary Register Content Logically)
- SFTS (Signed Shift of Accumulator Content)
- SFTS (Signed Shift of Accumulator, Auxiliary, or Temporary Register Content)

Example 1

Syntax	Description
SFTCC AC0, TC1	Because AC0(31) XORed with AC0(30) equals 1, the content of AC0 is not shifted left and TC1 is set to 1.

```
Before                          After
AC0          FF 8765 0055       AC0          FF 8765 0055
TC1                     0       TC1                     1
```

Example 2

Syntax	Description
SFTCC AC0, TC2	Because AC0(31) XORed with AC0(30) equals 0, the content of AC0 is shifted left by 1 bit and TC2 is cleared to 0.

```
Before                          After
AC0          00 1234 0000       AC0          00 2468 0000
TC2                     0       TC2                     0
```

SFTL *Shift Accumulator Content Logically*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTL** ACx, Tx[, ACy]	Yes	2	1	X
[2]	**SFTL** ACx, #SHIFTW[, ACy]	Yes	3	1	X

Description These instructions perform an unsigned shift by an immediate value, SHIFTW, or the content of a temporary register (Tx) in the D-unit shifter.

Status Bits

Affected by C54CM, M40

Affects CARRY

See Also See the following other related instructions:

- SFTCC (Shift Accumulator Content Conditionally)
- SFTL (Shift Accumulator, Auxiliary, or Temporary Register Content Logically)
- SFTS (Signed Shift of Accumulator Content)
- SFTS (Signed Shift of Accumulator, Auxiliary, or Temporary Register Content)

Shift Accumulator Content Logically

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTL** ACx, Tx[, ACy]	Yes	2	1	X

Opcode

0101 110E	DDSS ss00

Operands ACx, ACy, Tx

Description This instruction shifts by the temporary register (Tx) content the accumulator (ACx) content and stores the shifted-out bit in the CARRY status bit. If the 16-bit value contained in Tx is out of the –32 to +31 range, the shift is saturated to –32 or +31 and the shift operation is performed with this value. However, no overflow is reported when such saturation occurs.

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ The shift operation is performed according to M40.
- ❏ The CARRY status bit contains the shifted-out bit. When the shift count is zero, Tx = 0, the CARRY status bit is cleared to 0.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, the 6 LSBs of Tx define the shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits Affected by C54CM, M40

Affects CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SFTL AC0, T0, AC1	The content of AC0 is logically shifted right by the content of T0 and the result is stored in AC1. There is a right shift because the content of T0 is negative (−6). Because M40 = 0, the guard bits (39−32) are cleared.

```
Before                          After
AC0          5F B000 1234       AC0          5F B000 1234
AC1          00 C680 ACF0       AC1          00 02C0 0048
T0                   FFFA       T0                   FFFA
M40                     0       M40                     0
```

Shift Accumulator Content Logically

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**SFTL** ACx, #SHIFTW[, ACy]	Yes	3	1	X

Opcode

0001 000E	DDSS 0111	xxSH IFTW

Operands ACx, ACy, SHIFTW

Description This instruction shifts by a 6-bit value, SHIFTW, the accumulator (ACx) content and stores the shifted-out bit in the CARRY status bit.

- The operation is performed on 40 bits in the D-unit shifter.
- The shift operation is performed according to M40.
- The CARRY status bit contains the shifted-out bit. When the shift count is zero, SHIFTW = 0, the CARRY status bit is cleared to 0.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40

Affects CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SFTL AC1, #31, AC0	The content of AC1 is logically shifted left by 31 bits and the result is stored in AC0.

SFTL *Shift Accumulator, Auxiliary, or Temporary Register Content Logically*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTL** dst**, #1**	Yes	2	1	X
[2]	**SFTL** dst**, #−1**	Yes	2	1	X

Description

These instructions perform an unsigned shift by 1 bit:

- In the D-unit shifter, if the destination operand is an accumulator (ACx).
- In the A-unit ALU, if the destination operand is an auxiliary or temporary register (TAx).

Status Bits

Affected by C54CM, M40

Affects CARRY

Shift Accumulator, Auxiliary, or Temporary Register Content Logically

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTL** dst**, #1**	Yes	2	1	X

Opcode | 0101 000E | FDDD x000

Operands dst

Description This instruction shifts left by 1 bit the input operand (dst). The CARRY status bit contains the shifted-out bit.

- When the destination operand (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit shifter.
  - 0 is inserted at bit position 0.
  - The shifted-out bit is extracted at a bit position according to M40.
- When the destination operand (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - 0 is inserted at bit position 0.
  - The shifted-out bit is extracted at bit position 15 and stored in the CARRY status bit.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40

Affects CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SFTL AC1, #1	The content of AC1 is logically shifted left by 1 bit and the result is stored in AC1. Because M40 = 0, the CARRY status bit is extracted at bit 31 and the guard bits (39−32) are cleared.

```
Before                          After
AC1          8F E340 5678       AC1          00 C680 ACF0
CARRY                   0       CARRY                   1
M40                     0       M40                     0
```

Shift Accumulator, Auxiliary, or Temporary Register Content Logically

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**SFTL** dst**, #−1**	Yes	2	1	X

Opcode

0101 000E	FDDD x001

Operands dst

Description This instruction shifts right by 1 bit the input operand (dst). The CARRY status bit contains the shifted-out bit.

- When the destination operand (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit shifter.
  - 0 is inserted at a bit position according to M40.
  - The shifted-out bit is extracted at bit position 0 and stored in the CARRY status bit.
- When the destination operand (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - 0 is inserted at bit position 15.
  - The shifted-out bit is extracted at bit position 0 and stored in the CARRY status bit.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40

Affects CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SFTL AC0, #−1	The content of AC0 is logically shifted right by 1 bit and the result is stored in AC0.

SFTS *Signed Shift of Accumulator Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTS** ACx, Tx[, ACy]	Yes	2	1	X
[2]	**SFTSC** ACx, Tx[, ACy]	Yes	2	1	X
[3]	**SFTS** ACx, #SHIFTW[, ACy]	Yes	3	1	X
[4]	**SFTSC** ACx, #SHIFTW[, ACy]	Yes	3	1	X

Description These instructions perform a signed shift by an immediate value, SHIFTW, or by the content of a temporary register (Tx) in the D-unit shifter.

Status Bits

Affected by C54CM, M40, SATA, SATD, SXMD

Affects ACOVx, ACOVy, CARRY

See Also See the following other related instructions:

- SFTCC (Shift Accumulator Content Conditionally)
- SFTL (Shift Accumulator Content Logically)
- SFTL (Shift Accumulator, Auxiliary, or Temporary Register Content Logically)
- SFTS (Signed Shift of Accumulator, Auxiliary, or Temporary Register Content)

Signed Shift of Accumulator Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTS** ACx, Tx[, ACy]	Yes	2	1	X

Opcode

0101 110E	DDSS ss01

Operands ACx, ACy, Tx

Description This instruction shifts by the temporary register (Tx) content the accumulator (ACx) content. If the 16-bit value contained in Tx is out of the –32 to +31 range, the shift is saturated to –32 or +31 and the shift operation is performed with this value; a destination accumulator overflow is reported when such saturation occurs.

- The operation is performed on 40 bits in the D-unit shifter.
- When M40 = 0, the input to the shifter is modified according to SXMD and then the modified input is shifted by the Tx content:
  - if SXMD = 0, 0 is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
  - if SXMD = 1, bit 31 of the source operand is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
- The sign position of the source operand is compared to the shift quantity. This comparison depends on M40:
  - if M40 = 0, comparison is performed versus bit 31
  - if M40 = 1, comparison is performed versus bit 39
- 0 is inserted at bit position 0.
- The shifted-out bit is extracted according to M40.
- After shifting, unless otherwise noted, when M40 = 0:
  - overflow is detected at bit position 31 (if an overflow is detected, the destination ACOVy bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow)

- After shifting, unless otherwise noted, when M40 = 1:
  - overflow is detected at bit position 39 (if an overflow is detected, the destination ACOVy bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 7F FFFF FFFFh (positive overflow) or 80 0000 0000h (negative overflow)

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1:

- These instructions are executed as if M40 status bit was locally set to 1.
- There is no overflow detection, overflow report, and saturation performed by the D-unit shifter.
- The 6 LSBs of Tx are used to determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
SFTS AC1, T0, AC0	The content of AC1 is shifted by the content of T0 and the result is stored in AC0.

Signed Shift of Accumulator Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**SFTSC** ACx, Tx[, ACy]	Yes	2	1	X

Opcode

0101 110E	DDSS ss10

Operands ACx, ACy, Tx

Description This instruction shifts by the temporary register (Tx) content the accumulator (ACx) content and stores the shifted-out bit in the CARRY status bit. If the 16-bit value contained in Tx is out of the –32 to +31 range, the shift is saturated to –32 or +31 and the shift operation is performed with this value; a destination accumulator overflow is reported when such saturation occurs.

- The operation is performed on 40 bits in the D-unit shifter.
- When M40 = 0, the input to the shifter is modified according to SXMD and then the modified input is shifted by the Tx content:
  - if SXMD = 0, 0 is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
  - if SXMD = 1, bit 31 of the source operand is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
- The sign position of the source operand is compared to the shift quantity. This comparison depends on M40:
  - if M40 = 0, comparison is performed versus bit 31
  - if M40 = 1, comparison is performed versus bit 39
- 0 is inserted at bit position 0.
- The shifted-out bit is extracted according to M40 and stored in the CARRY status bit. When the shift count is zero, Tx = 0, the CARRY status bit is cleared to 0.
- After shifting, unless otherwise noted, when M40 = 0:
  - overflow is detected at bit position 31 (if an overflow is detected, the destination ACOVy bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow)

- After shifting, unless otherwise noted, when M40 = 1:
  - overflow is detected at bit position 39 (if an overflow is detected, the destination ACOVy bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 7F FFFF FFFFh (positive overflow) or 80 0000 0000h (negative overflow)

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1:

- These instructions are executed as if M40 status bit was locally set to 1.
- There is no overflow detection, overflow report, and saturation performed by the D-unit shifter.
- The 6 LSBs of Tx are used to determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits

Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat

This instruction can be repeated.

Example

Syntax	Description
SFTSC AC2, T1	The content of AC2 is shifted left by the content of T1 and the saturated result is stored in AC2. The shifted out bit is stored in the CARRY status bit. Since SATD = 1 and M40 = 0, AC2 = FF 8000 0000 (saturation).

Before		**After**	
AC2	80 AA00 1234	AC2	FF 8000 0000
T1	0005	T1	0005
CARRY	0	CARRY	1
M40	0	M40	0
ACOV2	0	ACOV2	1
SXMD	1	SXMD	1
SATD	1	SATD	1

Signed Shift of Accumulator Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**SFTS** ACx, #SHIFTW[, ACy]	Yes	3	1	X

Opcode

0001 000E	DDSS 0101	xxSH IFTW

Operands ACx, ACy, SHIFTW

Description This instruction shifts by a 6-bit value, SHIFTW, the accumulator (ACx) content.

- The operation is performed on 40 bits in the D-unit shifter.
- When M40 = 0, the input to the shifter is modified according to SXMD and then the modified input is shifted by the 6-bit value, SHIFTW:
  - if SXMD = 0, 0 is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
  - if SXMD = 1, bit 31 of the source operand is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
- The sign position of the source operand is compared to the shift quantity. This comparison depends on M40:
  - if M40 = 0, comparison is performed versus bit 31
  - if M40 = 1, comparison is performed versus bit 39
- 0 is inserted at bit position 0.
- The shifted-out bit is extracted according to M40.
- After shifting, unless otherwise noted, when M40 = 0:
  - overflow is detected at bit position 31 (if an overflow is detected, the destination ACOVy bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow)
- After shifting, unless otherwise noted, when M40 = 1:
  - overflow is detected at bit position 39 (if an overflow is detected, the destination ACOVy bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 7F FFFF FFFFh (positive overflow) or 80 0000 0000h (negative overflow)

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, these instructions are executed as if M40 status bit was locally set to 1. There is no overflow detection, overflow report, and saturation performed by the D-unit shifter.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy

Repeat This instruction can be repeated.

Example 1

Syntax	Description
SFTS AC1, #31, AC0	The content of AC1 is shifted left by 31 bits and the result is stored in AC0.

Example 2

Syntax	Description
SFTS AC1, #–32	The content of AC1 is shifted right by 32 bits and the result is stored in AC1.

Signed Shift of Accumulator Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**SFTSC** ACx, #SHIFTW[, ACy]	Yes	3	1	X

Opcode

0001 000E	DDSS 0110	xxSH IFTW

Operands ACx, ACy, SHIFTW

Description This instruction shifts by a 6-bit value, SHIFTW, the accumulator (ACx) content and stores the shifted-out bit in the CARRY status bit.

- The operation is performed on 40 bits in the D-unit shifter.
- When M40 = 0, the input to the shifter is modified according to SXMD and then the modified input is shifted by the 6-bit value, SHIFTW:
  - if SXMD = 0, 0 is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
  - if SXMD = 1, bit 31 of the source operand is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
- The sign position of the source operand is compared to the shift quantity. This comparison depends on M40:
  - if M40 = 0, comparison is performed versus bit 31
  - if M40 = 1, comparison is performed versus bit 39
- 0 is inserted at bit position 0.
- The shifted-out bit is extracted according to M40 and stored in the CARRY status bit. When the shift count is zero, SHIFTW = 0, the CARRY status bit is cleared to 0.
- After shifting, unless otherwise noted, when M40 = 0:
  - overflow is detected at bit position 31 (if an overflow is detected, the destination ACOVy bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow)

- After shifting, unless otherwise noted, when M40 = 1:
  - overflow is detected at bit position 39 (if an overflow is detected, the destination ACOVy bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 7F FFFF FFFFh (positive overflow) or 80 0000 0000h (negative overflow)

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, these instructions are executed as if M40 status bit was locally set to 1. There is no overflow detection, overflow report, and saturation performed by the D-unit shifter.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SFTSC AC0, #−5, AC1	The content of AC0 is shifted right by 5 bits and the result is stored in AC1. The shifted out bit is stored in the CARRY status bit.

```
Before                          After
AC0          FF 8765 0055       AC0          FF 8765 0055
AC1          00 4321 1234       AC1          FF FC3B 2802
CARRY                   0       CARRY                   1
SXMD                    1       SXMD                    1
```

SFTS *Signed Shift of Accumulator, Auxiliary, or Temporary Register Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTS** dst**, #−1**	Yes	2	1	X
[2]	**SFTS** dst**, #1**	Yes	2	1	X

Description These instructions perform a shift of 1 bit:

- ❑ In the D-unit shifter, if the destination operand is an accumulator (ACx).
- ❑ In the A-unit ALU, if the destination operand is an auxiliary or temporary register (TAx).

Status Bits Affected by C54CM, M40, SATA, SATD, SXMD

Affects ACOVx, ACOVy, CARRY

See Also See the following other related instructions:

Signed Shift of Accumulator, Auxiliary, or Temporary Register Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SFTS** dst**, #−1**	Yes	2	1	X

Opcode

0100 010E	01x0 FDDD

Operands dst

Description This instruction shifts right by 1 bit the content of the destination register (dst).

If the destination operand (dst) is an accumulator:

- The operation is performed on 40 bits in the D-unit shifter.
- When M40 = 0, the input to the shifter is modified according to SXMD and then the modified input is shifted right by 1 bit:
  - if SXMD = 0, 0 is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
  - if SXMD = 1, bit 31 of the source operand is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
- Bit 39 is extended according to SXMD
- The shifted-out bit is extracted at bit position 0.

If the destination operand (dst) is an auxiliary or temporary register:

- The operation is performed on 16 bits in the A-unit ALU.
- Bit 15 is sign extended.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, these instructions are executed as if M40 status bit was locally set to 1. There is no overflow detection, overflow report, and saturation performed by the D-unit shifter.

Status Bits Affected by C54CM, M40, SXMD

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
SFTS AC0, #−1	The content of AC0 is shifted right by 1 bit and the result is stored in AC0.

Signed Shift of Accumulator, Auxiliary, or Temporary Register Content

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**SFTS** dst**, #1**	Yes	2	1	X

Opcode | 0100 010E | 01x1 FDDD

Operands dst

Description This instruction shifts left by 1 bit the content of the destination register (dst).

If the destination operand (dst) is an accumulator:

- The operation is performed on 40 bits in the D-unit shifter.
- When M40 = 0, the input to the shifter is modified according to SXMD and then the modified input is shifted left by 1 bit:
  - if SXMD = 0, 0 is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
  - if SXMD = 1, bit 31 of the source operand is substituted for the guard bits (39−32) as the input, instead of ACx(39−32), to the shifter
- The sign position of the source operand is compared to the shift quantity. This comparison depends on M40:
  - if M40 = 0, comparison is performed versus bit 31
  - if M40 = 1, comparison is performed versus bit 39
- 0 is inserted at bit position 0.
- The shifted-out bit is extracted according to M40.
- After shifting, unless otherwise noted, when M40 = 0:
  - overflow is detected at bit position 31 (if an overflow is detected, the destination ACOVx bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 00 7FFF FFFFh (positive overflow) or FF 8000 0000h (negative overflow)
- After shifting, unless otherwise noted, when M40 = 1:
  - overflow is detected at bit position 39 (if an overflow is detected, the destination ACOVx bit is set)
  - if SATD = 1, when an overflow is detected, the destination accumulator saturation values are 7F FFFF FFFFh (positive overflow) or 80 0000 0000h (negative overflow)

If the destination operand (dst) is an auxiliary or temporary register:

- ❑ The operation is performed on 16 bits in the A-unit ALU.
- ❑ 0 is inserted at bit position 0.
- ❑ After shifting, unless otherwise noted:
  - overflow is detected at bit position 15 (if an overflow is detected, the destination ACOVx bit is set)
  - if SATA = 1, when an overflow is detected, the destination register saturation values are 7FFFh (positive overflow) or 8000h (negative overflow)

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, these instructions are executed as if M40 status bit was locally set to 1. There is no overflow detection, overflow report, and saturation performed by the D-unit shifter.

Status Bits Affected by C54CM, M40, SATA, SATD, SXMD

Affects ACOVx

Repeat This instruction can be repeated.

Example

Syntax	Description
SFTS T2, #1	The content of T2 is shifted left by 1 bit and the result is stored in T2.

```
Before                  After
T2              EF27    T2              DE4E
SATA               1    SATA               1
```

SQA *Square and Accumulate*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SQA**[R] [ACx,] ACy	Yes	2	1	X
[2]	**SQAM**[R] [T3 =]Smem, [ACx,] ACy	No	3	1	X

Description

This instruction performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are:

- ACx(32−16)
- the content of a memory (Smem) location, sign extended to 17 bits

Status Bits

Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVx, ACOVy

See Also

See the following other related instructions:

- MAC (Multiply and Accumulate)
- SQDST (Square Distance)
- SQR (Square)
- SQS (Square and Subtract)

Square and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SQA**[R] [ACx,] ACy	Yes	2	1	X

Opcode

0101 010E	DDSS 001%

Operands ACx, ACy

Description This instruction performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are ACx(32−16):

```
ACy = ACy + (ACx * ACx)
```

- If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an addition overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
SQA AC1, AC0	The content of AC1 squared is added to the content of AC0 and the result is stored in AC0.

Square and Accumulate

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**SQAM**[R] [T3 =]Smem, [ACx,] ACy	No	3	1	X

Opcode

1101 0010	AAAA AAAI	U%DD 10SS

Operands ACx, ACy, Smem

Description This instruction performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are the content of a memory (Smem) location, sign extended to 17 bits:

```
ACy = ACx + (Smem * Smem)
```

- If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACx.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an addition overflow is detected, the accumulator is saturated according to SATD.

This instruction provides the option to store the 16-bit data memory operand Smem in temporary register T3.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVy

Repeat This instruction can be repeated.

Example

Syntax	Description
SQAM *AR3, AC1, AC0	The content addressed by AR3 squared is added to the content of AC1 and the result is stored in AC0.

SQDST *Square Distance*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SQDST** Xmem, Ymem, ACx, ACy	No	4	1	X

Opcode

1000 0110	XXXM MMYY	YMMM DDDD	1110 xxn%

Operands ACx, ACy, Xmem, Ymem

Description This instruction performs two parallel operations: multiply and accumulate (MAC), and subtract:

```
ACy = ACy + (ACx * ACx)
:: ACx = (Xmem << #16) – (Ymem << #16)
```

The first operation performs a multiplication and an accumulation in the D-unit MAC. The input operands of the multiplier are ACx(32−16).

- ❏ If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- ❏ Multiplication overflow detection depends on SMUL.
- ❏ The 32-bit result of the multiplication is sign extended to 40 bits and added to the source accumulator ACy.
- ❏ Addition overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- ❏ When an addition overflow is detected, the accumulator is saturated according to SATD.

The second operation subtracts the content of data memory operand Ymem, shifted left 16 bits, from the content of data memory operand Xmem, shifted left 16 bits.

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, during the subtraction an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits

Affected by C54CM, FRCT, M40, SATD, SMUL, SXMD

Affects ACOVx, ACOVy, CARRY

Repeat

This instruction can be repeated.

[1]	**SQR**[R] [ACx,] ACy	Yes	2	1	X

Opcode

0101 010E	DDSS 100%

Operands ACx, ACy

Description This instruction performs a multiplication in the D-unit MAC. The input operands of the multiplier are ACx(32−16):

```
ACy = ACx * ACx
```

- If FRCT = 1, the output of the multiplier is shifted left by 1 bit.
- Multiplication overflow detection depends on SMUL.
- The 32-bit result of the multiplication is sign extended to 40 bits.
- Rounding is performed according to RDM, if the optional R keyword is applied to the instruction.
- Overflow detection depends on M40. If an overflow is detected, the destination accumulator overflow status bit (ACOVy) is set.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by FRCT, M40, RDM, SATD, SMUL

Affects ACOVy

Repeat This instruction can be repeated.

Dual 16-Bit Subtractions

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SUB dual(**Lmem**),** [ACy,] ACy	No	3	1	X

Opcode

1110 1110	AAAA AAAI	SSDD 001x

Operands ACx, ACy, Lmem

Description This instruction performs two paralleled subtraction operations in one cycle:

```
HI(ACy) = HI(ACx) − HI(Lmem)
:: LO(ACy) = LO(ACx) − LO(Lmem)
```

The operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulator are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit data path).

- The data memory operand dbl(Lmem) is divided into two 16-bit parts:
  - the lower part is used as one of the 16-bit operands of the ALU low part
  - the higher part is sign extended to 24 bits according to SXMD and is used in the ALU high part
- The data memory operand dbl(Lmem) addresses are aligned:
  - if Lmem address is even: most significant word = Lmem, least significant word = Lmem + 1
  - if Lmem address is odd: most significant word = Lmem, least significant word = Lmem − 1
- For each of the two computations performed in the ALU, an overflow detection is made. If an overflow is detected on any of the data paths, the destination accumulator overflow status bit (ACOVy) is set.
  - For the operations performed in the ALU low part, overflow is detected at bit position 15.
  - For the operations performed in the ALU high part, overflow is detected at bit position 31.
- For all instructions, the carry of the operation performed in the ALU high part is reported in the CARRY status bit. The CARRY status bit is always extracted at bit position 31.

- Independently on each data path, if SATD = 1 when an overflow is detected on the data path, a saturation is performed:
  - For the operations performed in the ALU low part, saturation values are 7FFFh and 8000h.
  - For the operations performed in the ALU high part, saturation values are 00 7FFFh and FF 8000h.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if SATD is locally cleared to 0. Overflow is only detected and reported for the computation performed in the higher 24-bit datapath (overflow is detected at bit position 31).

- When C54CM = 1 and C16 = 1, the instruction behaves like a dual 16-bit instruction and the carry is not propagated to bit 15 in the D-unit ALU.
- When C54CM = 1 and C16 = 0, the instruction behaves like a single arithmetic instruction and the carry is propagated to bit 15 in the D-unit ALU.

Status Bits Affected by C16, C54CM, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB dual(*AR3), AC1, AC0	Both instructions are performed in parallel. When the Lmem address is even (AR3 = even): The content addressed by AR3 (sign extended to 24 bits) is subtracted from the content of AC1(39–16) and the result is stored in AC0(39–16). The content addressed by AR3 + 1 is subtracted from the content of AC1(15–0) and the result is stored in AC0(15–0).

[1]	**SUB** [src,] dst	Yes	2	1	X

Opcode

0010 011E	FSSS FDDD

Operands dst, src

Description This instruction performs a subtraction operation between two registers:

```
dst = dst – src
```

- When the destination operand (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are sign extended to 40 bits according to SXMD.
  - If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended according to SXMD.
  - Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination operand (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source operand (src) of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - Overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB AC1, AC0	The content of AC1 is subtracted from the content of AC0 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**SUB** k4, dst	Yes	2	1	X

Opcode

0100 011E	kkkk FDDD

Operands dst, k4

Description This instruction subtracts a 4-bit unsigned constant, k4, from a register:

```
dst = dst – k4
```

- When the destination operand (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination operand (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - Overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATA, SATD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB #15, AC0	An unsigned 4-bit value (15) is subtracted from the content of AC0 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**SUB** K16, [src,] dst	No	4	1	X

Opcode

0111 1100	KKKK KKKK	KKKK KKKK	FDDD FSSS

Operands dst, K16, src

Description This instruction subtracts a 16-bit signed constant, K16, from a register:

```
dst = src – K16
```

- When the destination operand (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended according to SXMD.
  - The 16-bit constant, K16, is sign extended to 40 bits according to SXMD.
  - Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination operand (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source operand (src) of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - Overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB #FFFFh, AC1, AC0	A signed 16-bit value (FFFFh) is subtracted from the content of AC1 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**SUB** Smem, [src,] dst	No	3	1	X

Opcode

1101 0111	AAAA AAAI	FDDD FSSS

Operands dst, Smem, src

Description This instruction subtracts the content of a memory (Smem) location from a register:

```
dst = src – Smem
```

- When the destination operand (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended according to SXMD.
  - The content of the memory location is sign extended to 40 bits according to SXMD.
  - Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination operand (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source operand (src) of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - Overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB *AR3, AC1, AC0	The content addressed by AR3 is subtracted from the content of AC1 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**SUB** src, Smem, dst	No	3	1	X

Opcode

1101 1000	AAAA AAAI	FDDD FSSS

Operands dst, Smem, src

Description This instruction subtracts a register content from the content of a memory (Smem) location:

```
dst = Smem – src
```

- When the destination operand (dst) is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - If an auxiliary or temporary register is the source operand (src) of the instruction, the 16 LSBs of the auxiliary or temporary register are sign extended according to SXMD.
  - The content of the memory location is sign extended to 40 bits according to SXMD.
  - Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
  - When an overflow is detected, the accumulator is saturated according to SATD.
- When the destination operand (dst) is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source operand (src) of the instruction, the 16 LSBs of the accumulator are used to perform the operation.
  - Overflow detection is done at bit position 15.
  - When an overflow is detected, the destination register is saturated according to SATA.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATA, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB AC1, *AR3, AC0	The content of AC1 is subtracted from the content addressed by AR3 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**SUB** ACx **<<** Tx, ACy	Yes	2	1	X

Opcode

0101 101E	DDSS ss01

Operands ACx, ACy, Tx

Description This instruction subtracts an accumulator content ACx shifted by the content of Tx from an accumulator content ACy:

```
ACy = ACy – (ACx << Tx)
```

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1:

- ❏ An intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.
- ❏ The 6 LSBs of Tx are used to determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB AC1 << T0, AC0	The content of AC1 shifted by the content of T0 is subtracted from the content of AC0 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[7]	**SUB** ACx **<<** #SHIFTW, ACy	Yes	3	1	X

Opcode

0001 000E	DDSS 0100	xxSH IFTW

Operands ACx, ACy, SHIFTW

Description This instruction subtracts an accumulator content ACx shifted by the 6-bit value, SHIFTW, from an accumulator content ACy:

```
ACy = ACy - (ACx << #SHIFTW)
```

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB AC1 << #31, AC0	The content of AC1 shifted left by 31 bits is subtracted from the content of AC0 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[8]	**SUB** K16 **<< #16,** [ACx,] ACy	No	4	1	X

Opcode

0111 1010	KKKK KKKK	KKKK KKKK	SSDD 001x

Operands ACx, ACy, K16

Description This instruction subtracts the 16-bit signed constant, K16, shifted left by 16 bits from an accumulator content ACx:

```
ACy = ACx – (K16 << #16)
```

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB #FFFFh << #16, AC1, AC0	A signed 16-bit value (FFFFh) shifted left by 16 bits is subtracted from the content of AC1 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[9]	**SUB** K16 **<<** #SHFT, [ACx,] ACy	No	4	1	X

Opcode

0111 0001	KKKK KKKK	KKKK KKKK	SSDD SHFT

Operands ACx, ACy, K16, SHFT

Description This instruction subtracts the 16-bit signed constant, K16, shifted left by the 4-bit value, SHFT, from an accumulator content ACx:

```
ACy = ACx - (K16 << #SHFT)
```

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB #9800h << #5, AC0, AC1	A signed 16-bit value (9800h) shifted left by 5 bits is subtracted from the content of AC0 and the result is stored in AC1.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[10]	**SUB** Smem **<<** Tx, [ACx,] ACy	No	3	1	X

Opcode

1101 1101	AAAA AAAI	SSDD ss01

Operands ACx, ACy, Smem, Tx

Description This instruction subtracts the content of a memory (Smem) location shifted by the content of Tx from an accumulator content ACx:

```
ACy = ACx – (Smem << Tx)
```

- ❑ The operation is performed on 40 bits in the D-unit shifter.
- ❑ Input operands are sign extended to 40 bits according to SXMD.
- ❑ The shift operation is equivalent to the signed shift instruction.
- ❑ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❑ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1:

- ❑ An intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.
- ❑ The 6 LSBs of Tx are used to determine the shift quantity. The 6 LSBs of Tx define a shift quantity within –32 to +31. When the value is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB *AR3 << T0, AC1, AC0	The content addressed by AR3 shifted by the content of T0 is subtracted from the content of AC1 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[11]	**SUB** Smem **<< #16,** [ACx,], ACy	No	3	1	X

Opcode

1101 1110	AAAA AAAI	SSDD 0101

Operands ACx, ACy, Smem

Description This instruction subtracts the content of a memory (Smem) location shifted left by 16 bits from an accumulator content ACx:

```
ACy = ACx - (Smem << #16)
```

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. If the result of the subtraction generates a borrow, the CARRY status bit is cleared; otherwise, the CARRY status bit is not affected.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB *AR3 << #16, AC1, AC0	The content addressed by AR3 shifted left by 16 bits is subtracted from the content of AC1 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[12]	**SUB** ACx, Smem **<< #16,** ACy	No	3	1	X

Opcode

1101 1110	AAAA AAAI	SSDD 0110

Operands ACx, ACy, Smem

Description This instruction subtracts an accumulator content ACx from the content of a memory (Smem) location shifted left by 16 bits:

```
ACy = (Smem << #16) - ACx
```

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB AC1, *AR3 << #16, AC0	The content of AC1 is subtracted from the content addressed by AR3 shifted left by 16 bits and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[13]	**SUB** [uns(]Smem[)], **BORROW,** [ACx,] ACy	No	3	1	X

Opcode

1101 1111	AAAA AAAI	SSDD 101u

Operands ACx, ACy, Smem

Description This instruction subtracts the logical complement of the CARRY status bit (borrow) and the content of a memory (Smem) location from an accumulator content ACx:

```
ACy = ACx – Smem – BORROW
```

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are extended to 40 bits according to uns.
  - ■ If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
  - ■ If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by CARRY, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB uns(*AR1), BORROW, AC0, AC1	The complement of the CARRY bit (1) and the unsigned content addressed by AR1 (F000h) are subtracted from the content of AC0 and the result is stored in AC1.

```
Before                          After
AC0          00 EC00 0000       AC0          00 EC00 0000
AC1          00 0000 0000       AC1          00 EBFF 0FFF
AR1                  0302       AR1                  0302
302                  F000       302                  F000
CARRY                   0       CARRY                   1
```

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[14]	**SUB** [uns(]Smem[)], [ACx,] ACy	No	3	1	X

Opcode

1101 1111	AAAA AAAI	SSDD 111u

Operands ACx, ACy, Smem

Description This instruction subtracts the content of a memory (Smem) location from an accumulator content ACx:

```
ACy = ACx – Smem
```

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are extended to 40 bits according to uns.
  - ■ If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
  - ■ If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB uns(*AR3), AC1, AC0	The unsigned content addressed by AR3 is subtracted from the content of AC1 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[15]	**SUB** [uns(]Smem[)] **<<** #SHIFTW, [ACx,] ACy	No	4	1	X

Opcode

1111 1001	AAAA AAAI	uxSH IFTW	SSDD 01xx

Operands ACx, ACy, SHIFTW, Smem

Description This instruction subtracts the content of a memory (Smem) location shifted by the 6-bit value, SHIFTW, from an accumulator content ACx:

```
ACy = ACx - (Smem << #SHIFTW)
```

- ❏ The operation is performed on 40 bits in the D-unit shifter.
- ❏ Input operands are extended to 40 bits according to uns.
  - ■ If the optional uns keyword is applied to the input operand, the content of the memory location is zero extended to 40 bits.
  - ■ If the optional uns keyword is not applied to the input operand, the content of the memory location is sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB uns(*AR3) << #31, AC1, AC0	The unsigned content addressed by AR3 shifted left by 31 bits is subtracted from the content of AC1 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[16]	**SUB dbl(**Lmem**),** [ACx,] ACy	No	3	1	X

Opcode

1110 1101	AAAA AAAI	SSDD 001n

Operands ACx, ACy, Lmem

Description This instruction subtracts the content of data memory operand dbl(Lmem) from an accumulator content ACx:

```
ACy = ACx - dbl(Lmem)
```

- The data memory operand dbl(Lmem) addresses are aligned:
  - if Lmem address is even: most significant word = Lmem, least significant word = Lmem + 1
  - if Lmem address is odd: most significant word = Lmem, least significant word = Lmem − 1
- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are sign extended to 40 bits according to SXMD.
- Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB dbl(*AR3+), AC1, AC0	The content (long word) addressed by AR3 and AR3 + 1 is subtracted from the content of AC1 and the result is stored in AC0. Because this instruction is a long-operand instruction, AR3 is incremented by 2 after the execution.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[17]	**SUB** ACx, **dbl(**Lmem**),** ACy	No	3	1	X

Opcode

1110 1101	AAAA AAAI	SSDD 010x

Operands ACx, ACy, Lmem

Description This instruction subtracts an accumulator content ACx from the content of data memory operand dbl(Lmem):

```
ACy = dbl(Lmem) - ACx
```

- The data memory operand dbl(Lmem) addresses are aligned:
  - if Lmem address is even: most significant word = Lmem, least significant word = Lmem + 1
  - if Lmem address is odd: most significant word = Lmem, least significant word = Lmem − 1
- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are sign extended to 40 bits according to SXMD.
- Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured.

Status Bits Affected by M40, SATD, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB AC1, dbl(*AR3), AC0	The content of AC1 is subtracted from the content (long word) addressed by AR3 and AR3 + 1 and the result is stored in AC0.

Subtraction

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[18]	**SUB** Xmem, Ymem, ACx	No	3	1	X

Opcode

1000 0001	XXXM MMYY	YMMM 01DD

Operands ACx, Xmem, Ymem

Description This instruction subtracts the content of data memory operand Ymem, shifted left 16 bits, from the content of data memory operand Xmem, shifted left 16 bits:

```
ACx = (Xmem << #16) – (Ymem << #16)
```

- The operation is performed on 40 bits in the D-unit ALU.
- Input operands are sign extended to 40 bits according to SXMD.
- The shift operation is equivalent to the signed shift instruction.
- Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
- When an overflow is detected, the accumulator is saturated according to SATD.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.

Status Bits Affected by C54CM, M40, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUB *AR3, *AR4, AC0	The content addressed by AR4 shifted left by 16 bits is subtracted from the content addressed by AR3 shifted left by 16 bits and the result is stored in AC0.

SUB::MOV *Subtraction with Parallel Store Accumulator Content to Memory*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SUB** Xmem **<< #16,** ACx, ACy **:: MOV HI(**ACy **<< T2),** Ymem	No	4	1	X

Opcode

1000 0111	XXXM MMYY	YMMM SSDD	101x xxxx

Operands ACx, ACy, T2, Xmem, Ymem

Description This instruction performs two operations in parallel: subtraction and store:

```
ACy = (Xmem << #16) – ACx
:: Ymem = HI(ACy << T2)
```

The first operation subtracts an accumulator content from the content of data memory operand Xmem shifted left by 16 bits.

- ❏ The operation is performed on 40 bits in the D-unit ALU.
- ❏ Input operands are sign extended to 40 bits according to SXMD.
- ❏ The shift operation is equivalent to the signed shift instruction.
- ❏ Overflow detection and CARRY status bit depends on M40. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit. When C54CM = 1, an intermediary shift operation is performed as if M40 is locally set to 1 and no overflow detection, report, and saturation is done after the shifting operation.
- ❏ When an overflow is detected, the accumulator is saturated according to SATD.

The second operation shifts the accumulator ACy by the content of T2 and stores ACy(31−16) to data memory operand Ymem. If the 16-bit value in T2 is not within –32 to +31, the shift is saturated to –32 or +31 and the shift is performed with this value.

- ❏ The input operand is shifted in the D-unit shifter according to SXMD.
- ❏ After the shift, the high part of the accumulator, ACy(31−16), is stored to the memory location.

Compatibility with C54x devices (C54CM = 1)

When this instruction is executed with M40 = 0, compatibility is ensured. When this instruction is executed with C54CM = 1, the 6 LSBs of T2 are used to determine the shift quantity. The 6 LSBs of T2 define a shift quantity within –32 to +31. When the 16-bit value in T2 is between –32 to –17, a modulo 16 operation transforms the shift quantity to within –16 to –1.

- If the SST bit = 1 and the SXMD bit = 0, then the saturate and uns keywords are applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = (Xmem << #16) – ACx
  Ymem = HI(saturate(uns(ACy << T2)))
- If the SST bit = 1 and the SXMD bit = 1, then only the saturate keyword is applied to the instruction regardless of the optional keywords selected by the user, with the following syntax:
  ACy = (Xmem << #16) – ACx
  Ymem = HI(saturate(ACy << T2))

Status Bits Affected by C54CM, M40, RDM, SATD, SST, SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

- SUBC (Subtract Conditionally)

Example

Syntax	Description
SUB *AR3 << #16, AC1, AC0 :: MOV HI(AC0 << T2), *AR4	Both instructions are performed in parallel. The content of AC1 is subtracted from the content addressed by AR3 shifted left by 16 bits and the result is stored in AC0. The content of AC0 is shifted by the content of T2, and AC0(31−16) is stored at the address of AR4.

SUBADD *Dual 16-Bit Subtraction and Addition*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SUBADD** Tx, Smem, ACx	No	3	1	X
[2]	**SUBADD** Tx, **dual(**Lmem**),** ACx	No	3	1	X

Description These instructions perform two paralleled subtraction and addition operations in one cycle.

The operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulator are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit datapath).

Status Bits Affected by C54CM, SATD, SXMD

Affects ACOVx, ACOVy, CARRY

See Also See the following other related instructions:

- ADD (Addition)
- ADD (Dual 16-Bit Additions)
- ADDSUB (Dual 16-Bit Addition and Subtraction)
- SUB (Dual 16-Bit Subtractions)

Dual 16-Bit Subtraction and Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SUBADD** Tx, Smem, ACx	No	3	1	X

Opcode

1101 1110	AAAA AAAI	ssDD 1001

Operands ACx, Smem, Tx

Description This instruction performs two paralleled arithmetical operations in one cycle, a subtraction and addition:

```
HI(ACx) = Smem − Tx
:: LO(ACx) = Smem + Tx
```

The operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulator are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit datapath).

- The data memory operand Smem:
  - is used as one of the 16-bit operands of the ALU low part
  - is duplicated and, according to SXMD, sign extended to 24 bits to be used in the ALU high part
- The temporary register Tx:
  - is used as one of the 16-bit operands of the ALU low part
  - is duplicated and, according to SXMD, sign extended to 24 bits to be used in the ALU high part
- For each of the two computations performed in the ALU, an overflow detection is made. If an overflow is detected on any of the data paths, the destination accumulator overflow status bit (ACOVx) is set.
  - For the operations performed in the ALU low part, overflow is detected at bit position 15.
  - For the operations performed in the ALU high part, overflow is detected at bit position 31.
- For all instructions, the carry of the operation performed in the ALU high part is reported in the CARRY status bit. The CARRY status bit is always extracted at bit position 31.

- Independently on each data path, if SATD = 1 when an overflow is detected on the data path, a saturation is performed:
  - For the operations performed in the ALU low part, saturation values are 7FFFh and 8000h.
  - For the operations performed in the ALU high part, saturation values are 00 7FFFh and FF 8000h.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if SATD is locally cleared to 0. Overflow is only detected and reported for the computation performed in the higher 24-bit datapath (overflow is detected at bit position 31).

Status Bits Affected by C54CM, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUBADD T0, *AR3, AC0	Both instructions are performed in parallel. The content of T0 is subtracted from the content addressed by AR3 and the result is stored in AC0(39–16). The duplicated content of T0 is added to the duplicated content addressed by AR3 and the result is stored in AC0(15–0).

Dual 16-Bit Subtraction and Addition

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**SUBADD** Tx, **dual(**Lmem**),** ACx	No	3	1	X

Opcode

1110 1110	AAAA AAAI	ssDD 111x

Operands ACx, Lmem, Tx

Description This instruction performs two paralleled arithmetical operations in one cycle, a subtraction and addition:

```
HI(ACx) = HI(Lmem) − Tx
:: LO(ACx) = LO(Lmem) + Tx
```

The operations are executed on 40 bits in the D-unit ALU that is configured locally in dual 16-bit mode. The 16 lower bits of both the ALU and the accumulator are separated from their higher 24 bits (the 8 guard bits are attached to the higher 16-bit datapath).

- The temporary register Tx:
  - is used as one of the 16-bit operands of the ALU low part
  - is duplicated and, according to SXMD, sign extended to 24 bits to be used in the ALU high part
- The data memory operand dbl(Lmem) is divided into two 16-bit parts:
  - the lower part is used as one of the 16-bit operands of the ALU low part
  - the higher part is sign extended to 24 bits according to SXMD and is used in the ALU high part
- The data memory operand dbl(Lmem) addresses are aligned:
  - if Lmem address is even: most significant word = Lmem, least significant word = Lmem + 1
  - if Lmem address is odd: most significant word = Lmem, least significant word = Lmem − 1
- For each of the two computations performed in the ALU, an overflow detection is made. If an overflow is detected on any of the data paths, the destination accumulator overflow status bit (ACOVx) is set.
  - For the operations performed in the ALU low part, overflow is detected at bit position 15.
  - For the operations performed in the ALU high part, overflow is detected at bit position 31.

- For all instructions, the carry of the operation performed in the ALU high part is reported in the CARRY status bit. The CARRY status bit is always extracted at bit position 31.
- Independently on each data path, if SATD = 1 when an overflow is detected on the data path, a saturation is performed:
  - For the operations performed in the ALU low part, saturation values are 7FFFh and 8000h.
  - For the operations performed in the ALU high part, saturation values are 00 7FFFh and FF 8000h.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, this instruction is executed as if SATD is locally cleared to 0. Overflow is only detected and reported for the computation performed in the higher 24-bit datapath (overflow is detected at bit position 31).

- When C54CM = 1 and C16 = 1, the instruction behaves like a dual 16-bit instruction and the carry is not propagated to bit 15 in the D-unit ALU.
- When C54CM = 1 and C16 = 0, the instruction behaves like a single arithmetic instruction and the carry is propagated to bit 15 in the D-unit ALU.

Status Bits Affected by C16, C54CM, SATD, SXMD

Affects ACOVx, CARRY

Repeat This instruction can be repeated.

Example

Syntax	Description
SUBADD T0, dual(*AR3), AC0	Both instructions are performed in parallel. When the Lmem address is even (AR3 = even): The content of T0 is subtracted from the content addressed by AR3 and the result is stored in AC0(39–16). The duplicated content of T0 is added to the content addressed by AR3 + 1 and the result is stored in AC0(15–0).

SUBC *Subtract Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SUBC** Smem, [ACx,] ACy	No	3	1	X

Opcode

1101 1110	AAAA AAAI	SSDD 0011

Operands ACx, ACy, Smem

Description This instruction performs a conditional subtraction in the D-unit ALU. The D-unit shifter is not used to perform the memory operand shift.

- The 16-bit data memory operand Smem is sign extended to 40 bits according to SXMD, shifted left by 15 bits, and subtracted from the content of the source accumulator ACx.
  - The shift operation is equivalent to the signed shift instruction.
  - Overflow and CARRY bit is always detected at bit position 31. The subtraction borrow bit is reported in the CARRY status bit; the borrow bit is the logical complement of the CARRY status bit.
  - If an overflow is detected and reported in accumulator overflow bit ACOVy, no saturation is performed on the result of the operation.
- If the result of the subtraction is greater than 0 (bit 39 = 0), the result is shifted left by 1 bit, added to 1, and stored in the destination accumulator ACy.
- If the result of the subtraction is less than 0 (bit 39 = 1), the source accumulator ACx is shifted left by 1 bit and stored in the destination accumulator ACy.

```
if ((ACx – (Smem << #15)) >= 0)
   ACy = (ACx – (Smem << #15)) << #1 + 1
else
   ACy = ACx << #1
```

This instruction is used to make a 16 step 16-bit by 16-bit division. The divisor and the dividend are both assumed to be positive in this instruction. SXMD affects this operation:

- If SXMD = 1, the divisor must have a 0 value in the most significant bit
- If SXMD = 0, any 16-bit divisor value produces the expected result

The dividend, which is in the source accumulator ACx, must be positive (bit 31 = 0) during the computation.

Status Bits Affected by SXMD

Affects ACOVy, CARRY

Repeat This instruction can be repeated.

Opcode

`SWAPP AR4, T0`	`0101 111E`	`0001 1100`
`SWAPP AR6, T2`	`0101 111E`	`0001 1110`

Operands ARx, Tx

Description This instruction performs two parallel moves between two auxiliary registers and two temporary registers in one cycle. These operations are performed in a dedicated datapath independent of the A-unit operators. Auxiliary and temporary register swapping is performed in the address phase of the pipeline.

Instruction [1] performs two parallel moves:

- the content of AR4 to T0, and reciprocally the content of T0 to AR4
- the content of AR5 to T1, and reciprocally the content of T1 to AR5

Instruction [2] performs two parallel moves:

- the content of AR6 to T2, and reciprocally the content of T2 to AR6
- the content of AR7 to T3, and reciprocally the content of T3 to AR7

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

- SWAPP (Swap Auxiliary Register Pair Content)
- SWAPP (Swap Temporary Register Pair Content)
- SWAP4 (Swap Auxiliary and Temporary Register Pairs Content)

Example

Syntax	Description
SWAPP AR4, T0	The following two swap instructions are performed in parallel: the content of AR4 is moved to T0 and the content of T0 is moved to AR4, and the content of AR5 is moved to T1 and the content of T1 is moved to AR5.

Before		**After**	
AR4	0200	AR4	6788
AR5	0300	AR5	0200
T0	6788	T0	0200
T1	0200	T1	0300

SWAPP *Swap Temporary Register Pair Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SWAPP T0, T2**	Yes	2	1	AD

Opcode | 0101 111E | 0001 0100

Operands T0, T2

Description This instruction performs two parallel moves between four temporary registers (T0 and T2, T1 and T3) in one cycle. These operations are performed in a dedicated datapath independent of the A-unit operators. Temporary register swapping is performed in the address phase of the pipeline.

This instruction performs two parallel moves:

- the content of T0 to T2, and reciprocally the content of T2 to T0
- the content of T1 to T3, and reciprocally the content of T3 to T1

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

See Also See the following other related instructions:

- SWAP (Swap Temporary Register Content)
- SWAPP (Swap Accumulator Pair Content)

T3	0200	T3	0300

SWAP4 *Swap Auxiliary and Temporary Register Pairs Content*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**SWAP4 AR4, T0**	Yes	2	1	AD

Opcode | 0101 111E | 0010 1100

Operands AR4, T0

Description This instruction performs four parallel moves between four auxiliary registers (AR4, AR5, AR6, and AR7) and four temporary registers (T0, T1, T2, and T3) in one cycle. These operations are performed in a dedicated datapath independent of the A-unit operators. Auxiliary and temporary register swapping is performed in the address phase of the pipeline.

This instruction performs four parallel moves:

- ❏ the content of AR4 to T0, and reciprocally the content of T0 to AR4
- ❏ the content of AR5 to T1, and reciprocally the content of T1 to AR5
- ❏ the content of AR6 to T2, and reciprocally the content of T2 to AR6
- ❏ the content of AR7 to T3, and reciprocally the content of T3 to AR7

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

AR7	0400	AR7	0FD3
T0	0030	T0	0200
T1	0200	T1	0300
T2	3400	T2	0240
T3	0FD3	T3	0400

TRAP *Software Trap*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**TRAP** k5	No	2	?	D

Opcode

1001 0101	1xxk kkkk

Operands k5

Description This instruction passes control to a specified interrupt service routine (ISR) and this instruction does not affect INTM bit in ST1_55 and DBGM bit in ST2_55. The ISR address is stored at the interrupt vector address defined by the content of an interrupt vector pointer (IVPD or IVPH) combined with the 5-bit constant, k5. This instruction is executed regardless of the value of INTM bit . This instruction is not maskable.

Note:

DBSTAT (the debug status register) holds debug context information used during emulation. Make sure the ISR does not modify the value that will be returned to DBSTAT.

Before beginning an ISR, the CPU automatically saves the value of some CPU registers and two internal registers: the program counter (PC) and a loop context register. The CPU can use these values to re-establish the context of the interrupted program sequence when the ISR is done.

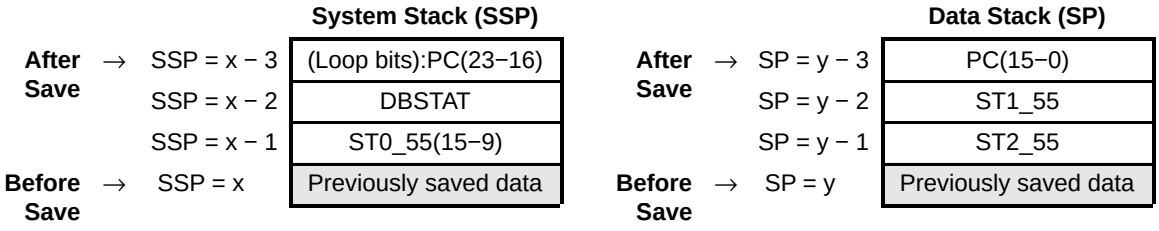
In the slow-return process (default), the return address (from the PC), the loop context bits, and some CPU registers are stored to the stacks (in memory). When the CPU returns from an ISR, the speed at which these values are restored is dependent on the speed of the memory accesses.

In the fast-return process, the return address (from the PC) and the loop context bits are saved to registers, so that these values can always be restored quickly. These special registers are the return address register (RETA) and the control-flow context register (CFCT). You can read from or write to RETA and CFCT as a pair with dedicated, 32-bit load and store instructions. Some CPU registers are saved to the stacks (in memory). For fast-return mode operation, see the *TMS320C55x DSP CPU Reference Guide* (SPRU371).

When control is passed to the ISR:

- The data stack pointer (SP) is decremented by 1 word in the address phase of the pipeline. The status register 2 (ST2_55) content is pushed to the top of SP.

- ❏ The system stack pointer (SSP) is decremented by 1 word in the address phase of the pipeline. The 7 higher bits of status register 0 (ST0_55) concatenated with 9 zeroes are pushed to the top of SSP.
- ❏ The SP is decremented by 1 word in the access phase of the pipeline. The status register 1 (ST1_55) content is pushed to the top of SP.
- ❏ The SSP is decremented by 1 word in the access phase of the pipeline. The debug status register (DBSTAT) content is pushed to the top of SSP.
- ❏ The SP is decremented by 1 word in the read phase of the pipeline. The 16 LSBs of the return address, from the program counter (PC), of the called subroutine are pushed to the top of SP.
- ❏ The SSP is decremented by 1 word in the read phase of the pipeline. The loop context bits concatenated with the 8 MSBs of the return address are pushed to the top of SSP.
- ❏ The PC is loaded with the ISR program address. The active control flow execution context flags are cleared.



Status Bits Affected by none

Affects none

Repeat This instruction cannot be repeated.

Example

Syntax	Description
TRAP #5	Program control is passed to the specified interrupt service routine. The interrupt vector address is defined by the content of an interrupt vector pointer (IVPD) combined with the unsigned 5-bit value (5).

XCC *Execute Conditionally*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**XCC** [label,]cond	No	2	1	AD
[2]	**XCCPART** [label,]cond	No	2	1	X

Description

These instructions evaluate a single condition defined by the cond field and allow you to control execution of all operations implied by the instruction or part of the instruction. See Table 1−3 for a list of conditions.

Instruction [1] allows you to control the entire execution flow from the address phase to the execute phase of the pipeline. Instruction [2] allows you to only control the execution flow from the execute phase of the pipeline. The use of a label, where control of the execute conditionally instruction ends, is optional.

- ❑ These instructions may be executed alone.
- ❑ These instructions may be executed with two paralleled instructions.
- ❑ These instructions may be executed with the instruction with which it is paralleled.
- ❑ These instructions may be executed with the previous instruction.
- ❑ These instructions may be executed with the previous instruction and two paralleled instructions.
- ❑ These instructions cannot be repeated.
- ❑ These instructions cannot be used as the last instruction in a repeat loop structure.
- ❑ These instructions cannot control the execution of the following program control instructions:

B (branch)	BCC	IDLE	INTR	XCC
CALL	CALLCC	RPT	RPTCC	XCCPART
RET	RETCC	RETI	RPTB	RPTBLOCAL
RESET	TRAP			

Status Bits

Affected by ACOVx, CARRY, C54CM, M40, TCx

Affects ACOVx

Execute Conditionally

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**XCC** [label,]cond	No	2	1	AD

Opcode

```
1001 0110 0CCC CCCC
1001 1110 0CCC CCCC
1001 1111 0CCC CCCC
```

The assembler selects the opcode depending on the instruction position in a paralleled pair.

Operands

cond

Description

This instruction evaluates a single condition defined by the cond field and allows you to control the execution flow of an instruction, or instructions, from the address phase to the execute phase of the pipeline. See Table 1−3 for a list of conditions.

When this instruction moves into the address phase of the pipeline, the condition specified in the cond field is evaluated. If the tested condition is true, the conditional instruction(s) is read and executed; if the tested condition is false, the conditional instruction(s) is not read and program control is passed to the instruction following the conditional instruction(s) or to the program address defined by label. There is a 3-cycle latency for the condition testing.

- This instruction may be executed alone:

```
      XCC [label, ]cond
      instruction_executes_conditionally
[label:]
```

- This instruction may be executed with two paralleled instructions:

```
      XCC [label, ]cond
      instruction_1_executes_conditionally
      || instruction_2_executes_conditionally
[label:]
```

- This instruction may be executed with the instruction with which it is paralleled:

```
      XCC [label, ]cond
      || instruction_executes_conditionally
[label:]
```

- This instruction may be executed with a previous instruction:

```
      previous_instruction
      || XCC [label, ]cond
      instruction_executes_conditionally
[label:]
```

- This instruction may be executed with a previous instruction and two paralleled instructions:

```
      previous_instruction
      || XCC [label, ]cond
      instruction_1_executes_conditionally
      || instruction_2_executes_conditionally
[label:]
```

This instruction cannot be used as the last instruction in a repeat loop structure.

This instruction cannot control the execution of the following program control instructions:

B (branch)	BCC	IDLE	INTR	XCC
CALL	CALLCC	RPT	RPTCC	XCCPART
RET	RETCC	RETI	RPTB	RPTBLOCAL
RESET	TRAP			

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the comparison of accumulators to 0 is performed as if M40 was set to 1.

Status Bits

Affected by ACOVx, CARRY, C54CM, M40, TCx

Affects ACOVx

Repeat

This instruction cannot be repeated.

Example 1

Syntax	Description
XCC branch, AR0 != #0 ADD *AR2+, AC0	The content of AR0 is not equal to 0, the next (ADD) instruction is executed. The content of AC0 is added to the content addressed by AR2 and the result is stored in AC0. AR2 is incremented by 1.

```
Before                          After
AR0                 3000        AR0                 3000
AR2                 0405        AR2                 0406
405                 EF00        405                 EF00
AC0          00 0000 000C       AC0          00 0000 EF0C
```

Example 2

Syntax	Description
XCC AR0 != #0 ADD *AR2+, AC0	The content of AR0 is equal to 0, the next (ADD) instruction is not executed and control is passed to the instruction following the conditionally executed (ADD) instruction.

Before		**After**	
AR0	0000	AR0	0000
AR2	0405	AR2	0405
405	EF00	405	EF00
AC0	00 0000 000C	AC0	00 0000 000C

Execute Conditionally

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**XCCPART** [label,]cond	No	2	1	X

Opcode

```
1001 0110 1CCC CCCC
1001 1110 1CCC CCCC
1001 1111 1CCC CCCC
```

The assembler selects the opcode depending on the instruction position in a paralleled pair.

Operands

cond

Description

This instruction evaluates a single condition defined by the cond field and allows you to control the execution flow of an instruction, or instructions, from the execute phase of the pipeline. This instruction differs from instruction [1] because in this instruction operations performed in the address phase are always executed. See Table 1−3 for a list of conditions.

When this instruction moves into the execute phase of the pipeline, the condition specified in the cond field is evaluated. If the tested condition is true, the conditional instruction(s) is read and executed; if the tested condition is false, the conditional instruction(s) is not read and program control is passed to the instruction following the conditional instruction(s) or to the program address defined by label. There is a 0-cycle latency for the condition testing.

- This instruction may be executed alone:

```
      XCCPART [label, ]cond
      instruction_executes_conditionally
[label:]
```

- This instruction may be executed with two paralleled instructions:

```
      XCCPART [label, ]cond
      instruction_1_executes_conditionally
      || instruction_2_executes_conditionally
[label:]
```

- This instruction may be executed with the instruction with which it is paralleled. When this instruction syntax is used and the instruction to be executed conditionally is a store-to-memory instruction, there is a 1-cycle latency for the condition setting.

```
      XCCPART [label, ]cond
      || instruction_executes_conditionally
[label:]
```

- This instruction may be executed with a previous instruction:

```
      previous_instruction
      || XCCPART [label, ]cond
      instruction_executes_conditionally
[label:]
```

- This instruction may be executed with a previous instruction and two paralleled instructions:

```
      previous_instruction
      || XCCPART [label, ]cond
      instruction_1_executes_conditionally
      || instruction_2_executes_conditionally
[label:]
```

This instruction cannot be used as the last instruction in a repeat loop structure.

This instruction cannot control the execution of the following program control instructions:

B (branch)	BCC	IDLE	INTR	XCC
CALL	CALLCC	RPT	RPTCC	XCCPART
RET	RETCC	RETI	RPTB	RPTBLOCAL
RESET	TRAP			

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the comparison of accumulators to 0 is performed as if M40 was set to 1.

Status Bits Affected by ACOVx, CARRY, C54CM, M40, TCx

Affects ACOVx

Repeat This instruction cannot be repeated.

Example 1

Syntax	Description
XCCPART branch, AR0 != #0 ADD *AR2+, AC0	The content of AR0 is not equal to 0, the next (ADD) instruction is executed. The content of AC0 is added to the content addressed by AR2 and the result is stored in AC0. AR2 is incremented by 1.

Before		**After**	
AR0	3000	AR0	3000
AR2	0405	AR2	0406
405	EF00	405	EF00
AC0	00 0000 000C	AC0	00 0000 EF0C

Example 2

Syntax	Description
XCCPART AR0 != #0 ADD *AR2+, AC0	The content of AR0 is equal to 0, the next (ADD) instruction is not executed and control is passed to the instruction following the conditionally executed (ADD) instruction; however, since the next (ADD) instruction includes a pointer modification, AR2 is incremented by 1 in the address phase.

```
Before                          After
AR0                  0000       AR0                  0000
AR2                  0405       AR2                  0406
405                  EF00       405                  EF00
AC0          00 0000 000C       AC0          00 0000 000C
```

XOR *Bitwise Exclusive OR (XOR)*

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**XOR** src, dst	Yes	2	1	X
[2]	**XOR** k8, src, dst	Yes	3	1	X
[3]	**XOR** k16, src, dst	No	4	1	X
[4]	**XOR** Smem, src, dst	No	3	1	X
[5]	**XOR** ACx **<<** #SHIFTW[, ACy]	Yes	3	1	X
[6]	**XOR** k16 **<< #16,** [ACx,] ACy	No	4	1	X
[7]	**XOR** k16 **<<** #SHFT, [ACx,] ACy	No	4	1	X
[8]	**XOR** k16, Smem	No	4	1	X

Description

These instructions perform a bitwise exclusive-OR (XOR) operation:

- In the D-unit, if the destination operand is an accumulator.
- In the A-unit ALU, if the destination operand is an auxiliary or temporary register.
- In the A-unit ALU, if the destination operand is the memory.

Status Bits

Affected by C54CM

Affects none

Bitwise Exclusive OR (XOR)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[1]	**XOR** src, dst	Yes	2	1	X

Opcode

0010 110E	FSSS FDDD

Operands dst, src

Description This instruction performs a bitwise exclusive-OR (XOR) operation between two registers:

```
dst = dst ^ src
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
XOR AC0, AC1	The content of AC0 is XORed with the content of AC1 and the result is stored in AC1.

```
Before                          After
AC0          7E 2355 4FC0       AC0          7E 2355 4FC0
AC1          0F E340 5678       AC1          71 C015 19B8
```

Bitwise Exclusive OR (XOR)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[2]	**XOR** k8, src, dst	Yes	3	1	X

Opcode

0001 110E	kkkk kkkk	FDDD FSSS

Operands dst, k8, src

Description This instruction performs a bitwise exclusive-OR (XOR) operation between a source (src) register content and an 8-bit value, k8:

```
dst = src ^ k8
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
XOR #FFh, AC1, AC0	The content of AC1 is XORed with the unsigned 8-bit value (FFh) and the result is stored in AC0.

Bitwise Exclusive OR (XOR)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[3]	**XOR** k16, src, dst	No	4	1	X

Opcode

0111 1111	kkkk kkkk	kkkk kkkk	FDDD FSSS

Operands dst, k16, src

Description This instruction performs a bitwise exclusive-OR (XOR) operation between a source (src) register content and a 16-bit unsigned constant, k16:

```
dst = src ^ k16
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
XOR #FFFFh, AC1, AC0	The content of AC1 is XORed with the unsigned 16-bit value (FFFFh) and the result is stored in AC0.

Bitwise Exclusive OR (XOR)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[4]	**XOR** Smem, src, dst	No	3	1	X

Opcode

1101 1011	AAAA AAAI	FDDD FSSS

Operands dst, Smem, src

Description This instruction performs a bitwise exclusive-OR (XOR) operation between a source (src) register content and a memory (Smem) location:

```
dst = src ^ Smem
```

- When the destination (dst) operand is an accumulator:
  - The operation is performed on 40 bits in the D-unit ALU.
  - Input operands are zero extended to 40 bits.
  - If an auxiliary or temporary register is the source (src) operand of the instruction, the 16 LSBs of the auxiliary or temporary register are zero extended.
- When the destination (dst) operand is an auxiliary or temporary register:
  - The operation is performed on 16 bits in the A-unit ALU.
  - If an accumulator is the source (src) operand of the instruction, the 16 LSBs of the accumulator are used to perform the operation.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
XOR *AR3, AC1, AC0	The content of AC1 is XORed with the content addressed by AR3 and the result is stored in AC0.

Bitwise Exclusive OR (XOR)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[5]	**XOR** ACx **<<** #SHIFTW[, ACy]	Yes	3	1	X

Opcode

0001 000E	DDSS 0010	xxSH IFTW

Operands ACx, ACy, SHIFTW

Description This instruction performs a bitwise exclusive-OR (XOR) operation between an accumulator (ACy) content and an accumulator (ACx) content shifted by the 6-bit value, SHIFTW:

```
ACy = ACy ^ (ACx <<< #SHIFTW)
```

- The shift and XOR operations are performed in one cycle in the D-unit shifter.
- When M40 = 0 and C54CM = 0, input operands ACx(31−0) are zero extended to 40 bits. Otherwise, ACx(39−0) is used as is.
- The input operand (ACx) is shifted by a 6-bit immediate value in the D-unit shifter.
- The CARRY status bit is not affected by the logical shift operation.

Compatibility with C54x devices (C54CM = 1)

When C54CM = 1, the intermediary logical shift is performed as if M40 is locally set to 1. The 8 upper bits of the 40-bit intermediary result are not cleared.

Status Bits Affected by C54CM, M40

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
XOR AC1 << #30, AC0	The content of AC0 is XORed with the content of AC1 logically shifted left by 30 bits and the result is stored in AC0.

Bitwise Exclusive OR (XOR)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[6]	**XOR** k16 **<< #16,** [ACx,] ACy	No	4	1	X

Opcode

0111 1010	kkkk kkkk	kkkk kkkk	SSDD 100x

Operands ACx, ACy, k16

Description This instruction performs a bitwise exclusive-OR (XOR) operation between an accumulator (ACx) content and a 16-bit unsigned constant, k16, shifted left by 16 bits:

```
ACy = ACx ^ (k16 <<< #16)
```

- ❑ The operation is performed on 40 bits in the D-unit ALU.
- ❑ Input operands are zero extended to 40 bits.
- ❑ The input operand (k16) is shifted 16 bits to the MSBs.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
XOR #FFFFh << #16, AC1, AC0	The content of AC1 is XORed with the unsigned 16-bit value (FFFFh) logically shifted left by 16 bits and the result is stored in AC0.

Bitwise Exclusive OR (XOR)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[7]	**XOR** k16 **<<** #SHFT, [ACx,] ACy	No	4	1	X

Opcode

0111 0100	kkkk kkkk	kkkk kkkk	SSDD SHFT

Operands ACx, ACy, k16, SHFT

Description This instruction performs a bitwise exclusive-OR (XOR) operation between an accumulator (ACx) content and a 16-bit unsigned constant, k16, shifted left by the 4-bit value, SHFT:

```
ACy = ACx ^ (k16 <<< #SHFT)
```

- ❑ The shift and XOR operations are performed in one cycle in the D-unit shifter.
- ❑ When M40 = 0 and C54CM = 0, input operands ACx(31−0) are zero extended to 40 bits. Otherwise, ACx(39−0) is used as is.
- ❑ The input operand (k16) is shifted by a 4-bit immediate value in the D-unit shifter.
- ❑ The CARRY status bit is not affected by the logical shift operation.

Status Bits Affected by C54CM, M40

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
XOR #FFFFh << #15, AC1, AC0	The content of AC1 is XORed with the unsigned 16-bit value (FFFFh) logically shifted left by 15 bits and the result is stored in AC0.

Bitwise Exclusive OR (XOR)

Syntax Characteristics

No.	Syntax	Parallel Enable Bit	Size	Cycles	Pipeline
[8]	**XOR** k16, Smem	No	4	1	X

Opcode

1111 0110	AAAA AAAI	kkkk kkkk	kkkk kkkk

Operands k16, Smem

Description This instruction performs a bitwise exclusive-OR (XOR) operation between a memory (Smem) location and a 16-bit unsigned constant, k16:

```
Smem = Smem ^ k16
```

- ❑ The operation is performed on 16 bits in the A-unit ALU.
- ❑ The result is stored in memory.

Status Bits Affected by none

Affects none

Repeat This instruction can be repeated.

Example

Syntax	Description
XOR #FFFFh, *AR3	The content addressed by AR3 is XORed with the unsigned 16-bit value (FFFFh) and the result is stored in the location addressed by AR3.

.

Chapter 6

Instruction Opcodes in Sequential Order

This chapter provides the opcode in sequential order for each TMS320C55x™ DSP instruction syntax.

Topic **Page**

6.1 Instruction Set Opcodes

Table 6−1 lists the opcodes of the instruction set. See Table 6−2 (page 6-18) for a list of the symbols and abbreviations used in the instruction set opcode. See Table 1−1 (page 1-2) and Table 1−2 (page 1-6) for a list of the terms, symbols, and abbreviations used in the mnemonic syntax.

11111101 AAAAAAAI 011100mm DDDDuug%	MAS[R][40] [uns()]HI(Lmem)[)], [uns()]HI(Cmem)[)], ACy :: MAS[R][40] [uns()]LO(Lmem)[)], [uns()]LO(Cmem)[)], ACx

6.2 Instruction Set Opcode Symbols and Abbreviations

Table 6−2 lists the symbols and abbreviations used in the instruction set opcode.

Table 6−2. Instruction Set Opcode Symbols and Abbreviations

Bit Field Name	Bit Field Value	Bit Field Description
%	0	Rounding is disabled
	1	Rounding is enabled
AAAA AAAI		Smem addressing mode:
	AAAA AAA0	@dma, direct memory address (dma) direct access
	AAAA AAA1	Smem indirect memory access:
	0001 0001	ABS16(#k16)
	0011 0001	*(#k23)
	0101 0001	port(#k16)
	0111 0001	*CDP
	1001 0001	*CDP+
	1011 0001	*CDP−
	1101 0001	*CDP(#K16)
	1111 0001	*+CDP(#K16)
	PPP0 0001	*ARn
	PPP0 0011	*ARn+
	PPP0 0101	*ARn−
	PPP0 0111	*(ARn + T0), when C54CM = 0 *(ARn + T0), when C54CM = 1
	PPP0 1001	*(ARn – T0), when C54CM = 0 *(ARn – T0), when C54CM = 1
	PPP0 1011	*ARn(T0), when C54CM = 0 *ARn(T0), when C54CM = 1
	PPP0 1101	*ARn(#K16)
	PPP0 1111	*+ARn(#K16)
	PPP1 0011	*(ARn + T1), when ARMS = 0 *ARn(short(#1)), when ARMS = 1

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description
	PPP1 0101	*(ARn – T1), when ARMS = 0 *ARn(short(#2)), when ARMS = 1
	PPP1 0111	*ARn(T1), when ARMS = 0 *ARn(short(#3)), when ARMS = 1
	PPP1 1001	*+ARn, when ARMS = 0 *ARn(short(#4)), when ARMS = 1
	PPP1 1011	*−ARn, when ARMS = 0 *ARn(short(#5)), when ARMS = 1
	PPP1 1101	*(ARn + T0B), when ARMS = 0 *ARn(short(#6)), when ARMS = 1
	PPP1 1111	*(ARn – T0B), when ARMS = 0 *ARn(short(#7)), when ARMS = 1
	PPP encodes an auxiliary register (ARn) as for XXX and YYY.	

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description	
cc		Relational operators (RELOP):	
	00	==	(equal to)
	01	<	(less than)
	10	>=	(greater than or equal to)
	11	!=	(not equal to)
CCC CCCC		Conditional field (cond) on source accumulator, auxiliary, or temporary register; TCx; and CARRY:	
	000 FSSS	src == 0	(source is equal to 0)
	001 FSSS	src != 0	(source is not equal to 0)
	010 FSSS	src < 0	(source is less than 0)
	011 FSSS	src <= 0	(source is less than or equal to 0)
	100 FSSS	src > 0	(source is greater than 0)
	101 FSSS	src >= 0	(source is greater than or equal to 0)
	110 00SS	overflow(ACx)	(source accumulator overflow status bit (ACOVx) is tested against 1)
	110 0100	TC1	(status bit is tested against 1)
	110 0101	TC2	(status bit is tested against 1)
	110 0110	CARRY	(status bit is tested against 1)
	110 0111	Reserved	

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description
	110 1000	TC1 & TC2
	110 1001	TC1 & !TC2
	110 1010	!TC1 & TC2
	110 1011	!TC1 & !TC2
	110 11xx	Reserved
	111 00SS	!overflow(ACx) (source accumulator overflow status bit (ACOVx) is tested against 0)
	111 0100	!TC1 (status bit is tested against 0)
	111 0101	!TC2 (status bit is tested against 0)
	111 0110	!CARRY (status bit is tested against 0)
	111 0111	Reserved
	111 1000	TC1 | TC2
	111 1001	TC1 | !TC2
	111 1010	!TC1 | TC2
	111 1011	!TC1 | !TC2
	111 1100	TC1 ^ TC2
	111 1101	TC1 ^ !TC2
	111 1110	!TC1 ^ TC2
	111 1111	!TC1 ^ !TC2
dd		Destination temporary register (Tx, Ty):
	00	Temporary register 0 (T0)
	01	Temporary register 1 (T1)
	10	Temporary register 2 (T2)
	11	Temporary register 3 (T3)

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description
DD		Destination accumulator register (ACw, ACx, ACy, ACz):
	00	Accumulator 0 (AC0)
	01	Accumulator 1 (AC1)
	10	Accumulator 2 (AC2)
	11	Accumulator 3 (AC3)
DDD . . . D		Data address label coded on n bits (absolute address)
E	0	Parallel Enable bit is cleared to 0
	1	Parallel Enable bit is set to 1
FDDD FSSS		Destination or Source accumulator, auxiliary, or temporary register (dst, src, TAx, TAy):
	0000	Accumulator 0 (AC0)
	0001	Accumulator 1 (AC1)
	0010	Accumulator 2 (AC2)
	0011	Accumulator 3 (AC3)
	0100	Temporary register 0 (T0)
	0101	Temporary register 1 (T1)
	0110	Temporary register 2 (T2)
	0111	Temporary register 3 (T3)
	1000	Auxiliary register 0 (AR0)
	1001	Auxiliary register 1 (AR1)
	1010	Auxiliary register 2 (AR2)
	1011	Auxiliary register 3 (AR3)
	1100	Auxiliary register 4 (AR4)
	1101	Auxiliary register 5 (AR5)
	1110	Auxiliary register 6 (AR6)
	1111	Auxiliary register 7 (AR7)

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description
g	0	40 keyword is not applied
	1	40 keyword is applied; M40 is locally set to 1
kk kkkk		Swap code for Swap Register Content instruction:
	00 0000	SWAP AC0, AC2
	00 0001	SWAP AC1, AC3
	00 0100	SWAP T0, T2
	00 0101	SWAP T1, T3
	00 1000	SWAP AR0, AR2
	00 1001	SWAP AR1, AR3
	00 1100	SWAP AR4, T0
	00 1101	SWAP AR5, T1
	00 1110	SWAP AR6, T2
	00 1111	SWAP AR7, T3
	01 0000	SWAPP AC0, AC2
	01 0001	Reserved
	01 0100	SWAPP T0, T2
	01 0101	Reserved
	01 1000	SWAPP AR0, AR2
	01 1001	Reserved
	01 1100	SWAPP AR4, T0
	01 1101	Reserved
	01 1110	SWAPP AR6, T2
	01 1111	Reserved
	10 1000	Reserved
	10 1100	SWAP4 AR4, T0
	11 1000	SWAP AR0, AR1
	11 1100	Reserved
	1x 0000	Reserved
	1x 0001	Reserved

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description
	1x 0100	Reserved
	1x 0101	Reserved
	1x 1001	Reserved
	1x 1101	Reserved
	1x 1110	Reserved
	1x 1111	Reserved
kkk . . . k		Unsigned constant of n bits
KKK . . . K		Signed constant of n bits
lll . . . l		Program address label coded on n bits (unsigned offset relative to program counter register)
LLL . . . L		Program address label coded on n bits (signed offset relative to program counter register)
mm		Coefficient addressing mode (Cmem):
	00	*CDP
	01	*CDP+
	10	*CDP−
	11	*(CDP + T0)
MMM		Modifier option for Xmem or Ymem addressing mode:
	000	*ARn
	001	*ARn+
	010	*ARn−
	011	*(ARn + T0), when C54CM = 0 *(ARn + AR0), when C54CM = 1
	100	*(ARn + T1)

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description
	101	*(ARn – T0), when C54CM = 0 *(ARn – AR0), when C54CM = 1
	110	*(ARn – T1)
	111	*ARn(T0), when C54CM = 0 *ARn(AR0), when C54CM = 1
n		Reserved bit
PPP . . . P		Program or data address label coded on n bits (absolute address)
r	0	Select TRN0
	1	Select TRN1
SHFT		4-bit immediate shift value, 0 to 15
SHIFTW		6-bit immediate shift value, −32 to +31
ss		Source temporary register (Tx, Ty):
	00	Temporary register 0 (T0)
	01	Temporary register 1 (T1)
	10	Temporary register 2 (T2)
	11	Temporary register 3 (T3)
SS		Source accumulator register (ACw, ACx, ACy, ACz):
	00	Accumulator 0 (AC0)
	01	Accumulator 1 (AC1)
	10	Accumulator 2 (AC2)
	11	Accumulator 3 (AC3)
tt	00	Bit 0: destination TCy bit of Compare Register Content instruction
	01	Bit 1: source TCx bit of Compare Register Content instruction

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description
	10	When value = 0: TC1 is selected
	11	When value = 1: TC2 is selected
u	0	U or uns keyword is not applied; operand is considered signed
	1	U or uns keyword is applied; operand is considered unsigned
U	0	No update of T3 with Smem or Xmem content
	1	T3 is updated with Smem or Xmem content
vv	00	Bit 0: shifted-out bit of Rotate instruction
	01	Bit 1: shifted-in bit of Rotate instruction
	10	When value = 0: CARRY is selected
	11	When value = 1: TC2 is selected
x		Reserved bit
XDDD XSSS		Destination or Source accumulator or extended register. All 23 bits of stack pointer (XSP), system stack pointer (XSSP), data page pointer (XDP), coefficient data pointer (XCDP), and extended auxiliary register (XARx).
	0000	Accumulator 0 (AC0)
	0001	Accumulator 1 (AC1)
	0010	Accumulator 2 (AC2)
	0011	Accumulator 3 (AC3)
	0100	Stack pointer (XSP)
	0101	System stack pointer (XSSP)
	0110	Data page pointer (XDP)
	0111	Coefficient data pointer (XCDP)
	1000	Auxiliary register 0 (XAR0)
	1001	Auxiliary register 1 (XAR1)
	1010	Auxiliary register 2 (XAR2)
	1011	Auxiliary register 3 (XAR3)
	1100	Auxiliary register 4 (XAR4)

Table 6−2. Instruction Set Opcode Symbols and Abbreviations (Continued)

Bit Field Name	Bit Field Value	Bit Field Description
	1101	Auxiliary register 5 (XAR5)
	1110	Auxiliary register 6 (XAR6)
	1111	Auxiliary register 7 (XAR7)
XXX YYY		Auxiliary register designation for Xmem or Ymem addressing mode:
	000	Auxiliary register 0 (AR0)
	001	Auxiliary register 1 (AR1)
	010	Auxiliary register 2 (AR2)
	011	Auxiliary register 3 (AR3)
	100	Auxiliary register 4 (AR4)
	101	Auxiliary register 5 (AR5)
	110	Auxiliary register 6 (AR6)
	111	Auxiliary register 7 (AR7)

Chapter 7

Cross-Reference of Mnemonic and Algebraic Instruction Sets

This chapter provides a cross-reference between the TMS320C55x™ DSP mnemonic instruction set and the algebraic instruction set (Table 7−1). For more information on the algebraic instruction set, see *TMS320C55x DSP Algebraic Instruction Set Reference Guide*, SWPU068.

Table 7−1. Cross-Reference of Mnemonic and Algebraic Instruction Sets

Mnemonic Syntax	Algebraic Syntax
AADD: Modify Auxiliary or Temporary Register Content by Addition	**Modify Auxiliary or Temporary Register Content by Addition**
AADD TAx, TAy	mar(TAy + TAx)
AADD P8, TAx	mar(TAx + P8)
AADD: Modify Data Stack Pointer (SP)	**Modify Data Stack Pointer**
AADD K8, SP	SP = SP + K8
AADD: Modify Extended Auxiliary Register Content by Addition	**Modify Extended Auxiliary Register Content by Addition**
AADD XACsrc, XACdst for DAG_X	mar(XACdst + XACsrc) for DAG_X
AADD XACsrc, XACdst for DAG_Y	mar(XACdst + XACsrc) for DAG_Y
ABDST: Absolute Distance	**Absolute Distance**
ABDST Xmem, Ymem, ACx, ACy	abdst(Xmem, Ymem, ACx, ACy)
ABS: Absolute Value	**Absolute Value**
ABS [src,] dst	dst = |src|
ADD: Addition	**Addition**
ADD [src,] dst	dst = dst + src
ADD k4, dst	dst = dst + k4
ADD K16, [src,] dst	dst = src + K16
ADD Smem, [src,] dst	dst = src + Smem
ADD ACx << Tx, ACy	ACy = ACy + (ACx << Tx)
ADD ACx << #SHIFTW, ACy	ACy = ACy + (ACx << #SHIFTW)

Table 7−1. Cross-Reference of Mnemonic and Algebraic Instruction Sets (Continued)

Mnemonic Syntax	Algebraic Syntax
ADD K16 << #16, [ACx,] ACy	ACy = ACx + (K16 << #16)
ADD K16 << #SHFT, [ACx,] ACy	ACy = ACx + (K16 << #SHFT)
ADD Smem << Tx, [ACx,] ACy	ACy = ACx + (Smem << Tx)
ADD Smem << #16, [ACx,] ACy	ACy = ACx + (Smem << #16)
ADD [uns(]Smem[)], CARRY, [ACx,] ACy	ACy = ACx + uns(Smem) + CARRY
ADD [uns(]Smem[)], [ACx,] ACy	ACy = ACx + uns(Smem)
ADD [uns(]Smem[)] << #SHIFTW, [ACx,] ACy	ACy = ACx + (uns(Smem) << #SHIFTW)
ADD dbl(Lmem), [ACx,] ACy	ACy = ACx + dbl(Lmem)
ADD Xmem, Ymem, ACx	ACx = (Xmem << #16) + (Ymem << #16)
ADD K16, Smem	Smem = Smem + K16
ADD: Dual 16-Bit Additions	**Dual 16-Bit Additions**
ADD dual(Lmem), [ACx,] ACy	HI(ACy) = HI(Lmem) + HI(ACx), LO(ACy) = LO(Lmem) + LO(ACx)
ADD dual(Lmem), Tx, ACx	HI(ACx) = HI(Lmem) + Tx, LO(ACx) = LO(Lmem) + Tx
ADD::MOV: Addition with Parallel Store Accumulator Content to Memory	**Addition with Parallel Store Accumulator Content to Memory**
ADD Xmem << #16, ACx, ACy :: MOV HI(ACy << T2), Ymem	ACy = ACx + (Xmem << #16), Ymem = HI(ACy << T2)
ADDSUB: Dual 16-Bit Addition and Subtraction	**Dual 16-Bit Addition and Subtraction**
ADDSUB Tx, Smem, ACx	HI(ACx) = Smem + Tx, LO(ACx) = Smem – Tx

Table 7−1. Cross-Reference of Mnemonic and Algebraic Instruction Sets (Continued)

Mnemonic Syntax	Algebraic Syntax
ADDSUB Tx, dual(Lmem), ACx	HI(ACx) = HI(Lmem) + Tx, LO(ACx) = LO(Lmem) – Tx
ADDSUBCC: Addition or Subtraction Conditionally	**Addition or Subtraction Conditionally**
ADDSUBCC Smem, ACx, TCx, ACy	ACy = adsc(Smem, ACx, TCx)
ADDSUBCC: Addition, Subtraction, or Move Accumulator Content Conditionally	**Addition, Subtraction, or Move Accumulator Content Conditionally**
ADDSUBCC Smem, ACx, TC1, TC2, ACy	ACy = adsc(Smem, ACx, TC1, TC2)
ADDSUB2CC: Addition or Subtraction Conditionally with Shift	**Addition or Subtraction Conditionally with Shift**
ADDSUB2CC Smem, ACx, Tx, TC1, TC2, ACy	ACy = ads2c(Smem, ACx, Tx, TC1, TC2)
ADDV: Addition with Absolute Value	**Addition with Absolute Value**
ADD[R]V [ACx,] ACy	ACy = rnd(ACy + |ACx|)
AMAR: Modify Auxiliary Register Content	**Modify Auxiliary Register Content**
AMAR Smem	mar(Smem)
AMAR: Modify Extended Auxiliary Register Content	**Modify Extended Auxiliary Register Content**
AMAR Smem, XAdst	XAdst = mar(Smem)
AMOV XACsrc, XACdst for DAG_X	mar(XACdst = XACsrc) for DAG_X
AMOV XACsrc, XACdst for DAG_Y	mar(XACdst = XACsrc) for DAG_Y
AMAR: Parallel Modify Auxiliary Register Contents	**Parallel Modify Auxiliary Register Contents**
AMAR Xmem, Ymem, Cmem	mar(Xmem), mar(Ymem), mar(coef(Cmem))

Table 7−1. Cross-Reference of Mnemonic and Algebraic Instruction Sets (Continued)

Mnemonic Syntax	Algebraic Syntax
AMAR::MAC: Modify Auxiliary Register Content with Parallel Multiply and Accumulate	**Modify Auxiliary Register Content with Parallel Multiply and Accumulate**
AMAR Xmem :: MAC[R][40] [uns()Ymem[])], [uns()Cmem[])], ACx	mar(Xmem), ACx = M40(rnd(ACx + (uns(Ymem) * uns(coef(Cmem))))
AMAR Xmem :: MAC[R][40] [uns()Ymem[])], [uns()Cmem[])], ACx >> #16	mar(Xmem), ACx = M40(rnd((ACx >> #16) + (uns(Ymem) * uns(coef(Cmem))))
AMAR::MAS: Modify Auxiliary Register Content with Parallel Multiply and Subtract	**Modify Auxiliary Register Content with Parallel Multiply and Subtract**
AMAR Xmem :: MAS[R][40] [uns()Ymem[])], [uns()Cmem[])], ACx	mar(Xmem), ACx = M40(rnd(ACx – (uns(Ymem) * uns(coef(Cmem))))
AMAR::MPY: Modify Auxiliary Register Content with Parallel Multiply	**Modify Auxiliary Register Content with Parallel Multiply**
AMAR Xmem :: MPY[R][40] [uns()Ymem[])], [uns()Cmem[])], ACx	mar(Xmem), ACx = M40(rnd(uns(Ymem) * uns(coef(Cmem))))
AMOV: Load Extended Auxiliary Register with Immediate Value	**Load Extended Auxiliary Register with Immediate Value**
AMOV k23, XAdst	XAdst = k23
AMOV: Modify Auxiliary or Temporary Register Content	**Modify Auxiliary or Temporary Register Content**
AMOV TAx, TAy	mar(TAy = TAx)
AMOV P8, TAx	mar(TAx = P8)
AMOV D16, TAx	mar(TAx = D16)

Table 7−1. Cross-Reference of Mnemonic and Algebraic Instruction Sets (Continued)

Mnemonic Syntax	Algebraic Syntax
AND: Bitwise AND	**Bitwise AND**
AND src, dst	dst = dst & src
AND k8, src, dst	dst = src & k8
AND k16, src, dst	dst = src & k16
AND Smem, src, dst	dst = src & Smem
AND ACx << #SHIFTW[, ACy]	ACy = ACy & (ACx <<< #SHIFTW)
AND k16 << #16, [ACx,] ACy	ACy = ACx & (k16 <<< #16)
AND k16 << #SHFT, [ACx,] ACy	ACy = ACx & (k16 <<< #SHFT)
AND k16, Smem	Smem = Smem & k16
ASUB: Modify Auxiliary or Temporary Register Content by Subtraction	**Modify Auxiliary or Temporary Register Content by Subtraction**
ASUB TAx, TAy	mar(TAy – TAx)
ASUB P8, TAx	mar(TAx – P8)
ASUB: Modify Extended Auxiliary Register Content by Subtraction	**Modify Extended Auxiliary Register Content by Subtraction**
ASUB XACsrc, XACdst for DAG_X	mar(XACdst − XACsrc) for DAG_X
ASUB XACsrc, XACdst for DAG_Y	mar(XACdst − XACsrc) for DAG_Y
B: Branch Unconditionally	**Branch Unconditionally**
B ACx	goto ACx

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
