
## MDEBUGSTOP

### Debug Stop Task

#### Operands

none This instruction does not have any operands

#### Opcode

```
LSW: 0000 0000 0000 0000
MSW: 0111 1111 0110 0000
```

#### Description

When CLA breakpoints are enabled, the MDEBUGSTOP instruction is used to halt a task so that it can be debugged. That is, MDEBUGSTOP is the CLA breakpoint. If CLA breakpoints are not enabled, the MDEBUGSTOP instruction behaves like a MNOP. Unlike the MSTOP, the MIRUN flag is not cleared and an interrupt is not issued. A single-step or run operation will continue execution of the task.

#### Restrictions

The MDEBUGSTOP instruction cannot be placed 3 instructions before or after a [MBCNDD](#), [MCCNDD](#), or [MRCNDD](#) instruction.

#### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

#### See also

[MSTOP](#)

## MDEBUGSTOP1

### Software Breakpoint

#### Operands

|      |   |
|------|---|
| none | This instruction does not have any operands |
|------|---|

#### Opcode

|      |      |      |      |      |
|------|------|------|------|------|
| LSW: | 0000 | 0000 | 0000 | 0000 |
| MSW: | 0111 | 1111 | 0011 | 0000 |

#### Description

The instruction at which a software breakpoint is placed will be replaced by the MDEBUGSTOP1 instruction. It will halt execution once it reaches the D2 phase in the pipeline; at that point the subsequent instructions that were fetched, after the halt, will be flushed from the pipeline. The replace instruction will be re-fetched after this and execution can continue normally (either in run or step mode).

See [Section 7.4.3](#) for a detailed explanation of its operation.

#### Restrictions

The MDEBUGSTOP1 instruction cannot be placed 3 instructions before or after a [MBCNDD](#), [MCCNDD](#), or [MRCNDD](#) instruction.

#### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

## MEALLOW

### Enable CLA Write Access to EALLOW Protected Registers

#### Operands

|      |   |
|------|---|
| none | This instruction does not have any operands |
|------|---|

#### Opcode

|                          |
|--------------------------|
| LSW: 0000 0000 0000 0000 |
| MSW: 0111 1111 1001 0000 |

#### Description

This instruction sets the MEALLOW bit in the CLA status register MSTF. When this bit is set, the CLA is allowed write access to EALLOW protected registers. To again protect against CLA writes to protected registers, use the MEDIS instruction.

MEALLOW and MEDIS only control CLA write access; reads are allowed even if MEALLOW has not been executed. MEALLOW and MEDIS are also independent from the main CPU's EALLOW/EDIS. This instruction does not modify the EALLOW bit in the main CPU's status register. The MEALLOW bit in MSTF only controls access for the CLA while the EALLOW bit in the ST1 register only controls access for the main CPU.

As with EALLOW, the MEALLOW bit is overridden via the JTAG port, allowing full control of register accesses during debug from Code Composer Studio.

#### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

#### Example

```

; C header file including definition of
; the EPwm1Regs structure
;
; The ePWM TZSEL register is EALLOW protected
;
.cdecls C,LIST,"CLAShared.h"
...
_Cla1Task1:
...
MEALLOW                ; Allow CLA write access
MMOV16 @_EPwm1Regs.TZSEL.all, MR3 ; Write to TZSEL
MEDIS                  ; Disallow CLA write access
...
...
MSTOP

```

[MEDIS](#)

**MEDIS****Disable CLA Write Access to EALLOW Protected Registers****Operands**

|      |   |
|------|---|
| none | This instruction does not have any operands |
|------|---|

**Opcode**

|                          |
|--------------------------|
| LSW: 0000 0000 0000 0000 |
| MSW: 0111 1111 1011 0000 |

**Description**

This instruction clears the MEALLOW bit in the CLA status register MSTF. When this bit is clear, the CLA is not allowed write access to EALLOW-protected registers. To enable CLA writes to protected registers, use the MEALLOW instruction.

MEALLOW and MEDIS only control CLA write access; reads are allowed even if MEALLOW has not been executed. MEALLOW and MEDIS are also independent from the main CPU's EALLOW/EDIS. This instruction does not modify the EALLOW bit in the main CPU's status register. The MEALLOW bit in MSTF only controls access for the CLA while the EALLOW bit in the ST1 register only controls access for the main CPU.

As with EALLOW, the MEALLOW bit is overridden via the JTAG port, allowing full control of register accesses during debug from the Code Composer Studio™ IDE.

**Flags**

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

This is a single-cycle instruction.

**Example**

```

; C header file including definition of
; the EPwm1Regs structure
;
; The ePWM TZSEL register is EALLOW protected
;
.cdecls C,LIST,"CLAShared.h"
...
_Cla1Task1:
...
MEALLOW                ; Allow CLA write access
MMOV16 @_EPwm1Regs.TZSEL.all, MR3 ; Write to TZSEL
MEDIS                  ; Disallow CLA write access
...
...
MSTOP

```

**MEINVF32 MRa, MRb****32-Bit Floating-Point Reciprocal Approximation****Operands**

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1111 0000 0000
```

**Description**

This operation generates an estimate of  $1/X$  in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

```
Ye = Estimate(1/X);
Ye = Ye*(2.0 - Ye*X);
Ye = Ye*(2.0 - Ye*X);
```

After two iterations of the Newton-Raphson algorithm, you will get an exact answer accurate to the 32-bit floating-point format. On each iteration the mantissa bit accuracy approximately doubles. The MEINVF32 operation will not generate a negative zero, DeNorm or NaN value.

```
MRa = Estimate of 1/MRb;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MEINVF32 generates an underflow condition.
- LVF = 1 if MEINVF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Calculate Num/Den using a Newton-Raphson algorithm for 1/Den
; Ye = Estimate(1/X)
; Ye = Ye*(2.0 - Ye*X)
; Ye = Ye*(2.0 - Ye*X)
;
-ClalTask1:
  MMOV32 MR1, @_Den      ; MR1 = Den
  MEINVF32 MR2, MR1      ; MR2 = Ye = Estimate(1/Den)
  MMPYF32 MR3, MR2, MR1 ; MR3 = Ye*Den
  MSUBF32 MR3, #2.0, MR3 ; MR3 = 2.0 - Ye*Den
  MMPYF32 MR2, MR2, MR3 ; MR2 = Ye = Ye*(2.0 - Ye*Den)
  MMPYF32 MR3, MR2, MR1 ; MR3 = Ye*Den
|| MMOV32 MR0, @_Num     ; MR0 = Num
  MSUBF32 MR3, #2.0, MR3 ; MR3 = 2.0 - Ye*Den
  MMPYF32 MR2, MR2, MR3 ; MR2 = Ye = Ye*(2.0 - Ye*Den)
|| MMOV32 MR1, @_Den     ; Reload Den To Set Sign
  MNEGF32 MR0, MR0, EQ   ; if(Den == 0.0) Change Sign Of Num
  MMPYF32 MR0, MR2, MR0  ; MR0 = Y = Ye*Num
  MMOV32 @_Dest, MR0     ; Store result
  MSTOP                  ; end of task
```

## MEISQRTF32 MRa, MRb

### 32-Bit Floating-Point Square-Root Reciprocal Approximation

#### Operands

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

#### Opcode

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1110 0100 0000
```

#### Description

This operation generates an estimate of  $1/\sqrt{X}$  in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

```
Ye = Estimate(1/sqrt(X));
Ye = Ye*(1.5 - Ye*Ye*X/2.0);
Ye = Ye*(1.5 - Ye*Ye*X/2.0);
```

After 2 iterations of the Newton-Raphson algorithm, you will get an exact answer accurate to the 32-bit floating-point format. On each iteration the mantissa bit accuracy approximately doubles. The MEISQRTF32 operation will not generate a negative zero, DeNorm or NaN value.

```
MRa = Estimate of 1/sqrt (MRb);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MEISQRTF32 generates an underflow condition.
- LVF = 1 if MEISQRTF32 generates an overflow condition.

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Y = sqrt(X)
; Ye = Estimate(1/sqrt(X));
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Y = X*Ye
;
_ClalTask3:
  MMOV32 MR0, @_x          ; MR0 = X
  MEISQRTF32 MR1, MR0      ; MR1 = Ye = Estimate(1/sqrt(X))
  MMOV32 MR1, @_x, EQ      ; if(X == 0.0) Ye = 0.0
  MMPYF32 MR3, MR0, #0.5   ; MR3 = X*0.5
  MMPYF32 MR2, MR1, MR3    ; MR2 = Ye*X*0.5
  MMPYF32 MR2, MR1, MR2    ; MR2 = Ye*Ye*X*0.5
  MSUBF32 MR2, #1.5, MR2   ; MR2 = 1.5 - Ye*Ye*X*0.5
  MMPYF32 MR1, MR1, MR2    ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
  MMPYF32 MR2, MR1, MR3    ; MR2 = Ye*X*0.5
  MMPYF32 MR2, MR1, MR2    ; MR2 = Ye*Ye*X*0.5
  MSUBF32 MR2, #1.5, MR2   ; MR2 = 1.5 - Ye*Ye*X*0.5
  MMPYF32 MR1, MR1, MR2    ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
  MMPYF32 MR0, MR1, MR0    ; MR0 = Y = Ye*X
  MMOV32 @_y, MR0          ; Store Y = sqrt(X)
  MSTOP                    ; end of task
```

**MF32TOUI32 MRa, MRb****Convert 32-Bit Floating-Point Value to 32-Bit Unsigned Integer****Operands**

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1101 1010 0000
```

**Description**

Convert the 32-bit floating-point value in MRb to an unsigned 32-bit integer and store the result in MRa.

```
MRa = F32TOUI32 (MRb);
```

**Flags**

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

This is a single-cycle instruction.

**Example**

```
MMOVIZ MR0, #12.5 ; MR0 = 12.5 (0x41480000)
MF32TOUI32 MR0, MR0 ; MR0 = MF32TOUI32 (MR0) = 12 (0x0000000C)
MMOVIZ MR1, #-6.5 ; MR1 = -6.5 (0xC0D00000)
MF32TOUI32 MR2, MR1 ; MR2 = MF32TOUI32 (MR1) = 0.0 (0x00000000)
```

## MFRACF32 MRa, MRb

### Fractional Portion of a 32-Bit Floating-Point Value

#### Operands

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

#### Opcode

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1110 0000 0000
```

#### Description

Returns in MRa the fractional portion of the 32-bit floating-point value in MRb

#### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVIZ MR2, #19.625 ; MR2 = 19.625 (0x419D0000)
MFRACF32 MR3, MR2 ; MR3 = MFRACF32(MR2) = 0.625 (0x3F200000)0
```

**MI16TOF32 MRa, MRb**
**Convert 16-Bit Integer to 32-Bit Floating-Point Value**
**Operands**

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1110 1000 0000
```

**Description**

Convert the 16-bit signed integer in MRb to a 32-bit floating point value and store the result in MRa.

```
MRa = MI16TOF32 (MRb);
```

**Flags**

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

This is a single-cycle instruction.

**Example**

```
MMOVIZ    MR0, #0x0000    ; MR0(31:16) = 0.0 (0x0000)
MMOVXI    MR0, #0x0004    ; MR0(15:0) = 4.0 (0x0004)
MI16TOF32 MR1, MR0        ; MR1 = MI16TOF32 (MR0) = 4.0 (0x40800000)
MMOVIZ    MR2, #0x0000    ; MR2(31:16) = 0.0 (0x0000)
MMOVXI    MR2, #0xFFFC    ; MR2(15:0) = -4.0 (0xFFFC)
MI16TOF32 MR3, MR2        ; MR3 = MI16TOF32 (MR2) = -4.0 (0xC0800000)
MSTOP
```

## MI16TOF32 MRa, mem16

### Convert 16-Bit Integer to 32-Bit Floating-Point Value

#### Operands

|       |  |
|-------|--|
| MRa   | CLA floating-point destination register (MR0 to MR3) |
| mem16 | 16-bit source memory location to be converted        |

#### Opcode

```
LSW: rrrrrm rrrrrm rrrrrm rrrrrm
MSW: 0111 0101 00aa addr
```

#### Description

Convert the 16-bit signed integer indicated by the mem16 pointer to a 32-bit floating-point value and store the result in MRa.

```
MRa = MI16TOF32 [mem16];
```

#### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction:

#### Example

```
; Assume A = 4 (0x0004)
; B = -4 (0xFFFC)
MI16TOF32 MR0, @_A ; MR0 = MI16TOF32(A) = 4.0 (0x40800000)
MI16TOF32 MR1, @_B ; MR1 = MI16TOF32(B) = -4.0 (0xC0800000)
```

## MI32TOF32 MRa, MRb

### Convert 32-Bit Integer to 32-Bit Floating-Point Value

#### Operands

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

#### Opcode

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1101 1000 0000
```

#### Description

Convert the signed 32-bit integer in MRb to a 32-bit floating-point value and store the result in MRa.

```
MRa = MI32TOF32 (MRb);
```

#### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVIZ MR2, #0x1111 ; MR2(31:16) = 4369 (0x1111)
MMOVXI MR2, #0x1111 ; MR2(15:0) = 4369 (0x1111)
; MR2 = +286331153 (0x11111111)
MI32TOF32 MR3, MR2 ; MR3 = MI32TOF32 (MR2) = 286331153.0 (0x4D888888)
```

**MLSL32 MRa, #SHIFT****Logical Shift Left****Operands**

|        |   |
|--------|---|
| MRa    | CLA floating-point source/destination register (MR0 to MR3) |
| #SHIFT | Number of bits to shift (1 to 32)                           |

**Opcode**

```
LSW: 0000 0000 0shi ftaa
MSW: 0111 1011 1100 0000
```

**Description**

Logical shift left of MRa by the number of bits indicated. The number of bits can be 1 to 32.

```
MARa(31:0) = Logical Shift Left(MARa(31:0) by #SHIFT bits);
```

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Given m2 = (int32)32
; x2 = (int32)64
; b2 = (int32)-128
;
; Calculate:
; m2 = m2*2
; x2 = x2*4
; b2 = b2*8
;
_Cla1Task3:
  MMOV32 MR0, @_m2 ; MR0 = 32 (0x00000020)
  MMOV32 MR1, @_x2 ; MR1 = 64 (0x00000040)
  MMOV32 MR2, @_b2 ; MR2 = -128 (0xFFFFFFFF80)
  MLSL32 MR0, #1 ; MR0 = 64 (0x00000040)
  MLSL32 MR1, #2 ; MR1 = 256 (0x00000100)
  MLSL32 MR2, #3 ; MR2 = -1024 (0xFFFFF0C0)
  MMOV32 @_m2, MR0 ; Store results
  MMOV32 @_x2, MR1
  MMOV32 @_b2, MR2
  MSTOP ; end of task
```

## MLSR32 MRa, #SHIFT

### Logical Shift Right

#### Operands

|        |   |
|--------|---|
| MRa    | CLA floating-point source/destination register (MR0 to MR3) |
| #SHIFT | Number of bits to shift (1 to 32)                           |

#### Opcode

```
LSW: 0000 0000 0shi ftaa
MSW: 0111 1011 1000 0000
```

#### Description

Logical shift right of MRa by the number of bits indicated. The number of bits can be 1 to 32. Unlike the arithmetic shift (MASR32), the logical shift does not preserve the number's sign bit. Every bit in the operand is moved the specified number of bit positions, and the vacant bit-positions are filled in with zeros

```
MARa(31:0) = Logical Shift Right(MARa(31:0) by #SHIFT bits);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1;}
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Illustrate the difference between MASR32 and MLSR32
MMOVIZ MR0, #0xAAAA ; MR0 = 0xAAAA5555
MMOVXI MR0, #0x5555
MMOV32 MR1, MR0 ; MR1 = 0xAAAA5555
MMOV32 MR2, MR0 ; MR2 = 0xAAAA5555
MASR32 MR1, #1 ; MR1 = 0xD5552AAA
MLSR32 MR2, #1 ; MR2 = 0x55552AAA
MASR32 MR1, #1 ; MR1 = 0xEAAA9555
MLSR32 MR2, #1 ; MR2 = 0x2AAA9555
MASR32 MR1, #6 ; MR1 = 0xFFAAA555
MLSR32 MR2, #6 ; MR2 = 0x00AAA555
```

**MMACF32 MR3, MR2, MRd, MRe, MRf ||MMOV32 MRa, mem32**
**32-Bit Floating-Point Multiply and Accumulate with Parallel Move**
**Operands**

|       |  |
|-------|--|
| MR3   | floating-point destination/source register MR3 for the add operation   |
| MR2   | CLA floating-point source register MR2 for the add operation   |
| MRd   | CLA floating-point destination register (MR0 to MR3) for the multiply operation<br>MRd cannot be the same register as MRa        |
| MRe   | CLA floating-point source register (MR0 to MR3) for the multiply operation   |
| MRf   | CLA floating-point source register (MR0 to MR3) for the multiply operation   |
| MRa   | CLA floating-point destination register for the MMOV32 operation (MR0 to MR3).<br>MRa cannot be MR3 or the same register as MRd. |
| mem32 | 32-bit source for the MMOV32 operation   |

**Opcode**

```
LSW: mmmmm mmmmm mmmmm mmmmm
MSW: 0011 ffee ddaa addr
```

**Description**

Multiply and accumulate the contents of floating-point registers and move from register to memory. The destination register for the MMOV32 cannot be the same as the destination registers for the MMACF32.

```
MR3 = MR3 + MR2;
MRd = MRe * MRf;
MRa = [mem32];
```

**Restrictions**

The destination registers for the MMACF32 and the MMOV32 must be unique. That is, MRa cannot be MR3 and MRa cannot be the same register as MRd.

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMACF32 (add or multiply) generates an underflow condition.
- LVF = 1 if MMACF32 (add or multiply) generates an overflow condition.

MMOV32 sets the NF and ZF flags as follows:

```
NF = MRa(31);
ZF = 0;
if(MRa(30:23) == 0) { ZF = 1; NF = 0; }
```

**Pipeline**

MMACF32 and MMOV32 complete in a single cycle.

**MMACF32 MR3, MR2, MRd, MRe, MRf ||MMOV32 MRa, mem32 (continued)**
**32-Bit Floating-Point Multiply and Accumulate with Parallel Move**
**Example 1**

```

; Perform 5 multiply and accumulate operations:
;
; X and Y are 32-bit floating point arrays
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2

Special cases for the output from the MMAXF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(MRa == MRb) {ZF=1; NF=0;}
if(MRa > MRb) {ZF=0; NF=0;}
if(MRa < MRb) {ZF=0; NF=1;}
```

**Pipeline**

This is a single-cycle instruction.

**Example 1**

```
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MMOVIZ MR1, #-2.0 ; MR1 = -2.0 (0xC0000000)
MMOVIZ MR2, #-1.5 ; MR2 = -1.5 (0xBFC00000)
MMAXF32 MR2, MR1 ; MR2 = -1.5, ZF = NF = 0
MMAXF32 MR1, MR2 ; MR1 = -1.5, ZF = 0, NF = 1
MMAXF32 MR2, MR0 ; MR2 = 5.0, ZF = 0, NF = 1
MAXF32 MR0, MR2 ; MR2 = 5.0, ZF = 1, NF = 0
```

## MMAXF32 MRa, #16FHi

### 32-Bit Floating-Point Maximum

#### Operands

|        |   |
|--------|---|
| MRa    | CLA floating-point source/destination register (MR0 to MR3)   |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |

#### Opcode

```
LSW: I III I III I III I III
MSW: 0111 1001 0000 00aa
```

#### Description

Compare MRa with the floating-point value represented by the immediate operand. If the immediate value is larger, then load it into MRa.

```
if(MRa < #16FHi:0) MRa = #16FHi:0;
```

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

Special cases for the output from the MMAXF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(MRa == #16FHi:0) {ZF=1; NF=0;}
if(MRa > #16FHi:0) {ZF=0; NF=0;}
if(MRa < #16FHi:0) {ZF=0; NF=1;}
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MMOVIZ MR1, #4.0 ; MR1 = 4.0 (0x40800000)
MMOVIZ MR2, #-1.5 ; MR2 = -1.5 (0xBFC00000)
MMAXF32 MR0, #5.5 ; MR0 = 5.5, ZF = 0, NF = 1
MMAXF32 MR1, #2.5 ; MR1 = 4.0, ZF = 0, NF = 0
MMAXF32 MR2, #-1.0 ; MR2 = -1.0, ZF = 0, NF = 1
MMAXF32 MR2, #-1.0 ; MR2 = -1.5, ZF = 1, NF = 0
```

## MMOV16 MARx, MRa, #16I

### Load the Auxiliary Register with MRa + 16-bit Immediate Value

#### Operands

|      |  |
|------|--|
| MARx | Auxiliary register MAR0 or MAR1          |
| MRa  | CLA Floating-point register (MR0 to MR3) |
| #16I | 16-bit immediate value                   |

#### Opcode

```
LSW: I III I III I III I III (opcode of MMOV16 MAR0, MRa, #16I)
MSW: 0111 1111 1101 00AA
LSW: I III I III I III I III (opcode of MMOV16 MAR1, MRa, #16I)
MSW: 0111 1111 1111 00AA
```

#### Description

Load the auxiliary register, MAR0 or MAR1, with MRa(15:0) + 16-bit immediate value. Refer to the pipeline section for important information regarding this instruction.

```
MARx = MRa(15:0) + #16I;
```

#### Flags

This instruction does not modify flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction. The load of MAR0 or MAR1 will occur in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing will occur in the D2 phase of the pipeline. Therefore the following applies when loading the auxiliary registers:

- **I1 and I2**

The two instructions following MMOV16 will use MAR0/MAR1 before the update occurs. Thus these two instructions will use the old value of MAR0 or MAR1.

- **I3**

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus I3 cannot use the auxiliary register or there will be a conflict. In the case of a conflict, the update due to address-mode post increment will win and the auxiliary register will not be updated with #\_X.

- **I4**

Starting with the 4th instruction MAR0 or MAR1 will be the new value loaded with MMOV16.

```
; Assume MAR0 is 50, MR0 is 10, and #_X is 20
MMOV16 MAR0, MR0, #_X ; Load MAR0 with address of X (20) + MR0 (10)
<Instruction 1> ; I1 Will use the old value of MAR0 (50)
<Instruction 2> ; I2 Will use the old value of MAR0 (50)
<Instruction 3> ; I3 Cannot use MAR0
<Instruction 4> ; I4 Will use the new value of MAR0 (30)
<Instruction 5> ; I5
```

**MMOV16 MARx, MRa, #16I** (continued)**Load the Auxiliary Register with MRa + 16-bit Immediate Value****Table 7-16. Pipeline Activity For MMOV16 MARx, MRa , #16I**

## MMOV16 MARx, mem16

### Load MAR1 with 16-bit Value

#### Operands

|       |  |
|-------|--|
| MARx  | CLA auxiliary register MAR0 or MAR1  |
| mem16 | 16-bit destination memory accessed using one of the available addressing modes |

#### Opcode

```
LSW: rrrrrr rrrrrr rrrrrr rrrrrr (Opcode for MMOV16 MAR0, mem16)
MSW: 0111 0110 0000 addr
LSW: rrrrrr rrrrrr rrrrrr rrrrrr (Opcode for MMOV16 MAR1, mem16)
MSW: 0111 0110 0100 addr
```

#### Description

Load MAR0 or MAR1 with the 16-bit value pointed to by mem16. Refer to the pipeline section for important information regarding this instruction.

```
MAR1 = [mem16];
```

#### Flags

No flags MSTF flags are affected.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction. The load of MAR0 or MAR1 will occur in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing will occur in the D2 phase of the pipeline. Therefore the following applies when loading the auxiliary registers:

- **I1 and I2**

The two instructions following MMOV16 will use MAR0/MAR1 before the update occurs. Thus these two instructions will use the old value of MAR0 or MAR1.

- **I3**

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus I3 cannot use the auxiliary register or there will be a conflict. In the case of a conflict, the update due to address-mode post increment will win send the auxiliary register will not be updated with #\_X.

- **I4**

Starting with the 4th instruction MAR0 or MAR1 will be the new value loaded with MMOV16.

```
; Assume MAR0 is 50 and @_X is 20
MMOV16 MAR0, @_X ; Load MAR0 with the contents of X (20)
<Instruction 1> ; I1 Will use the old value of MAR0 (50)
<Instruction 2> ; I2 Will use the old value of MAR0 (50)
<Instruction 3> ; I3 Cannot use MAR0
<Instruction 4> ; I4 Will use the new value of MAR0 (20)
<Instruction 5> ; I5
....
```

**MMOV32 mem32, MSTF****Move 32-Bit MSTF Register to Memory****Operands**

|       |                                |
|-------|--------------------------------|
| MSTF  | floating-point status register |
| mem32 | 32-bit destination memory      |

**Opcode**

```
LSW: rrrrrm rrrrrm rrrrrm rrrrrm
MSW: 0111 0111 0100 addr
```

**Description**

Copy the CLA's floating-point status register, MSTF, to memory.

```
[mem32] = MSTF;
```

**Flags**

This instruction does not modify flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

This is a single-cycle instruction.

One of the uses of this instruction is to save off the return PC (RPC) prior to calling a function. The decision to jump to a function is made when the MCCNDD is in the decode2 (D2) phase of the pipeline; the RPC is also updated in this phase. The actual jump occurs three cycles later when MCCNDD enters its execution (E) phase. The user must, therefore, save the old RPC before MCCNDD updates it in the D2 phase, that is, it must save MSTF three instructions prior to the function call.

**Example**

The following example illustrates the pipeline flow for the context save (of the flags and RPC) prior to a function call. The first column in the comments shows the pipeline stages for the MMOV32 instruction while the second column pertains to the MCCNDD instruction.

```
MMOV32 @_temp, MSTF ; D2| |
MNOP                ; R1|F1| MCCNDD is fetched
MNOP                ; R2|F2|
MNOP                ; E |D1|
MCCNDD _bar, UNC    ; W |D2| old RPC written to memory,
                   ;   |   | RPC updated with MPC+1
MNOP                ;   |R1|
MNOP                ;   |R2|
MNOP                ;   |E | execution branches to _bar
```

**MMOV32 MRa, mem32 {, CNDF}****Conditional 32-Bit Move****Operands**

|       |   |
|-------|---|
| MRa   | CLA floating-point destination register (MR0 to MR3)                        |
| mem32 | 32-bit memory location accessed using one of the available addressing modes |
| CNDF  | optional condition.   |

**Opcode**

```
LSW: mmmmm mmmmm mmmmm mmmmm
MSW: 0111 00cn dfaa addr
```

**Description**

If the condition is true, then move the 32-bit value referenced by mem32 to the floating-point register indicated by MRa.

```
if (CNDF == TRUE) MRa = [mem32];
```

CNDF is one of the following conditions:

| Encode <sup>(1)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(2)</sup> | Unconditional with flag modification | None                |

(1) Values not shown are reserved.

(2) This is the default operation if no CNDF field is specified. This condition will allow the ZF and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

```
if (CNDF == UNCF)
{
    NF = MRa(31);
    ZF = 0;
    if (MRa(30:23) == 0) { ZF = 1; NF = 0; }
}
else No flags modified;
```

**Pipeline**

This is a single-cycle instruction.

**MMOV32 MRa, mem32 {, CNDF}** (continued)

**Conditional 32-Bit Move**
**Example**

```

; Given A, B, X, M1 and M2 are 32-bit floating-point

| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(2)</sup> | Unconditional with flag modification | None                |

(1) Values not shown are reserved.

(2) This is the default operation if no CNDF field is specified. This condition will allow the ZF, and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

```
if (CNDF == UNCF)
{
  NF = MRa(31); ZF = 0;
  if (MRa(30:23) == 0) {ZF = 1; NF = 0;}
}
else No flags modified;
```

**Pipeline**

This is a single-cycle instruction.

**MMOV32 MRa, MRb {, CNDF}** (continued)

**Conditional 32-Bit Move**
**Example**

```

; Given: X = 8.0
;         Y = 7.0
;         A = 2.0
;         B = 5.0
; _ClaTask1
MMOV32 MR3, @_X      ; MR3 = X = 8.0
MMOV32 MR0, @_Y      ; MR0 = Y = 7.0
MMAXF32 MR3, MR0     ; ZF = 0, NF = 0, MR3 = 8.0
MMOV32 MR1, @_A, GT  ; true, MR1 = A = 2.0
MMOV32 MR1, @_B, LT  ; false, does not load MR1
MMOV32 MR2, MR1, GT  ; true, MR2 = MR1 = 2.0
MMOV32 MR2, MR0, LT  ; false, does not load MR2
MSTOP

```

**MMOV32 MSTF, mem32****Move 32-Bit Value from Memory to the MSTF Register****Operands**

|       |                               |
|-------|-------------------------------|
| MSTF  | CLA status register           |
| mem32 | 32-bit source memory location |

**Opcode**

```
LSW: rrrrrr rrrrrr rrrrrr rrrrrr
MSW: 0111 0111 0000 addr
```

**Description**

Move from memory to the CLA's status register MSTF. This instruction is most useful when nesting function calls (via MCCNDD).

```
MSTF = [mem32];
```

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF  | ZF  | NF  | LUF | LVF |
|----------|-----|-----|-----|-----|-----|
| Modified | Yes | Yes | Yes | Yes | Yes |

Loading the status register will overwrite all flags and the RPC field. The MEALLOW field is not affected.

**Pipeline**

This is a single-cycle instruction.

## MMOVD32 MRa, mem32

### Move 32-Bit Value from Memory with Data Copy

#### Operands

|       |   |
|-------|---|
| MRa   | CLA floating-point register (MR0 to MR3)                                    |
| mem32 | 32-bit memory location accessed using one of the available addressing modes |

#### Opcode

```
LSW: rrrrrr rrrrrr rrrrrr rrrrrr
MSW: 0111 0100 00aa addr
```

#### Description

Move the 32-bit value referenced by mem32 to the floating-point register indicated by MRa.

```
MRa = [mem32];
[mem32+2] = [mem32];
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

```
NF = MRa(31);
ZF = 0;
if(MRa(30:23) == 0) { ZF = 1; NF = 0; }
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; sum = X0*B0 + X1*B1 + X2*B2 + Y1*A1 + Y2*B2
;
;   X2 = X1
;   X1 = X0
;   Y2 = Y1
;   Y1 = sum
;

## MMOVF32 MRa, #32F

### Load the 32-Bits of a 32-Bit Floating-Point Register

#### Operands

This instruction is an alias for MMOVIZ and MMOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

```
MMOVIZ MRa, #16FHiHex MMOVXI MRa, #16FLoHex
```

|      |  |
|------|--|
| MRa  | CLA floating-point destination register (MR0 to MR3)               |
| #32F | immediate float value represented in floating-point representation |

#### Opcode

```
LSW: I I I I I I I I I I I I I I (opcode of MMOVIZ MRa, #16FHiHex)
MSW: 0111 1000 0100 00aa
LSW: I I I I I I I I I I I I I I (opcode of MMOVXI MRa, #16FLoHex)
MSW: 0111 1000 1000 00aa
```

#### Description

Note: This instruction accepts the immediate operand only in floating-point representation. To specify the immediate value as a hex value (IEEE 32-bit floating-point format) use the MOVI32 MRa, #32FHex instruction.

Load the 32-bits of MRa with the immediate float value represented by #32F.

#32F is a float value represented in floating-point representation. The assembler will only accept a float value represented in floating-point representation. That is, 3.0 can only be represented as #3.0. #0x40400000 will result in an error.

```
MRa = #32F;
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

Depending on #32FH, this instruction takes one or two cycles. If all of the lower 16-bits of the IEEE 32-bit floating-point format of #32F are zeros, then the assembler will convert MMOVF32 into only MMOVIZ instruction. If the lower 16-bits of the IEEE 32-bit floating-point format of #32F are not zeros, then the assembler will convert MMOVF32 into MMOVIZ and MMOVXI instructions.

#### Example

```
MMOVF32 MR1, #3.0 ; MR1 = 3.0 (0x40400000)
                  ; Assembler converts this instruction as
                  ; MMOVIZ MR1, #0x4040
MMOVF32 MR2, #0.0 ; MR2 = 0.0 (0x00000000)
                  ; Assembler converts this instruction as
                  ; MMOVIZ MR2, #0x0
MMOVF32 MR3, #12.265 ; MR3 = 12.625 (0x41443D71)
                    ; Assembler converts this instruction as
                    ; MMOVIZ MR3, #0x4144
                    ; MMOVXI MR3, #0x3D71
```

**MMOVI16 MARx, #16I****Load the Auxiliary Register with the 16-Bit Immediate Value****Operands**

|      |                                 |
|------|---------------------------------|
| MARx | Auxiliary register MAR0 or MAR1 |
| #16I | 16-bit immediate value          |

**Opcode**

```
LSW: IIII IIII IIII IIII (opcode of MMOVI16 MAR0, #16I)
MSW: 0111 1111 1100 0000
LSW: IIII IIII IIII IIII (opcode of MMOVI16 MAR1, #16I)
MSW: 0111 1111 1110 0000
```

**Description**

Load the auxiliary register, MAR0 or MAR1, with a 16-bit immediate value. Refer to the pipeline section for important information regarding this instruction.

```
MARx = #16I;
```

**Flags**

This instruction does not modify flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

This is a single-cycle instruction. The immediate load of MAR0 or MAR1 will occur in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing will occur in the D2 phase of the pipeline. Therefore the following applies when loading the auxiliary registers:

- **I1 and I2**

The two instructions following MMOVI16 will use MAR0/MAR1 before the update occurs. Thus these two instructions will use the old value of MAR0 or MAR1.

- **I3**

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus I3 cannot use the auxiliary register or there will be a conflict. In the case of a conflict, the update due to address-mode post increment will win and the auxiliary register will not be updated with #\_X.

- **I4**

Starting with the 4th instruction MAR0 or MAR1 will be the new value loaded with MMOVI16.

```
; Assume MAR0 is 50 and #_X is 20
MMOVI16 MAR0, #_X          ; Load MAR0 with address of X (20)
<Instruction 1>             ; I1 Will use the old value of MAR0 (50)
<Instruction 2>             ; I2 Will use the old value of MAR0 (50)
<Instruction 3>             ; I3 Cannot use MAR0
<Instruction 4>             ; I4 Will use the new value of MAR0 (20)
<Instruction 5>             ; I5
....
```

**MMOVI16 MARx, #16I** (continued)

**Load the Auxiliary Register with the 16-Bit Immediate Value**
**Table 7-18. Pipeline Activity For MMOVI16 MAR0/MAR1, #16I**

| Instruction       | F1      | F2      | D1      | D2      | R1      | R2      | E       | W |
|-------------------|---------|---------|---------|---------|---------|---------|---------|---|
| MMOVI16 MAR0, #_X | MMOVI16 |         |         |         |         |         |         |   |
| I1                | I1      | MMOVI16 |         |         |         |         |         |   |
| I2                | I2      | I1      | MMOVI16 |         |         |         |         |   |
| I3                | I3      | I2      | I1      | MMOVI16 |         |         |         |   |
| I4                | I4      | I3      | I2      | I1      | MMOVI16 |         |         |   |
| I5                | I5      | I4      | I3      | I2      | I1      | MMOVI16 |         |   |
| I6                | I6      | I5      | I4      | I3      | I2      | I1      | MMOVI16 |   |

**MMOVI32 MRa, #32FHex****Load the 32-Bits of a 32-Bit Floating-Point Register with the Immediate****Operands**

|         |   |
|---------|---|
| MRa     | floating-point register (MR0 to MR3)  |
| #32FHex | A 32-bit immediate value that represents an IEEE 32-bit floating-point value. |

This instruction is an alias for MMOVIZ and MMOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

```
MMOVIZ MRa, #16FHiHex
MMOVXI MRa, #16FLoHex
```

**Opcode**

```
LSW: IIII IIII IIII IIII (opcode of MMOVIZ MRa, #16FHiHex)
MSW: 0111 1000 0100 00aa
LSW: IIII IIII IIII IIII (opcode of MMOVXI MRa, #16FLoHex)
MSW: 0111 1000 1000 00aa
```

**Description**

**Note:** This instruction only accepts a hex value as the immediate operand. To specify the immediate value with a floating-point representation use the MMOVF32 MRa, #32F instruction.

Load the 32-bits of MRa with the immediate 32-bit hex value represented by #32Fhex.

#32Fhex is a 32-bit immediate hex value that represents the IEEE 32-bit floating-point value of a floating-point number. The assembler will only accept a hex immediate value. That is, 3.0 can only be represented as #0x40400000. #3.0 will result in an error.

```
MRa = #32FHex;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

Depending on #32FHex, this instruction takes one or two cycles. If all of the lower 16-bits of #32FHex are zeros, then assembler will convert MOVI32 to the MMOVIZ instruction. If the lower 16-bits of #32FHex are not zeros, then assembler will convert MOVI32 to a MMOVIZ and a MMOVXI instruction.

**Example**

```
MOVI32 MR1, #0x40400000 ; MR1 = 0x40400000
                          ; Assembler converts this instruction as
                          ; MMOVIZ MR1, #0x4040
MOVI32 MR2, #0x00000000 ; MR2 = 0x00000000
                          ; Assembler converts this instruction as
                          ; MMOVIZ MR2, #0x0
MOVI32 MR3, #0x40004001 ; MR3 = 0x40004001
                          ; Assembler converts this instruction as
                          ; MMOVIZ MR3, #0x4000
                          ; MMOVXI MR3, #0x4001
MOVI32 MR0, #0x00004040 ; MR0 = 0x00004040
                          ; Assembler converts this instruction as
                          ; MMOVIZ MR0, #0x0000
                          ; MMOVXI MR0, #0x4040
```

***MMOVI32 MRa, #32FHex*** (continued)

***Load the 32-Bits of a 32-Bit Floating-Point Register with the Immediate***

**MMOVIZ MRa, #16FHi****Load the Upper 16-Bits of a 32-Bit Floating-Point Register****Operands**

|        |   |
|--------|---|
| MRa    | floating-point register (MR0 to MR3)  |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |

**Opcode**

```
LSW: I I I I I I I I I I I I I I I I
MSW: 0111 1000 0100 00aa
```

**Description**

Load the upper 16-bits of MRa with the immediate value #16FHi and clear the low 16-bits of MRa.

#16FHiHex is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. The assembler will only accept a decimal or hex immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

By itself, MMOVIZ is useful for loading a floating-point register with a constant in which the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). If a constant requires all 32-bits of a floating-point register to be initialized, then use MMOVIZ along with the MMOVXI instruction.

```
MRa(31:16) = #16FHi;
MRa(15:0) = 0;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Load MR0 and MR1 with -1.5 (0xBFC00000)
MMOVIZ MR0, #0xBFC0 ; MR0 = 0xBFC00000 (1.5)
MMOVIZ MR1, #-1.5 ; MR1 = -1.5 (0xBFC00000)
; Load MR2 with pi = 3.141593 (0x40490FDB)
MMOVIZ MR2, #0x4049 ; MR2 = 0x40490000
MMOVXI MR2, #0x0FDB ; MR2 = 0x40490FDB
```

**Operands**

|       |  |
|-------|--|
| MRa   | CLA floating-point destination register (MR0 to MR3) |
| mem16 | 16-bit source memory location                        |

**Opcode**

```
LSW: rrrrrm rrrrrm rrrrrm rrrrrm
MSW: 0111 0101 10aa addr
```

**Description**

Move the 16-bit value referenced by mem16 to the floating-point register indicated by MRa.

```
MRa(31:16) = 0;
MRa(15:0) = [mem16];
```

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

```
NF = 0;
if (MRa(31:0) == 0) { ZF = 1; }
```

**Pipeline**

This is a single-cycle instruction.

**MMOVXI MRa, #16FLoHex****Move Immediate to the Low 16-Bits of a Floating-Point Register****Operands**

|           |  |
|-----------|--|
| MRa       | CLA floating-point register (MR0 to MR3)   |
| #16FLoHex | A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits will not be modified. |

**Opcode**

```
LSW: IIII IIII IIII IIII
MSW: 0111 1000 1000 00aa
```

**Description**

Load the low 16-bits of MRa with the immediate value #16FLoHex. #16FLoHex represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits of MRa will not be modified. MMOVXI can be combined with the MMOVIZ instruction to initialize all 32-bits of a MRa register.

```
MRa(15:0) = #16FLoHex;
MRa(31:16) = Unchanged;
```

**Flags**

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|

## MMPYF32 MRa, MRb, MRc

### 32-Bit Floating-Point Multiply

#### Operands

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |
| MRc | CLA floating-point source register (MR0 to MR3)      |

#### Opcode

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 0000 0000
```

#### Description

Multiply the contents of two floating-point registers.

```
MRa = MRb * MRc;
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Calculate Num/Den using a Newton-Raphson algorithm for 1/Den
; Ye = Estimate(1/X)
; Ye = Ye*(2.0 - Ye*X)
; Ye = Ye*(2.0 - Ye*X)
;
_Cla1Task1:
  MMOV32    MR1, @ Den      ; MR1 = Den

**MMPYF32 MRa, #16FHi, MRb****32-Bit Floating-Point Multiply****Operands**

|        |   |
|--------|---|
| MRa    | CLA floating-point destination register (MR0 to MR3)  |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |
| MRb    | CLA floating-point source register (MR0 to MR3)   |

**Opcode**

```
LSW: I I I I I I I I I I I I I I I I
MSW: 0 1 1 1 0 1 1 1 1 0 0 0 b b a a
```

**Description**

Multiply MRb with the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

```
MRa = MRb * #16FHi:0;
```

This instruction can also be written as MMPYF32 MRa, MRb, #16FHi.

**Flags**

This instruction modifies the following flags in the MSTF register:.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**Example 1**

```
; Same as example 2 but #16FHi is represented in float
MMOVIZ MR3, #2.0 ; MR3 = 2.0 (0x40000000)
MMPYF32 MR0, #3.0, MR3 ; MR0 = 3.0 * MR3 = 6.0 (0x40C00000)
MMOV32 @_X, MR0 ; Save the result in variable X
```

**Example 2**

```
; Same as example 1 but #16FHi is represented in Hex
MMOVIZ MR3, #2.0 ; MR3 = 2.0 (0x40000000)
MMPYF32 MR0, #0x4040, MR3 ; MR0 = 0x4040 * MR3 = 6.0 (0x40C00000)
MMOV32 @_X, MR0 ; Save the result in variable X
```

**MNEGF32 MRa, MRb{, CNDF}****Conditional Negation****Operands**

|      |  |
|------|--|
| MRa  | CLA floating-point destination register (MR0 to MR3) |
| MRb  | CLA floating-point source register (MR0 to MR3)      |
| CNDF | condition tested                                     |

**Opcode**

```
LSW: 0000 0000 cndf bbaa
MSW: 0111 1010 1000 0000
```

**Description**

```
if (CNDF == true) {MRa = - MRb; }
else {MRa = MRb; }
```

CNDF is one of the following conditions:

| Encode <sup>(1)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(2)</sup> | Unconditional with flag modification | None                |

(1) Values not shown are reserved.

(2) This is the default operation if no CNDF field is specified. This condition will allow the ZF, and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

**Pipeline**

This is a single-cycle instruction.

**MNEGF32 MRa, MRb{, CNDF}** (continued)

**Conditional Negation**
**Example 1**

```

; Show the basic operation of MNEGF32
;
MMOVIZ   MR0, #5.0      ; MR0 = 5.0 (0x40A00000)
MMOVIZ   MR1, #4.0      ; MR1 = 4.0 (0x40800000)
MMOVIZ   MR2, #-1.5     ; MR2 = -1.5 (0xBFC00000)
MMPYF32  MR3, MR1, MR2  ; MR3 = -6.0
MMPYF32  MR0, MR0, MR1  ; MR0 = 20.0
MMOVIZ   MR1, #0.0
MCMPIF32 MR3, MR1      ; NF = 1
MNEGF32  MR3, MR3, LT   ; if NF = 1, MR3 = 6.0
MCMPIF32 MR0, MR1      ; NF = 0
MNEGF32  MR0, MR0, GEQ  ; if NF = 0, MR0 = -20.0

```

**Example 2**

```

; Calculate Num/Den using a Newton-Raphson algorithm for 1/Den
; Ye = Estimate(1/X)
; Ye = Ye*(2.0 - Ye*X)
; Ye = Ye*(2.0 - Ye*X)
;
; ClalTask1:
; MMOV32   MR1, @_Den      ; MR1 = Den
; MEINVF32 MR2, MR1       ; MR2 = Ye = Estimate(1/Den)
; MMPYF32  MR3, MR2, MR1  ; MR3 = Ye*Den
; MSUBF32  MR3, #2.0, MR3 ; MR3 = 2.0 - Ye*Den

**MNOP****No Operation****Operands**

|      |   |
|------|---|
| none | This instruction does not have any operands |
|------|---|

**Opcode**

|                          |
|--------------------------|
| LSW: 0000 0000 0000 0000 |
| MSW: 0111 1111 1010 0000 |

**Description**

Do nothing. This instruction is used to fill required pipeline delay slots when other instructions are not available to fill the slots.

**Flags**

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

This is a single-cycle instruction.

**Example**

```

; X is an array of 32-bit floating-point values
; Find the maximum value in an array X
; and store it in Result
;
_ClalTask1:
  MMOV16    MAR1, #_X          ; Start address
  MUI16TOF32 MR0, @_len       ; Length of the array
  MNOP      ; delay for MAR1 load
  MNOP      ; delay for MAR1 load
  MMOV32    MR1, *MAR1[2]++   ; MR1 = X0
LOOP
  MMOV32    MR2, *MAR1[2]++   ; MR2 = next element
  MMAXF32   MR1, MR2          ; MR1 = MAX(MR1, MR2)
  MADD32    MR0, MR0, #-1.0   ; Decrement the counter
  MCMPF32   MR0 #0.0          ; Set/clear flags for MBCNDD
  MNOP      ; Too late to affect MBCNDD
  MNOP      ; Too late to affect MBCNDD
  MNOP      ; Too late to affect MBCNDD
  MBCNDD    LOOP, NEQ         ; Branch if not equal to zero
  MMOV32    @_Result, MR1     ; Always executed
  MNOP      ; Pad to separate MBCNDD and MSTOP
  MNOP      ; Pad to separate MBCNDD and MSTOP
  MSTOP     ; End of task

```

## MOR32 MRa, MRb, MRc

### Bitwise OR

#### Operands

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |
| MRc | CLA floating-point source register (MR0 to MR3)      |

#### Opcode

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 1000 0000
```

#### Description

Bitwise OR of MRb with MRc.

```
MARa(31:0) = MARb(31:0) OR MRc(31:0);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVIZ MR0, #0x5555 ; MR0 = 0x5555AAAA
MMOVXI MR0, #0xAAAA
MMOVIZ MR1, #0x5432 ; MR1 = 0x5432FEDC
MMOVXI MR1, #0xFEDC
; 0101 OR 0101 = 0101 (5)
; 0101 OR 0100 = 0101 (5)
; 0101 OR 0011 = 0111 (7)
; 0101 OR 0010 = 0111 (7)
; 1010 OR 1111 = 1111 (F)
; 1010 OR 1110 = 1110 (E)
; 1010 OR 1101 = 1111 (F)
; 1010 OR 1100 = 1110 (E)
MOR32 MR2, MR1, MR0 ; MR3 = 0x5555FEFE
```

**MRCNDD {CNDF}****Return Conditional Delayed****Operands**

|      |                     |
|------|---------------------|
| CNDF | optional condition. |
|------|---------------------|

**Opcode**

|                          |
|--------------------------|
| LSW: 0000 0000 0000 0000 |
| MSW: 0111 1001 1010 cndf |

**Description**

If the specified condition is true, then the RPC field of MSTF is loaded into MPC and fetching continues from that location. Otherwise program fetches will continue without the return.

Please refer to the pipeline section for important information regarding this instruction.

|   |
|---|
| <code>if (CNDF == TRUE) MPC = RPC;</code> |
|---|

CNDF is one of the following conditions:

| Encode <sup>(1)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(2)</sup> | Unconditional with flag modification | None                |

(1) Values not shown are reserved.

(2) This is the default operation if no CNDF field is specified. This condition will allow the ZF and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

**Flags**

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

The MRCNDD instruction by itself is a single-cycle instruction. As shown in [Table 7-19](#), for each return 6 instruction slots are executed; three before the return instruction (d5-d7) and three after the return instruction (d8-d10). The total number of cycles for a return taken or not taken depends on the usage of these slots. That is, the number of cycles depends on how many slots are filled with a MNOP as well as which slots are filled. The effective number of cycles for a return can, therefore, range from 1 to 7 cycles. The number of cycles for a return taken may not be the same as for a return not taken.

**MRCNDD {CNDF}** (continued)

**Return Conditional Delayed**

Referring to the following code fragment and the pipeline diagrams in [Table 7-19](#) and [Table 7-20](#), the instructions before and after MRCNDD have the following properties:

```

;
;
<Instruction 1> ; I1 Last instruction that can affect flags for
; the MCCNDD operation
<Instruction 2> ; I2 Cannot be stop, branch, call or return
<Instruction 3> ; I3 Cannot be stop, branch, call or return
<Instruction 4> ; I4 Cannot be stop, branch, call or return
MCCNDD _func, NEQ ; Call to func if not equal to zero
; Three instructions after MCCNDD are always
; executed whether the call is taken or not
<Instruction 5> ; I5 Cannot be stop, branch, call or return
<Instruction 6> ; I6 Cannot be stop, branch, call or return
<Instruction 7> ; I7 Cannot be stop, branch, call or return
<Instruction 8> ; I8 The address of this instruction is saved
; in the RPC field of the MSTF register.
; Upon return this value is loaded into MPC
; and fetching continues from this point.

<Instruction 9> ; I9
<Instruction 10> ; I10
....
....
_func:
<Destination 1> ; d1 Can be any instruction
<Destination 2> ; d2
<Destination 3> ; d3
<Destination 4> ; d4 Last instruction that can affect flags for
; the MRCNDD operation
<Destination 5> ; d5 Cannot be stop, branch, call or return
<Destination 6> ; d6 Cannot be stop, branch, call or return
<Destination 7> ; d7 Cannot be stop, branch, call or return

; executed whether the return is taken or not
<Destination 8> ; d8 Cannot be stop, branch, call or return
<Destination 9> ; d9 Cannot be stop, branch, call or return
<Destination 10> ; d10 Cannot be stop, branch, call or return
<Destination 11> ; d11
<Destination 12> ; d12
....
....
MSTOP
....

```

- **d4**
  - d4 is the last instruction that can effect the CNDF flags for the MRCNDD instruction. The CNDF flags are tested in the D2 phase of the pipeline. That is, a decision is made whether to return or not when MRCNDD is in the D2 phase.
  - There are no restrictions on the type of instruction for d4.
- **d5, d6 and d7**
  - The three instructions proceeding MRCNDD can change MSTF flags but will have no effect on whether the MRCNDD instruction makes the return or not. This is because the flag modification will occur after the D2 phase of the MRCNDD instruction.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD or MRCNDD.
- **d8, d9 and d10**
  - The three instructions following MRCNDD are always executed irrespective of whether the return is taken or not.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD or MRCNDD.

## MSETC BGINTM

### Set Background Task Interrupt Mask

#### Operands

|      |   |
|------|---|
| none | This instruction does not have any operands |
|------|---|

#### Opcode

|                          |
|--------------------------|
| LSW: 0000 0000 0000 0000 |
| MSW: 0111 1111 0101 0000 |

#### Description

This instruction will set the background task interrupt mask (BGINTM) bit in the MSTSBGRND register, making any code thereafter un-interruptible. No other higher priority task will be able to interrupt the background task until the BGINTM is cleared. This instruction sets the BGINTM bit at the end of its D2 phase.

Note: This instruction does not require the MEALLOW bit to be asserted before, or de-asserted after, setting BGINTM.

#### Flags

This instruction does not modify the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

#### Example

|              |   |                                  |
|--------------|---|----------------------------------|
| MSETC BGINTM | ; | Set the MSTSBGRND.BGINTM bit     |
|              | ; | to prevent any other tasks from  |
|              | ; | interrupting the background task |

#### See also

## MSETFLG FLAG, VALUE

### Set or Clear Selected Floating-Point Status Flags

#### Operands

|       |  |
|-------|--|
| FLAG  | 8-bit mask indicating which floating-point status flags to change. |
| VALUE | 8-bit mask indicating the flag value: 0 or 1.                      |

#### Opcode

```
LSW: FFFF FFFF VVVV VVVV
MSW: 0111 1001 1100 0000
```

#### Description

The MSETFLG instruction is used to set or clear selected floating-point status flags in the MSTF register. The FLAG field is an 11-bit value that indicates which flags will be changed. That is, if a FLAG bit is set to 1 it indicates that flag will be changed; all other flags will not be modified. The bit mapping of the FLAG field is:

| 9          | 8        | 7 | 6  | 5        | 4 | 3  | 2  | 1   | 0   |
|------------|----------|---|----|----------|---|----|----|-----|-----|
| RNDF<br>32 | Reserved |   | TF | Reserved |   | ZF | NF | LUF | LVF |

The VALUE field indicates the value the flag should be set to: 0 or 1.

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF  | ZF  | NF  | LUF | LVF |
|----------|-----|-----|-----|-----|-----|
| Modified | Yes | Yes | Yes | Yes | Yes |

Any flag can be modified by this instruction. The MEALLOW and RPC fields cannot be modified with this instruction.

#### Pipeline

This is a single-cycle instruction.

#### Example

To make it easier and legible, the assembler accepts a FLAG=VALUE syntax for the MSTFLG operation as shown below:

```
MSETFLG RNDF32=0, TF=0, NF=1; FLAG = 11000100; VALUE = 00XXX1XX;
```

## MSTOP

### Stop Task

#### Operands

|      |   |
|------|---|
| none | This instruction does not have any operands |
|------|---|

#### Opcode

|      |      |      |      |      |
|------|------|------|------|------|
| LSW: | 0000 | 0000 | 0000 | 0000 |
| MSW: | 0111 | 1111 | 1000 | 0000 |

#### Description

The MSTOP instruction must be placed to indicate the end of each task. In addition, placing MSTOP in unused memory locations within the CLA program RAM can be useful for debugging and preventing run away CLA code. When MSTOP enters the D2 phase of the pipeline, the MIRUN flag for the task is cleared and the associated interrupt is flagged in the PIE vector table.

There are three special cases that can occur when single-stepping a task such that the MPC reaches the MSTOP instruction.

1. If you are single-stepping or halted in "task A" and "task B" comes in before the MPC reaches the MSTOP, then "task B" will start if you continue to step through the MSTOP instruction. Basically if "task B" is pending before the MPC reaches MSTOP in "task A" then there is no issue in "task B" starting and no special action is required.
2. In this case you have single-stepped or halted in "task A" and the MPC has reached the MSTOP with no tasks pending. If "task B" comes in at this point, it will be flagged in the MIFR register but it may or may not start if you continue to single-step through the MSTOP instruction of "task A". It depends on exactly when the new task comes in. To reliably start "task B" perform a soft reset and reconfigure the MIER bits. Once this is done, you can start single-stepping "task B".
3. Case 2 can be handled slightly differently if there is control over when "task B" comes in (for example using the IACK instruction to start the task). In this case you have single-stepped or halted in "task A" and the MPC has reached the MSTOP with no tasks pending. Before forcing "task B", run free to force the CLA out of the debug state. Once this is done you can force "task B" and continue debugging.

#### Restrictions

The MSTOP instruction cannot be placed 3 instructions before or after a [MBCNDD](#), [MCCNDD](#), or [MRCNDD](#) instruction.

#### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**MSTOP** (continued)

**Stop Task**
**Pipeline**

This is a single-cycle instruction. [Table 7-21](#) shows the pipeline behavior of the MSTOP instruction. The MSTOP instruction cannot be placed with 3 instructions of a [MBCNDD](#), [MCCNDD](#), or [MRCNDD](#) instruction.

**Table 7-21. Pipeline Activity For MSTOP**

| Instruction                         | F1    | F2    | D1    | D2    | R1 | R2 | E  | W  |
|-------------------------------------|-------|-------|-------|-------|----|----|----|----|
| I1                                  | I1    |       |       |       |    |    |    |    |
| I2                                  | I2    | I1    |       |       |    |    |    |    |
| I3                                  | I3    | I2    | I1    |       |    |    |    |    |
| MSTOP                               | MSTOP | I3    | I2    | I1    |    |    |    |    |

## MSUB32 MRa, MRb, MRc

### 32-Bit Integer Subtraction

#### Operands

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point destination register (MR0 to MR3) |
| MRc | CLA floating-point destination register (MR0 to MR3) |

#### Opcode

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 1110 0000
```

#### Description

32-bit integer addition of MRb and MRc.

```
MARa(31:0) = MARb(31:0) - MRc(31:0);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified as follows:

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Given A = (int32)1
; B = (int32)2
; C = (int32)-7
;
;
; Calculate Y2 = A - B - C
;
_Cla1Task3:
  _MMOV32 MR0, @_A      ; MR0 = 1 (0x00000001)
  _MMOV32 MR1, @_B      ; MR1 = 2 (0x00000002)
  _MMOV32 MR2, @_C      ; MR2 = -7 (0xFFFFFFFF9)
  _MSUB32 MR3, MR0, MR1 ; A + B
  _MSUB32 MR3, MR3, MR2 ; A + B + C = 6 (0x00000006)
  _MMOV32 @_y2, MR3     ; Store y2
  _MSTOP                ; End of task
```

**MSUBF32 MRa, MRb, MRc****32-Bit Floating-Point Subtraction****Operands**

|     |   |
|-----|---|
| MRa | CLA floating-point destination register (MR0 to R1) |
| MRb | CLA floating-point source register (MR0 to R1)      |
| MRc | CLA floating-point source register (MR0 to R1)      |

**Opcode**

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 0100 0000
```

**Description**

Subtract the contents of two floating-point registers

```
MRa = MRb - MRc;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Given A, B and C are 32-bit floating-point numbers
; Calculate Y2 = A + B - C
;
_Cla1Task5:
  MMOV32  MR0, @_A      ; Load MR0 with A

## MSUBF32 MRa, #16FHi, MRb

### 32-Bit Floating-Point Subtraction

#### Operands

|        |   |
|--------|---|
| MRa    | CLA floating-point destination register (MR0 to R1)   |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |
| MRb    | CLA floating-point source register (MR0 to R1)  |

#### Opcode

```
LSW: IIII IIII IIII IIII
MSW: 0111 1000 0000 baaa
```

#### Description

Subtract MRb from the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

```
MRa = #16FHi:0 - MRb;
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Y = sqrt(X)
; Ye = Estimate(1/sqrt(X));
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Y = X*Ye
;
_Cla1Task3:
  MMOV32    MR0, @_x          ; MR0 = X
  MEISQRTF32 MR1, MR0        ; MR1 = Ye = Estimate(1/sqrt(X))
  MMOV32    MR1, @_x, EQ      ; if(X == 0.0) Ye = 0.0
  MMPYF32   MR3, MR0, #0.5    ; MR3 = X*0.5
  MMPYF32   MR2, MR1, MR3     ; MR2 = Ye*X*0.5
  MMPYF32   MR2, MR1, MR2     ; MR2 = Ye*Ye*X*0.5
  MSUBF32   MR2, #1.5, MR2    ; MR2 = 1.5 - Ye*Ye*X*0.5
  MMPYF32   MR1, MR1, MR2     ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
  MMPYF32   MR2, MR1, MR3     ; MR2 = Ye*X*0.5
  MMPYF32   MR2, MR1, MR2     ; MR2 = Ye*Ye*X*0.5
  MSUBF32   MR2, #1.5, MR2    ; MR2 = 1.5 - Ye*Ye*X*0.5
  MMPYF32   MR1, MR1, MR2     ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
  MMPYF32   MR0, MR1, MR0     ; MR0 = Y = Ye*X
  MMOV32    @_y, MR0         ; Store Y = sqrt(X)
  MSTOP
```

**32-Bit Floating-Point Subtraction with Parallel Move**
**Operands**

|       |  |
|-------|--|
| MRd   | CLA floating-point destination register (MR0 to MR3) for the MSUBF32 operation<br>MRd cannot be the same register as MRa |
| MRe   | CLA floating-point source register (MR0 to MR3) for the MSUBF32 operation  |
| MRf   | CLA floating-point source register (MR0 to MR3) for the MSUBF32 operation  |
| MRa   | CLA floating-point destination register (MR0 to MR3) for the MMOV32 operation<br>MRa cannot be the same register as MRd  |
| mem32 | 32-bit memory location accessed using one of the available addressing modes. Source for the MMOV32 operation.            |

**Opcode**

```
LSW: rrrrrr rrrrrr rrrrrr rrrrrr
MSW: 0010 ffee ddaa addr
```

**Description**

Subtract the contents of two floating-point registers and move from memory to a floating-point register.

```
MRd = MRe - MRf;
MRa = [mem32];
```

**Restrictions**

The destination register for the MSUBF32 and the MMOV32 must be unique. That is, MRa cannot be the same register as MRd.

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

The MMOV32 Instruction will set the NF and ZF flags.

**Pipeline**

Both MSUBF32 and MMOV32 complete in a single cycle.

**Example**

```
NF = MRa(31);
ZF = 0;
if(MRa(30:23) == 0) { ZF = 1; NF = 0; }
```

  MSTOP     ; End of task

```

## MTESTTF CNDF

### Test MSTF Register Flag Condition

#### Operands

|      |                                       |
|------|---------------------------------------|
| CNDF | condition to test based on MSTF flags |
|------|---------------------------------------|

#### Opcode

```
LSW: 0000 0000 0000 cndf
MSW: 0111 1111 0100 0000
```

#### Description

Test the CLA floating-point condition and if true, set the MSTF[TF] flag. If the condition is false, clear the MSTF[TF] flag. This is useful for temporarily storing a condition for later use.

```
if (CNDF == true) TF = 1;
else TF = 0;
```

CNDF is one of the following conditions:

| Encode <sup>(1)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |

## MUI32TOF32 MRa, mem32

### Convert Unsigned 32-Bit Integer to 32-Bit Floating-Point Value

#### Operands

|       |   |
|-------|---|
| MRa   | CLA floating-point destination register (MR0 to MR3)                        |
| mem32 | 32-bit memory location accessed using one of the available addressing modes |

#### Opcode

```
LSW: rrrrrr rrrrrr rrrrrr rrrrrr
MSW: 0111 0100 10aa addr
```

#### Description

```
MRa = UI32TOF32[mem32];
```

#### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Given x2, m2 and b2 are Uint32 numbers:
;
; x2 = Uint32(2) = 0x00000002
; m2 = Uint32(1) = 0x00000001
; b2 = Uint32(3) = 0x00000003
;
; Calculate y2 = x2 * m2 + b2
;
_Cla1Task1:
  MUI32TOF32 MR0, @_m2      ; MR0 = 1.0 (0x3F800000)
  MUI32TOF32 MR1, @_x2      ; MR1 = 2.0 (0x40000000)
  MUI32TOF32 MR2, @_b2      ; MR2 = 3.0 (0x40400000)
  MPPYF32 MR3, MR0, MR1     ; M*X
  MADD32 MR3, MR2, MR3      ; Y=MX+B = 5.0 (0x40A00000)
  MF32TOUI32 MR3, MR3       ; Y = Uint32(5.0) = 0x00000005
  MMOV32 @_y2, MR3         ; store result
  MSTOP                     ; end of task
```

## MXOR32 MRa, MRb, MRc

### Bitwise Exclusive Or

#### Operands

|     |  |
|-----|--|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |
| MRc | CLA floating-point source register (MR0 to MR3)      |

#### Opcode

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 1010 0000
```

#### Description

Bitwise XOR of MRb with MRc.

```
MARa(31:0) = MARb(31:0) XOR MRc(31:0);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVIZ MR0, #0x5555 ; MR0 = 0x5555AAAA
MMOVXI MR0, #0xAAAA
MMOVIZ MR1, #0x5432 ; MR1 = 0x5432FEDC
MMOVXI MR1, #0xFEDC
; 0101 XOR 0101 = 0000 (0)
; 0101 XOR 0100 = 0001 (1)
; 0101 XOR 0011 = 0110 (6)
; 0101 XOR 0010 = 0111 (7)
; 1010 XOR 1111 = 0101 (5)
; 1010 XOR 1110 = 0100 (4)
; 1010 XOR 1101 = 0111 (7)
; 1010 XOR 1100 = 0110 (6)
MXOR32 MR2, MR1, MR0 ; MR3 = 0x01675476
```

## 7.7 Software

### 7.7.1 CLA Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
 C2000Ware\_VERSION#/driverlib/f28003x/examples/cla

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

#### 7.7.1.1 CLA $\$ \text{arcsine}(x) \$$ Using a Lookup Table (*cla\_asin\_cpu01*)

FILE: cla\_ex1\_asin.c

In this example, Task 1 of the CLA will calculate the arcsine of an input argument in the range (-1.0 to 1.0) using a lookup table.

Note that since this example does not use background CLA task, the compile flag `cla_background_task` is turned off for this project. Set this flag as on to enable background CLA task. The option is available in Project Properties -> C2000 Build -> C2000 Compiler -> Advanced Options -> Runtime Model Options.

##### *Memory Allocation*

- CLA1 Math Tables (RAMLS1)
  - CLAasinTable - Lookup table
- CLA1 to CPU Message RAM
  - fResult - Result of the lookup algorithm
- CPU to CLA1 Message RAM
  - fVal - Sample input to the lookup algorithm

##### *Watch Variables*

- fVal - Argument to task 1
- fResult - Result of  $\$ \text{arcsin}(fVal) \$$

#### 7.7.1.2 CLA $\$ \text{arctangent}(x) \$$ Using a Lookup Table (*cla\_atan\_cpu01*)

FILE: cla\_ex2\_atan.c

In this example, Task 1 of the CLA will calculate the arctangent of an input argument using a lookup table.

Note that since this example does not use background CLA task, the compile flag `cla_background_task` is turned off for this project. Set this flag as on to enable background CLA task. The option is available in Project Properties -> C2000 Build -> C2000 Compiler -> Advanced Options -> Runtime Model Options.

##### *Memory Allocation*

- CLA1 Math Tables (RAMLS1)
  - CLAatan2Table - Lookup table
- CLA1 to CPU Message RAM
  - fResult - Result of the lookup algorithm
- CPU to CLA1 Message RAM
  - fNum - Numerator of sample input
  - fDen - Denominator of sample input

##### *Watch Variables*

- fVal - Argument to task 1
- fResult - Result of  $\$ \text{arctan}(fVal) \$$

### 7.7.1.3 CLA Background Nesting Task

FILE: cla\_ex3\_background\_nesting\_task.c

This example configures CLA task 1 to be triggered by EPWM1 running at 2 Hz (period = 0.5s). A background task is configured to be triggered by CPU timer running at .5 Hz (period = 2s). CLA task 1 toggles LED1 at the start and end of the task and the background task toggles LED2 at the start and end of the task. Background task will be preempted by Task1 and hence LED1 will be toggling even while LED2 is ON.

Note that the compile flag `cla_background_task` is turned on in this project. Enabling background task adds additional context save/restore cycles during task switching thus increasing the overall trigger-to-task latency. If the application does not use the background CLA task, it is recommended to turn this flag off for better performance. The option is available in Project Properties -> C2000 Build -> C2000 Compiler -> Advanced Options -> Runtime Model Options.

#### External Connections

- None

#### Watch Variables

- None

### 7.7.1.4 Controlling PWM Output Using CLA

FILE: cla\_ex4\_pwm\_control.c

This example showcases how to update PWM signal output using CLA. EPWM1 is configured to generate complementary signals on both of its channels of fixed frequency 100 kHz. EPWM4 is configured to trigger a periodic CLA control task of frequency 10 kHz. The CLA task implements a very simple logic to vary the duty of the EPWM1 outputs by increasing it by 0.1 in every iteration and maintaining it in the range of 0.1-0.9. For actual use cases, the control logic could be modified to much more complex depending upon the application. The other CLA task (CLA task 8) is triggered by software at beginning to initialize the CLA global variables

#### External Connections

- Observe GPIO0 (EPWM1A) on oscilloscope
- Observe GPIO1 (EPWM1B) on oscilloscope

#### Watch Variables

- duty

### 7.7.1.5 Just-in-time ADC Sampling with CLA

FILE: cla\_ex5\_adc\_just\_in\_time.c

This example showcases how to utilize early-interrupt feature of ADC in combination with the low interrupt response of CLA to enable faster system response and achieve high frequency control loops. EPWM1 is configured to generate a PWM output signal of frequency 1 MHz and this is also used to trigger the ADC sampling at each cycle. ADCA is configured to sample the input on Channel 0 and to generate the early interrupt at the end of S/H + offset cycles. This interrupt is used to trigger the CLA control task. The CLA task implements the control logic to update the duty of the PWM output based on reading the ADC sample data just-in-time, that is, as soon as the ADC results gets latched. The early interrupt feature and low interrupt latency of CLA allows to do some pre-processing as well before reading the ADC data and still completes updating the PWM output before the next interrupts comes in, that is, data read and PWM update is done within a 1 MHz cycle. For illustration purposes, 3-point moving average filter is used to simulate some processing and few steps of the filtering code are done before reading the ADC result which we consider as pre-processing code. The ADC interrupt offset is programmed based on the cycles consumed by the pre-processing code.

The calculation for interrupt offset value is:

ADC acquisition cycles programmed = 10 SYSCLKS

Conversion time for 12-bit data = 10.5 ADCCLKS = N = 42 SYSCLKS

CLA task trigger to first instruction in Fetch delay = 4

Let the interrupt offset value be 'x'

The code inside CLA control task before ADC read takes:

Setting up profiling gpio: 3 cycles

Pre-processing: 13 cycles

Total = 3 + 13 = 16 cycles

In order to read just-in-time, the total delay before reading ADC should be (N-2) cycles = 40 (that is,  $x + 4 + 16 = 40$ ; where  $x = 20$ )

NOTE: The optimization is off for this project and the cycles quoted above corresponds to that case.

GPIO2 is used for profiling purposes. GPIO2 is set at the beginning of CLA task 1 and is reset at the end of the task. Thus ON time of GPIO2 indicates the CLA activity. In order to validate the example functionality, observe the GPIO0 (PWM output) and GPIO2 (profiling GPIO) on CRO. The cycles difference between the rising edge of the GPIO0 and GPIO2 indicate the total delay from the time of ADC trigger to setting up of profiling GPIO inside CLA task which should be around 44 cycles (367 ns) based on the above calculation.

#### External Connections

- Provide constant DC input on ADCA0 for quick validation.
  - GND -> Should observe PWM output duty = 0.1
  - 3.3V -> Should observe PWM output duty = 0.9
  - Can also provide analog input in range 0 - 3.3V up to  $f_s / 10 = 100$  kHz for observing continuous duty variations
- Observe GPIO0 on oscilloscope
- Observe GPIO2 on oscilloscope

#### Watch Variables

- None

#### 7.7.1.6 Optimal Offloading of Control Algorithms to CLA

FILE: cla\_ex6\_cpu\_offloading.c

This example showcases how to optimally offload the control algorithms from CPU to CLA in order to meet the system requirements. In this example, two control loops are simulated, the faster one (loop1) running at 200 kHz and the slower one (loop2) running at 20 kHz. Loop1 senses the first parameter at ADCA Channel 0, runs the PI controller to achieve the target and contributes to the duty of EPWM1A output with 80% weightage. Loop2 senses the second parameter at ADCB Channel 2, runs the PI controller and contributes to the duty of EPWM1A output with 20% weightage. It is important to note that since these are just software simulated control loops but there is no actual physical process involved and hence updating the duty is not going to have any affect on sampled inputs. ADCA is configured to oversample the first parameter using SOCs 0-3 to suppress the noise and similarly ADCB is used to oversample the second parameter. EPWM4 and EPWM5 are configured to trigger the ADCA and ADCB sampling at loop1 and loop2 frequencies respectively. Once the conversion of all 4 SOCs complete, a CPU ISR or a CLA task is triggered based on the user-configuration. There is also a background task running in the main loop which disables the entire system including PWM output and the control loops when "system\_OFF" is set to 1. The system gets enabled again once "system\_OFF" is restored back to 0. By default system\_OFF is set to 0 but it's value can be updated dynamically by adding it to expression window and writing to it. DCL library is included in the project to make use of optimal PI controllers used in both the loops. User-configurable pre-defined symbol "run\_loop1\_cla" has been added to the project options in order to specify whether to run the loop1 on C28x or CLA. GPIO2 and GPIO3 are used to profile the execution of loop1 and loop2.

For run\_loop1\_cla == 0, that is, both loops running on CPU -> Loop1 Utilization = ~77.5% (measured using profiling GPIO2) -> Loop2 Utilization = ~6% (measured using profiling GPIO3) -> Background task in a while loop -> Total CPU utilization is greater than Utilization bound (UB) Hence the system is non-schedulable, lower priority task (Loop2) execution never completes (no toggling observed on GPIO3) and also background task never gets chance to execute.

For `run_loop1_cla == 1`, that is, high-frequency control loop (loop1) is offloaded to CLA while loop2 runs on CPU -> Loop1 Utilization (CLA) = ~73% -> Loop2 Utilization (CPU) = ~6% -> Total CPU utilization has come down to just ~6%. Hence, the system is perfectly schedulable, no miss happens for any of the loops and offloading of loop1 to CLA saves CPU bandwidth to execute background tasks as well.

For quick inspection of the example functionality, constant DC HIGH/LOW inputs can be provided to the analog channels instead of varying analog voltages. The target value for both the loops are set as some intermediate value, that is, 3500 corresponds to ~2.8V. Now since the sensed inputs are constant and not same as target so the controller outputs will get saturated soon to either 1 or 0. Thus the "duty" variable can take only fixed values based on the equations used in the loops. In fact, the duty output would be very intuitive, for instance if both inputs are LOW (GND), the controller will try to produce the maximum duty as the target is higher than sensed value hence the duty should be 1.0 (0.2 + 0.8) but will get saturated to 0.9 (the maximum value defined). Similarly if both inputs are made HIGH, the duty will be 0.1 (the minimum saturation value defined). The final duty table is shown below :

#### External Connections

- Observe GPIO2 (Loop1 Profiling) on oscilloscope
- Observe GPIO3 (Loop2 Profiling) on oscilloscope
- Observe GPIO0 (EPWM1A Output) on oscilloscope
- Provide constant HIGH(3.3V)/LOW(0V) on both ADCA Ch0 and ADCB Ch2 for quick validation, the following duty value should be observable at EPWM1A for various combinations if the system is perfectly schedulable, that is, both loops get a chance to execute properly:- A0 B2 duty GND GND 0.9 3.3V GND 0.2 GND 3.3V 0.8 3.3V 3.3V 0.1
- Note: The optimization is OFF for this project and all the profiling data quoted above corresponds to this case.

#### 7.7.1.7 Handling Shared Resources Across C28x and CLA

FILE: `cla_ex7_shared_resource_handling.c`

This example showcases how to handle shared resource challenges across C28x and CLA. As the peripherals are shared between CLA and the CPU, overlapping read-modify-write to the registers by them can lead to data race conditions ultimately leading to data violation or incorrect functionality. In this example, CPU ISR and CLA tasks runs independently. CPU ISR gets triggered by EPWM4 @10 kHz and toggles the EPWM1B output via software by controlling CSFB bits of AQCSFRC. CLA task gets triggered by EPWM5 @100 kHz and toggles the EPWM1A output via software by controlling CSFA bits of AQCSFRC. Thus in this process both CPU and CLA do read-modify-write to AQCSFRC register independently at different frequencies so there is chance of race condition and updates due to one of them can get lost/ overwritten. This can be clearly observed by updating "phase\_shift\_ON" to 0U and probing the EPWM1A and 1B outputs on a scope.

This is a standard critical section problem and can be handled by software handshaking mechanism like mutex. But most of the real-time control applications are time-sensitive and cannot afford addition software overhead hence this example suggests an alternative hardware based technique to avoid shared resource conflicts between CPU and CLA. The phase shifting mechanism of the EPWM modules is utilized to schedule the CLA task and CPU ISR as desired. EPWM4 generates a synchronous pulse every ZERO event and provides a phase shift of 20 cycles to EPWM5. This way both CLA task and C28x ISR runs at original frequencies, that is, 100 kHz and 10 kHz but CLA task leads with a phase offset of 20 cycles with respect to CPU ISR. Hence, concurrent read-modify-writes to AQCSFRC never happens and the EPWM1A and EPWM1B outputs behave as desired, that is, consistent 50 kHz PWM output on EPWM1A and 5 kHz PWM output on EPWM1B with a duty ~50% on both should be generated. In order to utilize this phase shifting mechanism in this example, make sure "phase\_shift\_ON" is set to 1.

#### External Connections

- Observe GPIO0 (EPWM1A Output) on oscilloscope
- Observe GPIO1 (EPWM1B Output) on oscilloscope
- Observe GPIO2 (CLA Task Profiling) on oscilloscope
- Observe GPIO3 (CPU ISR Profiling) on oscilloscope

Note: The phase offset value can easily be configured by updating the TBPHS register to schedule the CLA task and C28x ISR as desired depending upon the application need so as to avoid overlapping register writes by CPU and CLA.

Note: The optimization is on and set to O2 for the project and all the results quoted correspond to this case.

## 7.8 CLA Registers

This section describes the Control Law Accelerator registers.

### 7.8.1 CLA Base Address Table

**Table 7-22. CLA Base Address Table**

| Bit Field Name  |                  | DriverLib Name    | Base Address | CPU1 | DMA | HIC | CLA | Pipeline Protected |
|-----------------|------------------|-------------------|--------------|------|-----|-----|-----|--------------------|
| Instance        | Structure        |                   |              |      |     |     |     |                    |
| ClA1OnlyRegs    | CLA_ONLY_REGS    | CLA1_ONLY_BASE    | 0x0000_0C00  | -    | -   | -   | YES | -                  |
| ClA1SoftIntRegs | CLA_SOFTINT_REGS | CLA1_SOFTINT_BASE | 0x0000_0CE0  | -    | -   | -   | YES | -                  |
| ClA1Regs        | CLA_REGS         | CLA1_BASE         | 0x0000_1400  | YES  | -   | -   | -   | -                  |

## 7.8.2 CLA\_ONLY\_REGS Registers

Table 7-23 lists the memory-mapped registers for the CLA\_ONLY\_REGS registers. All register offset addresses not listed in Table 7-23 should be considered as reserved locations and the register contents should not be modified.

**Table 7-23. CLA\_ONLY\_REGS Registers**

| Offset | Acronym           | Register Name                          | Write Protection | Section            |
|--------|-------------------|--|------------------|--------------------|
| 80h    | _MVECTBGRNDACTIVE | Active register for MVECTBGRND.        | EALLOW           | <a href="#">Go</a> |
| C0h    | _MPSACTL          | CLA PSA Control Register               | EALLOW           | <a href="#">Go</a> |
| C2h    | _MPSA1            | CLA PSA1 Register                      | EALLOW           | <a href="#">Go</a> |
| C4h    | _MPSA2            | CLA PSA2 Register                      | EALLOW           | <a href="#">Go</a> |
| E0h    | SOFTINTEN         | CLA Software Interrupt Enable Register |                  | <a href="#">Go</a> |
| E2h    | SOFTINTFRC        | CLA Software Interrupt Force Register  |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 7-24 shows the codes that are used for access types in this section.

**Table 7-24. CLA\_ONLY\_REGS Access Type Codes**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| Read Type                |      |  |
| R                        | R    | Read   |
| R-0                      | R-0  | Read<br>Returns 0s   |
| Write Type               |      |  |
| W                        | W    | Write  |
| W1S                      | W1S  | Write<br>1 to set  |
| Reset or Default Value   |      |  |
| -n                       |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| i,j,k,l,m,n              |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 7.8.2.1 \_MVECTBGRNDACTIVE Register (Offset = 80h) [Reset = 0h]

\_MVECTBGRNDACTIVE is shown in [Figure 7-2](#) and described in [Table 7-25](#).

Return to the [Summary Table](#).

Gives the current interrupted MPC value of the background task, if the background task was running and interrupted, or reflects the MVECTBGRND value, if MCTLBGRND.BGSTART bit is 0.

**Figure 7-2. \_MVECTBGRNDACTIVE Register**

|      |    |    |    |    |    |   |   |
|------|----|----|----|----|----|---|---|
| 15   | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| i16  |    |    |    |    |    |   |   |
| R-0h |    |    |    |    |    |   |   |
| 7    | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| i16  |    |    |    |    |    |   |   |
| R-0h |    |    |    |    |    |   |   |

**Table 7-25. \_MVECTBGRNDACTIVE Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 15-0 | i16   | R    | 0h    | Gives the current interrupted MPC value of the background task, if the background task was running and interrupted, or reflects the MVECTBGRND value, if MCTLBGRND.BGSTART bit is 0.<br>Reset type: SYSRSn |

### 7.8.2.2 \_MPSACTL Register (Offset = C0h) [Reset = 0h]

\_MPSACTL is shown in [Figure 7-3](#) and described in [Table 7-26](#).

Return to the [Summary Table](#).

PSA Control Register

**Figure 7-3. \_MPSACTL Register**

|          |    |            |            |          |            |         |           |

### 7.8.2.6 SOFTINTFRC Register (Offset = E2h) [Reset = 0h]

SOFTINTFRC is shown in [Figure 7-7](#) and described in [Table 7-30](#).

Return to the [Summary Table](#).

Writing a value of 1 in a bit will generate the corresponding task interrupt.

**Figure 7-7. SOFTINTFRC Register**

### 7.8.3 CLA\_SOFTINT\_REGS Registers

Table 7-31 lists the memory-mapped registers for the CLA\_SOFTINT\_REGS registers. All register offset addresses not listed in Table 7-31 should be considered as reserved locations and the register contents should not be modified.

**Table 7-31. CLA\_SOFTINT\_REGS Registers**

| Offset | Acronym    | Register Name                          | Write Protection | Section            |
|--------|------------|--|------------------|--------------------|
| 0h     | SOFTINTEN  | CLA Software Interrupt Enable Register |                  | <a href="#">Go</a> |
| 2h     | SOFTINTFRC | CLA Software Interrupt Force Register  |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 7-32 shows the codes that are used for access types in this section.

**Table 7-32. CLA\_SOFTINT\_REGS Access Type Codes**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| Read Type                |      |  |
| R                        | R    | Read   |
| R-0                      | R-0  | Read Returns 0s  |
| Write Type               |      |  |
| W                        | W    | Write  |
| W1S                      | W1S  | Write 1 to set   |
| Reset or Default Value   |      |  |
| -n                       |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| i,j,k,l,m,n              |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 7.8.3.1 SOFTINTEN Register (Offset = 0h) [Reset = 0h]

SOFTINTEN is shown in [Figure 7-8](#) and described in [Table 7-33](#).

Return to the [Summary Table](#).

Enables the ability to generate CLA task interrupt from within the task, by writing to SOFTINTFRC register. SOFTINTFRC register can only be written from CLA.

**Figure 7-8. SOFTINTEN Register**

|          |        |        |        |        |        |        |        |

### 7.8.3.2 SOFTINTFRC Register (Offset = 2h) [Reset = 0h]

SOFTINTFRC is shown in [Figure 7-9](#) and described in [Table 7-34](#).

Return to the [Summary Table](#).

Writing a value of 1 in a bit will generate the corresponding task interrupt. This register is only accessible by the CLA (not the CPU).

**Figure 7-9. SOFTINTFRC Register**

|            |            |            |            |            |            |            |            |

| 46h    | _MPSA2            | CLA PSA2 Register                          | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 7-36 shows the codes that are used for access types in this section.

**Table 7-36. CLA\_REGS Access Type Codes**

| Access Type | Code    | Description        |
|-------------|---------|--------------------|
| Read Type   |         |                    |
| R           | R       | Read               |
| R-0         | R<br>-0 | Read<br>Returns 0s |
| Write Type  |         |                    |

**Table 7-36. CLA\_REGS Access Type Codes  
(continued)**

| Access Type              | Code    | Description  |
|--------------------------|---------|--|
| W                        | W       | Write  |
| W1C                      | W<br>1C | Write<br>1 to clear  |
| W1S                      | W<br>1S | Write<br>1 to set  |
| Reset or Default Value   |         |  |
| -n                       |         | Value after reset or the default value   |
| Register Array Variables |         |  |
| i,j,k,l,m,n              |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 7.8.4.1 MVECT1 Register (Offset = 0h) [Reset = 0h]

MVECT1 is shown in [Figure 7-10](#) and described in [Table 7-37](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 7-10. MVECT1 Register**

|        |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|---|---|
| 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |

**Table 7-37. MVECT1 Register Field Descriptions**

| Bit  | Field | Type | Reset | Description   |
|------|-------|------|-------|---|
| 15-0 | MVECT | R/W  | 0h    | <p>MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.</p> <p>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.</p> <p>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..</p> <p>Reset type: SYSRSn</p> |

### 7.8.4.2 MVECT2 Register (Offset = 1h) [Reset = 0h]

MVECT2 is shown in [Figure 7-11](#) and described in [Table 7-38](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 7-11. MVECT2 Register**

|        |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|---|---|
| 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |

**Table 7-38. MVECT2 Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 15-0 | MVECT | R/W  | 0h    | MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.<br>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.<br>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..<br>Reset type: SYSRSn |

### 7.8.4.3 MVECT3 Register (Offset = 2h) [Reset = 0h]

MVECT3 is shown in [Figure 7-12](#) and described in [Table 7-39](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 7-12. MVECT3 Register**

|        |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|---|---|
| 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |

**Table 7-39. MVECT3 Register Field Descriptions**

| Bit  | Field | Type | Reset | Description   |
|------|-------|------|-------|---|
| 15-0 | MVECT | R/W  | 0h    | <p>MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.</p> <p>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.</p> <p>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..</p> <p>Reset type: SYSRSn</p> |

#### 7.8.4.4 MVECT4 Register (Offset = 3h) [Reset = 0h]

MVECT4 is shown in [Figure 7-13](#) and described in [Table 7-40](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 7-13. MVECT4 Register**

|        |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|---|---|
| 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |

**Table 7-40. MVECT4 Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 15-0 | MVECT | R/W  | 0h    | MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.<br>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.<br>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..<br>Reset type: SYSRSn |

### 7.8.4.5 MVECT5 Register (Offset = 4h) [Reset = 0h]

MVECT5 is shown in [Figure 7-14](#) and described in [Table 7-41](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 7-14. MVECT5 Register**

|        |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|---|---|
| 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |

**Table 7-41. MVECT5 Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 15-0 | MVECT | R/W  | 0h    | MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.<br>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.<br>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..<br>Reset type: SYSRSn |

### 7.8.4.6 MVECT6 Register (Offset = 5h) [Reset = 0h]

MVECT6 is shown in [Figure 7-15](#) and described in [Table 7-42](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 7-15. MVECT6 Register**

|        |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|---|---|
| 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |

**Table 7-42. MVECT6 Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 15-0 | MVECT | R/W  | 0h    | MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.<br>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.<br>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..<br>Reset type: SYSRSn |

### 7.8.4.7 MVECT7 Register (Offset = 6h) [Reset = 0h]

MVECT7 is shown in [Figure 7-16](#) and described in [Table 7-43](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 7-16. MVECT7 Register**

|        |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|---|---|
| 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |

**Table 7-43. MVECT7 Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 15-0 | MVECT | R/W  | 0h    | MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.<br>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.<br>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..<br>Reset type: SYSRSn |

### 7.8.4.8 MVECT8 Register (Offset = 7h) [Reset = 0h]

MVECT8 is shown in [Figure 7-17](#) and described in [Table 7-44](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 7-17. MVECT8 Register**

|        |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|---|---|
| 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| MVECT  |    |    |    |    |    |   |   |
| R/W-0h |    |    |    |    |    |   |   |

**Table 7-44. MVECT8 Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 15-0 | MVECT | R/W  | 0h    | MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.<br>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.<br>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..<br>Reset type: SYSRSn |

### 7.8.4.9 MCTL Register (Offset = 10h) [Reset = 0h]

MCTL is shown in [Figure 7-18](#) and described in [Table 7-45](#).

Return to the [Summary Table](#).

Control Register

**Figure 7-18. MCTL Register**

|          |    |    |    |    |        |            |            |
|----------|----|----|----|----|--------|------------|------------|
| 15       | 14 | 13 | 12 | 11 | 10     | 9          | 8          |
| RESERVED |    |    |    |    |        |            |            |
| R-0h     |    |    |    |    |        |            |            |
| 7        | 6  | 5  | 4  | 3  | 2      | 1          | 0          |
| RESERVED |    |    |    |    | IACKE  | SOFTRESET  | HARDRESET  |
| R-0h     |    |    |    |    | R/W-0h | R-0/W1S-0h | R-0/W1S-0h |

**Table 7-45. MCTL Register Field Descriptions**

| Bit  | Field     | Type    | Reset | Description   |
|------|-----------|---------|-------|---|
| 15-3 | RESERVED  | R       | 0h    | Reserved  |
| 2    | IACKE     | R/W     | 0h    | <p>IACK Operation Enable Bit: Writing a "1" to this bit will enable the IACK operation for setting the MIFR bits in the same manner as the MIFRC register (write of "1" will set respective MIFR bit). At reset, this feature is disabled.</p> <p>This feature enables the C28 CPU to efficiently trigger a task.</p> <p>Note: IACK operation should ignore EALLOW status of C28 core when accessing the MIFRC register.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = The CLA ignores the IACK instruction. (default)</p> <p>1h (R/W) = Enable the main CPU to use the IACK #16bit instruction to set MIFR bits in the same manner as writing to the MIFRC register. Each bit in the operand, #16bit, corresponds to a bit in the MIFRC register. Using IACK has the advantage of not having to first set the EALLOW bit. This allows the main CPU to efficiently trigger a CLA task through software.</p> <p>Examples IACK #0x0001 Write a 1 to MIFRC bit 0 to force task 1</p> <p>IACK #0x0003 Write a 1 to MIFRC bit 0 and 1 to force task 1 and task 2</p> |
| 1    | SOFTRESET | R-0/W1S | 0h    | <p>Soft Reset Bit: Writing a "1" to this bit will stop a current task, clear the RUN flag and also clear all bits in the MIER register. Writes of "0" are ignored and reads always return a "0".</p> <p>Note: After issuing SOFTRESET command, user should wait at least 1 clock cycle before attempting to write to MIER register.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = This bit always reads back 0 and writes of 0 are ignored.</p> <p>1h (R/W) = Writing a 1 will cause a soft reset of the CLA. This will stop the current task, clear the MIRUN flag and clear all bits in the MIER register. After a soft reset you must wait at least 1 SYSCLKOUT cycle before reconfiguring the MIER bits. If these two operations are done back-to-back then the MIER bits will not get set.</p>   |
| 0    | HARDRESET | R-0/W1S | 0h    | <p>Hard Reset Bit: Writing a "1" to this bit will cause a HARD reset on the CLA. The behavior of a HARD reset is the same as a system reset SYSRSn on the CLA. Writes of "0" are ignored and reads always return a "0".</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = This bit always reads back 0 and writes of 0 are ignored.</p> <p>1h (R/W) = Writing a 1 will cause a hard reset of the CLA. This will set all CLA registers to their default state.</p>   |

#### 7.8.4.10 \_MVECTBGRNDACTIVE Register (Offset = 1Bh) [Reset = 0h]

\_MVECTBGRNDACTIVE is shown in [Figure 7-19](#) and described in [Table 7-46](#).

Return to the [Summary Table](#).

Gives the current interrupted MPC value of the background task, if the background task was running and interrupted, or reflects the MVECTBGRND value, if MCTLBGRND.BGSTART bit is 0.

**Figure 7-19. \_MVECTBGRNDACTIVE Register**

|      |    |    |    |    |    |   |   |
|------|----|----|----|----|----|---|---|
| 15   | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| i16  |    |    |    |    |    |   |   |
| R-0h |    |    |    |    |    |   |   |
| 7    | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| i16  |    |    |    |    |    |   |   |
| R-0h |    |    |    |    |    |   |   |

**Table 7-46. \_MVECTBGRNDACTIVE Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 15-0 | i16   | R    | 0h    | Gives the current interrupted MPC value of the background task, if the background task was running and interrupted, or reflects the MVECTBGRND value, if MCTLBGRND.BGSTART bit is 0.<br>Reset type: SYSRSn |

### 7.8.4.11 SOFTINTEN Register (Offset = 1Ch) [Reset = 0h]

SOFTINTEN is shown in [Figure 7-20](#) and described in [Table 7-47](#).

Return to the [Summary Table](#).

Enables the ability to generate CLA task interrupt from within the task, by writing to SOFTINTFRC register. SOFTINTFRC register can only be written from CLA. Only reads are allowed from CPU. Writes are not allowed from CPU.

**Figure 7-20. SOFTINTEN Register**

|          |        |        |        |        |        |        |        |
|----------|--------|--------|--------|--------|--------|--------|--------|
| 15       | 14     | 13     | 12     | 11     | 10     | 9      | 8      |
| RESERVED |        |        |        |        |        |        |        |
| R-0h     |        |        |        |        |        |        |        |
| 7        | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
| TASK8    | TASK7  | TASK6  | TASK5  | TASK4  | TASK3  | TASK2  | TASK1  |

### 7.8.4.15 MIFR Register (Offset = 20h) [Reset = 0h]

MIFR is shown in [Figure 7-24](#) and described in [Table 7-51](#).

Return to the [Summary Table](#).

Each bit in the interrupt flag register corresponds to a CLA task. The corresponding bit is automatically set when the task request is received from the peripheral interrupt. The bit can also be set by the main CPU writing to the MIFRC register or using the IACK instruction to start the task. To use the IACK instruction to begin a task first enable this feature in the MCTL register. If the bit is already set when a new peripheral interrupt is received, then the corresponding overflow bit will be set in the MIOVF register.

The corresponding MIFR bit is automatically cleared when the task begins execution. This will occur if the interrupt is enabled in the MIER register and no other higher priority task is pending. The bits can also be cleared manually by writing to the MICLR register. Writes to the MIFR register are ignored.

**Figure 7-24. MIFR Register**

### 7.8.4.16 MIOVF Register (Offset = 21h) [Reset = 0h]

MIOVF is shown in [Figure 7-25](#) and described in [Table 7-52](#).

Return to the [Summary Table](#).

Each bit in the overflow flag register corresponds to a CLA task. The bit is set when an interrupt overflow event has occurred for the specific task. An overflow event occurs when the MIFR register bit is already set when a new interrupt is received from a peripheral source. The MIOVF bits are only affected by peripheral interrupt events. They do not respond to a task request by the main CPU IACK instruction or by directly setting MIFR bits. The overflow flag will remain latched and can only be cleared by writing to the overflow flag clear (MICLROVF) register. Writes to the MIOVF register are ignored.

**Figure 7-25. MIOVF Register**

### 7.8.4.17 MIFRC Register (Offset = 22h) [Reset = 0h]

MIFRC is shown in [Figure 7-26](#) and described in [Table 7-53](#).

Return to the [Summary Table](#).

The interrupt force register can be used by the main CPU to start tasks through software. Writing a 1 to a MIFRC bit will set the corresponding bit in the MIFR register. Writes of 0 are ignored and reads always return 0. The IACK #16bit operation can also be used to start tasks and has the same effect as the MIFRC register. To enable IACK to set MIFR bits you must first set the MCTL[IACKE] bit. Using IACK has the advantage of not having to first set the EALLOW bit. This allows the main CPU to efficiently trigger CLA tasks through software.

### 7.8.4.18 MICLR Register (Offset = 23h) [Reset = 0h]

MICLR is shown in [Figure 7-27](#) and described in [Table 7-54](#).

Return to the [Summary Table](#).

Normally bits in the MIFR register are automatically cleared when a task begins. The interrupt flag clear register can be used to instead manually clear bits in the interrupt flag (MIFR) register. Writing a 1 to a MICLR bit will clear the corresponding bit in the MIFR register. Writes of 0 are ignored and reads always return 0.

**Figure 7-27. MICLR Register**

|            |            |            |            |            |            |            |            |

### 7.8.4.19 MICLROVF Register (Offset = 24h) [Reset = 0h]

MICLROVF is shown in [Figure 7-28](#) and described in [Table 7-55](#).

Return to the [Summary Table](#).

Overflow flag bits in the MIOVF register are latched until manually cleared using the MICLROVF register. Writing a 1 to a MICLROVF bit will clear the corresponding bit in the MIOVF register. Writes of 0 are ignored and reads always return 0.

**Figure 7-28. MICLROVF Register**

### 7.8.4.20 MIER Register (Offset = 25h) [Reset = 0h]

MIER is shown in [Figure 7-29](#) and described in [Table 7-56](#).

Return to the [Summary Table](#).

Setting the bits in the interrupt enable register (MIER) allow an incoming interrupt or main CPU software to start the corresponding CLA task. Writing a 0 will block the task, but the interrupt request will still be latched in the flag register (MIFLG). Setting the MIER register bit to 0 while the corresponding task is executing will have no effect on the task. The task will continue to run until it hits the MSTOP instruction. When a soft reset is issued, the MIER bits are cleared. There should always be at least a 1 SYSCLKOUT delay between issuing the soft reset and reconfiguring the MIER bits.

### 7.8.4.21 MIRUN Register (Offset = 26h) [Reset = 0h]

MIRUN is shown in [Figure 7-30](#) and described in [Table 7-57](#).

Return to the [Summary Table](#).

The interrupt run status register (MIRUN) indicates which task is currently executing. Only one MIRUN bit will ever be set to a 1 at any given time. The bit is automatically cleared when the task completes and the respective interrupt is fed to the peripheral interrupt expansion (PIE) block of the device. This lets the main CPU know when a task has completed. The main CPU can stop a currently running task by writing to the MCTL[SOFTRESET] bit. This will clear the MIRUN flag and stop the task. In this case no interrupt will be generated to the PIE.

**Figure 7-30. MIRUN Register**

### 7.8.4.25 \_MSTF Register (Offset = 2Eh) [Reset = 0h]

\_MSTF is shown in [Figure 7-34](#) and described in [Table 7-61](#).

Return to the [Summary Table](#).

The CLA status register (MSTF) reflects the results of different operations. These are the basic rules for the flags:

- Zero and negative flags are cleared or set based on:
- floating-point moves to registers
- the result of compare, minimum, maximum, negative and absolute value operations
- the integer result of operations such as MMOV16, MAND32, MOR32, MXOR32, MCMP32, MASR32, MLSR32
- Overflow and underflow flags are set by floating-point math instructions such as multiply, add, subtract and 1/x. These flags may also be connected to the peripheral interrupt expansion (PIE) block on your device. This can be useful for debugging underflow and overflow conditions within an application.

## 8.1 Introduction

The dual-clock comparator module is used for evaluating and monitoring the clock input based on a second clock, which can be a more accurate and reliable version. This instrumentation is used to detect faults in clock source or clock structures, thereby enhancing the system's safety metrics.

### 8.1.1 Features

The main features of each of the DCC modules are:

- Allows the application to ensure that a fixed ratio is maintained between frequencies of two clock signals.
- Supports the definition of a programmable tolerance window in terms of the number of reference clock cycles.
- Supports continuous monitoring without requiring application intervention.
- Supports a single-sequence mode for spot measurements.
- Allows the selection of a clock source for each of the counters, resulting in several specific use cases.

### 8.1.2 Block Diagram

Figure 8-1 shows the main concept of the DCC module.

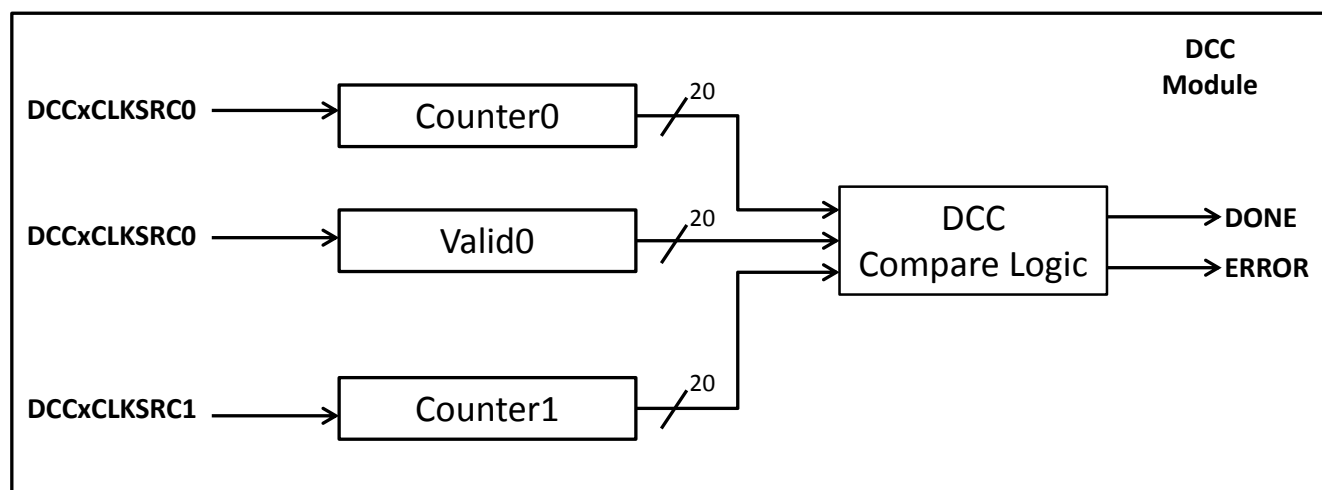

Figure 8-1. DCC Operation

## 8.2 Module Operation

As shown in Figure 8-1, DCC contains three counters – Counter0, Valid0 and Counter1. Initially, all counters are loaded with their user-defined, pre-load value. Counter0 and Counter1 start decrementing once the DCC is enabled at rates determined by the frequencies of Clock0 and Clock1, respectively. When Counter0 equals 0 (expires), the Valid0 counter decrements at a rate determined by Clock0. If Counter1 decrements to 0 in the valid window, then no error is generated and Clock1 is considered to be good within allowable tolerance as configured by the user.

### 8.2.1 Configuring DCC Counters

Counter0 and Counter1 are configured based on the ratio between the frequencies of Clock0 and Clock1 ( $F_{clk1} \times \text{Counter0} = F_{clk0} \times \text{Counter1}$ ). The Valid0 counter provides tolerance and is configured based on the error in DCC. Since Clock0 and Clock1 are asynchronous, the start and stop of the counters do not occur synchronously. Hence, while configuring the counters, two different sources of errors must be accounted for:

- DCC Errors due to the asynchronous timing of Clock0 and Clock1: this depends on the frequency of Clock0 and Clock1:
  - If  $F_{clk1} > F_{clk0}$ , then Async. Error (in Clock0 cycles) =  $2 + 2 \times (\max(F_{sysclk}/F_{clk0}))$
  - If  $F_{clk1} < F_{clk0}$ , then Async. Error (in Clock0 cycles) =  $2 \times (F_{clk0}/F_{clk1}) + 2 \times (\max(F_{sysclk}/F_{clk0}))$
  - If  $F_{clk1}$  is unknown, then Async. Error (in Clock0 cycles) =  $2 + 2 \times (F_{sysclk}/F_{clk0})$
- Digitization Error = 8 Clock0 cycles

#### DCC Error (in Clock0 Cycles) = Async. Error + Digitization Error

DCC error shows up as a frequency error for clock under measurement. This error is DCC induced and does not represent error in frequency of clock under measurement. The application needs to take this into consideration while configuring the counters and decide the desirable tolerance for DCC error that defines the window of measurement. To illustrate:

#### Window (in Clock0 Cycles) = (DCC Error) / (0.01 × Tolerance)

For example, if DCC Error is 10 and the tolerance desired is +/-0.1%, then:

$$\text{Window (in Clock0 Cycles)} = 10 / (0.01 \times 0.1) = 10000$$

Based on above formula for Window, if the desired tolerance is low, then the counter values are large and increase the window of measurement. This means that counter values for a tolerance of 0.1% are larger than that of 0.2%. So, based on the application defined tolerance, you can define the window of measurement in terms of Clock0 cycles.

Clock under measurement may have allowed frequency error. If this error is expected, then it should also be accounted while configuring counters. For example, if measuring INTOSC1/2 frequency using external crystal as a reference clock, allowable tolerance of INTOSC1/2 (for example, +/-1%) should be accounted and factored in the counter configuration. The formula is:

$$\text{Frequency Error Allowed (in Clock0 Cycles)} = \text{Window} \times (\text{Allowable Frequency Tolerance (in \%)} / 100)$$

$$\text{Total Error (in Clock0 Cycles)} = \text{DCC Error} + \text{Frequency Error Allowed}$$

The following equations are used to configure counter values:

$$\text{Counter0 (DCCNTSEED0)} = \text{Window} - \text{Total Error}$$

$$\text{Valid0 (DCCVALIDSEED0)} = 2 \times \text{Total Error}$$

$$\text{Counter1 (DCCNTSEED1)} = \text{Window} \times (F_{clk1}/F_{clk0})$$

---

#### Note

Counter1 is a 20-bit counter, so maximum possible value cannot exceed 1048575. If value does exceed, then you need to increase the desired Tolerance for DCC error, so that Window of measurement is lowered. The following formula should be used to compute minimum tolerance possible:

$$\text{Tolerance (\%)} = (100 \times \text{DCC Error} \times (F_{clk1}/F_{clk0})) / 1048575$$

---

## 8.2.2 Single-Shot Measurement Mode

The DCC module can be programmed to count down one time by enabling the single-shot mode. In this mode, the DCC stops operating when the down counter0 and the valid counter0 reach 0.

At the end of one sequence of counting down in this single-shot mode, the DCC gets disabled automatically, which prevents further counting. This mode is typically used for spot checking the frequency of a signal.

### Example-1: Validating PLLRAWCLK frequency

A practical example of the usage is to validate the PLL output clock frequency using the XTAL as the reference clock. Assume XTAL is 10 MHz, PLL output frequency is 100 MHz, SYSCLK is 100 MHz, allowable Frequency Tolerance is 0.1%, and DCC Tolerance required is 0.1%. The measurement sequence proceeds as follows:

- Set Clock0 source for Counter0 and Valid0 as XTAL, and Clock1 source for Counter1 as PLL output clock.
- Based on the equations defined in [Section 8.2.1](#), calculated seed values for Counters will be Counter0 = 29940; Valid0 = 120; Counter1 = 300000
- Once the DCC is enabled, the counters Counter0 and Counter1 both start counting down from their seed values.
- When Counter0 reaches zero, it automatically triggers the Valid0 counter.
- When Valid0 reaches zero and Counter1 is not zero, an ERROR status flag is set and a "DCC error" is sent to the PIE. Counter1 is frozen so that it stops counting down any further. The application can enable an interrupt to be generated from the PIE whenever this DCC error is indicated. Refer to [Section 3.5.5](#) to know the channel mapping of DCC Interrupt.
- The application then needs to clear the ERROR status flag and restart the DCC module so that it is ready for the next spot measurement.

If there is no error generated at the end of the sequence, then the DONE status flag is set and a DONE interrupt is generated. The application must clear the DONE flag before restarting the DCC.

### Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that Clock1 is faster than expected, or Clock0 is slower than expected. It includes the case when Clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that Clock1 is slower than expected. It includes the case when Clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

### Example-2: Measuring AUXCLKIN frequency

Another example of single-shot mode is to measure the frequency of AUXCLKIN (unknown frequency) using INTOSC1 (10 MHz) as the reference clock and SYSC1K is 10 MHz. The measurement sequence proceeds as follows:

- Set Clock0 source for Counter0 and Valid0 as INTOSC1 (10 MHz), and Clock1 source for Counter1 as AUXCLKIN.
- Now configure counter values using equations in [Section 8.2.1](#). For tolerance= $\pm 0.1\%$ , Total Error=10 clock0 cycles; Window=10000 clock0 cycles; Counter0=9990; Valid0=20. Since Clock1 frequency (Fclk1) is unknown, Counter1 value should be set to the max value, that is, 1048575 (0xFFFFF).
- Once the DCC is enabled, the counters Counter0 and Counter1 both start counting down from their seed values.
- Since Counter1 is set to max value that is, 1048575 it will not expire when Counter0 and Valid0 has expired. This will generate an error which is expected and the application should ignore this error and use Counter1 values to compute the frequency of Clock1 (Fclk1).
- Knowing the frequency of Clock0 (INTOSC1) that is, Fclk0=10 MHz, and using [Equation 1](#), frequency of AUXCLKIN that is, Fclk1, can be measured:

$$F_{clk1} = \frac{F_{clk0} \times (1048575 - Meas.Counter1)}{(Counter0 + Valid0)} = \frac{10 \times (1048575 - Meas.Counter1)}{(9990 + 20)} \quad (1)$$

### 8.2.3 Continuous Monitoring Mode

In this mode, the DCC is used by the application to ensure that two clock signals maintain the correct frequency ratio. Suppose the application wants to ensure that the PLL output signal always maintains a fixed frequency relationship with the XTAL.

- In this case, the application can use the XTAL as the Clock0 signal (for Counter0 and Valid0) and the PLL output as the Clock1 (for Counter1).
- The seed values of Counter0, Valid0 and Counter1 are selected based on the equations defined in [Section 8.2.1](#) such that if the actual frequencies of Clock0 and Clock1 are equal to their expected frequencies, then the Counter1 will reach zero during the count down of the Valid0 counter.
- If the Counter1 reaches zero during the count down of the Valid0 counter, then all the counters (Counter0, Valid0, Counter1) are reloaded with their initial seed values.
- This sequence of counting down and checking then continues as long as there is no error, or until the DCC module is disabled.
- The counters must get reloaded if the application resets and restarts the DCC module.

#### Error Conditions:

An error condition is generated by any one of the following:

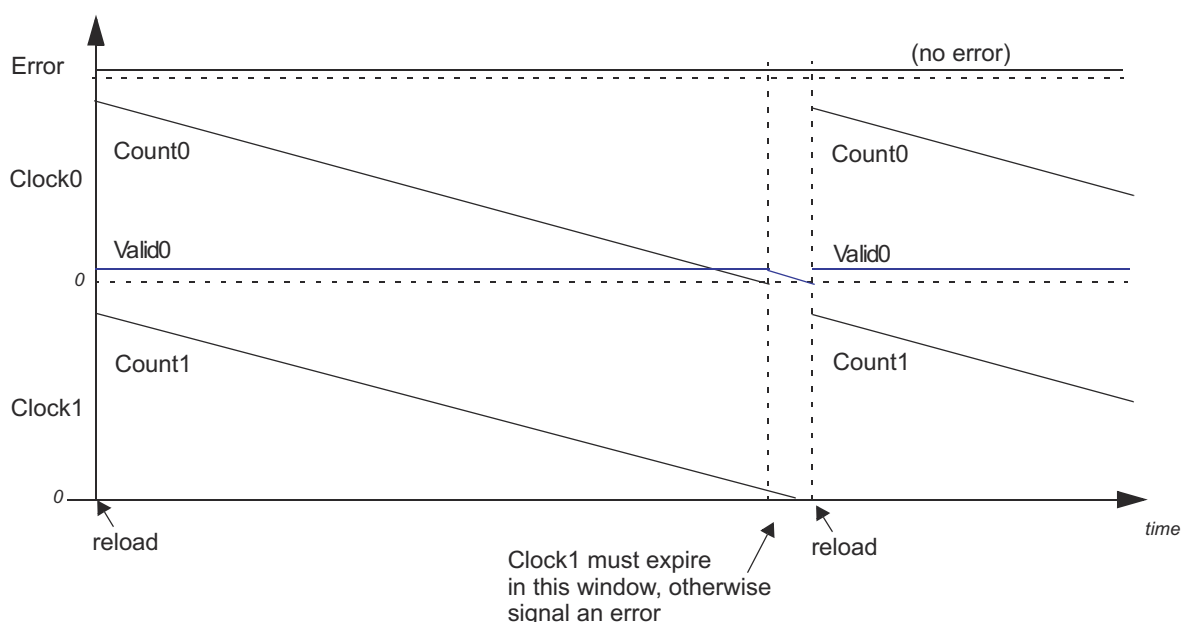

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that Clock1 is faster than expected, or Clock0 is slower than expected. It includes the case when Clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that Clock1 is slower than expected. It includes the case when Clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

### 8.2.4 Error Conditions

While operating in continuous mode, the counters get reloaded with the seed values and continue counting down under the following conditions:

- The module is reset or restarted by the application, OR
- Counter0, Valid 0 and Counter1 all reach 0 without any error.

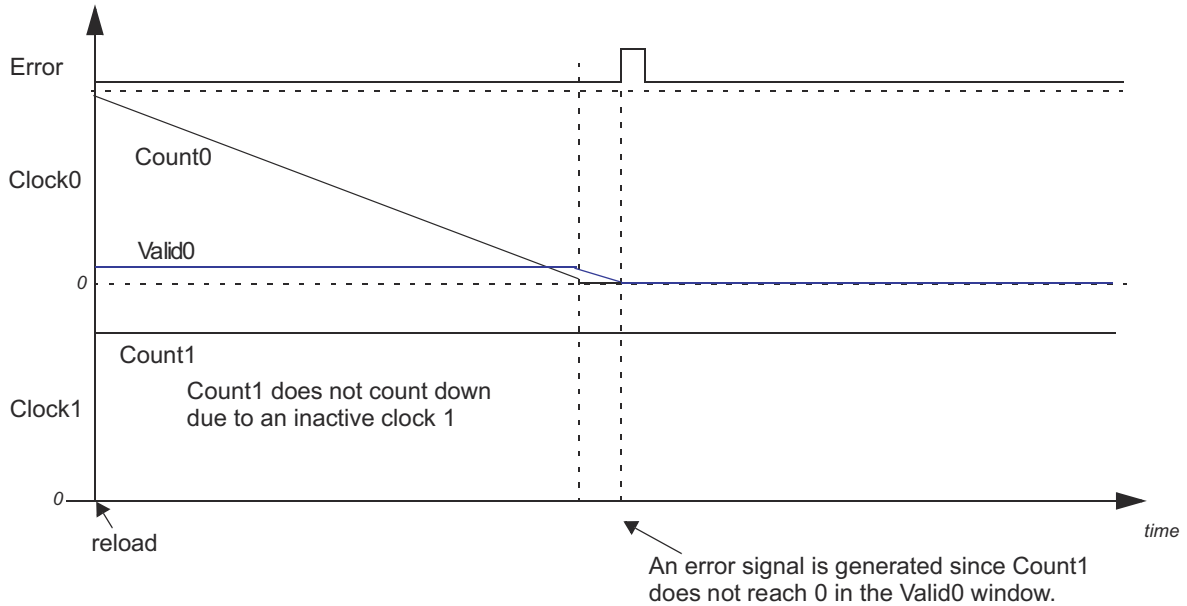

**Figure 8-2. Counter Relationship**

**Figure 8-3. Clock1 Slower Than Clock0 - Results in an Error and Stops Counting**

**Figure 8-4. Clock1 Faster Than Clock0 - Results in an Error and Stops Counting**

**Figure 8-5. Clock1 Not Present - Results in an Error and Stops Counting**

**Figure 8-6. Clock0 Not Present - Results in an Error and Stops Counting**

### 8.3 Interrupts

DCC generates an interrupt on either of two events:

- DCC finishes counting and all the counters expire within defined window indicating DONE operation, provided DCCGCTRL.DONENA=1.
- DCC finishes counting with error where counters do not expire in defined window. This indicates an ERROR event, and sets an interrupt provided DCCGCTRL.ERRENA=1.

Interrupt due to DONE or ERROR event is ORed and is flagged as DCCx Interrupt. Refer to determine the Interrupt channel mapping. Application ISR needs to check the status flag inside DCCSTATUS register to determine whether it is due to ERROR or DONE.

DCC Error interrupt can also configured as a Non Maskable Interrupt (NMI) by enabling CLKFAILCFG.DCCx\_ERROR\_EN flag.

## 8.4 Software

### 8.4.1 DCC Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/f28003x/examples/dcc

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

#### 8.4.1.1 DCC Single Shot Clock Verification

FILE: dcc\_ex1\_single\_shot\_verification.c

This program uses the XTAL clock as a reference clock to verify the frequency of the PLLRAW clock.

The Dual-Clock Comparator Module 0 is used for the clock verification. The clocksource0 is the reference clock (Fclk0 = 20 MHz) and the clocksource1 is the clock that needs to be verified (Fclk1 = 120 MHz). Seed is the value that gets loaded into the Counter.

##### *ExternalConnections*

- None

##### *Watch Variables*

- *status/result* - Status of the PLLRAW clock verification

#### 8.4.1.2 DCC Single Shot Clock Measurement

FILE: dcc\_ex2\_single\_shot\_measurement.c

This program demonstrates Single Shot measurement of the INTOSC2 clock post trim using XTAL as the reference clock.

The Dual-Clock Comparator Module 0 is used for the clock measurement. The clocksource0 is the reference clock (Fclk0 = 20 MHz) and the clocksource1 is the clock that needs to be measured (Fclk1 = 10 MHz). Since the frequency of the clock1 needs to be measured an initial seed is set to the max value of the counter.

##### *External Connections*

- None

##### *Watch Variables*

- *result* - Status if the INTOSC2 clock measurement completed successfully.
- *meas\_freq1* - measured clock frequency, in this case for INTOSC2.

#### 8.4.1.3 DCC Continuous Clock Monitoring

FILE: dcc\_ex3\_continuous\_monitoring\_of\_clock.c

This program demonstrates continuous monitoring of PLL Clock in the system using INTOSC2 as the reference clock. This would trigger an interrupt on any error, causing the decrement/ reload of counters to stop.

The Dual-Clock Comparator Module 0 is used for the clock monitoring. The clocksource0 is the reference clock (Fclk0 = 10 MHz) and the clocksource1 is the clock that needs to be monitored (Fclk1 = 120 MHz). The clock0 and clock1 seed are set to achieve a window of 340  $\mu$ s. Seed is the value that gets loaded into the Counter. For the sake of demo a slight variance is given to clock1 seed value to generate an error on continuous monitoring.

Note: When running in Flash configuration, it is good to do a reset and restart after loading the example to remove any stale flags/states.

#### External Connections

- None

#### Watch Variables

- *status/result* - Status of the PLLRAW clock monitoring
- *cnt0* - Counter0 Value measure when error is generated
- *cnt1* - Counter1 Value measure when error is generated
- *valid* - Valid0 Value measure when error is generated

#### 8.4.1.4 DCC Detection of Clock Failure

FILE: dcc\_ex4\_clock\_fail\_detect.c

This program demonstrates clock failure detection on continuous monitoring of the PLL Clock in the system using XTAL as the osc clock source. Once the oscillator clock fails, it would trigger a DCC error interrupt, causing the decrement/ reload of counters to stop. In this examples, the clock failure is simulated by turning off the XTAL oscillator. Once the ISR is serviced, the osc source is changed to INTOSC1 and the PLL is turned off.

The Dual-Clock Comparator Module 0 is used for the clock monitoring. The clocksource0 is the reference clock (Fclk0 = 20 MHz) and the clocksource1 is the clock that needs to be monitored (Fclk1 = 120 MHz). Seed is the value that gets loaded into the Counter.

In the current example, the XTAL is expected to be a Resonator running in Crystal mode which is later switched off to simulate the clock failure. If an SE Crystal is used, you will need to physically disconnect the clock on the board.

Note: When running in Flash configuration, it is good to do a reset and restart after loading the example to remove any stale flags/states.

#### External Connections

- None

#### Watch Variables

- *status/result* - Status of the clock failure detection

## 8.5 DCC Registers

This section describes the Dual Clock Comparator Registers.

### Note

DCC is used by Boot ROM, hence the register values could be different than HW reset value. User needs to make sure to configure the values of these registers to the desired value before enabling DCC.

### 8.5.1 DCC Base Address Table

**Table 8-1. DCC Base Address Table**

| Bit Field Name |           | DriverLib Name | Base Address | CPU1 | DMA | HIC | CLA | Pipeline Protected |
|----------------|-----------|----------------|--------------|------|-----|-----|-----|--------------------|
| Instance       | Structure |                |              |      |     |     |     |                    |
| Dcc0Regs       | DCC_REGS  | DCC0_BASE      | 0x0005_E700  | YES  | -   | -   | -   | YES                |
| Dcc1Regs       | DCC_REGS  | DCC1_BASE      | 0x0005_E740  | YES  | -   | -   | -   | YES                |

## 8.5.2 DCC\_REGS Registers

Table 8-2 lists the memory-mapped registers for the DCC\_REGS registers. All register offset addresses not listed in Table 8-2 should be considered as reserved locations and the register contents should not be modified.

**Table 8-2. DCC\_REGS Registers**

| Offset | Acronym       | Register Name  | Write Protection | Section            |
|--------|---------------|--|------------------|--------------------|
| 0h     | DCCGCTRL      | Starts / stops the counters. Clears the error signal.          |                  | <a href="#">Go</a> |
| 8h     | DCCCNTSEED0   | Seed value for the counter attached to Clock Source 0.         |                  | <a href="#">Go</a> |
| Ch     | DCCVALIDSEED0 | Seed value for the timeout counter attached to Clock Source 0. |                  | <a href="#">Go</a> |
| 10h    | DCCCNTSEED1   | Seed value for the counter attached to Clock Source 1.         |                  | <a href="#">Go</a> |
| 14h    | DCCSTATUS     | Specifies the status of the DCC Module.                        |                  | <a href="#">Go</a> |
| 18h    | DCCCNT0       | Value of the counter attached to Clock Source 0.               |                  | <a href="#">Go</a> |
| 1Ch    | DCCVALID0     | Value of the valid counter attached to Clock Source 0.         |                  | <a href="#">Go</a> |
| 20h    | DCCCNT1       | Value of the counter attached to Clock Source 1.               |                  | <a href="#">Go</a> |
| 24h    | DCCCLKSRC1    | Selects the clock source for Counter 1.                        |                  | <a href="#">Go</a> |
| 28h    | DCCCLKSRC0    | Selects the clock source for Counter 0.                        |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 8-3 shows the codes that are used for access types in this section.

**Table 8-3. DCC\_REGS Access Type Codes**

| Access Type              | Code    | Description  |
|--------------------------|---------|--|
| Read Type                |         |  |
| R                        | R       | Read   |
| R-0                      | R<br>-0 | Read<br>Returns 0s   |
| R-1                      | R<br>-1 | Read<br>Returns 1s   |
| Write Type               |         |  |
| W                        | W       | Write  |
| Reset or Default Value   |         |  |
| -n                       |         | Value after reset or the default value   |
| Register Array Variables |         |  |
| i,j,k,l,m,n              |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 8.5.2.1 DCCGCTRL Register (Offset = 0h) [Reset = 5555h]

DCCGCTRL is shown in [Figure 8-7](#) and described in [Table 8-4](#).

Return to the [Summary Table](#).

Starts / stops the counters. Clears the error signal.

**Figure 8-7. DCCGCTRL Register**

|          |    |    |    |            |    |    |    |        |    |    |    |        |    |    |    |
|----------|----|----|----|------------|----|----|----|--------|----|----|----|--------|----|----|----|

| <b>9.5 BGCR Registers</b> .....          | <b>1024</b> |

## 9.1 Introduction

The Background CRC (BGCR) module computes a CRC-32 on a configurable block of memory. It accomplishes this by fetching the specified block of memory during idle cycles (when the CPU, CLA, or DMA is not accessing the memory block). The calculated CRC-32 value is compared against a golden CRC-32 value to indicate a pass or fail. In essence, the BGCR helps identify memory faults and corruption. There are two BGCR modules, CPU\_CRC and CLA\_CRC. The two BGCR modules differ only in the memories they test.

### 9.1.1 Features

The BGCR module has the following features:

- One cycle CRC-32 computation on 32 bits of data
- No CPU bandwidth impact for zero wait state memory
- Minimal CPU bandwidth impact for non-zero wait state memory
- Dual operation modes (CRC-32 mode and scrub mode)
- Watchdog timer to time CRC-32 completion
- Ability to pause and resume CRC-32 computation

### 9.1.2 Block Diagram

Figure 9-1 shows the BGCR block diagram.

**Figure 9-1. BGCR Block Diagram**

### 9.1.3 Memory Wait States and Memory Map

Figure 9-2 shows the memory map of the BGCR module. M0, M1, MSGRAM, LS[x]RAM and GS[x]RAM are all zero wait-state memories. BGCR will access these memories with minimal impact on normal program operation. For instance, if a BGCR access is being made to a zero wait-state memory in the current cycle, the earliest the operating program can make access to the same memory location will be in the next cycle. Similarly for the non-zero wait state memories SECROM, DATAROM and BOOTROM etc, the worst case delay for functional access after a BGCR access will be the wait state amount.

Figure 9-2. BGCRC Memory Map

## 9.2 Functional Description

The CRC-32 calculation of the BGCRC module can be kicked off by configuring the register BGCRC\_EN.START to 1010. Once started, the module will perform the background memory checks without CPU or CLA intervention. However, on completion of the CRC-32 calculation or in the event of a failure, the CPU or CLA will be notified through an interrupt and task, respectively.

As highlighted in the overview, there are two BGCRC modules. CPU\_CRC that is configurable by the CPU can only generate an interrupt. CLA\_CRC however, can be configured by both the CPU and CLA and can generate an interrupt to the CPU or task for the CLA.

### 9.2.1 Data Read Unit

Once the CRC-32 calculation is started, the BGCRC module will continuously read data from memory as a background process. These reads happen during the idle times (when the CPU, CLA or DMA is not accessing the memory block) and so will not impact functional access. The data read unit will only read data if there is no pending functional access. The data read unit begins operation by reading a block of data BGCRC\_CTRL2.BLOCK\_SIZE from address BGCRC\_START\_ADDR. Note that BGCRC\_START\_ADDR must be 0x80 word aligned. For a non-0x80 word aligned BGCRC\_START\_ADDR, the LSB bits will be zeroed out to get a 0x80 word aligned BGCRC\_START\_ADDR. For instance, if the programmed BGCRC\_START\_ADDR = 0x1AF3, the internal 0x80 word aligned start address will be 0x1A80.

When the data read unit reads a block of data, ECC and parity will be checked. Any ECC or parity errors that occur during the read will be indicated by setting the respective NMI and generating an interrupt if configured as so. The BGCRC module however, will not write back the corrected memory contents on the occurrence of a correctable ECC error. Writing back the corrected values should be handled by software.

## 9.2.2 CRC-32 Compute Unit

After the data read unit reads a block of data, it feeds this data to the CRC-32 compute unit. This unit computes the CRC-32 using the standard polynomial  $0x04C11DB7$  ( $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$ ). The CRC-32 unit retrieves 32-bit of data at a time from the block of data to compute the polynomial. This computation takes 1 cycle. For instance the CRC-32 calculation for 1KB block of data will be 256 cycles, 1 cycle for each of the 256 32-bit chunks. The initial value for the CRC-32 computation can be configured using BGCRC\_SEED.

After the CRC-32 calculation is complete for a data block, the final result is loaded into BGCRC\_RESULT. Note that BGCRC\_RESULT will only contain the final calculation for the whole data block; intermediate 32-bit calculations will not update BGCRC\_RESULT. The value in BGCRC\_RESULT will be compared against the value in BGCRC\_GOLDEN by hardware and the NMI/Interrupt flags will be set accordingly by the CRC notification unit.

Once CRC-32 calculation is commenced, it can be halted by setting BGCRC\_CTRL2.TEST\_HALT to 1010. Clearing this bit resumes CRC-32 calculation from the halt point.

## 9.2.3 CRC Notification Unit

After the CRC-32 compute unit completes the CRC-32 calculation for a block of data or fails to complete the calculation within BGCRC\_WD\_MIN and BGCRC\_WD\_MAX, if configured, it will send out a NMI/Interrupt on the occurrence of a pass or fail. In addition, during a data read by the data read unit, if an ECC or parity error occurs, the CRC notification unit can send out a NMI/Interrupt. In the case of an ECC or parity error, the BGCRC will stop operation and BGCRC\_CURR\_ADDR will contain the memory address which caused the ECC or parity error. The contents of BGCRC\_CURR\_ADDR in addition to the NMI/Interrupt flags can be used to debug a BGCRC failure.

### 9.2.3.1 CPU Interrupt, CLA Task and NMI

The BGCRC module has configurable Interrupt and NMI lines. NMIs are enabled by default but can be disabled by writing 0xA to BGCRC\_CTRL1.NMIDIS register. Conversely, all Interrupts are disabled by default but can be enabled by writing 0x7E to BGCRC\_INTEN register. When an error occurs in the BGCRC, it can be configured to generate an NMI or Interrupt. Since NMIs are enabled by default, all BGCRC errors will cause an NMI. Figure 9-3 and Figure 9-4 show the NMI and Interrupt lines, respectively.

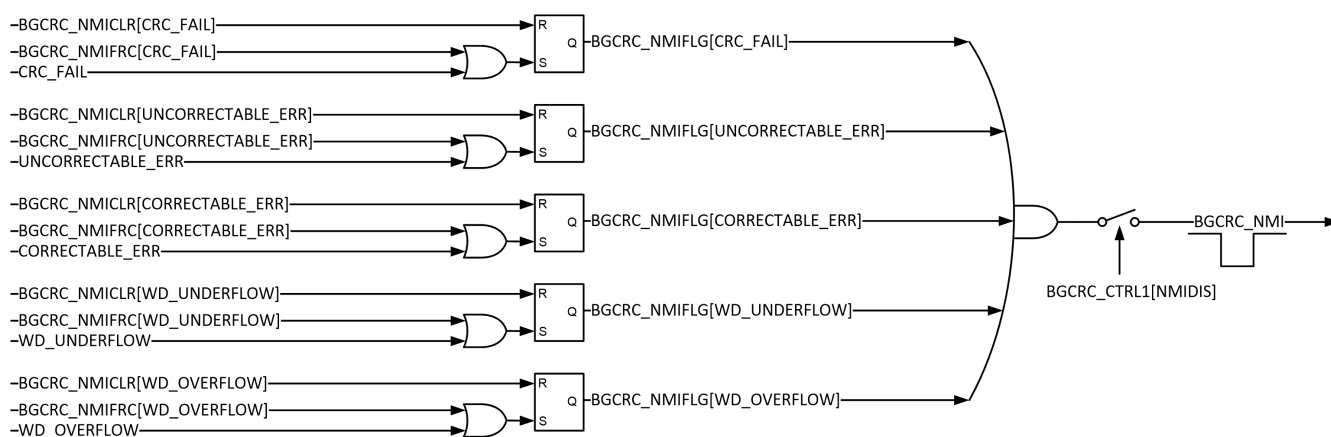

Figure 9-3. BG CRC NMI

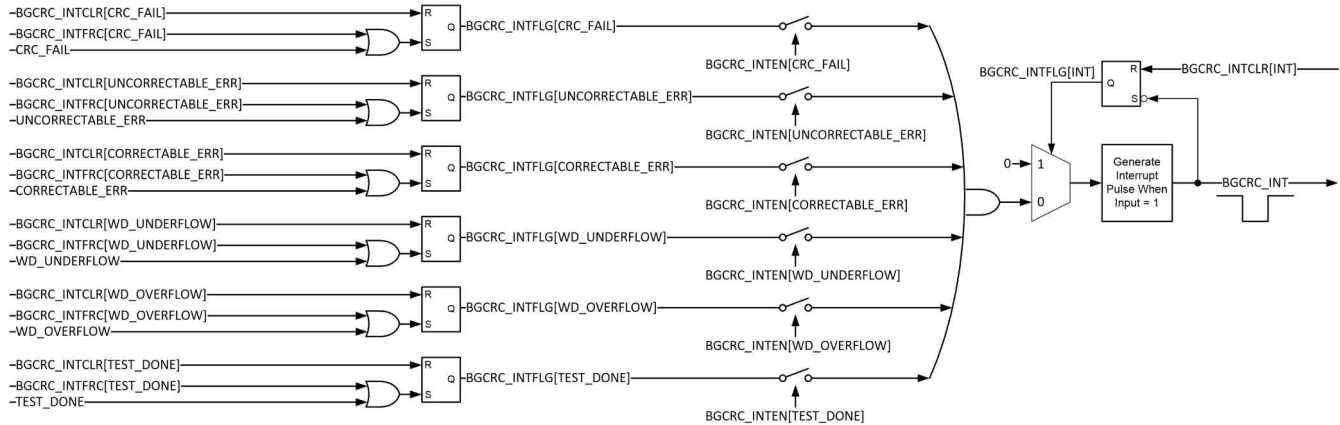

Figure 9-4. BGCR)C Interrupt

## 9.2.4 Operating Modes

BGCR)C module supports two modes of operation: CRC mode and scrub mode. The mode of operation can be configured by clearing or setting the register BGCR)C\_CTRL2.SCRUB\_MODE.

### 9.2.4.1 CRC Mode

In CRC mode, the BGCR)C module operates as explained in Section 9.2.2. CRC-32 calculation is performed on a block of data and the result compared against a golden value. ECC and parity errors are checked in this mode. Result mismatch, ECC or parity error can trigger an NMI/Interrupt.

### 9.2.4.2 Scrub Mode

In scrub mode, the CRC-32 result is not compared against the golden value and BGCR)C\_RESULT register is not updated. ECC and parity errors are also checked in this mode. However unlike CRC mode, NMI/Interrupt will only be from ECC or parity error. In scrub mode, Parity and ECC bits of the memory block need to be initialized by the CPU and/or CLA.

## 9.2.5 BGCR)C Watchdog

The BGCR)C module has an embedded windowed watchdog which is used as a diagnostic to check memory test completion within the expected time window. This can protect against hardware defects which can cause the memory check not to complete in the allotted time which may not be caught by the system watchdog as the error may be due to the CLA or DMA having continuous access. Windowing also helps detect additional failure modes in the watchdog operation, for example, stuck watchdog.

The BGCR)C watchdog is enabled by default and starts when the BGCR)C module begins reading from memory. The watchdog can be disabled using the register BGCR)C\_WD\_CFG.WDDIS. The BGCR)C watchdog counter is a 32-bit counter with its value reflected in BGCR)C\_WD\_CNT register. The lower and upper window settings are configured using BGCR)C\_WD\_MIN and BGCR)C\_WD\_MAX respectively. BGCR)C\_WD\_MIN and BGCR)C\_WD\_MAX need to be configured before the test is started and shouldn't be changed while the BGCR)C is operating. If configured, an NMI or Interrupt will be triggered if the memory test fails to complete within the configured time window. The counter stops on completion of the CRC-32 check done, CRC-32 check failure and ECC/Parity errors. The counter is reset when the next memory check begins.

The BGCR)C watchdog can be halted by configuring the BGCR)C\_WD\_CFG.WDDIS register. After the watchdog resumes from being halted, the counter starts counting from the previous count unless a new memory check operation is initiated. The counter is not halted when CRC-32 computation halts but by default will halt during a debug halt. The behavior of the watchdog during emulation can be changed by configuring the appropriate BGCR)C registers. In addition, due to the changing nature of memory contents during emulation, it's not recommended to run BGCR)C during emulation. CRC-32 computation will continue during a watchdog failure and software needs to address this condition.

### **9.2.6 Hardware and Software Faults Protection**

The configuration registers are protected using a lock and commit configuration. Each of the configuration registers can be individually locked and committed. The register once locked, can no longer be updated until the lock is removed. However if the register lock is committed, no further writes is permitted until the device is reset. It is recommended to lock the registers after configuration to protect against corruption due to software faults. In addition, registers critical to the module functionality and fault detection are implemented using multi-bit fields to protect against hardware faults.

### **9.3 Application of the BGCR**

This section contains use case scenarios of how the BGCR module can be configured to test a block of memory. However, the use case scenarios presented are for reference only and do not cover all the possible application scenarios. These use case scenarios could be used as a starting point to configure the BGCR module for specific applications.

### 9.3.1 Software Configuration

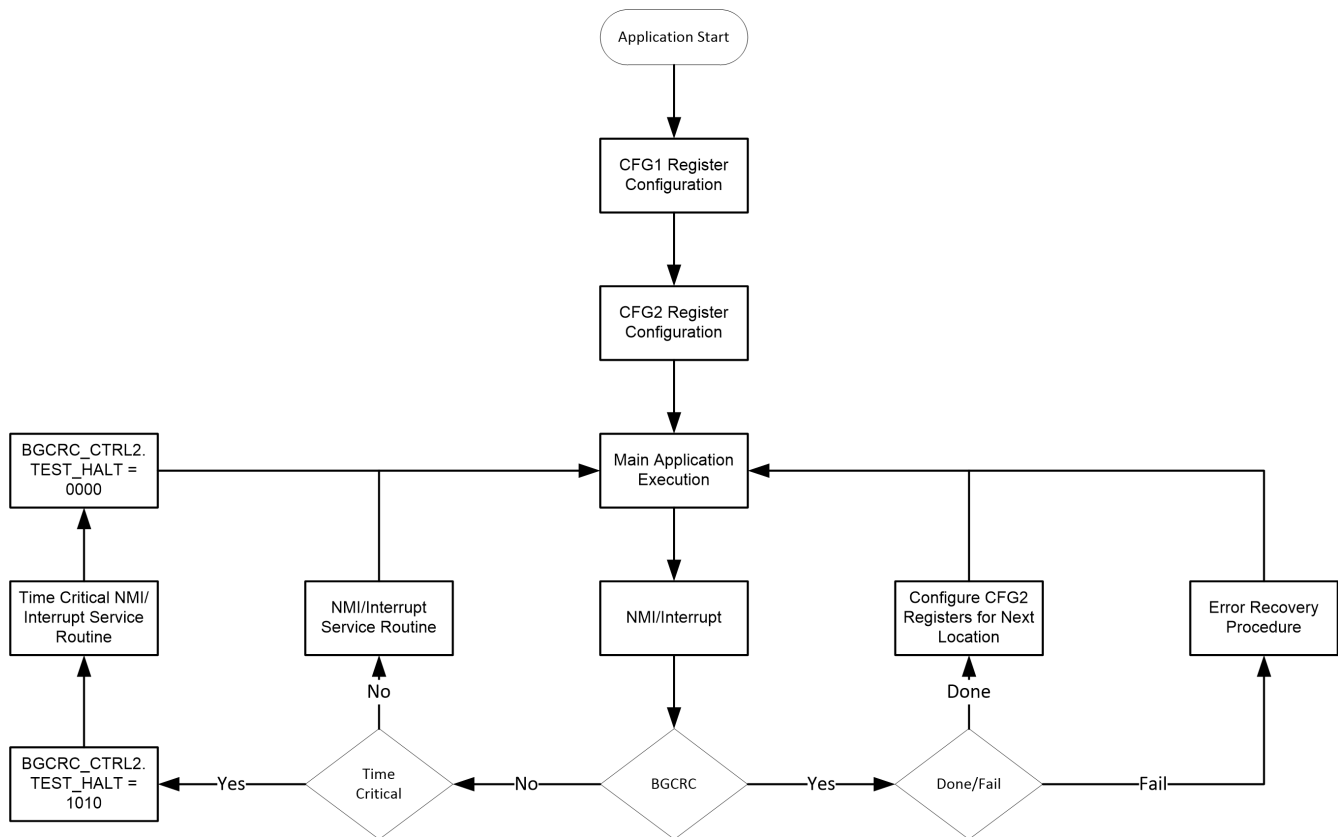

The configuration registers for the BGCRC can be split into three groups (see [Table 9-1](#)):

- **CFG1:** Registers that determine the operating mode and configured at the beginning.
- **CFG2:** Registers that need to be updated during kickoff of a new test.
- **CFG3:** Registers used for test and error management.

CFG1 registers are expected to be locked and committed after initial configuration. It is recommended to lock the CFG2 and CFG3 registers after configuration. [Figure 9-5](#) shows the BGCRC execution sequence.

**Table 9-1. BGCRC Register Groups**

| CFG1 - One Time Configuration Registers | CFG2 - Periodic Configuration Registers | CFG3 - Registers Used for Test and Error Management |
|---|---|---|
| BGCRC_CTRL1                             | BGCRC_EN                                | BGCRC_NMICLR  |
| BGCRC_WD_CFG                            | BGCRC_CTRL2                             | BGCRC_INTCLR  |
| BGCRC_INTEN                             | BGCRC_START_ADDR                        | BGCRC_NMIFRC  |
| BGCRC_SEED                              | BGCRC_GOLDEN                            | BGCRC_INTFRC  |
|   | BGCRC_WD_MIN                            |   |
|   | BGCRC_WD_MAX                            |   |

**Figure 9-5. BGCRC Execution Sequence Flow**

### 9.3.2 Decision on Error Response Severity

The error sources for BGCR are:

- Test completion before BGCR\_WD\_MIN.
- Test completed after BGCR\_WD\_MAX.
- Mismatch between the calculated CRC and golden CRC.
- Uncorrectable error during data read (single bit error for parity memory or double bit error for ECC memory).
- Correctable error during memory read (single bit error for ECC memory).

Error severity can be chosen as either NMI or Interrupt. By default, error severity is set to NMI. It is not possible to configure error response for each individual error source. The response can be chosen as either Interrupt or NMI for all error sources. When error severity is chosen as NMI, ERROR\_STS pin will be asserted during an error. CPU and CLA should be assigned the same error severity.

### 9.3.3 Decision of Controller for CLA\_CRC

CPU\_CRC can only be kicked off by the CPU. However, CLA\_CRC can be kicked off by the CPU or CLA. If BGCR error severity is chosen as NMI, it is possible to handle the background test using the CLA and error response with the CPU. Once the controller for BGCR is chosen, it is possible to prevent accesses from other controllers by using the system level access protection configuration.

### 9.3.4 Execution of Time Critical Code from Wait-Styled Memories

BGCR access to functionally wait-styled memories will also be wait-styled by the same number. Since it is impossible to predict the next functional access, any ongoing BGCR access will have to complete before functional access is granted. To mitigate delay in functional access, the BGCR can be halted when time-critical code which accesses the wait-styled memories is in progress. When BGCR execution is halted, the BGCR watchdog will not be halted. This is consistent with the safety requirement to complete the background test in a predictable window irrespective of the user code. In such scenarios, it is recommended to adjust the upper BGCR watchdog window limit to account for the halt duration during functional access. However, if required, the BGCR watchdog can be disabled.

### 9.3.5 BGCR Execution

Two notes about BGCR execution are as follows:

- BGCR task can run as a background task once kicked off.
- BGCR task does not impact functional execution for zero-wait styled memories. For memories with higher wait-states, the BGCR engine can be halted to make functional execution predictable.

Figure 9-6 shows a few examples of BGCR execution sequences.

CPU\_CRC executed in parallel with functional execution. CRC-32 check can be stalled during time critical ISRs if ISRs require access to non-zero wait-stated memories.

CLA\_CRC executed in parallel with other CLA tasks. This can cause delay in functional execution.

Functional tasks prioritized over CLA\_CRC tasks. CLA\_CRC will be stalled by functional tasks to avoid delays in functional execution.

**Figure 9-6. BGCR)C Execution Sequence Example**

**9.3.6 Debug/Error Response for BGCR)C Errors**

The BGCR)C error severity can be decoded by reading the BGCR)C\_INTFLG or BGCR)C\_NMIFLG. The errors can be:

- **WD\_OVERFLOW/WD\_UNDERFLOW:** The test did not complete in the programmed window. System timing needs to be checked to understand reason for non-completion of the test. BGCR)C\_CURR\_ADDR and BGCR)C\_WD\_CNT indicate how far the test progressed.
- **UNCORRECTABLE\_ERR:** BGCR)C\_CURR\_ADDR will contain the address of the memory location causing the error. This error is due to single bit failure for Parity SRAM or double bit failure for ECC SRAM. The memory location can be reloaded (if possible, for cases where code is copied from Flash) to see if the problem resolves. If the problem persists, it could be a permanent defect.
- **CORRECTABLE\_ERR:** This error is due to single bit failure for ECC SRAM. If the problem location is accessed again (execution from the location for execute only memory or reading the location in other cases), the expectation is that the single bit error will be corrected. If the single bit error is not corrected, this could be an indication of a permanent defect.
- **CRC\_FAIL:** This indicates a failure in the computation of the CRC-32 value. This error does not occur in scrub mode. For SRAMs with protection, in the absence of code bugs, this error is less likely since the error will most often manifest as a correctable/uncorrectable error. Code bugs can cause failure if the code inadvertently writes to a wrong address thus causing a CRC-32 error.

**9.3.7 BGCR)C Golden CRC-32 Value Computation**

The C28x is a little-endian, 16-bit word addressable CPU. Therefore, the 32-bit value of 0x12345678 stored at address 0x100 is stored in the C28x memory as shown in [Table 9-2](#).

**Table 9-2. Data Address Location Example 1**

| Address | 0x100  | 0x101  |
|---------|--------|--------|
| Data    | 0x5678 | 0x1234 |

The BGCR order of byte calculations of the above example is 0x78, 0x56, 0x34, 0x12 and yields 0x6A330D2D. The 32-bit polynomial 0x04C11DB7 is used with an initialization vector of 0x00000000. The code snippet in [Figure 9-7](#) shows the effective bit processing. Processing for all 32-bits within a word occurs in a single cycle within the BGCR hardware.

```

seed = 0x0UL; // Initialize With Seed
poly = 0x04C11DB7UL; // 32-Bit Polynomial
crc32 = seed;

for(i=0; i<dataSize; i++)
{
    byteSwappedData = ((data[i] & 0x000000FF) << 24) |
                      ((data[i] & 0x0000FF00) << 8) |
                      ((data[i] & 0x00FF0000) >> 8) |
                      ((data[i] & 0xFF000000) >> 24));

    crc32 = byteSwappedData ^ crc32;

    for(j=0; j<32; j++)
    {
        if(crc32 & 0x80000000) crc32 = (crc32 << 1) ^ poly;
        else crc32 = crc32 << 1;

        crc32 = crc32 & 0xFFFFFFFF;
    }
}
    
```

**Figure 9-7. BGCR Golden Value**

A second example ([Table 9-3](#)) with two 32-bit words, 0x12345678 and 0x9ABCDEF0 at address 0x100 and 0x102 successively, would calculate the bytes in the order 0x78, 0x56, 0x34, 0x12, 0xDE, 0xBC, and 0x9A and yield 0x7E0B4164.

**Table 9-3. Data Address Location Example 2**

| Address | 0x100  | 0x101  | 0x102  | 0x103  |
|---------|--------|--------|--------|--------|
| Data    | 0x5678 | 0x1234 | 0xDEF0 | 0x9ABC |

All data input to the BGCR must align to a 32-bit boundary, both in the starting address and the size. It is possible to include 16-bit data within the span of data; however, when the data is read by the BGCR, it will always assume 32-bits and conform to the above calculation order. For example, if two 16-bit words (0xA0B1 and 0xC2D3) were placed in between the previous two 32-bit words ([Table 9-4](#)), the calculations would be performed in byte order 0x78, 0x56, 0x34, 0x12, 0xB1, 0xA0, 0xD3, 0xC2, 0xF0, 0xDE, 0xBC and 0x9A and yield 0x2AEFD987.

**Table 9-4. Data Address Location Example 3**

| Address | 0x100  | 0x101  | 0x102  | 0x103  | 0x104  | 0x105  |
|---------|--------|--------|--------|--------|--------|--------|
| Data    | 0x5678 | 0x1234 | 0xA0B1 | 0xC2D3 | 0xDEF0 | 0x9ABC |

## 9.4 Software

### 9.4.1 BGCR Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/f28003x/examples/bgcr

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

#### 9.4.1.1 BGCR CPU Interrupt Example

FILE: bgcr\_ex1\_cpuinterrupt.c

This example demonstrates how to configure and trigger BGCR from the CPU. BGCR module is configured for 1 KB of GS0 RAM which is programmed with a known data. The pre-computed CRC value is used as the golden CRC value. Interrupt is generated once the computation is done and checks if no error flags are raised. Calculation uses the 32-bit polynomial 0x04C11DB7 and seed value 0x00000000.

##### *External Connections*

- None.

##### *Watch Variables*

- pass - This should be 1.
- runStatus - BGCR running status. This will be BGCR\_ACTIVE if the module is running, BGCR\_IDLE if the module is idle

#### 9.4.1.2 BGCR Example with Watchdog and Lock

FILE: bgcr\_ex2\_cpdbgcr\_basic.c

This example demonstrates how to configure and trigger BGCR from the CPU. It also showcases how to configure the CRC watchdog and lock the registers after configuring the module. The watchdog is used as a diagnostic to check memory test completion within the expected time window. An error signal is generated if the test does not complete in the specified time window.

The module is configured for 1kB of GS0 RAM which is programmed with random data. The golden CRC value for comparison is computed using software method. Interrupt is generated once the computation is done and checks if no error flags are raised. The NMI is enabled and is triggered if an error is detected.

##### *External Connections*

- None.

##### *Watch Variables*

- pass
- bgcrDone

### 9.4.1.3 CLA-BGCRC Example in CRC Mode

FILE: bgcrc\_ex3\_clabgcrc\_crcmode.c

This example demonstrates how to configure and trigger CLABGCRC from the CPU. It also showcases how to configure the CRC watchdog and lock the registers after configuring the module. The watchdog is used as a diagnostic to check memory test completion within the expected time window. An error signal is generated if the test does not complete in the specified time window.

The module is configured for 1kB of CLA ROM memory. The golden CRC value for comparison is computed using software method. Interrupt is generated once the computation is done and checks if no error flags are raised. The NMI is enabled and is triggered if an error is detected.

#### External Connections

- None.

#### Watch Variables

- pass
- bgcrcDone

### 9.4.1.4 CLA-BGCRC Example in Scrub Mode

FILE: bgcrc\_ex4\_clabgcrc\_scrubmode.c

This example demonstrates how to configure and trigger CLA-BGCRC in Scrub mode. In Scrub mode, CRC of data is not compared with the golden CRC. Error check is done using the ECC/Parity logic. It also showcases how to configure the CRC watchdog and lock the registers after configuring the module. The watchdog is used as a diagnostic to check memory test completion within the expected time window. An error signal is generated if the test does not complete in the specified time window.

The module is configured for 256 bytes of CLA ROM memory. Interrupt is generated once the computation is done and checks if no error flags are raised. The NMI is enabled and is triggered if an error is detected.

#### External Connections

- None.

#### Watch Variables

- pass
- bgcrcDone

## 9.5 BGCRC Registers

This section describes the Background CRC registers.

### 9.5.1 BGCRC Base Address Table

**Table 9-5. BGCRC Base Address Table**

| Bit Field Name |            | DriverLib Name  | Base Address | CPU1 | DMA | HIC | CLA | Pipeline Protected |
|----------------|------------|-----------------|--------------|------|-----|-----|-----|--------------------|
| Instance       | Structure  |                 |              |      |     |     |     |                    |
| BgcrcCpuRegs   | BGCRC_REGS | BGCRC_CPU_BASE  | 0x0000_6340  | YES  | -   | -   | -   | YES                |
| BgcrcCla1Regs  | BGCRC_REGS | BGCRC_CLA1_BASE | 0x0000_6380  | YES  | -   | -   | YES | YES                |

## 9.5.2 BGCR\_REGS Registers

Table 9-6 lists the memory-mapped registers for the BGCR\_REGS registers. All register offset addresses not listed in Table 9-6 should be considered as reserved locations and the register contents should not be modified.

**Table 9-6. BGCR\_REGS Registers**

| Offset | Acronym         | Register Name                          | Write Protection | Section            |
|--------|-----------------|--|------------------|--------------------|
| 0h     | BGCR_EN         | BGCR Enable                            | EALLOW           | <a href="#">Go</a> |
| 2h     | BGCR_CTRL1      | BGCR Control register 1                | EALLOW           | <a href="#">Go</a> |
| 4h     | BGCR_CTRL2      | BGCR Control register 2                | EALLOW           | <a href="#">Go</a> |
| 6h     | BGCR_START_ADDR | Start address for the BGCR check       | EALLOW           | <a href="#">Go</a> |
| 8h     | BGCR_SEED       | Seed for CRC calculation               | EALLOW           | <a href="#">Go</a> |
| Eh     | BGCR_GOLDEN     | Golden CRC to be compared against      | EALLOW           | <a href="#">Go</a> |
| 10h    | BGCR_RESULT     | CRC calculated                         |                  | <a href="#">Go</a> |
| 12h    | BGCR_CURR_ADDR  | Current address register               |                  | <a href="#">Go</a> |
| 1Ch    | BGCR_WD_CFG     | BGCR windowed watchdog configuration   | EALLOW           | <a href="#">Go</a> |
| 1Eh    | BGCR_WD_MIN     | BGCR windowed watchdog min value       | EALLOW           | <a href="#">Go</a> |
| 20h    | BGCR_WD_MAX     | BGCR windowed watchdog max value       | EALLOW           | <a href="#">Go</a> |
| 22h    | BGCR_WD_CNT     | BGCR windowed watchdog count           |                  | <a href="#">Go</a> |
| 2Ah    | BGCR_NMIFLG     | BGCR NMI flag register                 |                  | <a href="#">Go</a> |
| 2Ch    | BGCR_NMICLR     | BGCR NMI flag clear register           | EALLOW           | <a href="#">Go</a> |
| 2Eh    | BGCR_NMIFRC     | BGCR NMI flag force register           | EALLOW           | <a href="#">Go</a> |
| 34h    | BGCR_INTEN      | Interrupt enable                       | EALLOW           | <a href="#">Go</a> |
| 36h    | BGCR_INTFLG     | Interrupt flag                         |                  | <a href="#">Go</a> |
| 38h    | BGCR_INTCLR     | Interrupt flag clear                   | EALLOW           | <a href="#">Go</a> |
| 3Ah    | BGCR_INTFRC     | Interrupt flag force                   | EALLOW           | <a href="#">Go</a> |
| 3Ch    | BGCR_LOCK       | BGCR register map lock configuration   | EALLOW           | <a href="#">Go</a> |
| 3Eh    | BGCR_COMMIT     | BGCR register map commit configuration | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 9-7 shows the codes that are used for access types in this section.

**Table 9-7. BGCR\_REGS Access Type Codes**

| Access Type              | Code  | Description                            |
|--------------------------|-------|--|
| Read Type                |       |  |
| R                        | R     | Read                                   |
| R-0                      | R-0   | Read Returns 0s                        |
| Write Type               |       |  |
| W                        | W     | Write                                  |
| W1S                      | W1S   | Write 1 to set                         |
| WOnce                    | WOnce | Write Set once                         |
| Reset or Default Value   |       |  |
| -n                       |       | Value after reset or the default value |
| Register Array Variables |       |  |

**Table 9-7. BGCR\_REGS Access Type Codes  
(continued)**

| Access Type | Code | Description  |
|-------------|------|--|
| i,j,k,l,m,n |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y           |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 9.5.2.1 BGCR\_EN Register (Offset = 0h) [Reset = 0h]

BGCR\_EN is shown in [Figure 9-8](#) and described in [Table 9-8](#).

Return to the [Summary Table](#).

BGCR Enable

**Figure 9-8. BGCR\_EN Register**

|          |          |    |    |          |    |    |    |

The GPIO module controls the device's digital and analog I/O multiplexing, which uses shared pins to maximize application flexibility. The pins are named by their general-purpose I/O name (for example, GPIO0, GPIO25, GPIO58). These pins can be individually selected to operate as digital I/O (also called GPIO mode), or connected to one of several peripheral I/O signals. The input signals can be qualified to remove unwanted noise.

## 10.1 Introduction

Up to twelve independent peripheral signals are multiplexed on a single GPIO-enabled pin in addition to the CPU-controlled I/O capability. Each pin output can be controlled by either a peripheral or one of the two CPU masters (CPU1, CPU1.CLA). There are two I/O ports:

Up to twelve independent peripheral signals are multiplexed on a single GPIO-enabled pin in addition to the CPU-controlled I/O capability. Each pin output can be controlled by either a peripheral or the CPU. There are two I/O ports:

- Port A consists of GPIO0-GPIO31
- Port B consists of GPIO32-GPIO59

The analog signals on this device are multiplexed with digital inputs. Some of these analog IO (AIO) pins do not have digital output capability. Others of these are analog pins capable of full digital input and output capability (AGPIO). Analog pins multiplexed with digital inputs (and outputs) are assigned to a single port:

- Port H consists of GPIO224-GPIO253

---

### Note

By default, all analog pins with digital input support shall come up in analog mode. To turn ON the digital input functionality, GPHAMSEL register needs to be configured.

---

Figure 10-1 shows the GPIO logic for a single pin.

There are two key features to note in Figure 10-1. The first is that the input and output paths are entirely separate, connecting only at the pin. The second is that peripheral muxing takes place far from the pin. As a result, it is always possible for both CPUs and CLAs to read the physical state of the pin independent of CPU mastering and peripheral muxing. Likewise, external interrupts can be generated from peripheral activity. All pin options such as input qualification and open-drain output are valid for all peripherals. Table 10-1 provides details of GPIO registers accessible by different masters

**Table 10-1. GPIO access by different masters**

| Register Type       | CPU | CLA | DMA | HIC | Comments                       |
|---------------------|-----|-----|-----|-----|--------------------------------|
| GPIO_CTRL_REGS      | Yes | No  | No  | No  |                                |
| GPIO_DATA_REGS      | Yes | Yes | No  | No  | Based on GPxCSEL configuration |
| GPIO_DATA_READ_REGS | Yes | Yes | No  | Yes |                                |

---

### Note

JTAG uses a different signal path that does not support inversion or qualification.

GPIO18/X2 and GPIO19/X1 have different timings due to the load placed on them by the oscillator circuit. For information on using GPIO18/X2 and GPIO19/X1 as GPIOs, see the device data sheet and the Clocking section of this document.

If digital signals with sharp edges (high dv/dt) are connected to the AIOs or AGPIOs, cross-talk can occur with adjacent analog signals. Therefore, you should limit the edge rate of signals connected to AIOs or AGPIOs if adjacent channels are being used for analog functions.

## 10.3 Configuration Overview

I/O pin configuration consists of several steps:

### 1. Plan the device pin-out

Make a list of all required peripherals for the application. Using the peripheral mux information in the device data manual, choose which GPIOs to use for the peripheral signals. Decide which of the remaining GPIOs to use as inputs and outputs for each CPU and CLA.

Once the peripheral muxing has been chosen, it should be implemented by writing the appropriate values to the GPyMUX1/2 and GPyGMUX1/2 registers. When changing the GPyGMUX value for a pin, always set the corresponding GPyMUX bits to zero first to avoid glitching in the muxes. By default, all pins are general-purpose I/Os, not peripheral signals.

## 2. (Optional) Enable internal pullup resistors

To enable or disable the pullup resistors, write to the appropriate bits in the GPIO pullup disable registers (GPyPUD). All pullups are disabled by default. Pullups can be used to keep input pins in a known state when there is no external signal driving them.

## 3. Select input qualification

If the pin will be used as an input, specify the required input qualification, if any. The input qualification sampling period is selected in the GPyCTRL registers, while the type of qualification is selected in the GPyQSEL1 and GPyQSEL2 registers. By default, all qualification is synchronous with a sampling period equal to PLLSYSCLK. For an explanation of input qualification, see [Section 10.5](#).

## 4. Select the direction of any general-purpose I/O pins

For each pin configured as a GPIO, specify the direction of the pin as either input or output using the GPyDIR registers. By default, all GPIO pins are inputs. Before changing a pin to an output, load the output latch with the value to be driven by writing that value to the GPySET, GPyCLEAR, or GPyDAT registers. Once the latch is loaded, write to GPyDIR to change the pin direction. By default, all output latches are zero.

The GPyDAT\_R register can be used to read what value was written to the GPyDAT register.

## 5. Select low-power mode wake-up sources

GPIOs 0-63 can be used to wake the system up from low power modes. To select one or more GPIOs for wake-up, write to the appropriate bits in the GPIOLPMSEL0 and GPIOLPMSEL1 registers. These registers are part of the CPU system register space. For more information on low-power modes and GPIO wake-up, see the Low Power Modes section in the *System Control and Interrupts* chapter.

## 6. Select external interrupt sources

Configuring external interrupts is a two-step process. First, the interrupts themselves must be enabled and their polarity must be configured via the XINTnCR registers. Second, the XINT1-5 GPIO pins must be set by selecting the sources for Input X-BAR signals 4, 5, 6, 13, and 14, respectively. For more information on the Input X-BAR architecture, see the *Crossbar (X-BAR)* chapter.

## 10.4 Digital General-Purpose I/O Control

The values on the pins that are configured as GPIO can be changed by using the following registers.

### • GPyDAT Registers

Each I/O port has one data register. Each bit in the data register corresponds to one GPIO pin. No matter how the pin is configured (GPIO or peripheral function), the corresponding bit in the data register reflects the current state of the pin after qualification. Writing to the GPyDAT register clears or sets the corresponding output latch and if the pin is enabled as a general purpose output (GPIO output) the pin will also be driven either low or high. If the pin is not configured as a GPIO output then the value will be latched, but the pin will not be driven. Only if the pin is later configured as a GPIO output, will the latched value be driven onto the pin.

When using the GPyDAT register to change the level of an output pin, you should be cautious not to accidentally change the level of another pin. For example, if you mean to change the output latch level of GPIOA1 by writing to the GPADAT register bit 0 using a read-modify-write instruction, a problem can occur if another I/O port A signal changes level between the read and the write stage of the instruction. Following is an analysis of why this happens:

The GPyDAT registers reflect the state of the pin, not the latch. This means the register reflects the actual pin value. However, there is a lag between when the register is written to when the new pin value is reflected back in the register. This may pose a problem when this register is used in subsequent program statements to alter the state of GPIO pins. An example is shown below where two program statements attempt to drive two different GPIO pins that are currently low to a high state.

If Read-Modify-Write operations are used on the GPyDAT registers, because of the delay between the output and the input of the first instruction (I1), the second instruction (I2) will read the old value and write it back.

```
GpioDataRegs.GPADAT.bit.GPIO1 = 1; //I1 performs read-modify-write of GPADAT
GpioDataRegs.GPADAT.bit.GPIO2 = 1; //I2 also a read-modify-write of GPADAT
//GPADAT gets the old value of GPIO1 due to the delay
```

The second instruction will wait for the first to finish its write due to the write-followed-by-read protection on this peripheral frame. There will be some lag, however, between the write of (I1) and the GPyDAT bit reflecting the new value (1) on the pin. During this lag, the second instruction will read the old value of GPIO1 (0) and write it back along with the new value of GPIO2 (1). Therefore, GPIO1 pin stays low.

One solution is to put some NOPs between instructions. A better solution is to use the GPySET/GPyCLEAR/GPyTOGGLE registers instead of the GPyDAT registers. These registers always read back a 0 and writes of 0 have no effect. Only bits that need to be changed can be specified without disturbing any other bit(s) that are currently in the process of changing.

- **GPyDAT\_R Registers**

The GPyDAT\_R registers are read only registers which return the value written to the GPyDAT registers instead of pin status. Writes to these registers have no effect.

- **GPySET Registers**

The set registers are used to drive specified GPIO pins high without disturbing other pins. Each I/O port has one set register and each bit corresponds to one GPIO pin. The set registers always read back 0. If the corresponding pin is configured as an output, then writing a 1 to that bit in the set register will set the output latch high and the corresponding pin will be driven high. If the pin is not configured as a GPIO output, then the value will be latched but the pin will not be driven. Only if the pin is later configured as a GPIO output will the latched value be driven onto the pin. Writing a 0 to any bit in the set registers has no effect.

- **GPyCLEAR Registers**

The clear registers are used to drive specified GPIO pins low without disturbing other pins. Each I/O port has one clear register. The clear registers always read back 0. If the corresponding pin is configured as a general purpose output, then writing a 1 to the corresponding bit in the clear register will clear the output latch and the pin will be driven low. If the pin is not configured as a GPIO output, then the value will be latched but the pin will not be driven. Only if the pin is later configured as a GPIO output will the latched value be driven onto the pin. Writing a 0 to any bit in the clear registers has no effect.

- **GPyTOGGLE Registers**

The toggle registers are used to drive specified GPIO pins to the opposite level without disturbing other pins. Each I/O port has one toggle register. The toggle registers always read back 0. If the corresponding pin is configured as an output, then writing a 1 to that bit in the toggle register flips the output latch and pulls the corresponding pin in the opposite direction. That is, if the output pin is driven low, then writing a 1 to the corresponding bit in the toggle register will pull the pin high. Likewise, if the output pin is high, then writing a 1 to the corresponding bit in the toggle register will pull the pin low. If the pin is not configured as a GPIO output, then the value will be latched but the pin will not be driven. Only if the pin is later configured as a GPIO output will the latched value be driven onto the pin. Writing a 0 to any bit in the toggle registers has no effect.

## 10.5 Input Qualification

The input qualification scheme has been designed to be very flexible. You can select the type of input qualification for each GPIO pin by configuring the GPyQSEL1 and GPyQSEL2 registers. In the case of a GPIO input pin, the qualification can be specified as only synchronize to SYSCLKOUT or qualification by a sampling window. For pins that are configured as peripheral inputs, the input can also be asynchronous in addition to synchronized to SYSCLKOUT or qualified by a sampling window. The remainder of this section describes the options available.

### 10.5.1 No Synchronization (Asynchronous Input)

This mode is used for peripherals where input synchronization is not required or the peripheral itself performs the synchronization. Examples include communication ports McBSP, SCI, SPI, and I<sup>2</sup>C. In addition, it may be desirable to have the ePWM trip zone ( $\overline{TZn}$ ) signals function independent of the presence of SYSCLKOUT.

The asynchronous option is not valid if the pin is used as a general purpose digital input pin (GPIO). If the pin is configured as a GPIO input and the asynchronous option is selected then the qualification defaults to synchronization to SYSCLKOUT as described in [Section 10.5.2](#).

---

#### Note

Using input synchronization when the peripheral itself performs the synchronization may cause unexpected results. The user should ensure that the GPIO pin is configured for asynchronous in this case.

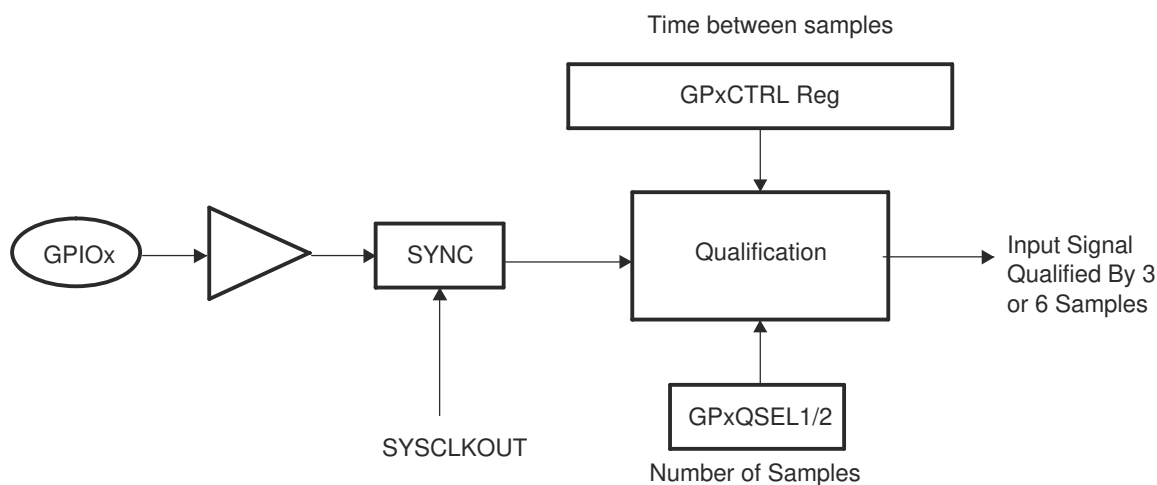

---

### 10.5.2 Synchronization to SYSCLKOUT Only

This is the default qualification mode of all the pins at reset. In this mode, the input signal is only synchronized to the system clock (SYSCLKOUT). Because the incoming signal is asynchronous, it can take up to a SYSCLKOUT period of delay in order for the input to the MCU to be changed. No further qualification is performed on the signal.

### 10.5.3 Qualification Using a Sampling Window

In this mode, the signal is first synchronized to the system clock (SYSCLKOUT) and then qualified by a specified number of cycles before the input is allowed to change. [Figure 10-2](#) and [Figure 10-3](#) show how the input qualification is performed to eliminate unwanted noise. Two parameters are specified by the user for this type of qualification: 1) the sampling period, or how often the signal is sampled, and 2) the number of samples to be taken.

**Figure 10-2. Input Qualification Using a Sampling Window**

#### Time between samples (sampling period):

To qualify the signal, the input signal is sampled at a regular period. The sampling period is specified by the user and determines the time duration between samples, or how often the signal will be sampled, relative to the CPU clock (SYSCLKOUT).

The sampling period is specified by the qualification period (QUALPRDn) bits in the GPxCTRL register. The sampling period is configurable in groups of 8 input signals. For example, GPIO0 to GPIO7 use GPECTRL[QUALPRD0] setting and GPIO8 to GPIO15 use GPECTRL[QUALPRD1]. [Table 10-2](#) and [Table 10-3](#) show the relationship between the sampling period or sampling frequency and the GPxCTRL[QUALPRDn] setting.

**Table 10-2. Sampling Period**

| Sampling Period   |   |
|---|---|
| If GPxCTRL[QUALPRDn] = 0  | $1 \times T_{\text{SYSCLKOUT}}$                                 |
| If GPxCTRL[QUALPRDn] $\neq$ 0                                   | $2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$ |
| Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT |   |

**Table 10-3. Sampling Frequency**

| Sampling Frequency   |  |
|--|--|
| If GPxCTRL[QUALPRDn] = 0                                   | $f_{\text{SYSCLKOUT}}$   |
| If GPxCTRL[QUALPRDn] $\neq$ 0                              | $f_{\text{SYSCLKOUT}} \times 1 \div (2 \times \text{GPxCTRL[QUALPRDn]})$ |
| Where $f_{\text{SYSCLKOUT}}$ is the frequency of SYSCLKOUT |  |

From these equations, the minimum and maximum time between samples can be calculated for a given SYSCLKOUT frequency:

**Example: Maximum Sampling Frequency:**

If GPxCTRL[QUALPRDn] = 0

then the sampling frequency is  $f_{\text{SYSCLKOUT}}$

If, for example,  $f_{\text{SYSCLKOUT}} = 60 \text{ MHz}$

then the signal will be sampled at 60 MHz or one sample every 16.67 ns.

**Example: Minimum Sampling Frequency:**

If GPxCTRL[QUALPRDn] = 0xFF (255)

then the sampling frequency is  $f_{\text{SYSCLKOUT}} \times 1 \div (2 \times \text{GPxCTRL[QUALPRDn]})$

If, for example,  $f_{\text{SYSCLKOUT}} = 60 \text{ MHz}$

then the signal will be sampled at  $60 \text{ MHz} \times 1 \div (2 \times 255)$  or one sample every 8.5  $\mu\text{s}$ .

**Number of samples:**

The number of times the signal is sampled is either three samples or six samples as specified in the qualification selection (GPAQSEL1, GPAQSEL2, GPBQSEL1, and GPBQSEL2) registers. When three or six consecutive cycles are the same, then the input change will be passed through to the MCU.

**Total Sampling Window Width:**

The sampling window is the time during which the input signal will be sampled as shown in [Figure 10-3](#). By using the equation for the sampling period along with the number of samples to be taken, the total width of the window can be determined.

For the input qualifier to detect a change in the input, the level of the signal must be stable for the duration of the sampling window width or longer.

The number of sampling periods within the window is always one less than the number of samples taken. For a three-sample window, the sampling window width is two sampling periods wide where the sampling period is

defined in [Table 10-2](#). Likewise, for a six-sample window, the sampling window width is five sampling periods wide. [Table 10-4](#) and [Table 10-5](#) show the calculations that can be used to determine the total sampling window width based on GPxCTRL[QUALPRDn] and the number of samples taken.

**Table 10-4. Case 1: Three-Sample Sampling Window Width**

| Total Sampling Window Width                                     |  |
|---|--|
| If GPxCTRL[QUALPRDn] = 0  | $2 \times T_{\text{SYSCLKOUT}}$  |
| If GPxCTRL[QUALPRDn] $\neq$ 0                                   | $2 \times 2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$ |
| Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT |  |

**Table 10-5. Case 2: Six-Sample Sampling Window Width**

| Total Sampling Window Width                                     |  |
|---|--|
| If GPxCTRL[QUALPRDn] = 0  | $5 \times T_{\text{SYSCLKOUT}}$  |
| If GPxCTRL[QUALPRDn] $\neq$ 0                                   | $5 \times 2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$ |
| Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT |  |

### Note

The external signal change is asynchronous with respect to both the sampling period and SYSCLKOUT. Due to the asynchronous nature of the external signal, the input should be held stable for a time greater than the sampling window width to make sure the logic detects a change in the signal. The extra time required can be up to an additional sampling period +  $T_{\text{SYSCLKOUT}}$ .

The required duration for an input signal to be stable for the qualification logic to detect a change is described in the data sheet.

### Example Qualification Window:

For the example shown in [Figure 10-3](#), the input qualification has been configured as follows:

- GPxQSEL1/2 = 1,0. This indicates a six-sample qualification.
- GPxCTRL[QUALPRDn] = 1. The sampling period is  $t_w(\text{SP}) = 2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}} = 2 \times T_{\text{SYSCLKOUT}}$ .

This configuration results in the following:

- The width of the sampling window is:

$$t_w(\text{IQSW}) = 5 \times t_w(\text{SP}) = 5 \times 2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}} = 5 \times 2 \times T_{\text{SYSCLKOUT}}$$

- If, for example,  $T_{\text{SYSCLKOUT}} = 16.67 \text{ ns}$ , then the duration of the sampling window is:

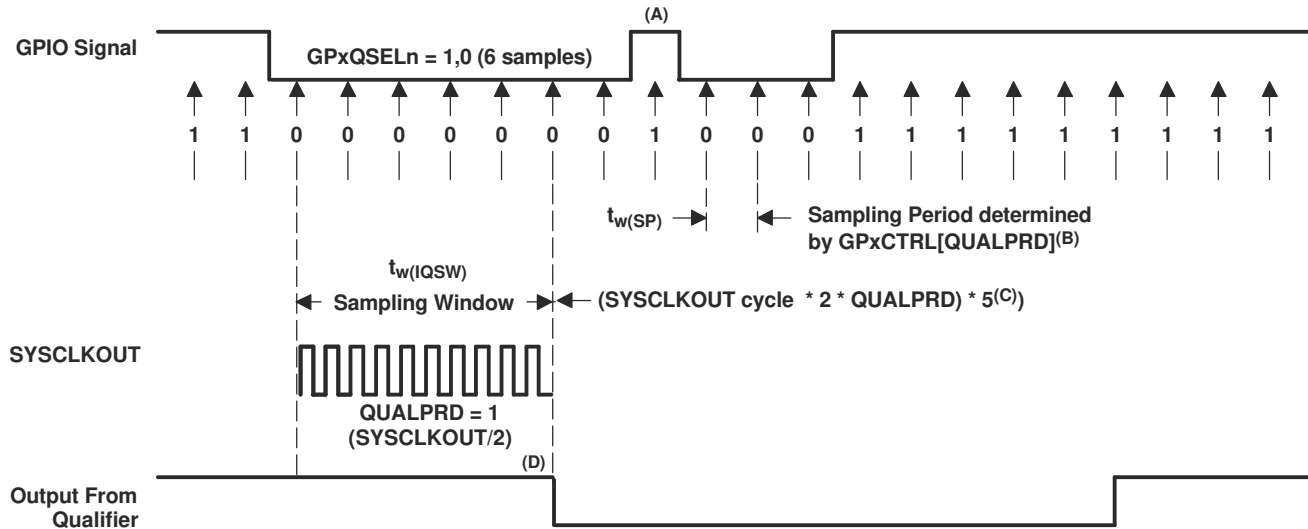

$$\text{Sampling period, } t_w(\text{SP}) = 2 \times T_{\text{SYSCLKOUT}} = 2 \times 16.67 \text{ ns} = 33.3 \text{ ns}$$

$$\text{Sampling window, } t_w(\text{IQSW}) = 5 \times t_w(\text{SP}) = 5 \times 33.3 \text{ ns} = 166.7 \text{ ns}$$

- To account for the asynchronous nature of the input relative to the sampling period and SYSCLKOUT, up to an additional sampling period and SYSCLK period may be required to detect a change in the input signal. For this example:

$$t_w(\text{IQSW}) + t_w(\text{SP}) + T_{\text{SYSCLKOUT}} = 166.7 \text{ ns} + 33.3 \text{ ns} + 16.67 \text{ ns} = 216.7 \text{ ns}$$

- In [Figure 10-3](#), the glitch (A) is shorter than the qualification window and will be ignored by the input qualifier.

- A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYSCLKOUT cycle. For any other value "n", the qualification sampling period in 2n SYSCLKOUT cycles (i.e., at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).
- B. The qualification period selected via the GPxCTRL register applies to groups of 8 GPIO pins.
- C. The qualification block can take either three or six samples. The GPxQSELn Register selects which sample mode is used.
- D. In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for (5 x QUALPRD x 2) SYSCLKOUT cycles. That would ensure 5 sampling periods for detection to occur. Since external signals are driven asynchronously, a 13-SYSCLKOUT-wide pulse ensures reliable recognition.

**Figure 10-3. Input Qualifier Clock Cycles**

## 10.6 GPIO and Peripheral Muxing

## 10.6.1 GPIO Muxing

Up to twelve different peripheral functions are multiplexed to each pin along with a general-purpose input/output (GPIO) function. This allows you to choose the peripheral mix and pinout that works best for your particular application. Refer to [Table 10-6](#) for muxing combinations and definitions.

**Table 10-6. GPIO Muxed Pins**

| 0, 4, 8, 12 | 1                | 2           | 3           | 5                | 6           | 7                | 9                | 10                  | 11                  | 13           | 14                  | 15                  | ALT |

## 10.6.2 Peripheral Muxing

For example, multiplexing for the GPIO6 pin is controlled by writing to GPAGMUX[13:12] and GPAMUX[13:12]. By writing to these bits, GPIO6 is configured as either a general-purpose digital I/O or one of four different peripheral functions. The options are shown in [Table 10-7](#).

**Table 10-7. GPIO and Peripheral Muxing**

| GPAGMUX1[13:12] | GPAMUX1[13:12] | Pin Functionality |
|-----------------|----------------|-------------------|
| 00              | 00             | GPIO6             |
| 00              | 01             | EPWM4_A           |
| 00              | 10             | OUTPUTXBAR4       |
| 00              | 11             | SYNCOUT           |
| 01              | 00             | GPIO6             |
| 01              | 01             | EQEP1_A           |
| 01              | 10             |                   |
| 01              | 11             | SPIBSOMI          |
| 10              | 00             | GPIO6             |
| 10              | 01             | FSITXAD0          |
| 10              | 10             |                   |
| 10              | 11             | FSITXAD1          |
| 11              | 00             | GPIO6             |
| 11              | 01             | HIC_NBE1          |
| 11              | 10             | CLB_OUTPUTXBAR8   |
| 11              | 11             | HIC_D14           |

The devices have different multiplexing schemes. If a peripheral is not available on a particular device, that mux selection is reserved on that device and should not be used.

### CAUTION

If you select a reserved GPIO mux configuration that is not mapped to either a peripheral or GPIO mode, the state of the pin will be undefined and the pin may be driven. Unimplemented configurations are for future expansion and must not be selected. In the device mux table (see datasheet), these options are indicated as Reserved or left blank.

Some peripherals can be assigned to more than one pin by way of the mux registers. For example, OUTPUTXBAR1 can be assigned to GPIOs 2, 24, 34, or 58, depending on individual system requirements. An example of this is shown in [Table 10-8](#).

If none, or more than one, of the GPIO pins are configured as peripheral input pins, then that GPIO will be set to a hard-wired default value.

**Table 10-8. Peripheral Muxing (Multiple Pins Assigned)**

| GMUX Configuration  | MUX Configuration  |                   |
|---------------------|--------------------|-------------------|
| Choice 1: GPIO2     | GPAGMUX1[5:4]=01   | GPAMUX1[5:4]=01   |
| or Choice 2: GPIO24 | GPAGMUX2[17:16]=00 | GPAMUX2[17:16]=01 |
| or Choice 3: GPIO34 | GPBGMUX1[5:4]=00   | GPBMUX1[5:4]=01   |
| or Choice 4: GPIO58 | GPBGMUX2[21:20]=01 | GPBMUX2[21:20]=01 |

## 10.7 Internal Pullup Configuration Requirements

On reset, GPIOs are in input mode and have the internal pullups disabled. An un-driven input can float to a mid-rail voltage and cause wasted shoot-through current on the input buffer. The user should always put each GPIO in one of these configurations:

- Input mode and driven on the board by another component to a level above  $V_{ih}$  or below  $V_{il}$
- Input mode with GPIO internal pullup enabled
- Output mode

On devices with lesser pin count packages, pull-ups on unbonded GPIOs are by default enabled to prevent floating inputs. The user should take care to avoid disabling these pullups in their application code.

On devices in the 176 PTP packages, the pullups for any internally unbonded GPIO must be enabled to prevent floating inputs. TI has provided functions in controlSUITE/C2000Ware which users can call to enable the pullup on any unbonded GPIO for the package they are using. This function, `GPIO_EnabledUnbondedIOPullups()`, resides in the `(Device)_Sysctrl.c` file and is called by default from `InitSysCtrl()`. The user should take care to avoid disabling these pullups in their application code.

## 10.8 Software

### 10.8.1 GPIO Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/f28003x/examples/gpio

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

#### 10.8.1.1 Device GPIO Setup

FILE: gpio\_ex1\_setup.c

Configures the device GPIO into two different configurations This code is verbose to illustrate how the GPIO could be setup. In a real application, lines of code can be combined for improved code size and efficiency.

This example only sets-up the GPIO. Nothing is actually done with the pins after setup.

*In general:*

- All pullup resistors are enabled. For ePWMs this may not be desired.
- Input qual for communication ports (CAN, SPI, SCI, I2C) is asynchronous
- Input qual for Trip pins (TZ) is asynchronous
- Input qual for eCAP and eQEP signals is synch to SYSCLKOUT
- Input qual for some I/O's and \_\_interrupts may have a sampling window

#### 10.8.1.2 Device GPIO Toggle

FILE: gpio\_ex2\_toggle.c

Configures the device GPIO through the sysconfig file. The GPIO pin is toggled in the infinite loop.

#### 10.8.1.3 Device GPIO Interrupt

FILE: gpio\_ex3\_interrupt.c

Configures the device GPIOs through the sysconfig file. One GPIO output pin, and one GPIO input pin is configured. The example then configures the GPIO input pin to be the source of an external interrupt which toggles the GPIO output pin.

#### 10.8.1.4 External Interrupt (XINT)

FILE: gpio\_ex4\_aio\_external\_interrupt.c

In this example AIO pins are configured as digital inputs. Two other GPIO signals (connected externally to AIO pins) are toggled in software to trigger external interrupt through AIO224 and AIO225 (AIO224 assigned to XINT1 and AIO225 assigned to XINT2). The user is required to externally connect these signals for the program to work properly. Each interrupt is fired in sequence: XINT1 first and then XINT2.

GPIO34 will go high outside of the interrupts and low within the interrupts. This signal can be monitored on a scope.

*External Connections*

- Connect GPIO30 to AIO224. AIO224 will be assigned to XINT1
- Connect GPIO31 to AIO225. AIO225 will be assigned to XINT2
- GPIO34 can be monitored on an oscilloscope

*Watch Variables*

- xint1Count for the number of times through XINT1 interrupt
- xint2Count for the number of times through XINT2 interrupt
- loopCount for the number of times through the idle loop

## 10.8.2 LED Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/f28003x/examples/led

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

### 10.8.2.1 LED Blinky Example

FILE: led\_ex1\_blinky.c

This example demonstrates how to blink a LED.

#### External Connections

- None.

#### Watch Variables

- None.

## 10.9 GPIO Registers

This section describes the General-Purpose Input/Output Registers.

### 10.9.1 GPIO Base Address Table

**Table 10-9. GPIO Base Address Table**

| Bit Field Name   |                     | DriverLib Name    | Base Address | CPU1 | DMA | HIC | CLA | Pipeline Protected |
|------------------|---------------------|-------------------|--------------|------|-----|-----|-----|--------------------|
| Instance         | Structure           |                   |              |      |     |     |     |                    |
| GpioCtrlRegs     | GPIO_CTRL_REGS      | GPIOCTRL_BASE     | 0x0000_7C00  | YES  | -   | -   | -   | YES                |
| GpioDataRegs     | GPIO_DATA_REGS      | GPIODATA_BASE     | 0x0000_7F00  | YES  | -   | -   | YES | YES                |
| GpioDataReadRegs | GPIO_DATA_READ_REGS | GPIODATAREAD_BASE | 0x0000_7F80  | YES  | -   | YES | YES | YES                |

## 10.9.2 GPIO\_CTRL\_REGS Registers

Table 10-10 lists the memory-mapped registers for the GPIO\_CTRL\_REGS registers. All register offset addresses not listed in Table 10-10 should be considered as reserved locations and the register contents should not be modified.

**Table 10-10. GPIO\_CTRL\_REGS Registers**

| Offset | Acronym  | Register Name   | Write Protection | Section            |
|--------|----------|---|------------------|--------------------|
| 0h     | GPACTRL  | GPIO A Qualification Sampling Period Control (GPIO0 to 31)  | EALLOW           | <a href="#">Go</a> |
| 2h     | GPAQSEL1 | GPIO A Qualifier Select 1 Register (GPIO0 to 15)            | EALLOW           | <a href="#">Go</a> |
| 4h     | GPAQSEL2 | GPIO A Qualifier Select 2 Register (GPIO16 to 31)           | EALLOW           | <a href="#">Go</a> |
| 6h     | GPAMUX1  | GPIO A Mux 1 Register (GPIO0 to 15)                         | EALLOW           | <a href="#">Go</a> |
| 8h     | GPAMUX2  | GPIO A Mux 2 Register (GPIO16 to 31)                        | EALLOW           | <a href="#">Go</a> |
| Ah     | GPADIR   | GPIO A Direction Register (GPIO0 to 31)                     | EALLOW           | <a href="#">Go</a> |
| Ch     | GPAPUD   | GPIO A Pull Up Disable Register (GPIO0 to 31)               | EALLOW           | <a href="#">Go</a> |
| 10h    | GPAINV   | GPIO A Input Polarity Invert Registers (GPIO0 to 31)        | EALLOW           | <a href="#">Go</a> |
| 12h    | GPAODR   | GPIO A Open Drain Output Register (GPIO0 to GPIO31)         | EALLOW           | <a href="#">Go</a> |
| 14h    | GPAAMSEL | GPIO A Analog Mode Select register (GPIO0 to GPIO31)        | EALLOW           | <a href="#">Go</a> |
| 20h    | GPAGMUX1 | GPIO A Peripheral Group Mux (GPIO0 to 15)                   | EALLOW           | <a href="#">Go</a> |
| 22h    | GPAGMUX2 | GPIO A Peripheral Group Mux (GPIO16 to 31)                  | EALLOW           | <a href="#">Go</a> |
| 28h    | GPACSEL1 | GPIO A Core Select Register (GPIO0 to 7)                    | EALLOW           | <a href="#">Go</a> |
| 2Ah    | GPACSEL2 | GPIO A Core Select Register (GPIO8 to 15)                   | EALLOW           | <a href="#">Go</a> |
| 2Ch    | GPACSEL3 | GPIO A Core Select Register (GPIO16 to 23)                  | EALLOW           | <a href="#">Go</a> |
| 2Eh    | GPACSEL4 | GPIO A Core Select Register (GPIO24 to 31)                  | EALLOW           | <a href="#">Go</a> |
| 3Ch    | GPALOCK  | GPIO A Lock Configuration Register (GPIO0 to 31)            | EALLOW           | <a href="#">Go</a> |
| 3Eh    | GPACR    | GPIO A Lock Commit Register (GPIO0 to 31)                   | EALLOW           | <a href="#">Go</a> |
| 40h    | GPBCTRL  | GPIO B Qualification Sampling Period Control (GPIO32 to 63) | EALLOW           | <a href="#">Go</a> |
| 42h    | GPBQSEL1 | GPIO B Qualifier Select 1 Register (GPIO32 to 47)           | EALLOW           | <a href="#">Go</a> |
| 44h    | GPBQSEL2 | GPIO B Qualifier Select 2 Register (GPIO48 to 63)           | EALLOW           | <a href="#">Go</a> |
| 46h    | GPBMUX1  | GPIO B Mux 1 Register (GPIO32 to 47)                        | EALLOW           | <a href="#">Go</a> |
| 48h    | GPBMUX2  | GPIO B Mux 2 Register (GPIO48 to 63)                        | EALLOW           | <a href="#">Go</a> |
| 4Ah    | GPBDIR   | GPIO B Direction Register (GPIO32 to 63)                    | EALLOW           | <a href="#">Go</a> |
| 4Ch    | GPBPUD   | GPIO B Pull Up Disable Register (GPIO32 to 63)              | EALLOW           | <a href="#">Go</a> |
| 50h    | GPBINV   | GPIO B Input Polarity Invert Registers (GPIO32 to 63)       | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. [Table 10-11](#) shows the codes that are used for access types in this section.

**Table 10-11. GPIO\_CTRL\_REGS Access Type Codes**

| Access Type              | Code       | Description  |
|--------------------------|------------|--|
| Read Type                |            |  |
| R                        | R          | Read   |
| Write Type               |            |  |
| W                        | W          | Write  |
| WOnce                    | W<br>Sonce | Write<br>Set once  |
| Reset or Default Value   |            |  |
| -n                       |            | Value after reset or the default value   |
| Register Array Variables |            |  |
| i,j,k,l,m,n              |            | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |

**Table 10-11. GPIO\_CTRL\_REGS Access Type Codes  
(continued)**

| Access Type | Code | Description   |
|-------------|------|---|
| y           |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array. |

### 10.9.2.1 GPACTRL Register (Offset = 0h) [Reset = 0h]

GPACTRL is shown in [Figure 10-4](#) and described in [Table 10-12](#).

Return to the [Summary Table](#).

GPIO A Qualification Sampling Period Control (GPIO0 to 31)

### 10.9.2.4 GPAMUX1 Register (Offset = 6h) [Reset = 0h]

GPAMUX1 is shown in [Figure 10-7](#) and described in [Table 10-15](#).

Return to the [Summary Table](#).

GPIO A Mux 1 Register (GPIO0 to 15)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO. Refer to GPIO chapter for more details.

**Figure 10-7. GPAMUX1 Register**

### 10.9.2.5 GPAMUX2 Register (Offset = 8h) [Reset = 0h]

GPAMUX2 is shown in [Figure 10-8](#) and described in [Table 10-16](#).

Return to the [Summary Table](#).

GPIO A Mux 2 Register (GPIO16 to 31)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO. Refer to GPIO chapter for more details.

**Figure 10-8. GPAMUX2 Register**

### 10.9.2.6 GPADIR Register (Offset = Ah) [Reset = 0h]

GPADIR is shown in [Figure 10-9](#) and described in [Table 10-17](#).

Return to the [Summary Table](#).

GPIO A Direction Register (GPIO0 to 31)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

### 10.9.2.7 GPAPUD Register (Offset = Ch) [Reset = FFFFFFFFh]

GPAPUD is shown in [Figure 10-10](#) and described in [Table 10-18](#).

Return to the [Summary Table](#).

GPIO A Pull Up Disable Register (GPIO0 to 31)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

Note:

[1] The Pull-Ups on the GPIO pins are disabled asynchronously when IORSn signal is low.

### 10.9.2.8 GPAINV Register (Offset = 10h) [Reset = 0h]

GPAINV is shown in [Figure 10-11](#) and described in [Table 10-19](#).

Return to the [Summary Table](#).

GPIO A Input Polarity Invert Registers (GPIO0 to 31)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

**Figure 10-11. GPAINV Register**

### 10.9.2.9 GPAODR Register (Offset = 12h) [Reset = 0h]

GPAODR is shown in [Figure 10-12](#) and described in [Table 10-20](#).

Return to the [Summary Table](#).

GPIO A Open Drain Output Register (GPIO0 to GPIO31)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

### 10.9.2.10 GPAAMSEL Register (Offset = 14h) [Reset = 00300000h]

GPAAMSEL is shown in [Figure 10-13](#) and described in [Table 10-21](#).

Return to the [Summary Table](#).

GPIO A Analog Mode Select register (GPIO0 to GPIO31)

Selects between digital and analog functionality for GPIO pins.

0: The analog function of the pin is disabled and the pin is capable of digital functions as specified by the other GPIO configuration registers

1: The analog function of the pin is enabled and the pin is capable of analog functions

Reading the register returns the current value of the register setting.

Note:

[1] This register and bits are only valid for GPIO signals that share analog function through a unified I/O pad. For all the IOs, the corresponding bits in these registers don't have any affect.

### 10.9.2.17 GPALOCK Register (Offset = 3Ch) [Reset = 0h]

GPALOCK is shown in [Figure 10-20](#) and described in [Table 10-28](#).

Return to the [Summary Table](#).

GPIO A Lock Configuration Register (GPIO0 to 31)

GPIO Configuration Lock for GPIO.

0: Bits in GPyMUX1, GPyMUX2, GPyDIR, GPyINV, GPyODR, GPyAMSEL, GPyGMUX1, GPyGMUX2 and GPyCSELx register which control the same pin can be changed

1: Locks changes to the bits in GPyMUX1, GPyMUX2, GPyDIR, GPyINV, GPyODR, GPyAMSEL, GPyGMUX1, GPyGMUX2 and GPyCSELx registers which control the same pin

**Figure 10-20. GPALOCK Register**

### 10.9.2.18 GPACR Register (Offset = 3Eh) [Reset = 0h]

GPACR is shown in [Figure 10-21](#) and described in [Table 10-29](#).

Return to the [Summary Table](#).

GPIO A Lock Commit Register (GPIO0 to 31)

GPIO Configuration Lock Commit for GPIO:

1: Locks changes to the bit in GPyLOCK register which controls the same pin

0: Bit in the GPyLOCK register which controls the same pin can be changed

**Figure 10-21. GPACR Register**

### 10.9.2.2 GPBMUX1 Register (Offset = 46h) [Reset = CC0h]

GPBMUX1 is shown in [Figure 10-25](#) and described in [Table 10-33](#).

Return to the [Summary Table](#).

GPIO B Mux 1 Register (GPIO32 to 47)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO. Refer to GPIO chapter for more details.

**Figure 10-25. GPBMUX1 Register**

### 10.9.2.23 GPBMUX2 Register (Offset = 48h) [Reset = 0h]

GPBMUX2 is shown in [Figure 10-26](#) and described in [Table 10-34](#).

Return to the [Summary Table](#).

GPIO B Mux 2 Register (GPIO48 to 63)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO. Refer to GPIO chapter for more details.

### 10.9.2.24 GPBDIR Register (Offset = 4Ah) [Reset = 0h]

GPBDIR is shown in [Figure 10-27](#) and described in [Table 10-35](#).

Return to the [Summary Table](#).

GPIO B Direction Register (GPIO32 to 63)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

### 10.9.2.25 GPBPUD Register (Offset = 4Ch) [Reset = FFFFFFFFh]

GPBPUD is shown in [Figure 10-28](#) and described in [Table 10-36](#).

Return to the [Summary Table](#).

GPIO B Pull Up Disable Register (GPIO32 to 63)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

Note:

[1] The Pull-Ups on the GPIO pins are disabled asynchronously when IORSn signal is low.

### 10.9.2.26 GPBINV Register (Offset = 50h) [Reset = 0h]

GPBINV is shown in [Figure 10-29](#) and described in [Table 10-37](#).

Return to the [Summary Table](#).

GPIO B Input Polarity Invert Registers (GPIO32 to 63)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

**Figure 10-29. GPBINV Register**

### 10.9.2.27 GPBODR Register (Offset = 52h) [Reset = 0h]

GPBODR is shown in [Figure 10-30](#) and described in [Table 10-38](#).

Return to the [Summary Table](#).

GPIO B Open Drain Output Register (GPIO32 to GPIO63)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

### 10.9.2.41 GPHINV Register (Offset = 1D0h) [Reset = 0h]

GPHINV is shown in [Figure 10-44](#) and described in [Table 10-52](#).

Return to the [Summary Table](#).

GPIO H Input Polarity Invert Registers (GPIO224 to 255)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

### 10.9.2.42 GPHAMSEL Register (Offset = 1D4h) [Reset = FFFFFFFFh]

GPHAMSEL is shown in [Figure 10-45](#) and described in [Table 10-53](#).

Return to the [Summary Table](#).

GPIO H Analog Mode Select register (GPIO224 to GPIO255)

Selects between digital and analog functionality for GPIO pins.

0: The analog function of the pin is disabled and the pin is capable of digital functions as specified by the other GPIO configuration registers

1: The analog function of the pin is enabled and the pin is capable of analog functions

Reading the register returns the current value of the register setting.

Note:

[1] This register and bits are only valid for GPIO signals that share analog function through a unified I/O pad. For all the IOs, t

### 10.9.3 GPIO\_DATA\_REGS Registers

Table 10-62 lists the memory-mapped registers for the GPIO\_DATA\_REGS registers. All register offset addresses not listed in Table 10-62 should be considered as reserved locations and the register contents should not be modified.

**Table 10-62. GPIO\_DATA\_REGS Registers**

| Offset | Acronym   | Register Name                              | Write Protection | Section            |
|--------|-----------|--|------------------|--------------------|
| 0h     | GPADAT    | GPIO A Data Register (GPIO0 to 31)         |                  | <a href="#">Go</a> |
| 2h     | GPASET    | GPIO A Data Set Register (GPIO0 to 31)     |                  | <a href="#">Go</a> |
| 4h     | GPACLEAR  | GPIO A Data Clear Register (GPIO0 to 31)   |                  | <a href="#">Go</a> |
| 6h     | GPATOGGLE | GPIO A Data Toggle Register (GPIO0 to 31)  |                  | <a href="#">Go</a> |
| 8h     | GPBDAT    | GPIO B Data Register (GPIO32 to 63)        |                  | <a href="#">Go</a> |
| Ah     | GPBSET    | GPIO B Data Set Register (GPIO32 to 63)    |                  | <a href="#">Go</a> |
| Ch     | GPBCLEAR  | GPIO B Data Clear Register (GPIO32 to 63)  |                  | <a href="#">Go</a> |
| Eh     | GPBTOGGLE | GPIO B Data Toggle Register (GPIO32 to 63) |                  | <a href="#">Go</a> |
| 38h    | GPHDAT    | GPIO H Data Register (GPIO224 to 255)      |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 10-63 shows the codes that are used for access types in this section.

**Table 10-63. GPIO\_DATA\_REGS Access Type Codes**

| Access Type              | Code    | Description  |
|--------------------------|---------|--|
| Read Type                |         |  |
| R                        | R       | Read   |
| R-0                      | R<br>-0 | Read<br>Returns 0s   |
| Write Type               |         |  |
| W                        | W       | Write  |
| Reset or Default Value   |         |  |
| -n                       |         | Value after reset or the default value   |
| Register Array Variables |         |  |
| i,j,k,l,m,n              |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 10.9.3.1 GPADAT Register (Offset = 0h) [Reset = 0h]

GPADAT is shown in [Figure 10-54](#) and described in [Table 10-64](#).

Return to the [Summary Table](#).

#### GPIO A Data Register (GPIO0 to 31)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

#### DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the GPIODAT register.

**Figure 10-54. GPADAT Register**

### 10.9.3.2 GPASET Register (Offset = 2h) [Reset = 0h]

GPASET is shown in [Figure 10-55](#) and described in [Table 10-65](#).

Return to the [Summary Table](#).

GPIO A Data Set Register (GPIO0 to 31)

Writing a 1 will force GPIO output data latch to 1.

Writes of 0 are ignored.

Always reads back a 0.

**Figure 10-55. GPASET Register**

### 10.9.3.3 GPACLEAR Register (Offset = 4h) [Reset = 0h]

GPACLEAR is shown in [Figure 10-56](#) and described in [Table 10-66](#).

Return to the [Summary Table](#).

GPIO A Data Clear Register (GPIO0 to 31)

Writing a 1 will force GPIO0 output data latch to 0.

Writes of 0 are ignored.

Always reads back a 0.

**Figure 10-56. GPACLEAR Register**

### 10.9.3.5 GPBDAT Register (Offset = 8h) [Reset = 0h]

GPBDAT is shown in [Figure 10-58](#) and described in [Table 10-68](#).

Return to the [Summary Table](#).

GPIO B Data Register (GPIO32 to 63)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the GPIODAT register.

**Figure 10-58. GPBDAT Register**

### 10.9.3.6 GPBSET Register (Offset = Ah) [Reset = 0h]

GPBSET is shown in [Figure 10-59](#) and described in [Table 10-69](#).

Return to the [Summary Table](#).

GPIO B Data Set Register (GPIO32 to 63)

Writing a 1 will force GPIO output data latch to 1.

Writes of 0 are ignored.

Always reads back a 0.

### 10.9.3.7 GPBCLEAR Register (Offset = Ch) [Reset = 0h]

GPBCLEAR is shown in [Figure 10-60](#) and described in [Table 10-70](#).

Return to the [Summary Table](#).

GPIO B Data Clear Register (GPIO32 to 63)

Writing a 1 will force GPIO0 output data latch to 0.

Writes of 0 are ignored.

Always reads back a 0.

### 10.9.3.9 GPHDAT Register (Offset = 38h) [Reset = 0h]

GPHDAT is shown in [Figure 10-62](#) and described in [Table 10-72](#).

Return to the [Summary Table](#).

GPIO H Data Register (GPIO224 to 255)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the

A system reset will clear all bits and latched values to zero.</p> <p>DESIGNER NOTE:<br/>[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the GPIODAT register.</p> <p>Reset type: SYSRSn</p> |

### 10.9.4 GPIO\_DATA\_READ\_REGS Registers

Table 10-73 lists the memory-mapped registers for the GPIO\_DATA\_READ\_REGS registers. All register offset addresses not listed in Table 10-73 should be considered as reserved locations and the register contents should not be modified.

**Table 10-73. GPIO\_DATA\_READ\_REGS Registers**

| Offset | Acronym  | Register Name             | Write Protection | Section            |
|--------|----------|---------------------------|------------------|--------------------|
| 0h     | GPADAT_R | GPIO A Data Read Register |                  | <a href="#">Go</a> |
| 2h     | GPBDAT_R | GPIO B Data Read Register |                  | <a href="#">Go</a> |
| Eh     | GPHDAT_R | GPIO H Data Read Register |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 10-74 shows the codes that are used for access types in this section.

**Table 10-74. GPIO\_DATA\_READ\_REGS Access Type Codes**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| Read Type                |      |  |
| R                        | R    | Read   |
| Reset or Default Value   |      |  |
| -n                       |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| i,j,k,l,m,n              |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

#### 10.9.4.1 GPADAT\_R Register (Offset = 0h) [Reset = 0h]

GPADAT\_R is shown in [Figure 10-63](#) and described in [Table 10-75](#).

Return to the [Summary Table](#).

GPIO A Data Read Register.

Returns the contents of GPADAT register on a read, write to this register has no effect

**Figure 10-63. GPADAT\_R Register**

|      |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

This page intentionally left blank.

The crossbars (referred to as X-BAR throughout this chapter) provide flexibility to connect device inputs, outputs, and internal resources in a variety of configurations.

The device contains a total of six X-BARs:

- Input X-BAR
- CLB Input X-BAR
- Output X-BAR
- CLB Output X-BAR
- CLB X-BAR
- ePWM X-BAR

Each of the X-BARs is named according to where they take signals. For example, the Input X-BAR and CLB Input X-BAR bring external signals “in” to the device. The Output X-BAR and CLB Output X-BAR take internal signals “out” of the device to a GPIO. The CLB X-BAR and ePWM X-BAR take signals to the CLB and ePWM modules, respectively.

You can read more about each of these X-BARs in the following sections.

### 11.1 Input X-BAR and CLB Input X-BAR

On this device, the Input X-BAR is used to route signals from a GPIO to many different IP blocks such as the ADC(s), eCAP(s), ePWM(s), and external interrupts. The Input X-BAR has access to every GPIO and can route each signal to any (or multiple) of the IP blocks previously mentioned. The digital input of AIOs are also available on the Input X-BAR. This flexibility relieves some of the constraints on peripheral muxing by just requiring any GPIO pin to be available. It is important to note that the function selected on the GPIO mux does not affect the Input X-BAR. The Input X-BAR simply connects the signal on the input buffer to the selected destination. Therefore, you can do things such as route the output of one peripheral to another (that is, measure the output of an ePWM with an eCAP for a frequency test).

The Input X-BAR is configured by way of the INPUTxSELECT registers. The available IP destinations for each INPUTx is shown in Figure 11-1 and Table 11-1. For more information on configuration, see the INPUT\_XBAR\_REGS register definitions in the XBAR Registers section.

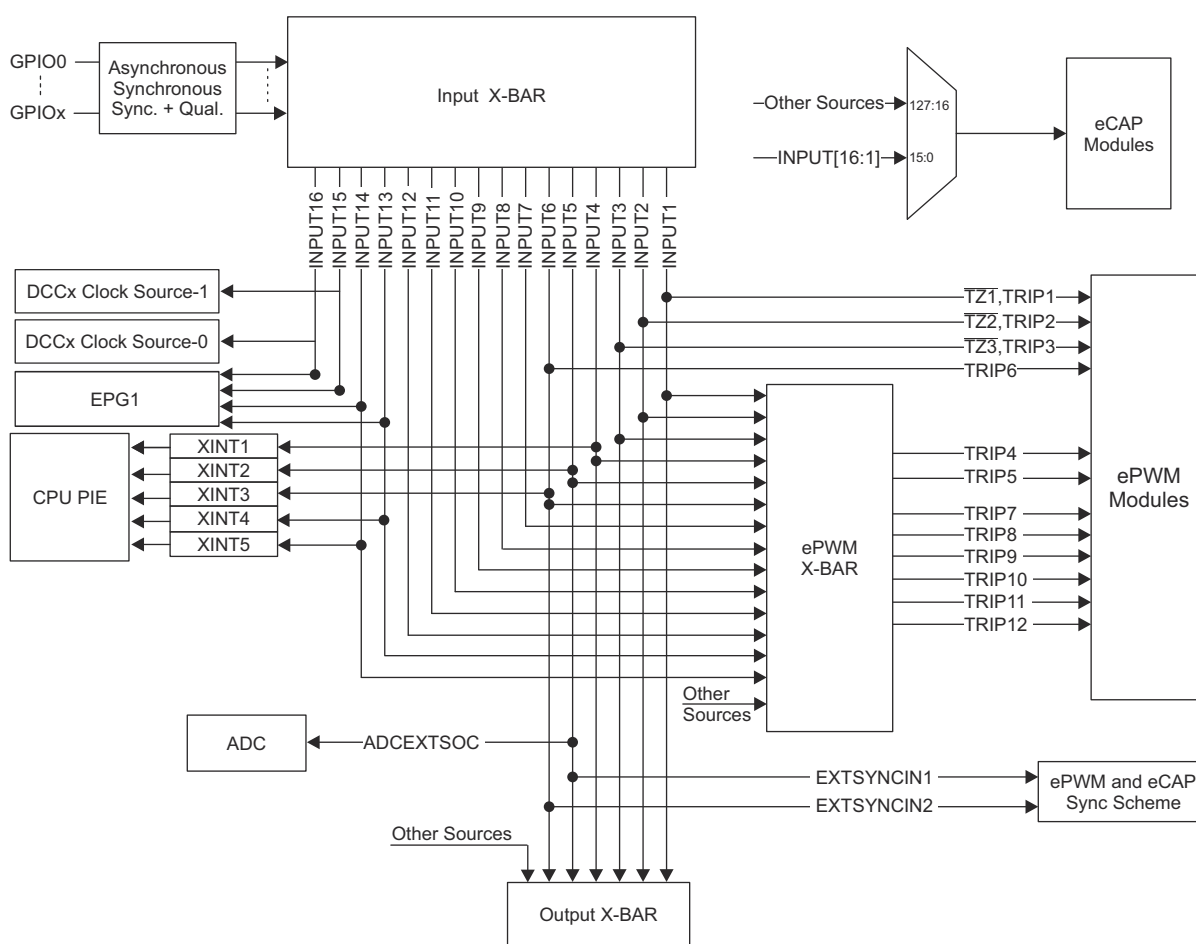

Figure 11-1. Input X-BAR

**Table 11-1. Input X-BAR Destinations**

| Input   | eCAP / HRCAP | ePWM X-BAR | CLB X-BAR | Output X-BAR | CPU XINT | ePWM Trip  | ADC Start of Conversion | ePWM / eCAP Sync | DCC | ERAD | EPG            |

### 11.1.1 CLB Input X-BAR

The CLB Input X-BAR is architecturally identical to the Input X-BAR. The only difference is the destination for each INPUTx. The destination for each INPUTx is only the CLB Tiles as shown in [Table 11-2](#). This allows for GPIOs to be accessed by the CLB tiles without using the combination of Input X-BAR and CLB X-BAR.

**Table 11-2. CLB Input X-BAR Destinations**

| Input   | Destinations              |
|---------|---------------------------|
| INPUT1  | CLB Tiles                 |
| INPUT2  | CLB Tiles                 |
| INPUT3  | CLB Tiles                 |

## 11.2 ePWM, CLB, and GPIO Output X-BAR

This section describes the ePWM, CLB, and GPIO Output X-BAR.

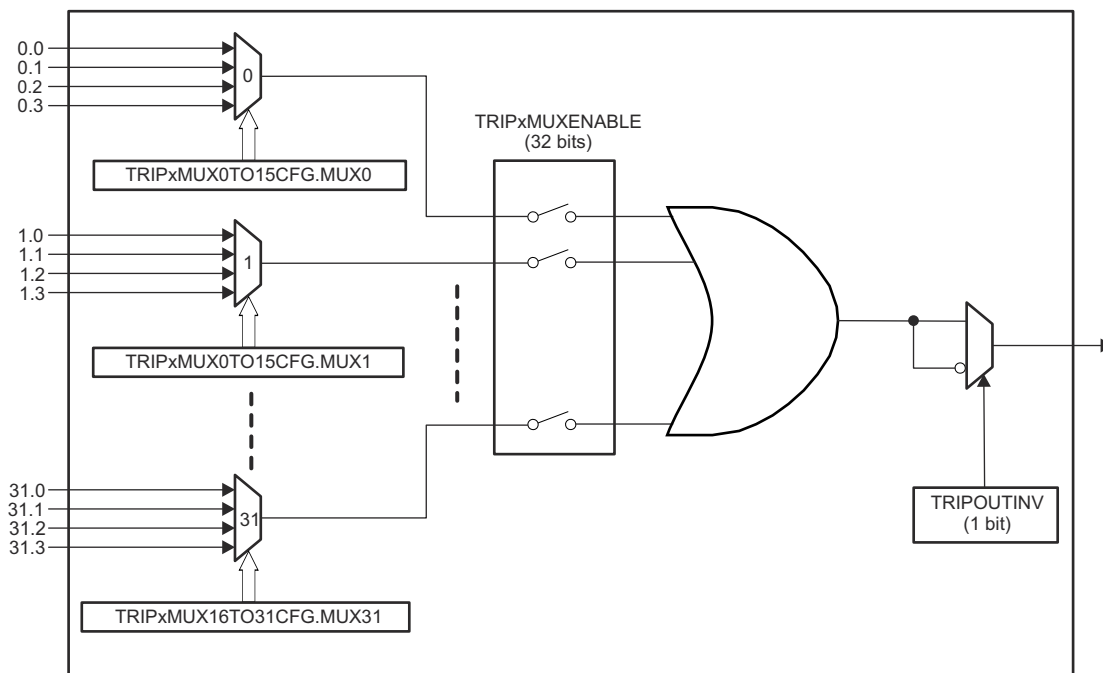

### 11.2.1 ePWM X-BAR

The ePWM X-BAR brings signals to the ePWM modules. Specifically, the ePWM X-BAR is connected to the Digital Compare (DC) submodule of each ePWM module for actions such as tripzones and syncing. Refer to the *Enhanced Pulse Width Modulator (ePWM)* chapter for more information on additional ways the DC submodule can be used. [Figure 11-2](#) shows the architecture of the ePWM X-BAR. Note that the architecture of the ePWM X-BAR is identical to the architecture of the GPIO Output X-BAR (with the exception of the output latch).

#### 11.2.1.1 ePWM X-BAR Architecture

The ePWM X-BAR has eight outputs that are routed to each ePWM module. [Figure 11-2](#) represents the architecture of a single output but it is identical to the architecture of all of the other outputs.

First, determine the signal(s) that should be passed to the ePWM by referencing [Table 11-3](#). You may select up to one signal per mux (32 total muxes) for each TRIPx output. Select the inputs to each mux via the TRIPxMUX0TO15CFG and TRIPxMUX16TO31CFG registers. In order to pass any signal through to the ePWM, you must also enable the mux in the TRIPxMUXENABLE register. All muxes that are enabled will be logically ORed before being passed on to the respective TRIPx signal on the ePWM. You may also optionally invert the signal via the TRIPxOUTINV register.

**Figure 11-2. ePWM X-BAR Architecture - Single Output**

**Note**

Do not use "Reserved" signals in your application.

## 11.2.2 CLB X-BAR

The CLB X-BAR brings signals to the CLB modules. Figure 11-3 shows the architecture of the CLB X-BAR. Note that the architecture of the CLB X-BAR is identical to the architecture of the GPIO Output X-BAR (with the exception of the output latch).

### 11.2.2.1 CLB X-BAR Architecture

The CLB X-BAR has eight outputs that are routed to each CLB module. Figure 11-3 represents the architecture of a single output but it is identical to the architecture of all of the other outputs.

First, determine the signal(s) that should be passed to the CLB by referencing Table 11-4. You may select up to one signal per mux (31 total muxes) for each AUXSIGx output. Select the inputs to each mux via the AUXSIGxMUX0TO15CFG and AUXSIGxMUX16TO31CFG registers. In order to pass any signal through to the CLB, you must also enable the mux in the AUXSIGxMUXENABLE register. All muxes which are enabled will be logically ORed before being passed on to the respective AUXSIGx signal on the CLB. You may also optionally invert the signal via the AUXSIGOUTINV register.

**Figure 11-3. CLB X-BAR Architecture - Single Output**

**Table 11-4. CLB X-BAR Mux Configuration Table**

| Mux | 0             | 1                       | 2                 | 3                 |

### 11.2.3 GPIO Output X-BAR

The GPIO Output X-BAR takes signals from inside the device and brings them out to a GPIO. Figure 11-4 shows the architecture of the GPIO Output X-BAR. The X-BAR contains eight outputs and each will contain at least one position on the GPIO mux, denoted as OUTPUTXBARx. The X-BAR allows the selection of a single signal or a logical OR of up to 32 signals.

#### 11.2.3.1 GPIO Output X-BAR Architecture

The GPIO Output X-BAR has eight outputs that are routed to the GPIO module. Figure 11-4 represents the architecture of a single output, but it is identical to the architecture of all of the other outputs. It is worth noting that the architecture of the Output X-BAR (with the exception of the output latch) is identical to the architecture of the ePWM X-BAR.

First, determine the signal(s) that should be passed to the GPIO by referencing Table 11-5. You may select up to one signal per mux (32 total muxes) for each OUTPUTXBARx output. Select the inputs to each mux via the OUTPUTxMUX0TO15CFG and OUTPUTxMUX16TO31CFG registers.

In order to pass any signal through to the GPIO, you must also enable the mux in the OUTPUTxMUXENABLE register. All muxes which are enabled will be logically ORed before being passed on to the respective OUTPUTx signal on the GPIO module. You may also optionally invert the signal via the OUTPUTINV register. The signal will only be seen on the GPIO if the proper OUTPUTx muxing options are selected via the GpioCtrlRegs.GPxMUX and GpioCtrlRegs.GPxGMUX registers.

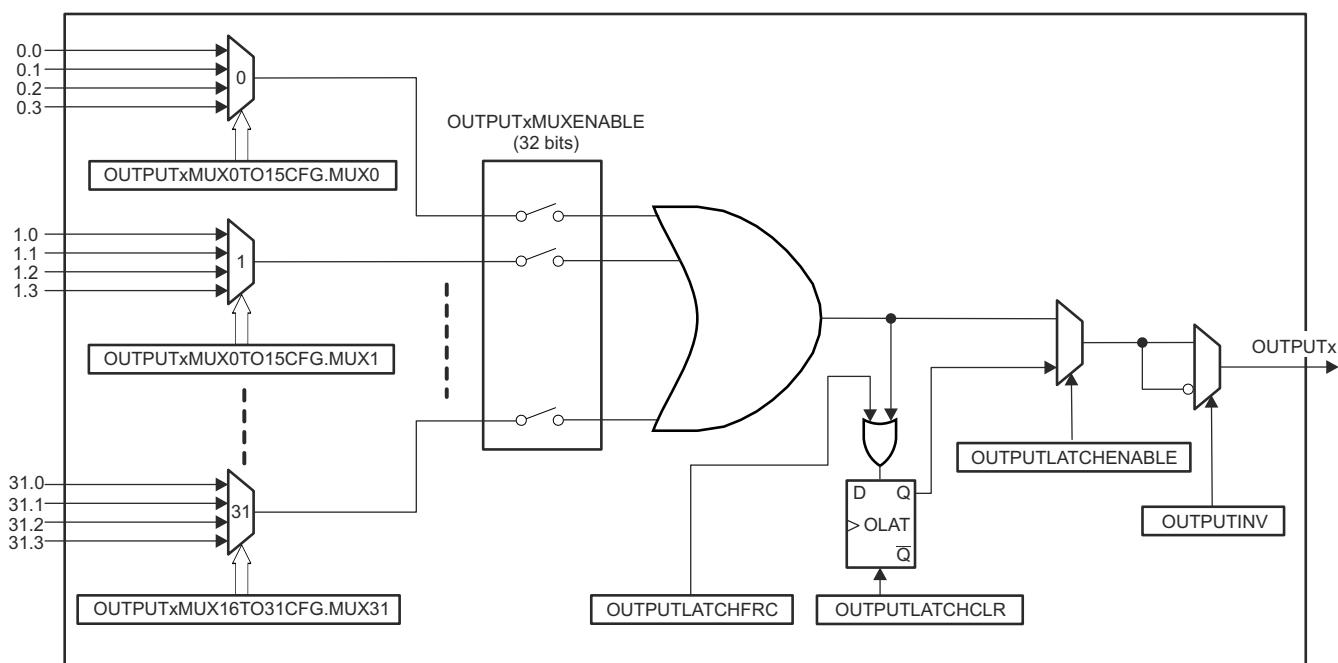

Figure 11-4. GPIO Output X-BAR Architecture

**Table 11-5. OUTPUT X-BAR Mux Configuration Table**

| 31  | CLB4_OUT7 | Reserved | Reserved | EPG1 EPGOUT3 |

### Note

Do not use "Reserved" signals in your application.

### 11.2.5 X-BAR Flags

With the exception of the CMPSS signals, the ePWM X-BAR and the Output X-BAR have all of the same input signals. Due to the inputs being similar, the ePWM X-BAR and Output X-BAR leverage a single set of input flags to indicate which input signals have been triggered. This allows software to check the input flags when an event occurs. See [Figure 11-5](#) for more information. There is a bit allocated for each input signal in one of the XBARFLGx registers. The flag will remain set until cleared through the appropriate XBARCLR<sub>x</sub> register.

## 11.3 XBAR Registers

This section describes the Crossbar registers.

### 11.3.1 XBAR Base Address Table

**Table 11-7. XBAR Base Address Table**

| Bit Field Name    |                  | DriverLib Name     | Base Address | CPU1 | DMA | HIC | CLA | Pipeline Protected |
|-------------------|------------------|--------------------|--------------|------|-----|-----|-----|--------------------|
| Instance          | Structure        |                    |              |      |     |     |     |                    |
| InputXbarRegs     | INPUT_XBAR_REGS  | INPUTXBAR_BASE     | 0x0000_7900  | YES  | -   | -   | -   | YES                |
| XbarRegs          | XBAR_REGS        | XBAR_BASE          | 0x0000_7920  | YES  | -   | -   | -   | YES                |
| ClbInputXbarRegs  | INPUT_XBAR_REGS  | CLBINPUTXBAR_BASE  | 0x0000_7960  | YES  | -   | -   | -   | YES                |
| EPwmXbarRegs      | EPWM_XBAR_REGS   | EPWMXBAR_BASE      | 0x0000_7A00  | YES  | -   | -   | -   | YES                |
| ClbXbarRegs       | CLB_XBAR_REGS    | CLBXBAR_BASE       | 0x0000_7A40  | YES  | -   | -   | -   | YES                |
| OutputXbarRegs    | OUTPUT_XBAR_REGS | OUTPUTXBAR_BASE    | 0x0000_7A80  | YES  | -   | -   | -   | YES                |
| ClbOutputXbarRegs | OUTPUT_XBAR_REGS | CLBOUTPUTXBAR_BASE | 0x0000_7BC0  | YES  | -   | -   | -   | YES                |

### 11.3.2 INPUT\_XBAR\_REGS Registers

Table 11-8 lists the memory-mapped registers for the INPUT\_XBAR\_REGS registers. All register offset addresses not listed in Table 11-8 should be considered as reserved locations and the register contents should not be modified.

**Table 11-8. INPUT\_XBAR\_REGS Registers**

| Offset | Acronym         | Register Name                              | Write Protection | Section            |
|--------|-----------------|--|------------------|--------------------|
| 0h     | INPUT1SELECT    | INPUT1 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 1h     | INPUT2SELECT    | INPUT2 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 2h     | INPUT3SELECT    | INPUT3 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 3h     | INPUT4SELECT    | INPUT4 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 4h     | INPUT5SELECT    | INPUT5 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 5h     | INPUT6SELECT    | INPUT6 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 6h     | INPUT7SELECT    | INPUT7 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 7h     | INPUT8SELECT    | INPUT8 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 8h     | INPUT9SELECT    | INPUT9 Input Select Register (GPIO0 to x)  | EALLOW           | <a href="#">Go</a> |
| 9h     | INPUT10SELECT   | INPUT10 Input Select Register (GPIO0 to x) | EALLOW           | <a href="#">Go</a> |
| Ah     | INPUT11SELECT   | INPUT11 Input Select Register (GPIO0 to x) | EALLOW           | <a href="#">Go</a> |
| Bh     | INPUT12SELECT   | INPUT12 Input Select Register (GPIO0 to x) | EALLOW           | <a href="#">Go</a> |
| Ch     | INPUT13SELECT   | INPUT13 Input Select Register (GPIO0 to x) | EALLOW           | <a href="#">Go</a> |
| Dh     | INPUT14SELECT   | INPUT14 Input Select Register (GPIO0 to x) | EALLOW           | <a href="#">Go</a> |
| Eh     | INPUT15SELECT   | INPUT15 Input Select Register (GPIO0 to x) | EALLOW           | <a href="#">Go</a> |
| Fh     | INPUT16SELECT   | INPUT16 Input Select Register (GPIO0 to x) | EALLOW           | <a href="#">Go</a> |
| 1Eh    | INPUTSELECTLOCK | Input Select Lock Register                 | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 11-9 shows the codes that are used for access types in this section.

**Table 11-9. INPUT\_XBAR\_REGS Access Type Codes**

| Access Type              | Code      | Description  |
|--------------------------|-----------|--|
| Read Type                |           |  |
| R                        | R         | Read   |
| R-0                      | R-0       | Read<br>Returns 0s   |
| Write Type               |           |  |
| W                        | W         | Write  |
| WOnce                    | W<br>Once | Write<br>Set once  |
| Reset or Default Value   |           |  |
| -n                       |           | Value after reset or the default value   |
| Register Array Variables |           |  |
| i,j,k,l,m,n              |           | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |

**Table 11-9. INPUT\_XBAR\_REGS Access Type Codes  
(continued)**

| Access Type | Code | Description   |
|-------------|------|---|
| y           |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array. |

### 11.3.2.1 INPUT1SELECT Register (Offset = 0h) [Reset = FFFEh]

INPUT1SELECT is shown in [Figure 11-6](#) and described in [Table 11-10](#).

Return to the [Summary Table](#).

INPUT1 Input Select Register (GPIO0 to x)

**Figure 11-6. INPUT1SELECT Register**

|           |    |    |    |    |    |   |   |
|-----------|----|----|----|----|----|---|---|
| 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |
| 7         | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |

**Table 11-10. INPUT1SELECT Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description  |
|------|--------|------|-------|--|
| 15-0 | SELECT | R/W  | FFFEh | Select GPIO for INPUT1 signal:<br>0x0 : Select GPIO0<br>0x1 : Select GPIO1<br>0x2 : Select GPIO2<br>...<br>0xFFFFD: '1' will be driven to the destination<br>0xFFFFE: '1' will be driven to the destination<br>0xFFFFF: '0' will be driven to the destination<br>NOTE: SELECT value greater than the available number of GPIO pins on a device (except 0xFFFF) will cause the destination to be driven '1'.<br>Reset type: CPU1.SYSRSn |

### 11.3.2.2 INPUT2SELECT Register (Offset = 1h) [Reset = FFFEh]

INPUT2SELECT is shown in [Figure 11-7](#) and described in [Table 11-11](#).

Return to the [Summary Table](#).

INPUT2 Input Select Register (GPIO0 to x)

**Figure 11-7. INPUT2SELECT Register**

|           |    |    |    |    |    |   |   |
|-----------|----|----|----|----|----|---|---|
| 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |
| 7         | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |

**Table 11-11. INPUT2SELECT Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description  |
|------|--------|------|-------|--|
| 15-0 | SELECT | R/W  | FFFEh | Select GPIO for INPUT2 signal:<br>0x0 : Select GPIO0<br>0x1 : Select GPIO1<br>0x2 : Select GPIO2<br>...<br>0xFFFFD: '1' will be driven to the destination<br>0xFFFFE: '1' will be driven to the destination<br>0xFFFFF: '0' will be driven to the destination<br>NOTE: SELECT value greater than the available number of GPIO pins on a device (except 0xFFFF) will cause the destination to be driven '1'.<br>Reset type: CPU1.SYSRSn |

### 11.3.2.3 INPUT3SELECT Register (Offset = 2h) [Reset = FFFEh]

INPUT3SELECT is shown in [Figure 11-8](#) and described in [Table 11-12](#).

Return to the [Summary Table](#).

INPUT3 Input Select Register (GPIO0 to x)

**Figure 11-8. INPUT3SELECT Register**

|           |    |    |    |    |    |   |   |
|-----------|----|----|----|----|----|---|---|
| 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |
| 7         | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |

**Table 11-12. INPUT3SELECT Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description  |
|------|--------|------|-------|--|
| 15-0 | SELECT | R/W  | FFFEh | Select GPIO for INPUT3 signal:<br>0x0 : Select GPIO0<br>0x1 : Select GPIO1<br>0x2 : Select GPIO2<br>...<br>0xFFFFD: '1' will be driven to the destination<br>0xFFFFE: '1' will be driven to the destination<br>0xFFFFF: '0' will be driven to the destination<br>NOTE: SELECT value greater than the available number of GPIO pins on a device (except 0xFFFF) will cause the destination to be driven '1'.<br>Reset type: CPU1.SYSRSn |

### 11.3.2.4 INPUT4SELECT Register (Offset = 3h) [Reset = FFFEh]

INPUT4SELECT is shown in [Figure 11-9](#) and described in [Table 11-13](#).

Return to the [Summary Table](#).

INPUT4 Input Select Register (GPIO0 to x)

**Figure 11-9. INPUT4SELECT Register**

|           |    |    |    |    |    |   |   |
|-----------|----|----|----|----|----|---|---|
| 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |
| 7         | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |

**Table 11-13. INPUT4SELECT Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description  |
|------|--------|------|-------|--|
| 15-0 | SELECT | R/W  | FFFEh | Select GPIO for INPUT4 signal:<br>0x0 : Select GPIO0<br>0x1 : Select GPIO1<br>0x2 : Select GPIO2<br>...<br>0xFFFFD: '1' will be driven to the destination<br>0xFFFFE: '1' will be driven to the destination<br>0xFFFFF: '0' will be driven to the destination<br>NOTE: SELECT value greater than the available number of GPIO pins on a device (except 0xFFFF) will cause the destination to be driven '1'.<br>Reset type: CPU1.SYSRSn |

### 11.3.2.5 INPUT5SELECT Register (Offset = 4h) [Reset = FFFEh]

INPUT5SELECT is shown in [Figure 11-10](#) and described in [Table 11-14](#).

Return to the [Summary Table](#).

INPUT5 Input Select Register (GPIO0 to x)

**Figure 11-10. INPUT5SELECT Register**

|           |    |    |    |    |    |   |   |
|-----------|----|----|----|----|----|---|---|
| 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |
| 7         | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| SELECT    |    |    |    |    |    |   |   |
| R/W-FFFEh |    |    |    |    |    |   |   |

**Table 11-14. INPUT5SELECT Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description  |
|------|--------|------|-------|--|
| 15-0 | SELECT | R/W  | FFFEh | Select GPIO for INPUT5 signal:<br>0x0 : Select GPIO0<br>0x1 : Select GPIO1<br>0x2 : Select GPIO2<br>...<br>0xFFFFD: '1' will be driven to the destination<br>0xFFFFE: '1' will be driven to the destination<br>0xFFFFF: '0' will be driven to the destination<br>NOTE: SELECT value greater than the available number of GPIO pins on a device (except 0xFFFF) will cause the destination to be driven '1'.<br>Reset type: CPU1.SYSRSn |

### 11.3.2.6 INPUT6SELECT Register (Offset = 5h) [Reset = FFFEh]

INPUT6SELECT is shown in [Figure 11-11](#) and described in [Table 11-15](#).

Return to the [Summary Table](#).

INPUT6 Input Select Register (GPIO0 to x)

**Figure 11-11. INPUT6SELECT Register**

|           |    |    |    |    |    |   |   |
|-----------|----|----|----|----|----|---|---|
| 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SELECT    |    |    |    |    |    |   |   |

### 11.3.2.17 INPUTSELECTLOCK Register (Offset = 1Eh) [Reset = 0h]

INPUTSELECTLOCK is shown in [Figure 11-22](#) and described in [Table 11-26](#).

Return to the [Summary Table](#).

Input Select Lock Register.

Any bit in this register, once set can only be cleared through SYSRSn. Write of 0 to any bit of this register has no effect. Reads to the registers which have LOCK protection are always allowed.

**Figure 11-22. INPUTSELECTLOCK Register**

### 11.3.3 XBAR\_REGS Registers

Table 11-27 lists the memory-mapped registers for the XBAR\_REGS registers. All register offset addresses not listed in Table 11-27 should be considered as reserved locations and the register contents should not be modified.

**Table 11-27. XBAR\_REGS Registers**

| Offset | Acronym  | Register Name                     | Write Protection | Section            |
|--------|----------|-----------------------------------|------------------|--------------------|
| 0h     | XBARFLG1 | X-Bar Input Flag Register 1       |                  | <a href="#">Go</a> |
| 2h     | XBARFLG2 | X-Bar Input Flag Register 2       |                  | <a href="#">Go</a> |
| 4h     | XBARFLG3 | X-Bar Input Flag Register 3       |                  | <a href="#">Go</a> |
| 6h     | XBARFLG4 | X-Bar Input Flag Register 4       |                  | <a href="#">Go</a> |
| 8h     | XBARCLR1 | X-Bar Input Flag Clear Register 1 |                  | <a href="#">Go</a> |
| Ah     | XBARCLR2 | X-Bar Input Flag Clear Register 2 |                  | <a href="#">Go</a> |
| Ch     | XBARCLR3 | X-Bar Input Flag Clear Register 3 |                  | <a href="#">Go</a> |
| Eh     | XBARCLR4 | X-Bar Input Flag Clear Register 4 |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 11-28 shows the codes that are used for access types in this section.

**Table 11-28. XBAR\_REGS Access Type Codes**

| Access Type              | Code    | Description  |
|--------------------------|---------|--|
| Read Type                |         |  |
| R                        | R       | Read   |
| R-0                      | R<br>-0 | Read<br>Returns 0s   |
| Write Type               |         |  |
| W1S                      | W<br>1S | Write<br>1 to set  |
| Reset or Default Value   |         |  |
| -n                       |         | Value after reset or the default value   |
| Register Array Variables |         |  |
| i,j,k,l,m,n              |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 11.3.3.1 XBARFLG1 Register (Offset = 0h) [Reset = 0h]

XBARFLG1 is shown in [Figure 11-23](#) and described in [Table 11-29](#).

Return to the [Summary Table](#).

| 1   | SD2FLT1_DRINT | R    | 0h    | Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register.<br>Writing 0 has no effect<br>Reset type: CPU1.SYSRSn |
| 0   | SD2FLT1_COMPZ | R    | 0h    | Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register.<br>Writing 0 has no effect<br>Reset type: CPU1.SYSRSn |

### 11.3.4 EPWM\_XBAR\_REGS Registers

Table 11-37 lists the memory-mapped registers for the EPWM\_XBAR\_REGS registers. All register offset addresses not listed in Table 11-37 should be considered as reserved locations and the register contents should not be modified.

**Table 11-37. EPWM\_XBAR\_REGS Registers**

| Offset | Acronym            | Register Name                          | Write Protection | Section            |
|--------|--------------------|--|------------------|--------------------|
| 0h     | TRIP4MUX0TO15CFG   | ePWM XBAR Mux Configuration for TRIP4  | EALLOW           | <a href="#">Go</a> |
| 2h     | TRIP4MUX16TO31CFG  | ePWM XBAR Mux Configuration for TRIP4  | EALLOW           | <a href="#">Go</a> |
| 4h     | TRIP5MUX0TO15CFG   | ePWM XBAR Mux Configuration for TRIP5  | EALLOW           | <a href="#">Go</a> |
| 6h     | TRIP5MUX16TO31CFG  | ePWM XBAR Mux Configuration for TRIP5  | EALLOW           | <a href="#">Go</a> |
| 8h     | TRIP7MUX0TO15CFG   | ePWM XBAR Mux Configuration for TRIP7  | EALLOW           | <a href="#">Go</a> |
| Ah     | TRIP7MUX16TO31CFG  | ePWM XBAR Mux Configuration for TRIP7  | EALLOW           | <a href="#">Go</a> |
| Ch     | TRIP8MUX0TO15CFG   | ePWM XBAR Mux Configuration for TRIP8  | EALLOW           | <a href="#">Go</a> |
| Eh     | TRIP8MUX16TO31CFG  | ePWM XBAR Mux Configuration for TRIP8  | EALLOW           | <a href="#">Go</a> |
| 10h    | TRIP9MUX0TO15CFG   | ePWM XBAR Mux Configuration for TRIP9  | EALLOW           | <a href="#">Go</a> |
| 12h    | TRIP9MUX16TO31CFG  | ePWM XBAR Mux Configuration for TRIP9  | EALLOW           | <a href="#">Go</a> |
| 14h    | TRIP10MUX0TO15CFG  | ePWM XBAR Mux Configuration for TRIP10 | EALLOW           | <a href="#">Go</a> |
| 16h    | TRIP10MUX16TO31CFG | ePWM XBAR Mux Configuration for TRIP10 | EALLOW           | <a href="#">Go</a> |
| 18h    | TRIP11MUX0TO15CFG  | ePWM XBAR Mux Configuration for TRIP11 | EALLOW           | <a href="#">Go</a> |
| 1Ah    | TRIP11MUX16TO31CFG | ePWM XBAR Mux Configuration for TRIP11 | EALLOW           | <a href="#">Go</a> |
| 1Ch    | TRIP12MUX0TO15CFG  | ePWM XBAR Mux Configuration for TRIP12 | EALLOW           | <a href="#">Go</a> |
| 1Eh    | TRIP12MUX16TO31CFG | ePWM XBAR Mux Configuration for TRIP12 | EALLOW           | <a href="#">Go</a> |
| 20h    | TRIP4MUXENABLE     | ePWM XBAR Mux Enable for TRIP4         | EALLOW           | <a href="#">Go</a> |
| 22h    | TRIP5MUXENABLE     | ePWM XBAR Mux Enable for TRIP5         | EALLOW           | <a href="#">Go</a> |
| 24h    | TRIP7MUXENABLE     | ePWM XBAR Mux Enable for TRIP7         | EALLOW           | <a href="#">Go</a> |
| 26h    | TRIP8MUXENABLE     | ePWM XBAR Mux Enable for TRIP8         | EALLOW           | <a href="#">Go</a> |
| 28h    | TRIP9MUXENABLE     | ePWM XBAR Mux Enable for TRIP9         | EALLOW           | <a href="#">Go</a> |
| 2Ah    | TRIP10MUXENABLE    | ePWM XBAR Mux Enable for TRIP10        | EALLOW           | <a href="#">Go</a> |
| 2Ch    | TRIP11MUXENABLE    | ePWM XBAR Mux Enable for TRIP11        | EALLOW           | <a href="#">Go</a> |
| 2Eh    | TRIP12MUXENABLE    | ePWM XBAR Mux Enable for TRIP12        | EALLOW           | <a href="#">Go</a> |
| 38h    | TRIPOUTINV         | ePWM XBAR Output Inversion Register    | EALLOW           | <a href="#">Go</a> |
| 3Eh    | TRIPLOCK           | ePWM XBAR Configuration Lock register  | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 11-38 shows the codes that are used for access types in this section.

**Table 11-38. EPWM\_XBAR\_REGS Access Type Codes**

| Access Type            | Code    | Description     |
|------------------------|---------|-----------------|
| Read Type              |         |                 |
| R                      | R       | Read            |
| R-0                    | R-0     | Read Returns 0s |
| Write Type             |         |                 |
| W                      | W       | Write           |
| WSonce                 | W Sonce | Write Set once  |
| Reset or Default Value |         |                 |

**Table 11-38. EPWM\_XBAR\_REGS Access Type Codes (continued)**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| $-n$                     |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| $i,j,k,l,m,n$            |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| $y$                      |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 11.3.4.1 TRIP4MUX0TO15CFG Register (Offset = 0h) [Reset = 0h]

TRIP4MUX0TO15CFG is shown in [Figure 11-31](#) and described in [Table 11-39](#).

Return to the [Summary Table](#).

| 6   | MUX6  | R/W  | 0h    | Selects the output of Mux6 to drive TRIP7 of EPWM-XBAR<br>0: Respective output of Mux6 is disabled to drive the TRIP7 of EPWM-XBAR<br>1: Respective output of Mux6 is enabled to drive the TRIP7 of EPWM-XBAR<br>Refer to the EPWM X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 5   | MUX5  | R/W  | 0h    | Selects the output of Mux5 to drive TRIP7 of EPWM-XBAR<br>0: Respective output of Mux5 is disabled to drive the TRIP7 of EPWM-XBAR<br>1: Respective output of Mux5 is enabled to drive the TRIP7 of EPWM-XBAR<br>Refer to the EPWM X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 4   | MUX4  | R/W  | 0h    | Selects the output of Mux4 to drive TRIP7 of EPWM-XBAR<br>0: Respective output of Mux4 is disabled to drive the TRIP7 of EPWM-XBAR<br>1: Respective output of Mux4 is enabled to drive the TRIP7 of EPWM-XBAR<br>Refer to the EPWM X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 3   | MUX3  | R/W  | 0h    | Selects the output of Mux3 to drive TRIP7 of EPWM-XBAR<br>0: Respective output of Mux3 is disabled to drive the TRIP7 of EPWM-XBAR<br>1: Respective output of Mux3 is enabled to drive the TRIP7 of EPWM-XBAR<br>Refer to the EPWM X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |

**Table 11-57. TRIP7MUXENABLE Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description   |
|-----|-------|------|-------|---|
| 2   | MUX2  | R/W  | 0h    | Selects the output of Mux2 to drive TRIP7 of EPWM-XBAR<br>0: Respective output of Mux2 is disabled to drive the TRIP7 of EPWM-XBAR<br>1: Respective output of Mux2 is enabled to drive the TRIP7 of EPWM-XBAR<br>Refer to the EPWM X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 1   | MUX1  | R/W  | 0h    | Selects the output of Mux1 to drive TRIP7 of EPWM-XBAR<br>0: Respective output of Mux1 is disabled to drive the TRIP7 of EPWM-XBAR<br>1: Respective output of Mux1 is enabled to drive the TRIP7 of EPWM-XBAR<br>Refer to the EPWM X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 0   | MUX0  | R/W  | 0h    | Selects the output of mux0 to drive TRIP7 of EPWM-XBAR<br>0: Respective output of Mux0 is disabled to drive the TRIP7 of EPWM-XBAR<br>1: Respective output of Mux0 is enabled to drive the TRIP7 of EPWM-XBAR<br>Refer to the EPWM X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |

### 11.3.4.20 TRIP8MUXENABLE Register (Offset = 26h) [Reset = 0h]

TRIP8MUXENABLE is shown in [Figure 11-50](#) and described in [Table 11-58](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP8

### 11.3.4.23 TRIP11MUXENABLE Register (Offset = 2Ch) [Reset = 0h]

TRIP11MUXENABLE is shown in [Figure 11-53](#) and described in [Table 11-61](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP11

|-------|----------|---------|-------|---|
| 31-16 | KEY      | R-0/W   | 0h    | Bit-0 of this register can be set only if KEY= 0x5a5a<br>Reset type: CPU1.SYSRSn  |
| 15-1  | RESERVED | R       | 0h    | Reserved  |
| 0     | LOCK     | R/WOnce | 0h    | Locks the configuration for EPWM-XBAR. Once the configuration is locked, writes to the below registers for EPWM-XBAR is blocked.<br>Registers Affected by the LOCK mechanism:<br>EPWM-XBAROUTyMUX0TO15CFG<br>EPWM-XBAROUTyMUX16TO31CFG<br>EPWM-XBAROUTyMUXENABLE<br>EPWM-XBAROUTLATEN<br>EPWM-XBAROUTINV<br>0: Writes to the above registers are allowed<br>1: Writes to the above registers are blocked<br>Note:<br>[1] LOCK mechanism only applies to writes. Reads are never blocked.<br>Reset type: CPU1.SYSRSn |

### 11.3.5 CLB\_XBAR\_REGS Registers

Table 11-65 lists the memory-mapped registers for the CLB\_XBAR\_REGS registers. All register offset addresses not listed in Table 11-65 should be considered as reserved locations and the register contents should not be modified.

**Table 11-65. CLB\_XBAR\_REGS Registers**

| Offset | Acronym             | Register Name                             | Write Protection | Section            |
|--------|---------------------|---|------------------|--------------------|
| 0h     | AUXSIG0MUX0TO15CFG  | CLB XBAR Mux Configuration for Output-0   | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 11-66 shows the codes that are used for access types in this section.

**Table 11-66. CLB\_XBAR\_REGS Access Type Codes**

| Access Type            | Code    | Description     |
|------------------------|---------|-----------------|
| Read Type              |         |                 |
| R                      | R       | Read            |
| R-0                    | R-0     | Read Returns 0s |
| Write Type             |         |                 |
| W                      | W       | Write           |
| WSonce                 | W Sonce | Write Set once  |
| Reset or Default Value |         |                 |

**Table 11-66. CLB\_XBAR\_REGS Access Type Codes  
(continued)**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| <i>-n</i>                |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| <i>i,j,k,l,m,n</i>       |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| <i>y</i>                 |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 11.3.5.1 AUXSIG0MUX0TO15CFG Register (Offset = 0h) [Reset = 0h]

AUXSIG0MUX0TO15CFG is shown in [Figure 11-57](#) and described in [Table 11-67](#).

Return to the [Summary Table](#).

| 22  | MUX22 | R/W  | 0h    | Selects the output of MUX22 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX22 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX22 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 21  | MUX21 | R/W  | 0h    | Selects the output of MUX21 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX21 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX21 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 20  | MUX20 | R/W  | 0h    | Selects the output of MUX20 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX20 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX20 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 19  | MUX19 | R/W  | 0h    | Selects the output of MUX19 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX19 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX19 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |

**Table 11-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description  |
|-----|-------|------|-------|--|
| 18  | MUX18 | R/W  | 0h    | Selects the output of MUX18 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX18 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX18 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 17  | MUX17 | R/W  | 0h    | Selects the output of MUX17 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX17 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX17 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 16  | MUX16 | R/W  | 0h    | Selects the output of MUX16 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX16 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX16 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 15  | MUX15 | R/W  | 0h    | Selects the output of MUX15 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX15 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX15 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 14  | MUX14 | R/W  | 0h    | Selects the output of MUX14 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX14 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX14 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 13  | MUX13 | R/W  | 0h    | Selects the output of MUX13 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX13 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX13 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 12  | MUX12 | R/W  | 0h    | Selects the output of MUX12 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX12 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX12 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 11  | MUX11 | R/W  | 0h    | Selects the output of MUX11 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX11 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX11 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |

**Table 11-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description  |
|-----|-------|------|-------|--|
| 10  | MUX10 | R/W  | 0h    | Selects the output of MUX10 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX10 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX10 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 9   | MUX9  | R/W  | 0h    | Selects the output of MUX9 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX9 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX9 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 8   | MUX8  | R/W  | 0h    | Selects the output of MUX8 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX8 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX8 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 7   | MUX7  | R/W  | 0h    | Selects the output of MUX7 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX7 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX7 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 6   | MUX6  | R/W  | 0h    | Selects the output of MUX6 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX6 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX6 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 5   | MUX5  | R/W  | 0h    | Selects the output of MUX5 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX5 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX5 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 4   | MUX4  | R/W  | 0h    | Selects the output of MUX4 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX4 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX4 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 3   | MUX3  | R/W  | 0h    | Selects the output of MUX3 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX3 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX3 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |

**Table 11-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description   |
|-----|-------|------|-------|---|
| 2   | MUX2  | R/W  | 0h    | Selects the output of MUX2 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX2 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX2 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 1   | MUX1  | R/W  | 0h    | Selects the output of MUX1 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX1 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX1 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 0   | MUX0  | R/W  | 0h    | Selects the output of mux0 to drive AUXSIG0 of CLB-XBAR<br>0: Respective output of MUX0 is disabled to drive the AUXSIG0 of CLB-XBAR<br>1: Respective output of MUX0 is enabled to drive the AUXSIG0 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |

### 11.3.5.18 AUXSIG1MUXENABLE Register (Offset = 22h) [Reset = 0h]

AUXSIG1MUXENABLE is shown in [Figure 11-74](#) and described in [Table 11-84](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-1

| 14  | MUX14 | R/W  | 0h    | Selects the output of MUX14 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX14 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX14 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 13  | MUX13 | R/W  | 0h    | Selects the output of MUX13 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX13 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX13 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 12  | MUX12 | R/W  | 0h    | Selects the output of MUX12 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX12 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX12 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 11  | MUX11 | R/W  | 0h    | Selects the output of MUX11 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX11 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX11 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |

**Table 11-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description  |
|-----|-------|------|-------|--|
| 10  | MUX10 | R/W  | 0h    | Selects the output of MUX10 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX10 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX10 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 9   | MUX9  | R/W  | 0h    | Selects the output of MUX9 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX9 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX9 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 8   | MUX8  | R/W  | 0h    | Selects the output of MUX8 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX8 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX8 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 7   | MUX7  | R/W  | 0h    | Selects the output of MUX7 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX7 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX7 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 6   | MUX6  | R/W  | 0h    | Selects the output of MUX6 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX6 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX6 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 5   | MUX5  | R/W  | 0h    | Selects the output of MUX5 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX5 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX5 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 4   | MUX4  | R/W  | 0h    | Selects the output of MUX4 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX4 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX4 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 3   | MUX3  | R/W  | 0h    | Selects the output of MUX3 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX3 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX3 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |

**Table 11-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description   |
|-----|-------|------|-------|---|
| 2   | MUX2  | R/W  | 0h    | Selects the output of MUX2 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX2 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX2 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 1   | MUX1  | R/W  | 0h    | Selects the output of MUX1 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX1 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX1 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 0   | MUX0  | R/W  | 0h    | Selects the output of mux0 to drive AUXSIG3 of CLB-XBAR<br>0: Respective output of MUX0 is disabled to drive the AUXSIG3 of CLB-XBAR<br>1: Respective output of MUX0 is enabled to drive the AUXSIG3 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |

### 11.3.5.21 AUXSIG4MUXENABLE Register (Offset = 28h) [Reset = 0h]

AUXSIG4MUXENABLE is shown in [Figure 11-77](#) and described in [Table 11-87](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-4

| 12  | MUX12 | R/W  | 0h    | Selects the output of MUX12 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX12 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX12 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 11  | MUX11 | R/W  | 0h    | Selects the output of MUX11 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX11 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX11 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |

**Table 11-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description  |
|-----|-------|------|-------|--|
| 10  | MUX10 | R/W  | 0h    | Selects the output of MUX10 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX10 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX10 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 9   | MUX9  | R/W  | 0h    | Selects the output of MUX9 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX9 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX9 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 8   | MUX8  | R/W  | 0h    | Selects the output of MUX8 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX8 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX8 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 7   | MUX7  | R/W  | 0h    | Selects the output of MUX7 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX7 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX7 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 6   | MUX6  | R/W  | 0h    | Selects the output of MUX6 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX6 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX6 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 5   | MUX5  | R/W  | 0h    | Selects the output of MUX5 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX5 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX5 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 4   | MUX4  | R/W  | 0h    | Selects the output of MUX4 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX4 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX4 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |
| 3   | MUX3  | R/W  | 0h    | Selects the output of MUX3 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX3 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX3 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn    |

**Table 11-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description   |
|-----|-------|------|-------|---|
| 2   | MUX2  | R/W  | 0h    | Selects the output of MUX2 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX2 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX2 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 1   | MUX1  | R/W  | 0h    | Selects the output of MUX1 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX1 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX1 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |
| 0   | MUX0  | R/W  | 0h    | Selects the output of mux0 to drive AUXSIG6 of CLB-XBAR<br>0: Respective output of MUX0 is disabled to drive the AUXSIG6 of CLB-XBAR<br>1: Respective output of MUX0 is enabled to drive the AUXSIG6 of CLB-XBAR<br>Refer to the CLB X-BAR section of this chapter for more details.<br>Reset type: CPU1.SYSRSn |

### 11.3.5.24 AUXSIG7MUXENABLE Register (Offset = 2Eh) [Reset = 0h]

AUXSIG7MUXENABLE is shown in [Figure 11-80](#) and described in [Table 11-90](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-7

Complex bit access types are encoded to fit into small table cells. Table 11-94 shows the codes that are used for access types in this section.

**Table 11-94. OUTPUT\_XBAR\_REGS Access Type Codes**

| Access Type | Code | Description        |
|-------------|------|--------------------|
| Read Type   |      |                    |
| R           | R    | Read               |
| R-0         | R-0  | Read<br>Returns 0s |
| Write Type  |      |                    |

**Table 11-94. OUTPUT\_XBAR\_REGS Access Type Codes (continued)**

| Access Type              | Code       | Description  |
|--------------------------|------------|--|
| W                        | W          | Write  |
| W1S                      | W<br>1S    | Write<br>1 to set  |
| WSonce                   | W<br>Sonce | Write<br>Set once  |
| Reset or Default Value   |            |  |
| -n                       |            | Value after reset or the default value   |
| Register Array Variables |            |  |
| i,j,k,l,m,n              |            | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |            | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 11.3.6.1 OUTPUT1MUX0TO15CFG Register (Offset = 0h) [Reset = 0h]

OUTPUT1MUX0TO15CFG is shown in [Figure 11-83](#) and described in [Table 11-95](#).

Return to the [Summary Table](#).

Output X-BAR Mux Configuration for Output 1

### 11.3.6.22 OUTPUT6MUXENABLE Register (Offset = 2Ah) [Reset = 0h]

OUTPUT6MUXENABLE is shown in [Figure 11-104](#) and described in [Table 11-116](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 6

The direct memory access (DMA) module provides a hardware method of transferring data between peripherals and/or memory without intervention from the CPU, thereby freeing up bandwidth for other system functions. Additionally, the DMA has the capability to orthogonally rearrange the data as it is transferred as well as “ping-pong” data between buffers. These features are useful for structuring data into blocks for optimal CPU processing.

## 12.1 Introduction

The strength of a controller is not measured purely in processor speed, but in total system capabilities. As a part of the equation, any time the CPU bandwidth for a given function can be reduced, the greater the system capabilities. Many times applications spend a significant amount of their bandwidth moving data, whether it is from off-chip memory to on-chip memory, or from a peripheral such as an analog-to-digital converter (ADC) to RAM, or even from one peripheral to another. Furthermore, many times this data comes in a format that is not conducive to the optimum processing powers of the CPU. The DMA module described in this reference guide has the ability to free up CPU bandwidth and rearrange the data into a pattern for more streamlined processing.

The DMA module is an event-based machine, meaning it requires a peripheral or software trigger to start a DMA transfer. Although it can be made into a periodic time-driven machine by configuring a timer as the DMA trigger source, there is no mechanism within the module itself to start memory transfers periodically. The DMA module has six independent DMA channels which can be configured separately and each channel contains its own independent PIE interrupt to let the CPU know when a DMA transfer has either started or completed. Five of the six channels are exactly the same, while Channel 1 has the ability to be configured at a higher priority than the others. At the heart of the DMA is a state machine and tightly coupled address control logic. It is this address control logic that allows for rearrangement of the block of data during the transfer as well as the process of ping-ponging data between buffers. Each of these features, along with others, will be discussed in detail in this chapter.

### 12.1.1 Features

DMA features include:

- Six channels with independent PIE interrupts
- Each DMA channel can be triggered from multiple peripheral trigger sources independently
- Word Size: 16-bit or 32-bit (SPI limited to 16-bit)
- Throughput: 3 cycles/word without arbitration

### 12.1.2 Block Diagram

[Figure 12-1](#) shows a device-level block diagram of the DMA.

Figure 12-1. DMA Block Diagram

## 12.2 Architecture

### 12.2.1 Peripheral Interrupt Event Trigger Sources

Each DMA Channel can be configured to trigger by software and other peripheral triggers events. DMACHSRCSELx register can be used to configure DMA Trigger sources for each DMA channel. CHx.MODE.PERINTSEL register bitfield should be set to channel number (CHx.MODE.PERINTSEL = x) as shown in [Figure 12-2](#). Included in these DMA Trigger sources are five external interrupt signals which can be connected to most of the general-purpose input/output (GPIO) pins on the device. This adds significant flexibility to the event trigger capabilities. Upon receipt of a peripheral interrupt event signal, the DMA will automatically send a clear signal to the interrupt source so that subsequent interrupt events will occur.

---

#### Note

To use the system level DMA Trigger source selection, the DMA internal trigger source selection configuration for each channel should be done using the DMACHSRCSELx register, and the CHx.MODE.PERINTSEL register as shown here. See [Table 12-1](#) or the DMACHSRCSELx register definition for a complete list of DMA trigger sources.

---

Regardless of the value of the MODE.CHx[PERINTSEL] bit field, software can always force a trigger by using the CONTROL.CHx[PERINTFRC] bit. Likewise, software can always clear a pending DMA trigger using the CONTROL.CHx[PERINTCLR] bit.

Once a particular peripheral trigger event sets a channel's PERINTFLG bit, the bit remains pending until the priority logic of the state machine starts the burst transfer for that channel. Once the burst transfer starts, the flag is cleared. If a new peripheral trigger event is generated while a burst is in progress, the burst will complete before responding to the new peripheral trigger event (after proper prioritization). If a third peripheral trigger event occurs before the pending event is serviced, an error flag is set in the CONTROL.CHx[OVRFLG] bit. If a peripheral trigger event occurs at the same time as the latched flag is being cleared, the trigger event has priority and the PERINTFLG will remain set.

[Figure 12-3](#) shows a diagram of the trigger select circuit.

[Table 12-1](#) shows the peripheral trigger source options that are available for each channel.

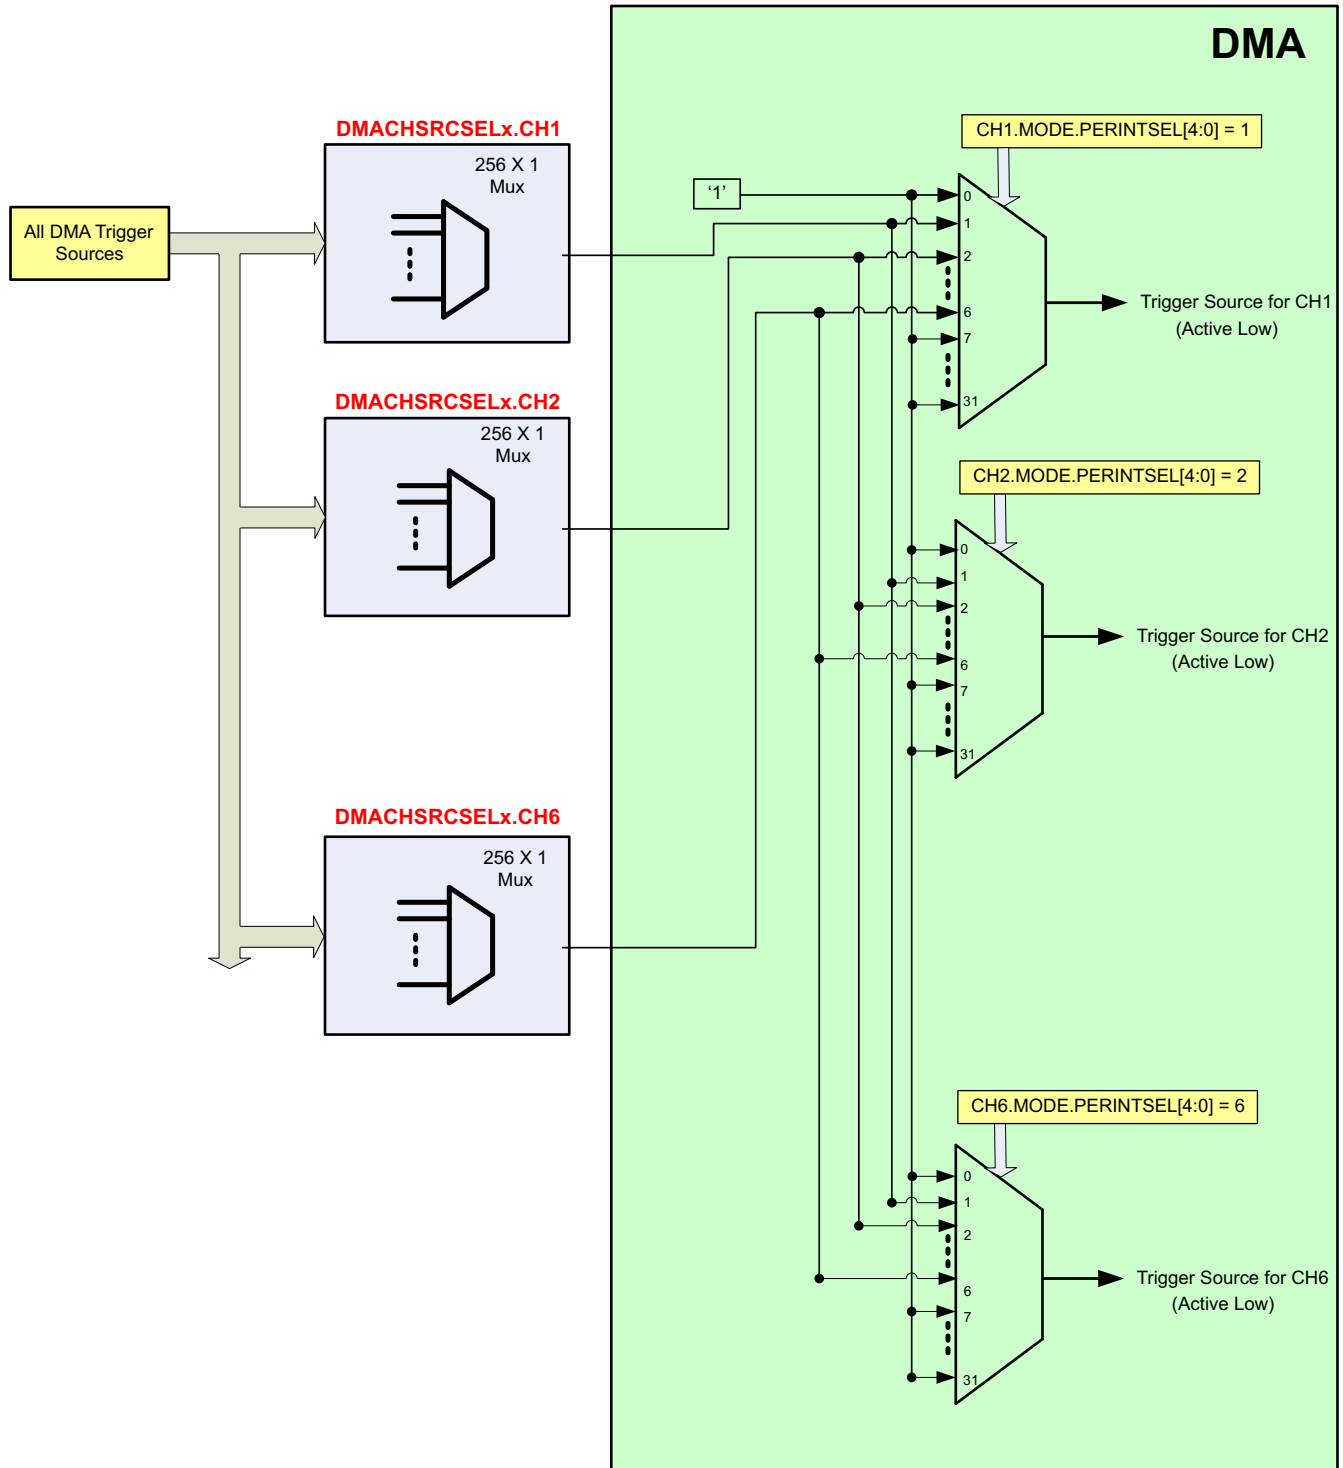

Figure 12-2. DMA Trigger Architecture

Note: See [Figure 12-2](#).

### 12.2.2 DMA Bus

The DMA bus architecture consists of a 32-bit address bus, a 32-bit data read bus, and a 32-bit data write bus. Memories and register locations connected to the DMA bus are via interfaces that sometimes share resources with the CPU memory or peripheral bus.

## 12.3 Address Pointer and Transfer Control

The DMA state machine is, at its most basic level, two nested loops.

### Burst (Inner) Loop:

The burst (inner) loop transfers programmable number of words set by (BURST\_SIZE + 1) register when a DMA channel trigger (Peripheral / Software trigger) is received. The BURST\_SIZE register allows a maximum of 32 sixteen-bit words to be transferred in one burst. Each DMA channel supports both 16-bit (or) 32-bit word burst which can be controlled by MODE.DATASIZE bit field. Each DMA channel contains a shadowed address pointer for the source (SRC\_ADDR\_SHADOW) and the destination (DST\_ADDR\_SHADOW) address. At the beginning of each transfer, the shadowed version of each pointer is copied into its respective active (SRC\_ADDR\_ACTIVE / DST\_ADDR\_ACTIVE) register. During the burst loop, after each word is transferred, the signed value contained in the appropriate source or destination BURST\_STEP register is added to the active register:

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_ADDR\_ACTIVE} + \text{SRC\_BURST\_STEP}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_ADDR\_ACTIVE} + \text{DST\_BURST\_STEP}$$

The burst (inner) loop transfers a burst of data when a DMA Channel Trigger (Peripheral / Software trigger) is received.

### Transfer (Outer) Loop:

The Transfer (outer) loop transfers programmable number of bursts set by (TRANSFER\_SIZE + 1) register for each channel. Since TRANSFER\_SIZE is a 16-bit register, the total size of a transfer allowed is well beyond any practical requirement. During the transfer loop, after each burst is complete, there are two methods that can be used to modify the active address pointer.

**Method 1 (Default):** When address wrapping is disabled (SRC\_WRAP\_SIZE / DST\_WRAP\_SIZE is greater than TRANSFER\_SIZE), active address pointer is updated as shown below

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_ADDR\_ACTIVE} + \text{SRC\_TRANSFER\_STEP}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_ADDR\_ACTIVE} + \text{DST\_TRANSFER\_STEP}$$

**Method 2:** Address wrapping gets enabled when SRC\_WRAP\_SIZE / DST\_WRAP\_SIZE is less than TRANSFER\_SIZE. This allows the channel to wrap multiple times within a single transfer. When the number of bursts is equal to (SRC/DST\_WRAP\_SIZE + 1) register, the state machine modifies the active address pointers as:

$$\text{SRC\_BEG\_ADDR\_ACTIVE} = \text{SRC\_BEG\_ADDR\_ACTIVE} + \text{SRC\_WRAP\_STEP}$$

$$\text{DST\_BEG\_ADDR\_ACTIVE} = \text{DST\_BEG\_ADDR\_ACTIVE} + \text{DST\_WRAP\_STEP}$$

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_BEG\_ADDR\_ACTIVE}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_BEG\_ADDR\_ACTIVE}$$

At the end of DMA transfer, DMA would have transferred (BURST\_SIZE + 1) x (TRANSFER\_SIZE + 1) words.

### OneShot Mode:

OneShot mode is disabled by default.

When OneShot mode is disabled (MODE.CHx[ONESHOT] = 0), DMA transfers one burst [(BURST\_SIZE + 1) words] of data each time a DMA Channel Trigger is received. After the burst is completed, the state machine moves on to the next pending channel in the priority scheme, even if another trigger for the channel just completed is pending. This feature keeps any single channel from monopolizing the DMA bus.

When OneShot mode is enabled (MODE.CHx[ONESHOT] = 1), DMA transfers all the bursts [(BURST\_SIZE + 1) x (TRANSFER\_SIZE + 1) words] on a single DMA channel trigger. Be careful when using this mode, since this can create a condition where one trigger uses up the majority of the DMA bandwidth.

**Continuous Mode:**

Continuous mode is disabled by default.

When Continuous mode is disabled (MODE.CHx[CONTINUOUS] = 0), DMA state machine disables channel after all bursts in a transfer loop (TRANSFER\_COUNT = 0) are complete. The channel must be re-enabled by setting the RUN bit in the CONTROL register before another transfer can be started on that channel.

When Continuous mode is enabled (MODE.CHx[CONTINUOUS] = 1), DMA state machine keep channel active even after all bursts in a transfer loop (TRANSFER\_COUNT = 0) are complete.

Each DMA channel can trigger its own EPIE interrupt for each DMA transfer either at start of DMA transfer (or) end of DMA transfer using MODE.CHx[CHINTMODE] bit.

**Source/Destination Address Pointers (SRC/DST\_ADDR)** The value written into the shadow register is the start address of the first location where data is read or written to.

At the beginning of a transfer the shadow register (SRC/DST\_ADDR\_SHADOW) is copied into the active register (SRC/DST\_ADDR\_ACTIVE). The active register performs as the current address pointer.

**Source/Destination Begin Address Pointers (SRC/DST\_BEG\_ADDR)** This is the wrap pointer.

The value written into the shadow register (SRC/DST\_BEG\_ADDR\_SHADOW) will be loaded into the active register (SRC/DST\_BEG\_ADDR\_ACTIVE) at the start of a transfer. On a wrap condition, the active register (SRC/DST\_BEG\_ADDR\_ACTIVE) will be incremented by the signed value in the appropriate SRC/DST\_WRAP\_STEP register prior to being loaded into the active register ((SRC/DST\_ADDR\_ACTIVE).

For each channel, the transfer process can be controlled with the following size values:

**Source and Destination Burst Size (BURST\_SIZE):** This specifies the number of words to be transferred in a burst.

This value is loaded into the BURST\_COUNT register at the beginning of each burst. The BURST\_COUNT decrements each word that is transferred and when it reaches a zero value, the burst is complete, indicating that the next channel can be serviced. The behavior of the current channel is defined by the ONE\_SHOT bit in the MODE register. The maximum size of the burst is dictated by the type of peripheral. For the ADC, the burst size could be all 16 registers (if all 16 registers are used). For RAM the burst size can be up to the maximum allowed by the BURST\_SIZE register, which is 32. See [Table 12-2](#) to understand how BURST\_SIZE register affects the number of 16-bit words transferred with respect to DATASIZE.

**Table 12-2. BURSTSIZE vs DATASIZE Behavior**

| BURSTSIZE | Number of 16-bit words transferred in |                        |
|-----------|---------------------------------------|------------------------|
|           | DataSize = 16-bit data                | DataSize = 32-bit data |
| 0         | 1                                     | 2                      |
| 1         | 2                                     | 2                      |
| 2         | 3                                     | 4                      |
| 3         | 4                                     | 4                      |
| 4         | 5                                     | 6                      |
| 5         | 6                                     | 6                      |
| 6         | 7                                     | 8                      |
| 7         | 8                                     | 8                      |
| 8         | 9                                     | 10                     |
| 9         | 10                                    | 10                     |

**Table 12-2. BURSTSIZE vs DATASIZE Behavior (continued)**

| BURSTSIZE | Number of 16-bit words transferred in |                        |
|-----------|---------------------------------------|------------------------|
|           | DataSize = 16-bit data                | DataSize = 32-bit data |
| 10        | 11                                    | 12                     |
| 11        | 12                                    | 12                     |
| *         | *                                     | *                      |
| *         | *                                     | *                      |
| *         | *                                     | *                      |
| 30        | 31                                    | 32                     |
| 31        | 32                                    | 32                     |

**Source and Destination Transfer Size (TRANSFER\_SIZE):**

This specifies the number of bursts to be transferred per CPU interrupt (if enabled). Whether this interrupt is generated at the beginning or the end of the transfer is defined in the CHINTMODE bit in the MODE register. Whether the channel remains enabled or not after the transfer is completed is defined by the CONTINUOUS bit in the MODE register. The TRANSFER\_SIZE register is loaded into the TRANSFER\_COUNT register at the beginning of each transfer. The TRANSFER\_COUNT register keeps track of how many bursts of data the channel has transferred and when it reaches zero, the DMA transfer is complete.

**Source/Destination Wrap Size (SRC/DST\_WRAP\_SIZE)**

This specifies the number of bursts to be transferred before the current address pointer wraps around to the beginning.

This feature is used to implement a circular addressing type function. This value is loaded into the appropriate SRC/DST\_WRAP\_COUNT register at the beginning of each transfer. The SRC/DST\_WRAP\_COUNT registers keep track of how many bursts of data the channel has transferred and when they reach zero, the wrap procedure is performed on the appropriate source or destination address pointer. A separate size and count register is allocated for source and destination pointers. To *disable* the wrap function, assign the value of these registers to be larger than the TRANSFER\_SIZE.

---

**Note**

The value written to the SIZE registers is one less than the intended size. So, to transfer three 16-bit words, the value 2 should be placed in the SIZE register.

Regardless of the state of the DATASIZE bit, the value specified in the SIZE registers are for 16-bit addresses. So, to transfer three 32-bit words, the value 5 should be placed in the SIZE register.

---

For each source/destination pointer, the address changes can be controlled with the following step values:

**Source/Destination Burst Step (SRC/DST\_BURST\_STEP)**

Within each burst transfer, the address source and destination step sizes are specified by these registers.

This value is a signed 2's complement number so that the address pointer can be incremented or decremented as required. If no increment is desired, such as when accessing the data receive or transmit registers in a communication peripheral, the value of these registers should be set to zero.

|   |   |
|---|---|
| <b>Source/Destination Transfer Step (SRC/DST_TRANSFER_STEP)</b> | <p>This specifies the address offset to start the next burst transfer after completing the current burst transfer.</p> <p>This is used in cases where registers or data memory locations are spaced at constant intervals. This value is a signed 2's complement number so that the address pointer can be incremented or decremented as required.</p>                                      |
| <b>Source/Destination Wrap Step (SRC/DST_WRAP_STEP):</b>        | <p>When the wrap counter reaches zero, this value specifies the number of words to add/subtract from the SRC/DST_BEG_ADDR pointer and hence sets the new start address.</p> <p>This implements a circular type of addressing mode, useful in many applications. This value is a signed 2's complement number so that the address pointer can be incremented or decremented as required.</p> |

---

#### Note

Regardless of the state of the DATASIZE bit, the value specified in the STEP registers are for 16-bit addresses. So, to increment one 32-bit address, a value of 2 should be placed in these registers.

---

|   |  |
|---|--|
| <b>Channel Interrupt Mode (CHINTMODE)</b> | <p>This mode bit selects whether the DMA interrupt from the respective channel is generated at the beginning of a new transfer or at the end of the transfer.</p> <p>If implementing a ping-pong buffer scheme with continuous mode of operation, then the interrupt would be generated at the beginning, just after the working registers are copied to the shadow set. If the DMA does not operate in continuous mode, then the interrupt is typically generated at the end when the transfer is complete.</p> |
|---|--|

All of the above features and modes are shown in [Figure 12-4](#). The following items are in reference to [Figure 12-4](#).

- The *HALT* points represent where the channel halts operation when interrupted by a high priority channel 1 trigger, or when the HALT command is set, or when an emulation halt is issued and the FREE bit is cleared to 0.
- The SRC/DST\_ADDR\_ACTIVE registers are not affected by SRC/DST\_BEG\_ADDR\_ACTIVE at the start of a transfer. SRC/DST\_BEG\_ADDR\_ACTIVE only affects the SRC/DST\_ADDR\_ACTIVE registers on a wrap. Following is what happens when a transfer first starts:
  - SRC/DST\_BEG\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_BEG\_ADDR\_ACTIVE = SRC/DST\_BEG\_ADDR\_SHADOW
  - SRC/DST\_ADDR\_ACTIVE = SRC/DST\_ADDR\_SHADOW
- The active registers get updated when a wrap occurs. The shadow registers remain unchanged. Specifically:
  - SRC/DST\_BEG\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_BEG\_ADDR\_ACTIVE += SRC/DST\_WRAP\_STEP
  - SRC/DST\_ADDR\_ACTIVE = SRC/DST\_BEG\_ADDR\_ACTIVE
- The best way to remember this is:
  - The shadow registers never change except by software.
  - The active registers never change except by hardware, and a shadow register is only copied into its own active register, never an active register by another name.

Figure 12-4. DMA State Diagram

## 12.4 Pipeline Timing and Throughput

In addition to the pipeline there are a few other behaviors of the DMA that affect its total throughput:

- A 1-cycle delay is added at the beginning of each burst
- A 1-cycle delay is added when returning from a CH1 high priority interrupt
- Collisions with the CPU may add delay slots
- 32-bit transfers run at double the speed of a 16-bit transfer (it takes the same amount of time to transfer a 32-bit word as it does a 16-bit word)

For example, to transfer 128 16-bit words from GS0 RAM to GS3 RAM, a channel can be configured to transfer 8 bursts of 16 words/burst. This will give:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 16 \text{ words/burst}) + 1] = 392 \text{ cycles}$$

If instead the channel were configured to transfer the same amount of data 32 bits at a time (the word size is configured to 32 bits) the transfer would take:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 8 \text{ words/burst}) + 1] = 200 \text{ cycles}$$

The DMA module consists of a 3-stage pipeline as shown in [Figure 12-5](#) and [Figure 12-6](#).

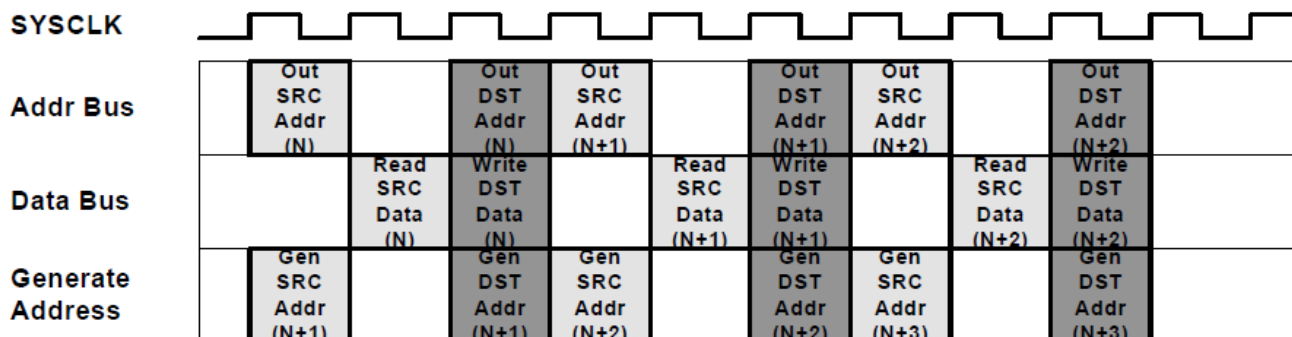

Figure 12-5. 3-Stage Pipeline DMA Transfer

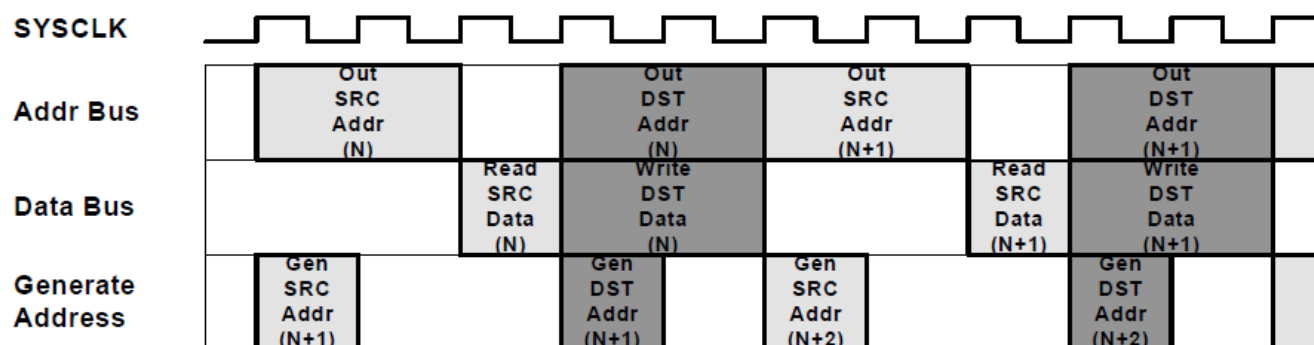

Figure 12-6. 3-stage Pipeline With One Read Stall

## 12.5 CPU and CLA Arbitration

Typically, DMA activity is independent of CPU and CLA activity. However, when the DMA and CPU (or CLA) try to access the same peripheral at the same time, an arbitration procedure is required to resolve the conflict. All instances of the same peripheral type conflict with each other. For instance, CAN-A and CAN-B conflict, as do the GS0 and GS2 RAMs. Different peripheral types can share a bus interface, which creates further opportunities for conflicts. These bus interfaces are:

- Peripheral frame 1: ePWM, eCAP, eQEP, SDFM, CMPSS, DAC
- Peripheral frame 2: PMBus and SPI

**Conflict Example:** The CLA is accessing DAC-A while the DMA is simultaneously accessing DAC-B.

**Conflict Example:** The CPU is accessing an SPI FIFO while the DMA is simultaneously accessing a PMBus register.

**Non-conflict Example:** The CPU is accessing a shared ePWM while the DMA is accessing an SPI.

The exception to all this is the ADC result registers, which are duplicated for each bus master. The CPU, DMA, and CLA can all simultaneously read these registers with no stalls for any master.

A DMA transfer consists of four phases: send source address, read source data, send destination address, and write destination data (see [Section 12.4](#)). Suppose CPU accesses a peripheral / memory causing conflict in middle of a DMA transfer, CPU is stalled till the current DMA access is complete and not until the completion of whole DMA transfer.

The following priority schemes are implemented for the various interfaces on the device.

- The arbitration follows a fixed arbitration scheme with highest priority first:
  - DMA WRITE
  - DMA READ
  - CLA WRITE
  - CLA READ
  - CPU WRITE
  - CPU READ
- The priority scheme for GSx RAM accesses is round-robin.
- All masters can access the ADC result registers simultaneously without delay.

---

### Note

If the CPU is performing a read-modify-write operation and the DMA performs a write to the same location, the DMA write may be lost if the operation occurs in between the CPU read and the CPU write. Avoid mixing CPU writes with DMA writes to the same locations.

---

Arbitration within DMA channels is based on a round-robin priority (or) Channel 1 high priority scheme described in [Section 12.6](#).

## 12.6 Channel Priority

Two priority schemes exist when determining channel priority: Round-robin mode and Channel 1 high-priority mode.

### 12.6.1 Round-Robin Mode

In this mode, all channels have *equal* priority and each enabled channel is serviced in round-robin fashion as follows:

CH1 → CH2 → CH3 → CH4 → CH5 → CH6 → CH1 → CH2 → ...

In the case above, after each channel has transferred a burst of words, the next channel is serviced. You can specify the size of the burst for each channel. Once CH6 (or the last enabled channel) has been serviced, and no other channels are pending, the round-robin state machine enters an idle state.

From the idle state, channel 1 (if enabled) is always serviced first. However, if the DMA is currently processing another channel  $x$ , all other pending channels between  $x$  and the end of the round are serviced before CH1. It is in this sense that all the channels are of *equal* priority. For instance, take an example where CH1, CH4, and CH5 are enabled in round-robin mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from their respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When CH4 completes its burst, CH5 will be serviced next. Only after CH5 completes will CH1 be serviced. Upon completion of CH1, if there are no more channels pending, the round-robin state machine will enter an idle state.

A more complicated example is shown below:

- Assume all channels are enabled, and the DMA is in an idle state,
- Initially a trigger occurs on CH1, CH3, and CH5 on the same cycle,
- When the CH1 burst transfer starts, requests from CH3 and CH5 are pending,
- Before completion of the CH1 burst, the DMA receives a request from CH2. Now the pending requests are from CH2, CH3, and CH5,
- After completing the CH1 burst, CH2 will be serviced since it is next in the round-robin scheme after CH1.
- After the burst from CH2 is finished, the CH3 burst will be serviced, followed by CH5 burst.
- Now while the CH5 burst is being serviced, the DMA receives a request from CH1, CH3, and CH6.
- The burst from CH6 will start after the completion of the CH5 burst since it is the next channel after CH5 in the round-robin scheme.
- This will be followed by the CH1 burst and then the CH3 burst
- After the CH3 burst finishes, assuming no more triggers have occurred, the round-robin state machine will enter an idle state.

The round-robin state machine may be reset to the idle state via the DMACTRL[PRIORITYRESET] bit.

### 12.6.2 Channel 1 High Priority Mode

In this mode, Channel 1 has high priority over all the other channels. Channel 2 – 6 have equal priority and each enabled channel is serviced in round-robin fashion.

Higher Priority: CH1  
Lower priority: CH2 → CH3 → CH4 → CH5 → CH6 → CH2 → ...

Given an example where CH1, CH4 and CH5 are enabled in Channel 1 High Priority Mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from their respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When the current CH4 word transfer is completed, regardless of whether the DMA has completed the entire CH4 burst, CH4 execution will be suspended and CH1 will be serviced. After the CH1 burst completes, CH4 will resume execution.

Upon completion of CH4, CH5 will be serviced. After CH5 completes, if there are no more channels pending, the round-robin state machine will enter an idle state.

Typically Channel 1 would be used in this mode for the ADC, since its data rate is so high. However, Channel 1 High Priority Mode may be used in conjunction with any peripheral.

---

#### Note

High-priority mode and ONESHOT mode may not be used at the same time on channel 1. Other channels may use ONESHOT mode when channel 1 is in high-priority mode.

---

### 12.7 Overrun Detection Feature

The DMA contains overrun detection logic. When a peripheral event trigger is received by the DMA, the PERINTFLG bit in the CONTROL register is set, pending the channel to the DMA state machine. When the burst for that channel is started, the PERINTFLG is cleared. If however, between the time that the PERINTFLG bit is set by an event trigger and cleared by the start of the burst, an additional event trigger arrives, the second trigger will be lost. This condition will set the OVRFLG bit in the CONTROL register as in Figure 12-7. If the overrun interrupt is enabled, the channel interrupt will be generated to the PIE module.

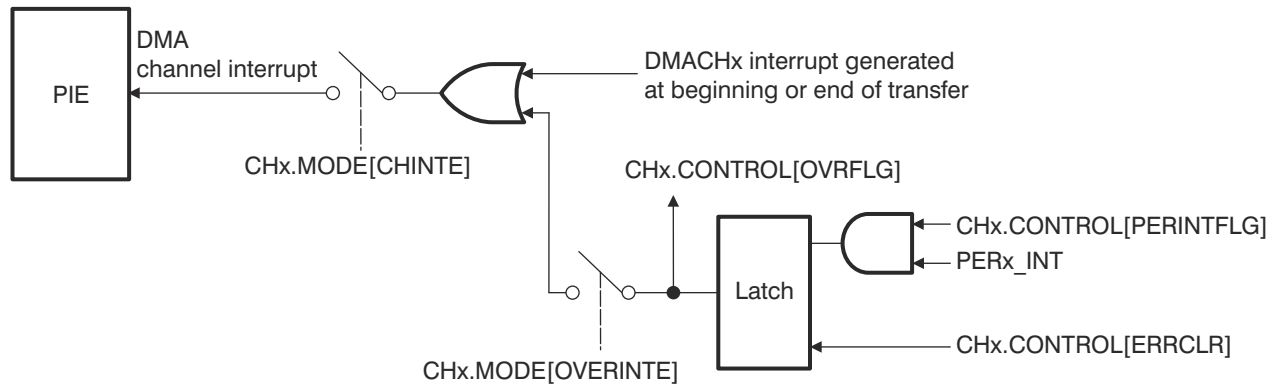

Figure 12-7. Overrun Detection Logic

## 12.8 Software

### 12.8.1 DMA Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/f28003x/examples/dma

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

#### 12.8.1.1 DMA GSRAM Transfer (dma\_ex1\_gsram\_transfer)

FILE: dma\_ex1\_gsram\_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

#### Watch Variables

- *sData* - Data to send
- *rData* - Received data

## 12.9 DMA Registers

This section describes the C28x Direct Memory Access Registers.

### 12.9.1 DMA Base Address Table

**Table 12-3. DMA Base Address Table**

| Bit Field Name |             | DriverLib Name | Base Address | CPU1 | DMA | HIC | CLA | Pipeline Protected |
|----------------|-------------|----------------|--------------|------|-----|-----|-----|--------------------|
| Instance       | Structure   |                |              |      |     |     |     |                    |
| DmaRegs        | DMA_REGS    | DMA_BASE       | 0x0000_1000  | YES  | -   | -   | -   | -                  |

## 12.9.2 DMA\_REGS Registers

Table 12-4 lists the memory-mapped registers for the DMA\_REGS registers. All register offset addresses not listed in Table 12-4 should be considered as reserved locations and the register contents should not be modified.

**Table 12-4. DMA\_REGS Registers**

| Offset | Acronym       | Register Name               | Write Protection | Section            |
|--------|---------------|-----------------------------|------------------|--------------------|
| 0h     | DMACTRL       | DMA Control Register        | EALLOW           | <a href="#">Go</a> |
| 1h     | DEBUGCTRL     | Debug Control Register      | EALLOW           | <a href="#">Go</a> |
| 4h     | PRIORITYCTRL1 | Priority Control 1 Register | EALLOW           | <a href="#">Go</a> |
| 6h     | PRIORITYSTAT  | Priority Status Register    | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 12-5 shows the codes that are used for access types in this section.

**Table 12-5. DMA\_REGS Access Type Codes**

| Access Type              | Code    | Description  |
|--------------------------|---------|--|
| Read Type                |         |  |
| R                        | R       | Read   |
| R-0                      | R<br>-0 | Read<br>Returns 0s   |
| Write Type               |         |  |
| W                        | W       | Write  |
| W1S                      | W<br>1S | Write<br>1 to set  |
| Reset or Default Value   |         |  |
| -n                       |         | Value after reset or the default value   |
| Register Array Variables |         |  |
| i,j,k,l,m,n              |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 12.9.2.1 DMACTRL Register (Offset = 0h) [Reset = 0h]

DMACTRL is shown in [Figure 12-7](#) and described in [Table 12-6](#).

Return to the [Summary Table](#).

DMA Control Register

**Figure 12-7. DMACTRL Register**

|          |    |    |    |    |    |                   |            |
|----------|----|----|----|----|----|-------------------|------------|
| 15       | 14 | 13 | 12 | 11 | 10 | 9                 | 8          |
| RESERVED |    |    |    |    |    |                   |            |
| R-0h     |    |    |    |    |    |                   |            |
| 7        | 6  | 5  | 4  | 3  | 2  | 1                 | 0          |
| RESERVED |    |    |    |    |    | PRIORITYRES<br>ET | HARDRESET  |
| R-0h     |    |    |    |    |    | R-0/W1S-0h        | R-0/W1S-0h |

**Table 12-6. DMACTRL Register Field Descriptions**

| Bit  | Field         | Type    | Reset | Description   |
|------|---------------|---------|-------|---|
| 15-2 | RESERVED      | R       | 0h    | Reserved  |
| 1    | PRIORITYRESET | R-0/W1S | 0h    | <p>The priority reset bit resets the round-robin state machine when a 1 is written. Service starts from the first enabled channel. Writes of 0 are ignored and this bit always reads back a 0.</p> <p>When a 1 is written to this bit, any pending burst transfer completes before resetting the channel priority machine. If CH1 is configured as a high-priority channel, and this bit is written to while CH1 is servicing a burst, both the CH1 burst and the next pending low-priority burst are completed before the state machine is reset.</p> <p>If CH1 is high-priority, the state machine restarts from CH2 (or the next highest enabled channel).</p> <p>Reset type: SYSRSn</p> |
| 0    | HARDRESET     | R-0/W1S | 0h    | <p>Writing a 1 to the hard reset bit resets the whole DMA and aborts any current access (similar to applying a device reset). Writes of 0 are ignored and this bit always reads back a 0.</p> <p>For a soft reset, a bit is provided for each channel to perform a gentler reset. Refer to the channel control registers.</p> <p>When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register.</p> <p>Reset type: SYSRSn</p>  |

### 12.9.2.2 DEBUGCTRL Register (Offset = 1h) [Reset = 0h]

DEBUGCTRL is shown in [Figure 12-8](#) and described in [Table 12-7](#).

Return to the [Summary Table](#).

Debug Control Register

**Figure 12-8. DEBUGCTRL Register**

| Bit | Field      | Type | Reset | Description   |
|-----|------------|------|-------|---|
| 15  | CHINTE     | R/W  | 0h    | Channel Interrupt Enable Bit<br>This bit enables the DMA channel's CPU interrupt.<br>Reset type: SYSRSn<br>0h (R/W) = Interrupt disabled<br>1h (R/W) = Interrupt enabled  |
| 14  | DATASIZE   | R/W  | 0h    | Data Size Mode Bit<br>This bit determines whether the DMA channel transfers 16 bits or 32 bits of data per read/write operation. Regardless of this setting, all data lengths and offsets in other DMA registers refer to 16-bit words. The pointer step increments must be configured to accommodate 32-bit words.<br>Reset type: SYSRSn<br>0h (R/W) = 16-bit data transfer size<br>1h (R/W) = 32-bit data transfer size |
| 13  | RESERVED   | R/W  | 0h    | Reserved  |
| 12  | RESERVED   | R/W  | 0h    | Reserved  |
| 11  | CONTINUOUS | R/W  | 0h    | Continuous Mode Bit<br>If this bit is set to 1, then the channel re-initializes when TRANSFER_COUNT is zero and waits for the next event trigger. Otherwise, the DMA stops and clears the RUNSTS bit.<br>Reset type: SYSRSn   |
| 10  | ONESHOT    | R/W  | 0h    | One Shot Mode<br>If this bit is set to 1, each peripheral event trigger causes the channel to perform an entire transfer. Otherwise, the channel only performs one burst per trigger.<br>Reset type: SYSRSn   |
| 9   | CHINTMODE  | R/W  | 0h    | Channel Interrupt Generation Mode<br>This bit specifies when the DMA channel generates a CPU interrupt for a transfer.<br>Reset type: SYSRSn<br>0h (R/W) = Generate interrupt at beginning of new transfer<br>1h (R/W) = Generate interrupt at end of transfer.   |
| 8   | PERINTE    | R/W  | 0h    | Peripheral Event Trigger Enable<br>This bit enables peripheral event triggers on the DMA channel.<br>Reset type: SYSRSn<br>0h (R/W) = Peripheral event trigger disabled. Neither the selected peripheral nor software can start a DMA burst.<br>1h (R/W) = Peripheral event trigger enabled.  |

**Table 12-12. MODE Register Field Descriptions (continued)**

| Bit | Field     | Type | Reset | Description  |
|-----|-----------|------|-------|--|
| 7   | OVRINTE   | R/W  | 0h    | Overflow Interrupt Enable<br>The bit determines whether the DMA module generates a CPU interrupt when it detects an overflow event.<br>Reset type: SYSRSn<br>0h (R/W) = Overflow interrupt disabled<br>1h (R/W) = Overflow interrupt enabled         |
| 6-5 | RESERVED  | R    | 0h    | Reserved   |
| 4-0 | PERINTSEL | R/W  | 0h    | Peripheral Event Trigger Source Select<br>These are legacy bits and should be set to the channel number. The actual source selection is done via the DMACHSRCSELn registers, which are part of the DMA_CLA_SRC_SEL_REGS group.<br>Reset type: SYSRSn |

### 12.9.3.2 CONTROL Register (Offset = 1h) [Reset = 0h]

CONTROL is shown in [Figure 12-12](#) and described in [Table 12-13](#).

Return to the [Summary Table](#).

Control Register

**Figure 12-12. CONTROL Register**

| 15         | 14         | 13         | 12         | 11          | 10         | 9          | 8          |

**Table 12-13. CONTROL Register Field Descriptions**

| Bit | Field       | Type | Reset | Description  |
|-----|-------------|------|-------|--|
| 15  | RESERVED    | R    | 0h    | Reserved   |
| 14  | OVRFLG      | R    | 0h    | Overflow Flag<br>This bit indicates that a peripheral event trigger was received while PERINTFLG was already set. It can be cleared by writing to the ERRCLR bit.<br>Reset type: SYSRSn<br>0h (R/W) = No overflow detected<br>1h (R/W) = Overflow detected   |
| 13  | RUNSTS      | R    | 0h    | Run Status Flag<br>This bit indicates that the DMA channel is ready to respond to peripheral event triggers. This bit is set when a 1 is written to the RUN bit. It is cleared when a transfer completes (TRANSFER_COUNT = 0) and continuous mode is disabled, or when the HARDRESET, SOFTRESET, or HALT bit is set.<br>Reset type: SYSRSn<br>0h (R/W) = The channel is disabled<br>1h (R/W) = The channel is enabled  |
| 12  | BURSTSTS    | R    | 0h    | Burst Status Flag<br>This bit is set when a DMA burst begins. The BURST_COUNT is set to the BURST_SIZE. This bit is cleared when BURST_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set.<br>Reset type: SYSRSn<br>0h (R/W) = No burst activity<br>1h (R/W) = The DMA is currently servicing or suspending a burst transfer from this channel  |
| 11  | TRANSFERSTS | R    | 0h    | Transfer Status Flag<br>This bit is set when a DMA transfer begins. The address registers are copied to the shadow set and the TRANSFER_COUNT is set to the TRANSFER_SIZE. This bit is cleared when TRANSFER_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set.<br>Reset type: SYSRSn<br>0h (R/W) = No transfer activity<br>1h (R/W) = The channel is currently in the middle of a transfer regardless of whether a burst of data is actively being transferred or not |
| 10  | RESERVED    | R    | 0h    | Reserved   |
| 9   | RESERVED    | R    | 0h    | Reserved   |

**Table 12-13. CONTROL Register Field Descriptions (continued)**

| Bit | Field     | Type    | Reset | Description   |
|-----|-----------|---------|-------|---|
| 8   | PERINTFLG | R       | 0h    | Peripheral Event Trigger Flag<br>This bit indicates whether a peripheral event trigger has arrived. This bit is automatically cleared when the first burst transfer begins.<br>Reset type: SYSRSn<br>0h (R/W) = Waiting for event trigger<br>1h (R/W) = Event trigger pending   |
| 7   | ERRCLR    | R-0/W1S | 0h    | Clear Error<br>Writing a 1 to this bit will clear the OVRFLG bit. This is normally done when initializing the DMA module or if an overflow condition is detected. If an overflow event occurs at the same time this bit is set, the overrun has priority and the OVRFLG bit is set.<br>Reset type: SYSRSn   |
| 6   | RESERVED  | R-0/W1S | 0h    | Reserved  |
| 5   | RESERVED  | R-0/W1S | 0h    | Reserved  |
| 4   | PERINTCLR | R-0/W1S | 0h    | Clear Peripheral Event Trigger<br>Writing a 1 to this bit clears PERINTFLG, which cancels a pending event trigger. This is normally done when initializing the DMA module. If an event trigger arrives at the same time this bit is set, the trigger has priority and PERINTFLG is set.<br>Reset type: SYSRSn   |
| 3   | PERINTFRC | R-0/W1S | 0h    | Force Peripheral Event Trigger<br>If the PERINTE bit of the MODE register is set, writing a 1 to this bit sets PERINTFLG, which triggers a DMA burst. This bit can be used to start a DMA transfer in software.<br>Reset type: SYSRSn   |
| 2   | SOFTRESET | R-0/W1S | 0h    | Channel Soft Reset<br>Writing a 1 to this bit places the channel into its default state after the current read/write access has completed:<br>RUNSTS = 0<br>TRANSFERSTS = 0<br>BURSTSTS = 0<br>BURST_COUNT = 0<br>TRANSFER_COUNT = 0<br>SRC_WRAP_COUNT = 0<br>DST_WRAP_COUNT = 0<br>When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register.<br>Reset type: SYSRSn |
| 1   | HALT      | R-0/W1S | 0h    | Halt Channel<br>Writing a 1 to this bit halts the DMA channel in its current state after any ongoing read/write access has completed.<br>Reset type: SYSRSn   |
| 0   | RUN       | R-0/W1S | 0h    | Run Channel<br>Writing a 1 to this bit enables the DMA channel and sets the RUNSTS bit to 1. This bit is also used to resume after a channel halt.<br>The RUN bit is typically used to start the DMA channel after configuration. The channel will then wait for the first peripheral event trigger (PERINTFLG == 1) to start a burst.<br>Reset type: SYSRSn  |

### 12.9.3.3 BURST\_SIZE Register (Offset = 2h) [Reset = 0h]

BURST\_SIZE is shown in [Figure 12-13](#) and described in [Table 12-14](#).

Return to the [Summary Table](#).

Burst Size Register

| 7               | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| DSTTRANSFERSTEP |    |    |    |    |    |   |   |
| R/W-0h          |    |    |    |    |    |   |   |

**Table 12-21. DST\_TRANSFER\_STEP Register Field Descriptions**

| Bit  | Field           | Type | Reset | Description  |
|------|-----------------|------|-------|--|
| 15-0 | DSTTRANSFERSTEP | R/W  | 0h    | <p>These bits specify the change in the destination address after a burst completes. The size must be a 16-bit two's complement value between -4096 and 4095 (inclusive). This value is added to the destination address after each burst completes.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = No address change</p> <p>1h (R/W) = Add 1 to the address</p> <p>2h (R/W) = Add 2 to the address</p> <p>FFEh (R/W) = Add 4094 to the address</p> <p>FFFh (R/W) = Add 4095 to the address</p> <p>F00h (R/W) = Subtract 4096 from the address</p> <p>F01h (R/W) = Subtract 4095 from the address</p> <p>FFFEh (R/W) = Subtract 2 from the address</p> <p>FFFFh (R/W) = Subtract 1 from the address</p> |

### 12.9.3.11 SRC\_WRAP\_SIZE Register (Offset = Ah) [Reset = FFFFh]

SRC\_WRAP\_SIZE is shown in [Figure 12-21](#) and described in [Table 12-22](#).

Return to the [Summary Table](#).

Source Wrap Size Register

**Figure 12-21. SRC\_WRAP\_SIZE Register**

|           |    |    |    |    |    |   |   |
|-----------|----|----|----|----|----|---|---|
| 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| WRAPSIZE  |    |    |    |    |    |   |   |
| R/W-FFFFh |    |    |    |    |    |   |   |
| 7         | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| WRAPSIZE  |    |    |    |    |    |   |   |
| R/W-FFFFh |    |    |    |    |    |   |   |

**Table 12-22. SRC\_WRAP\_SIZE Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 15-0 | WRAPSIZE | R/W  | FFFFh | These bits specify the number of bursts to transfer before the source address wraps around to the beginning address. The actual number is equal to WRAPSIZE + 1. To disable the wrapping function, set WRAPSIZE to a value larger than TRANSFERSIZE.<br>Reset type: SYSRSn |

### 12.9.3.12 SRC\_WRAP\_COUNT Register (Offset = Bh) [Reset = 0h]

SRC\_WRAP\_COUNT is shown in [Figure 12-22](#) and described in [Table 12-23](#).

Return to the [Summary Table](#).

Source Wrap Count Register

**Figure 12-22. SRC\_WRAP\_COUNT Register**

|          |    |    |    |    |    |   |   |
|----------|----|----|----|----|----|---|---|
| 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| WRAPSIZE |    |    |    |    |    |   |   |
| R-0h     |    |    |    |    |    |   |   |
| 7        | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| WRAPSIZE |    |    |    |    |    |   |   |
| R-0h     |    |    |    |    |    |   |   |

**Table 12-23. SRC\_WRAP\_COUNT Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 15-0 | WRAPSIZE | R    | 0h    | These bits indicate the number of bursts left before wrapping the source address.<br>Reset type: SYSRSn |

### 12.9.3.13 SRC\_WRAP\_STEP Register (Offset = Ch) [Reset = 0h]

SRC\_WRAP\_STEP is shown in [Figure 12-23](#) and described in [Table 12-24](#).

Return to the [Summary Table](#).

Source Wrap Step Register

**Figure 12-23. SRC\_WRAP\_STEP Register**

|          |    |    |    |    |    |   |   |
|----------|----|----|----|----|----|---|---|
| 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| WRAPSTEP |    |    |    |    |    |   |   |
| R/W-0h   |    |    |    |    |    |   |   |
| 7        | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| WRAPSTEP |    |    |    |    |    |   |   |
| R/W-0h   |    |    |    |    |    |   |   |

**Table 12-24. SRC\_WRAP\_STEP Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 15-0 | WRAPSTEP | R/W  | 0h    | These bits specify the change in the source beginning address when the wrap counter reaches zero. The size must be a 16-bit two's complement value between -4096 and 4095 (inclusive). This value is added to the source address when wrapping occurs.<br>Reset type: SYSRSn<br>0h (R/W) = No address change<br>1h (R/W) = Add 1 to the address<br>2h (R/W) = Add 2 to the address<br>FFEh (R/W) = Add 4094 to the address<br>FFFh (R/W) = Add 4095 to the address<br>F00h (R/W) = Subtract 4096 from the address<br>F01h (R/W) = Subtract 4095 from the address<br>FFFEh (R/W) = Subtract 2 from the address<br>FFFFh (R/W) = Subtract 1 from the address |

### 12.9.3.14 DST\_WRAP\_SIZE Register (Offset = Dh) [Reset = FFFFh]

DST\_WRAP\_SIZE is shown in [Figure 12-24](#) and described in [Table 12-25](#).

Return to the [Summary Table](#).

Destination Wrap Size Register

**Figure 12-24. DST\_WRAP\_SIZE Register**

|           |    |    |    |    |    |   |   |
|-----------|----|----|----|----|----|---|---|
| 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| WRAPSIZE  |    |    |    |    |    |   |   |
| R/W-FFFFh |    |    |    |    |    |   |   |
| 7         | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| WRAPSIZE  |    |    |    |    |    |   |   |
| R/W-FFFFh |    |    |    |    |    |   |   |

**Table 12-25. DST\_WRAP\_SIZE Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 15-0 | WRAPSIZE | R/W  | FFFFh | These bits specify the number of bursts to transfer before the destination address wraps around to the beginning address. The actual number is equal to WRAPSIZE + 1. To disable the wrapping function, set WRAPSIZE to a value larger than TRANSFERSIZE. Reset type: SYSRSn |

### 12.9.3.15 DST\_WRAP\_COUNT Register (Offset = Eh) [Reset = 0h]

DST\_WRAP\_COUNT is shown in [Figure 12-25](#) and described in [Table 12-26](#).

Return to the [Summary Table](#).

Destination Wrap Count Register

**Figure 12-25. DST\_WRAP\_COUNT Register**

|          |    |    |    |    |    |   |   |
|----------|----|----|----|----|----|---|---|
| 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| WRAPSIZE |    |    |    |    |    |   |   |
| R-0h     |    |    |    |    |    |   |   |
| 7        | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
| WRAPSIZE |    |    |    |    |    |   |   |
| R-0h     |    |    |    |    |    |   |   |

# Embedded Real-time Analysis and Diagnostic (ERAD)

This chapter describes the features and operation of the embedded real-time analysis and diagnostic (ERAD) module. The ERAD module enhances the debug and system analysis capabilities of the device. The debug and system analysis enhancements provided by the ERAD module are implemented external to the CPU. The EBC units are used to generate hardware breakpoints, hardware watch points, and other output events. The SEC units are used to analyze and profile the system. The ERAD module is accessible both by the debugger and the application software, which significantly increases the debug capabilities of many real-time systems, especially in situations where the debugger is not connected.

## 13.1 Introduction

The ERAD module is shown in [Figure 13-1](#).

The ERAD enhances the debug and system analysis capabilities of the device external to the CPU. The C28x CPU alone has two analysis resources; Analysis Unit 1 (AU1) and Analysis Unit 2 (AU2). The first analysis unit counts events or monitors address buses. The second analysis unit monitors address and data buses. The two analysis units can be configured for hardware breakpoints or hardware watch points, and additionally the first analysis unit can be configured as a benchmark counter or event counter. The ERAD module further expands this capability to provide additional hardware breakpoints, hardware watch points, and counters for profiling, as well as other advanced features. The ERAD module can be utilized by the debugger, and also by the application software. For many real-time systems, it is not always possible to connect a debugger and perform an intrusive debug. Under these situations, the user's code has the ability to set up and control the ERAD module in order to debug and profile the system without disturbing the end application.

The ERAD module consists of eight enhanced bus comparator (EBC) units and four system event counter (SEC) units. The EBC units monitor buses and generate output events. The SEC units can be used with EBC units to profile and analyze the system. These units are described in detail in the following sections.

**Figure 13-1. ERAD Overview**

## 13.2 Enhanced Bus Comparator Unit

The EBC units connect to the CPU similar to any standard direct memory interface connection. The program space buses, data space buses, debug qualifiers for memory access, and debug-related strobes necessary for breakpoints, watch points and trace points, are connected between the CPU and these units. The EBC units are usually controlled by the debug software. However, a CPU application code can also configure and use these units for interrupt and event generation. The ERAD module can be configured and used by either the application software or debug software. It is not possible for an EBC unit to be used by both the application software and the debug software simultaneously. The ERAD module will be owned by either the debugger or the application software through the memory-mapped registers.

The EBC unit has the following capabilities:

- Generate hardware breakpoints
- Generate hardware watch points
- Generate trace tags for instruction fetch matches and generate RTOSINT
- Monitor data read address buses, data write address buses, data write data bus, and generate RTOSINT
- Generate an event output which can be used by other modules. This is done through monitoring any of the program address buses, Virtual Program Counter (VPC), or the Program Counter of the CPU

The following features are not supported by the EBC units:

- Chain breakpoints
- Ability to monitor DMA transfers
- Ability to monitor CLA buses

The EBC units have the capability to monitor a range of addresses by defining masks and generating outputs based on greater than, less than, or equal events.

The EBC units can be used with the SEC units for profiling and analysis purposes.

### 13.2.1 Enhanced Bus Comparator Unit Operations

The following operations are supported by the EBC unit:

- Operation of a hardware breakpoint: The EBC unit will generate the appropriate tags for an access made to a particular address. When the instruction is going to enter the DECODE 2 (D2) phase of the pipeline, the CPU is halted.
- Operation of a watch point: Unlike breakpoints which halt the CPU before a designated address is executed, watch points will detect the occurrence of a data memory read or write, and will halt the CPU. There is no precise definition as to when the CPU will halt, since it is entirely dependant on the current state of the CPU pipeline. The CPU will halt at the next interruptible boundary.
- Operation of program trace: This operation is very similar to the hardware breakpoint operation. The difference between the CPU behavior is that it will internally generate an RTOSINT when the tagged instruction reaches the DECODE 2 (D2) phase of the pipeline. If this instruction is discarded in the fetch buffer due to discontinuity, then no RTOSINT will be generated.
- Operation of RTOSINTn: This is an alternative to a watch point where an interrupt can be generated to the CPU on detecting the designated read and write access.

It is important to note that a hardware breakpoint will only halt the CPU if a debugger is connected.

### 13.2.2 Event Masking and Exporting

The events generated by different EBC units can be combined using OR and AND logics to generate new events as required. There are four AND and four OR combinations that could be exported using masks to suppress unnecessary events. These events may also be configured to generate an RTOSINT.

**Figure 13-2. EBC Units Event Masking**

### 13.3 System Event Counter Unit

The SEC units provide better system profiling, analysis, and debug capability. The SEC units contain counters which can enhance the debug and profiling process in various types of system scenarios such as:

- Profiling code segments
- Counting duration between specified memory reads and writes
- Counting system events (such as interrupts)
- Counting duration between system events
- System timer
- Measuring the number of wait states in code segments
- Measuring the maximum amount of time spent in between a pair of events, measured over multiple iterations
- Chaining counters in order to link events or create larger counters

Furthermore, the SEC unit has the capability to:

- Function as a counter capable of counting:
  - Any of the match events generated by the EBC units
  - Events generated by the EBC units. These events can be used to start and stop the counting.
  - System events including the PIE interrupts, timer interrupts, and CLA task interrupts. These system events can be used to start and stop the counting.
  - More information on the sources of the SEC units can be found at the Event Selector Mux Signals Table.
- Generate an interrupt or a watch point if the count reaches a reference value.
- Operate in counting mode in one of the following two modes:
  - Duration mode: The counter will count the CPU cycles as long as the event is active.
  - Event mode: The counter will count only the positive edge of the event signal. This is effectively counting the number of times the event transitions from inactive to active.

### 13.3.1 System Event Counter Modes

The following are the key features of the SEC unit. The counters are initialized to zero and will always count up.

- **Continuous Count:** In this mode the counter continues to count as specified by the input selector. If the counter reaches the maximum value, it resets to zero and will continue to count up. A sticky overflow bit will be set to indicate that this counter had overflowed. The counter can count the CPU cycles without any events selected. In this mode the module can be used as a software controlled SYSCLK counter.
- **Timer Mode Count:** In this mode, the counter counts up to a set reference value and after reaching the reference value, it resets to zero. The counter will generate an event that can send an interrupt to the CPU or generate a watch point. The counter can be set up to either continue incrementing or reset when a match event occurs.
- **Start-Stop Count:** In this mode, two events are allowed to act as start and stop indicators to the counter. The counter will commence counting only when the defined start event occurs. The counter will then continue to count up until the stop event occurs. Once the first start event has occurred, further start events will be ignored till the stop event occurs.

#### 13.3.1.1 Counting Active Levels Versus Edges

The SEC units can be configured to either count active levels or edges of the selected inputs.

Each SEC unit has eight inputs from the EBC units and many inputs from other events in the device. Each SEC unit can be configured to count any of the input events or just count up on every cycle. For example, if an input event occurs and is active for 25 cycles, the SEC unit's counter increments only by 1 in event mode, whereas in the duration mode, it increments by 25.

#### 13.3.1.2 Max Mode

Max mode is also supported by the SEC units. This mode allows the user to detect the maximum count that has occurred during various count iterations in start-stop mode. For example, a user can set up the counter in the start-stop count mode to count the duration of a critical code loop. Every time the stop event occurs and the counter stops, the counter value is checked against the current MAX\_COUNT present in the register. If the new value is greater, then the MAX\_COUNT register is updated. The counter will always reset to zero at the stop event and will be ready to start counting on the next start event. Therefore the MAX\_COUNT will contain the maximum number of cycles that occurred between the start and stop condition over many iterations.

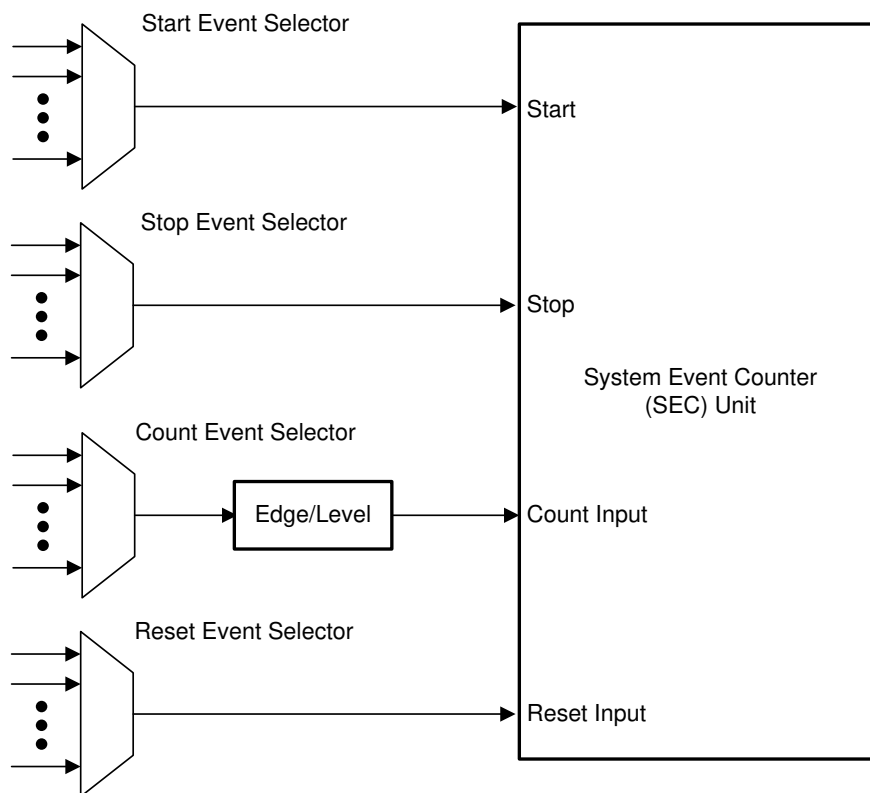

#### 13.3.1.3 Cumulative Mode

The SEC units can be used to yield the cumulative count over several start and stop events. In this mode the, unlike Max mode, the counter does not reset due to a stop event. Instead it stops counting and resumes counting when a start event occurs. In cumulative count mode, the MAX\_COUNT is not valid.

#### 13.3.1.4 Input Signal Selection

The SEC inputs can be selected from various signals from in the system to enable debug and system analysis. [Figure 13-3](#) shows the SEC inputs. Each event selector MUX can select from various signals on in the system. These signals are show in [Table 13-1](#).

### 13.3.2 Reset on Event

It is also possible to reset the counters on external events. Additionally all the counter event outputs are fed back to each of the counter's input MUX which will select the event that can be used as a reset input. When enabled, an active high on the reset input will cause the counter to reset. This gives a powerful feature which allows the user to set up threshold monitors. This can be used to flag an interrupt or a watch point if the distance between two events crosses a certain threshold.

### 13.3.3 Operation Conditions

The SEC units will count accurately only when the CPU is operating in normal conditions. If the counters are running and capturing the CPU cycles while the CPU is controlled through the debugger in order to single-step through the code, then the result may differ from when the CPU was executing the code in normal conditions.

It is also important to note that if the counters are set up to use the value of the raw program counter register (VPC) as the source for the start and stop events, the value of the CPU cycles measured may be off by a few cycles when the CALL instruction is executed.

## 13.4 ERAD Ownership, Initialization and Reset

Even though the features of this module are meant for the debugger to use, the user application may also need to take advantage of the capabilities to monitor the buses and generate interrupts and events. It is an option to completely hand over the ownership of the ERAD module to the application software or the debugger. Another option is for both the application code and the debugger to use the ERAD module. Only the owner of the module (application code or debugger) is allowed to use the module at that time. The responsibility of resolving any ownership conflict, is on the software. The last option is to have no owner. In this mode, both the application code and the debugger have the capability to access the module at the same time. It is critical for the software, both on the application side and the debugger side, to resolve any conflicts. In this mode, it is possible for the debugger to use some of the EBC units and the SEC units, while the application software uses the remaining units.

The ERAD module will initialize its internal states and all the registers to their initialized states under the following conditions:

- At power-on-reset (POR)
- With DCON and SYSRSN
  - Debug logic disconnected when the debugger owns the module
  - Functional reset when application owns the module

## 13.5 ERAD Programming Sequence

The ERAD module can be used to set hardware breakpoints and hardware watch points. The programming sequence to set hardware breakpoints, hardware watch points, or to use the timers to profile and analyze the system are described in this section. The same sequence can be used through the debugger software or the application code.

Refer to the Driverlib example projects in C2000Ware for JavaScript files to configure the ERAD module. Example projects are also available to showcase the usage of these script files. These examples are included in the latest Driverlib install: <C2000Ware installation>\driverlib\28004x\examples\erad

### 13.5.1 Hardware Breakpoint and Hardware Watch Point Programming Sequence

The programming sequence is identical when using the EBC units, regardless of whether it is a debug software or the application programming the units. A typical programming sequence for a unit is described below.

- Read and make sure the ownership is set as expected; if not, acquire the ownership before proceeding further if required.
- Ensure the unit is in IDLE mode.
- Set up the address reference, mask, bus select and stop bits.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write '1' to Clear EVENT\_FIRED sticky bit; This will take the module back to the enabled state.

The example programming sequences for hardware breakpoints and hardware watch points are shown below.

Set a hardware breakpoint on address 0x201000:

- Read GLBL\_OWNER to confirm ownership.
- Read HWBP\_STATUS to confirm the module is in IDLE state.
- Write 0x0 to HWBP\_MASK.
- Write 0x201000 to HWBP\_REF.
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on read of addresses from 0x121010 to 0x12101f:

- Read GLBL\_OWNER to confirm ownership.
- Read HWBP\_STATUS to confirm the module is in IDLE state.
- Write 0xf to HWBP\_MASK.
- Write 0x121010 to HWBP\_REF.
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on write to address 0xff10101a:

- Read GLBL\_OWNER to confirm ownership
- Read HWBP\_STATUS to confirm the module is in IDLE state
- Write 0x0 to HWBP\_MASK
- Write 0xff10101a to HWBP\_REF
- Enable the corresponding module bit in the global enable register.

### 13.5.2 Timer and Counter Programming Sequence

The programming sequence is identical when using the SEC units, regardless of whether it is a debug software, or the application, programming the units. Typical programming sequence for a unit is described below.

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further if required.
- Ensure the unit is in IDLE mode.
- Set up the counter reference, counter registers (clear/reset if a clean start is required) and CTM\_CNTL.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write '1' to Clear EVENT\_FIRED sticky bit. This will take the module back to the enabled state.

Set up a free running counter:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM\_STATUS to confirm that the module is in IDLE state.
- Write 0x0 to CTM\_INPUT\_SEL.
- Write 0x0 to CTM\_CNTL.
- Enable the module in the GLBL\_ENABLE register.

Set up the counter to count the duration spent between addresses 0x1000 and 0x1210:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM\_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x1000.
- Set up the EBC unit 2 to generate an event for VPC = 0x1210.
- Enable the module in the GLBL\_ENABLE register.

Set up the counter to count the number of times a function at address 0x2010 is called and fire an RTOSINT if this count reaches 0x300:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM\_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x2010.
- Write 0x300 CTM\_REF.
- Enable the counter in the EVENT\_MODE, and also allow it to generate an RTOSINT when the count matches the reference. This is achieved by writing 0x88 to CTM\_CNTL (bit 3 = 1 and bit 7 = 1).
- Enable the module in the GLBL\_ENABLE register.

### 13.6 Cyclic Redundancy Check Unit

The cyclic redundancy check (CRC) units monitor CPU buses and compute CRC when the self-test code is executed. This capability aids in achieving simpler, non-intrusive and interruptible self-test mechanisms with Software Test Library (STL). Each CRC unit is used to monitor a different CPU interface. For example, CRC unit 1 is used to monitor the Program Counter, while CRC unit 2 is used to monitor the data read address bus. [Table 13-2](#) identifies the CPU interface monitored by each of the CRC units.

**Table 13-2. CPU Interfaces Monitored by CRC Units**

| CRC Unit   | CPU Interface                              |
|------------|--|
| CRC Unit 1 | Program Counter Register                   |
| CRC Unit 2 | Data Read Address Bus                      |
| CRC Unit 3 | Data Read Data Bus                         |
| CRC Unit 4 | Data Write Address Bus                     |
| CRC Unit 5 | Data Write Data Bus                        |
| CRC Unit 6 | Instruction Register Value (Unsecured)     |
| CRC Unit 7 | Instruction Register Value (Secure-Zone 1) |
| CRC Unit 8 | Instruction Register Value (Secure-Zone 2) |

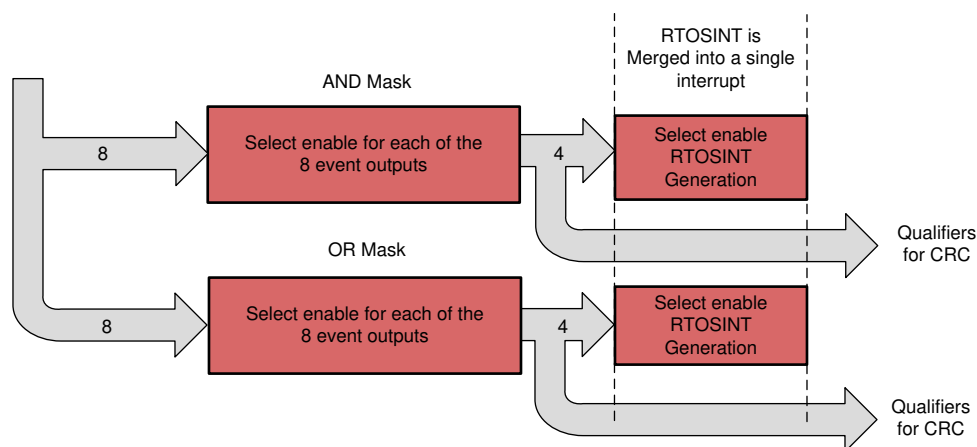

The main purpose of the CRC units is to ensure that the CPU functionally remains intact when it is executing the same software test library over multiple iterations. This is done by comparing the computed CRC values after each iteration, with a pre-computed golden value.

CRC units 7 and 8 are intended to compute the Instruction Register values for secure-zone 1 and secure-zone 2 instruction execution. Computed CRC values for the a given secure-zone is available only for accesses originating from that zone.

### 13.6.1 CRC Unit Qualifier

By default, all the valid events on a given interface enables a CRC unit for computation. However there are optional qualifiers which can be used to gate the CRC computation when valid events occur. If required, these qualifiers can be generated by masking the EBC units events. The AND/OR masks discussed in [Section 13.2.2](#) are used to generate these qualifiers. Refer to the CRC\_QUALIFIER register for a full list of available qualifiers. [Figure 13-4](#) shows the connection between EBC event masking and exporting with the CRC qualifiers.

EBC units have the capability to monitor the Program Counter, data writes and data reads. CRC units can use the EBC units to decide when the check values should be calculated. For example, if it is required to calculate the check values only when the CPU is executing a specific function, the user can set up an EBC unit to monitor the PC and generate a CRC qualifier when that function is executed. This allows the CRC unit to calculated the check value only when desired.

**Figure 13-4. Event Masking and Exporting for CRC Qualifiers**

### 13.6.2 CRC Unit Programming Sequence

The following sequence can be used to initialize a CRC unit to calculate the check value for the corresponding CPU interface.

1. Initialize the CRC unit by writing a '1' to the corresponding CRC\_INIT field in the CRC\_GLOBAL\_CTRL register.
2. Configure the seed value (if required) using CRC\_SEED register (CRC\_EN should be '0' for when modifying the CRC\_SEED register).
3. Configure the CRC\_QUALIFIER register if additional qualification from EBC units is required; If not additional qualification is not required, set the CRC\_QUALIFIER register to '0'.
4. Enable the CRC unit by setting the CRC\_EN to '1' at the beginning of the software for which the CRC calculation is done.
5. Disable the CRC unit by setting the CRC\_EN to '0' at the end of the software for which the CRC calculation is done.
6. Read the CRC\_CURRENT register to record the computed CRC; This check value can be compared with previous check values to ensure no changes has occurred.
7. Repeat steps 1-7 periodically as needed.

---

#### Note

Sufficient NOP's must be added immediately after the CRC submodule is enabled in order to make sure the pipeline contains predictable code as soon as the CRC is enabled. Similarly, sufficient NOP's must be added before the CRC submodule is disabled. Disabling the CRC write access will take a few cycles, therefore there must be predictable code in the pipeline stages until the write takes place.

---

## 13.7 ERAD Registers

This section describes the Embedded Real-Time Analysis and Diagnostic Registers.

### 13.7.1 ERAD Base Address Table

**Table 13-3. ERAD Base Address Table**

| Bit Field Name    |                      | DriverLib Name       | Base Address | CPU1 | DMA | HIC | CLA | Pipeline Protected |
|-------------------|----------------------|----------------------|--------------|------|-----|-----|-----|--------------------|
| Instance          | Structure            |                      |              |      |     |     |     |                    |

### 13.7.2 ERAD\_GLOBAL\_REGS Registers

Table 13-4 lists the memory-mapped registers for the ERAD\_GLOBAL\_REGS registers. All register offset addresses not listed in Table 13-4 should be considered as reserved locations and the register contents should not be modified.

**Table 13-4. ERAD\_GLOBAL\_REGS Registers**

| Offset | Acronym                 | Register Name                                 | Write Protection | Section            |
|--------|-------------------------|---|------------------|--------------------|
| 0h     | GLBL_EVENT_STAT         | Global Event Status Register                  |                  | <a href="#">Go</a> |
| 2h     | GLBL_HALT_STAT          | Global Halt Status Register                   |                  | <a href="#">Go</a> |
| 4h     | GLBL_ENABLE             | Global Enable Register                        | EALLOW           | <a href="#">Go</a> |
| 6h     | GLBL_CTM_RESET          | Global Counter Reset                          | EALLOW           | <a href="#">Go</a> |
| 8h     | GLBL_NMI_CTL            | Global Debug NMI control                      | EALLOW           | <a href="#">Go</a> |
| Ah     | GLBL_OWNER              | Global Ownership                              | EALLOW           | <a href="#">Go</a> |
| Ch     | GLBL_EVENT_AND_MASK     | Global Bus Comparator Event AND Mask Register | EALLOW           | <a href="#">Go</a> |
| Eh     | GLBL_EVENT_OR_MASK      | Global Bus Comparator Event OR Mask Register  | EALLOW           | <a href="#">Go</a> |
| 10h    | GLBL_AND_EVENT_INT_MASK | Global AND Event Interrupt Mask Register      | EALLOW           | <a href="#">Go</a> |
| 12h    | GLBL_OR_EVENT_INT_MASK  | Global OR Event Interrupt Mask Register       | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 13-5 shows the codes that are used for access types in this section.

**Table 13-5. ERAD\_GLOBAL\_REGS Access Type Codes**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| Read Type                |      |  |
| R                        | R    | Read   |
| R-0                      | R-0  | Read Returns 0s  |
| Write Type               |      |  |
| W                        | W    | Write  |
| Reset or Default Value   |      |  |
| -n                       |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| i,j,k,l,m,n              |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 13.7.2.1 GLBL\_EVENT\_STAT Register (Offset = 0h) [Reset = 0h]

GLBL\_EVENT\_STAT is shown in [Figure 13-5](#) and described in [Table 13-6](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the EVENT\_FIRED bit of the corresponding module. This facilitates software to just read one register and find out if any of the debug modules had fired.

**Figure 13-5. GLBL\_EVENT\_STAT Register**

|          |       |       |       |       |       |       |       |

### 13.7.2.2 GLBL\_HALT\_STAT Register (Offset = 2h) [Reset = 0h]

GLBL\_HALT\_STAT is shown in [Figure 13-6](#) and described in [Table 13-7](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the EVENT\_FIRED status bit. This facilitates software to just read one register and find out if any of the debug modules have fired.

**Figure 13-6. GLBL\_HALT\_STAT Register**

### 13.7.2.3 GLBL\_ENABLE Register (Offset = 4h) [Reset = 0h]

GLBL\_ENABLE is shown in [Figure 13-7](#) and described in [Table 13-8](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly acts as a global enable for the corresponding module. This bit has to be set to 1 for the module to be functional.

**Figure 13-7. GLBL\_ENABLE Register**

### 13.7.2.4 GLBL\_CTM\_RESET Register (Offset = 6h) [Reset = 0h]

GLBL\_CTM\_RESET is shown in [Figure 13-8](#) and described in [Table 13-9](#).

Return to the [Summary Table](#).

This register contains one bit for each of the counter modules that are present in a device. Each bit directly acts as a reset for the counters for the corresponding module. (It does not affect anything else except resetting the counter.

Example: If the counter was previously incrementing before reset, then on a reset event the counter gets reset and continues to increment again).

**Figure 13-8. GLBL\_CTM\_RESET Register**

|          |    |    |    |          |          |          |          |

### 13.7.2.5 GLBL\_NMI\_CTL Register (Offset = 8h) [Reset = 0h]

GLBL\_NMI\_CTL is shown in [Figure 13-9](#) and described in [Table 13-10](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that can cause an NMI to the CPU. When the corresponding bit of a unit is set to 1, then if an event occurs from that module, then an NMI will be generated.

**Figure 13-9. GLBL\_NMI\_CTL Register**

|          |        |        |        |        |        |        |        |

### 13.7.3 ERAD\_HWBP\_REGS Registers

Table 13-16 lists the memory-mapped registers for the ERAD\_HWBP\_REGS registers. All register offset addresses not listed in Table 13-16 should be considered as reserved locations and the register contents should not be modified.

**Table 13-16. ERAD\_HWBP\_REGS Registers**

| Offset | Acronym     | Register Name                 | Write Protection | Section            |
|--------|-------------|-------------------------------|------------------|--------------------|
| 0h     | HWBP_MASK   | HWBP (EBC) Mask Register      | EALLOW           | <a href="#">Go</a> |
| 2h     | HWBP_REF    | HWBP (EBC) Reference Register | EALLOW           | <a href="#">Go</a> |
| 4h     | HWBP_CLEAR  | HWBP (EBC) Clear Register     | EALLOW           | <a href="#">Go</a> |
| 6h     | HWBP_CNTL   | HWBP (EBC) Control Register   | EALLOW           | <a href="#">Go</a> |
| 7h     | HWBP_STATUS | HWBP (EBC) Status Register    | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 13-17 shows the codes that are used for access types in this section.

**Table 13-17. ERAD\_HWBP\_REGS Access Type Codes**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| Read Type                |      |  |
| R                        | R    | Read   |
| R-0                      | R-0  | Read Returns 0s  |
| Write Type               |      |  |
| W                        | W    | Write  |
| Reset or Default Value   |      |  |
| -n                       |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| i,j,k,l,m,n              |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 13.7.3.1 HWBP\_MASK Register (Offset = 0h) [Reset = 0h]

HWBP\_MASK is shown in [Figure 13-15](#) and described in [Table 13-18](#).

Return to the [Summary Table](#).

HWBP (EBC) Mask Register

**Figure 13-15. HWBP\_MASK Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31     | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MASK   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/W-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

**Table 13-18. HWBP\_MASK Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 31-0 | MASK  | R/W  | 0h    | <p>This register contains address mask for comparison. The contents of this register are used along with the reference register to determine the address match. The equation used to determine a match is as follows. Match is true if,</p> $(\text{address} \mid \text{mask}) == (\text{ref} \mid \text{mask})$ <p>This register is writable by CPU only if application owns the unit and if EALLOW is set. Otherwise, the writes are ignored. The register is writable by the debugger only if the debugger owns this unit. Otherwise, the writes are ignored.</p> <p>Reset type: ERAD_RESET</p> |

### 13.7.3.2 HWBP\_REF Register (Offset = 2h) [Reset = 0h]

HWBP\_REF is shown in [Figure 13-16](#) and described in [Table 13-19](#).

Return to the [Summary Table](#).

HWBP (EBC) Reference Register

**Figure 13-16. HWBP\_REF Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31     | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| REF    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/W-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

**Table 13-19. HWBP\_REF Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 31-0 | REF   | R/W  | 0h    | This register contains the reference address for comparison. The contents of this register are used along with the mask register to determine the address match. The equation used to determine a match is as follows. Match is true if,<br>$(\text{address}   \text{mask}) == (\text{ref}   \text{mask})$<br>This register is writable by CPU only if application owns the unit and if EALLOW is set. Otherwise, the writes are ignored. The register is writable by the debugger only if the debugger owns this unit. Otherwise, the writes are ignored.<br>Reset type: ERAD_RESET |

### 13.7.3.3 HWBP\_CLEAR Register (Offset = 4h) [Reset = 0h]

HWBP\_CLEAR is shown in [Figure 13-17](#) and described in [Table 13-20](#).

Return to the [Summary Table](#).

HWBP (EBC) Clear Register

**Figure 13-17. HWBP\_CLEAR Register**

|          |    |    |    |    |    |   |           |

### 13.7.3.5 HWBP\_STATUS Register (Offset = 7h) [Reset = 400h]

HWBP\_STATUS is shown in [Figure 13-19](#) and described in [Table 13-22](#).

Return to the [Summary Table](#).

HWBP (EBC) Status Register

**Figure 13-19. HWBP\_STATUS Register**

|          |    |           |    |    |    |   |             |
|----------|----|-----------|----|----|----|---|-------------|
| 15       | 14 | 13        | 12 | 11 | 10 | 9 | 8           |
| STATUS   |    | MODULE_ID |    |    |    |   |             |
| R-0h     |    | R-4h      |    |    |    |   |             |
| 7        | 6  | 5         | 4  | 3  | 2  | 1 | 0           |
| RESERVED |    |           |    |    |    |   | EVENT_FIRED |
| R-0h     |    |           |    |    |    |   | R-0h        |

**Table 13-22. HWBP\_STATUS Register Field Descriptions**

| Bit   | Field       | Type | Reset | Description   |
|-------|-------------|------|-------|---|
| 15-14 | STATUS      | R    | 0h    | Bus comparator status:<br>00 Idle<br>10 Enabled<br>11 Completed<br>Reset type: ERAD_RESET   |
| 13-8  | MODULE_ID   | R    | 4h    | These bits are always a constant representing a unique identification for the Enhanced Bus Comparator (EBC) unit.<br>Reset type: ERAD_RESET   |
| 7-1   | RESERVED    | R    | 0h    | Reserved  |
| 0     | EVENT_FIRED | R    | 0h    | This is a sticky bit which gets set every time the HWBP (EBC) unit generates a match event. This will be used by software to figure out whether this HWBP module fired an event or not. This bit will get cleared by writing a '1' to bit 0 of the HWBP_CLEAR register.<br>Reset type: ERAD_RESET |

### 13.7.4 ERAD\_COUNTER\_REGS Registers

Table 13-23 lists the memory-mapped registers for the ERAD\_COUNTER\_REGS registers. All register offset addresses not listed in Table 13-23 should be considered as reserved locations and the register contents should not be modified.

**Table 13-23. ERAD\_COUNTER\_REGS Registers**

| Offset | Acronym         | Register Name                           | Write Protection | Section            |
|--------|-----------------|---|------------------|--------------------|
| 0h     | CTM_CNTL        | Counter Control Register                | EALLOW           | <a href="#">Go</a> |
| 1h     | CTM_STATUS      | Counter Status Register                 | EALLOW           | <a href="#">Go</a> |
| 2h     | CTM_REF         | Counter Reference Register              | EALLOW           | <a href="#">Go</a> |
| 4h     | CTM_COUNT       | Counter Current Value Register          | EALLOW           | <a href="#">Go</a> |
| 6h     | CTM_MAX_COUNT   | Counter Max Count Value Register        | EALLOW           | <a href="#">Go</a> |
| 8h     | CTM_INPUT_SEL   | Counter Input Select Register           | EALLOW           | <a href="#">Go</a> |
| 9h     | CTM_CLEAR       | Counter Clear Register                  | EALLOW           | <a href="#">Go</a> |
| Ah     | CTM_INPUT_SEL_2 | Counter Input Select Extension Register | EALLOW           | <a href="#">Go</a> |
| Bh     | CTM_INPUT_COND  | Counter Input Conditioning Register     |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 13-24 shows the codes that are used for access types in this section.

**Table 13-24. ERAD\_COUNTER\_REGS Access Type Codes**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| Read Type                |      |  |
| R                        | R    | Read   |
| R-0                      | R-0  | Read Returns 0s  |
| Write Type               |      |  |
| W                        | W    | Write  |
| Reset or Default Value   |      |  |
| -n                       |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| i,j,k,l,m,n              |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 13.7.4.1 CTM\_CNTL Register (Offset = 0h) [Reset = 0h]

CTM\_CNTL is shown in [Figure 13-20](#) and described in [Table 13-25](#).

Return to the [Summary Table](#).

Counter Control Register

**Figure 13-20. CTM\_CNTL Register**

|----------|--------|----------|---------------|----------------|-----------------|----------|-----------------------|
| RESERVED |        |          |               | CNT_INP_SEL_EN | RST_EN          | RESERVED | START_STOP_CUMULATIVE |
| R-0h     |        |          |               | R/W-0h         | R/W-0h          | R-0h     | R/W-0h                |
| 7        | 6      | 5        | 4             | 3              | 2               | 1        | 0                     |
| RTOSINT  | STOP   | RESERVED | RST_ON_MAT_CH | EVENT_MODE     | START_STOP_MODE | RESERVED |                       |
| R/W-0h   | R/W-0h | R-0h     | R/W-0h        | R/W-0h         | R/W-0h          | R-0h     |                       |

**Table 13-25. CTM\_CNTL Register Field Descriptions**

| Bit   | Field                 | Type | Reset | Description  |
|-------|-----------------------|------|-------|--|
| 15-12 | RESERVED              | R    | 0h    | Reserved   |
| 11    | CNT_INP_SEL_EN        | R/W  | 0h    | 0 = Disable using the input_select register for the count input. The counter will always count CPU cycles.<br>1 = Enable using the input_select register for the count input. The counter will count the event selected by the count input register.<br>Reset type: ERAD_RESET   |
| 10    | RST_EN                | R/W  | 0h    | This bit decides if the reset input is enabled or not. Setting this to 1 will cause the counter to reset to zero whenever the selected reset input goes active high. No event will be generated when the counter is reset. Setting this bit to 0 will cause the counter to ignore the reset inputs.<br>Reset type: ERAD_RESET  |
| 9     | RESERVED              | R    | 0h    | Reserved   |
| 8     | START_STOP_CUMULATIVE | R/W  | 0h    | This bit decides whether the counter counts to give the cumulative cycle count for 'n' number of successive start stop events or clears the counter on every stop event to record the MAX_COUNT across successive start stop sequences.<br>0 When in START_STOP mode counter gets cleared on every stop event and MAX_COUNT records the max value<br>1 When in START_STOP mode counter keeps counting between successive start stop events to generate a cumulative count w/o clearing the counter on any stop events. MAX_COUNT register is invalid when this bit is set.<br>Reset type: ERAD_RESET |
| 7     | RTOSINT               | R/W  | 0h    | This bit decides whether the counter module will generate RTOSINTn interrupt when count value matches the reference. Note that the event outputs will always be generated regardless of the state of this bit.<br>0 The counter unit will not cause any action towards the CPU.<br>1 The counter unit will assert RTOSINTn when the count value matches the reference value.<br>Reset type: ERAD_RESET   |
| 6     | STOP                  | R/W  | 0h    | This bit decides whether the counter module will generate a watchpoint to the CPU when the count value matches the reference. Note that the event outputs will always be generated regardless of the state of this bit.<br>0 The counter unit will not generate a watchpoint.<br>1 The counter unit will assert ANASTOP when the count value matches the reference.<br>Reset type: ERAD_RESET  |

**Table 13-25. CTM\_CNTL Register Field Descriptions (continued)**

| Bit | Field           | Type | Reset | Description  |
|-----|-----------------|------|-------|--|
| 5   | RESERVED        | R    | 0h    | Reserved   |
| 4   | RST_ON_MATCH    | R/W  | 0h    | This bit is used to decide whether the counter will reset to zero once it reaches the reference value.<br>0 Counter will stay at the reference value and the counter will go to COMPLETED state and further counting will be stopped.<br>1 The counter will reset to zero once it reaches the match value and will stay enabled.<br>Reset type: ERAD_RESET   |
| 3   | EVENT_MODE      | R/W  | 0h    | This bit is used to decide whether the counter will count the level of the event or the edge of the event.<br>0 Counter will increment the count as long as the count input is active high.<br>1 The counter will count only on the rising edge of the count input.<br>Reset type: ERAD_RESET  |
| 2   | START_STOP_MODE | R/W  | 0h    | This bit is used to decide whether the counter will count in the START_STOP mode or not.<br>0 Normal count mode. The counter will not depend on the START and STOP events<br>1 This is the START-STOP mode of the counter. The counter will start counting only after the START input has been asserted. It will continue to count the selected event till the STOP event is seen.<br>Reset type: ERAD_RESET |
| 1-0 | RESERVED        | R    | 0h    | Reserved   |

### 13.7.4.2 CTM\_STATUS Register (Offset = 1h) [Reset = 10h]

CTM\_STATUS is shown in [Figure 13-21](#) and described in [Table 13-26](#).

Return to the [Summary Table](#).

Counter Status Register

**Figure 13-21. CTM\_STATUS Register**

|           |    |    |    |           |    |          |             |
|-----------|----|----|----|-----------|----|----------|-------------|
| 15        | 14 | 13 | 12 | 11        | 10 | 9        | 8           |
| STATUS    |    |    |    | MODULE_ID |    |          |             |
| R-0h      |    |    |    | R-4h      |    |          |             |
| 7         | 6  | 5  | 4  | 3         | 2  | 1        | 0           |
| MODULE_ID |    |    |    |           |    | OVERFLOW | EVENT_FIRED |
| R-4h      |    |    |    |           |    | R-0h     | R-0h        |

**Table 13-26. CTM\_STATUS Register Field Descriptions**

| Bit   | Field       | Type | Reset | Description   |
|-------|-------------|------|-------|---|
| 15-12 | STATUS      | R    | 0h    | Counter unit status,<br>00 Idle<br>10 Enabled<br>11 Completed<br>Reset type: ERAD_RESET   |
| 11-2  | MODULE_ID   | R    | 4h    | These bits are always a constant representing a unique identification for the trigger unit.<br>Reset type: ERAD_RESET   |
| 1     | OVERFLOW    | R    | 0h    | This is a sticky bit which gets set every time the counter overflows and wraps around after reaching 0xffffffff. This bit will get cleared by writing a '1' to bit 9 of the CTM_CNTL register.<br>Reset type: ERAD_RESET  |
| 0     | EVENT_FIRED | R    | 0h    | This is a sticky bit which gets set every time the CTM unit generates a match event. This will be used by software to figure out whether this CTM module fired an event or not. This bit will get cleared by writing a '1' to bit 9 of the CTM_CNTL register.<br>Reset type: ERAD_RESET |

### 13.7.4.3 CTM\_REF Register (Offset = 2h) [Reset = 0h]

CTM\_REF is shown in [Figure 13-22](#) and described in [Table 13-27](#).

Return to the [Summary Table](#).

Counter Reference Register

**Figure 13-22. CTM\_REF Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31     | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| REF    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/W-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

**Table 13-27. CTM\_REF Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 31-0 | REF   | R/W  | 0h    | <p>This register contains the counter reference value for comparison. The counter will generate an event if the count value matches the reference register (considering both upper and lower half of the register).</p> <p>This register is writable by CPU only if application owns the unit and if EALLOW is set. Otherwise, the writes are ignored. The register is writable by the debugger only if the debugger owns this unit. Otherwise, the writes are ignored.</p> <p>Reference match is enabled only when a non zero value is programmed on one of the REF register.</p> <p>Reset type: ERAD_RESET</p> |

#### 13.7.4.4 CTM\_COUNT Register (Offset = 4h) [Reset = 0h]

CTM\_COUNT is shown in [Figure 13-23](#) and described in [Table 13-28](#).

Return to the [Summary Table](#).

Counter Current Value Register

**Figure 13-23. CTM\_COUNT Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| R/W-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

**Table 13-28. CTM\_COUNT Register Field Descriptions**

| Bit  | Field | Type | Reset | Description   |
|------|-------|------|-------|---|
| 31-0 | COUNT | R/W  | 0h    | This register contains the current count value.<br>The counter will generate an event if the count value matches the reference register (considering both upper and lower half of the register).<br>This register is writable by CPU only if application owns the unit and if EALLOW is set. Otherwise, the writes are ignored.<br>The register is writable by the debugger only if the debugger owns this unit. Otherwise, the writes are ignored.<br>Reset type: ERAD_RESET |

### 13.7.4.5 CTM\_MAX\_COUNT Register (Offset = 6h) [Reset = 0h]

CTM\_MAX\_COUNT is shown in [Figure 13-24](#) and described in [Table 13-29](#).

Return to the [Summary Table](#).

Counter Max Count Value Register

**Figure 13-24. CTM\_MAX\_COUNT Register**

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MAX_COUNT |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/W-0h    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

**Table 13-29. CTM\_MAX\_COUNT Register Field Descriptions**

| Bit  | Field     | Type | Reset | Description   |
|------|-----------|------|-------|---|
| 31-0 | MAX_COUNT | R/W  | 0h    | <p>This register contains the maximum recorded counter value. This is relevant only in the Start Stop mode of operation.</p> <p>This register is writable by CPU only if application owns the unit and if EALLOW is set. Otherwise, the writes are ignored.</p> <p>The register is writable by the debugger only if the debugger owns this unit. Otherwise, the writes are ignored.</p> <p>Reset type: ERAD_RESET</p> |

### 13.7.4.6 CTM\_INPUT\_SEL Register (Offset = 8h) [Reset = 0h]

CTM\_INPUT\_SEL is shown in [Figure 13-25](#) and described in [Table 13-30](#).

Return to the [Summary Table](#).

Counter Input Select Register

**Figure 13-25. CTM\_INPUT\_SEL Register**

|          |             |        |    |    |    |   |   |
|----------|-------------|--------|----|----|----|---|---|
| 15       | 14          | 13     | 12 | 11 | 10 | 9 | 8 |
| RESERVED | STA_INP_SEL |        |    |    |    |   |   |
| R-0h     |             | R/W-0h |    |    |    |   |   |
| 7        | 6           | 5      | 4  | 3  | 2  | 1 | 0 |
| RESERVED | CNT_INP_SEL |        |    |    |    |   |   |
| R-0h     |             | R/W-0h |    |    |    |   |   |

**Table 13-30. CTM\_INPUT\_SEL Register Field Descriptions**

| Bit  | Field       | Type | Reset | Description   |
|------|-------------|------|-------|---|
| 15   | RESERVED    | R    | 0h    | Reserved  |
| 14-8 | STA_INP_SEL | R/W  | 0h    | These bits decide which of the inputs will be selected as the START event for the counter. These inputs will be hooked up to the event outputs from the breakpoint module, counter module and to other system events. The usage of these bits are relevant only in the START_STOP mode of counting.<br>Reset type: ERAD_RESET |
| 7    | RESERVED    | R    | 0h    | Reserved  |
| 6-0  | CNT_INP_SEL | R/W  | 0h    | These bits decide which of the inputs will be selected to enable counting. These inputs will be hooked up to the event outputs from the breakpoint module, counter module and to other system events<br>Reset type: ERAD_RESET  |

### 13.7.4.7 CTM\_CLEAR Register (Offset = 9h) [Reset = 0h]

CTM\_CLEAR is shown in [Figure 13-26](#) and described in [Table 13-31](#).

Return to the [Summary Table](#).

Counter Clear Register

**Figure 13-26. CTM\_CLEAR Register**

|          |    |    |    |    |    |                    |             |
|----------|----|----|----|----|----|--------------------|-------------|
| 15       | 14 | 13 | 12 | 11 | 10 | 9                  | 8           |

### 13.7.5 ERAD\_CRC\_GLOBAL\_REGS Registers

Table 13-34 lists the memory-mapped registers for the ERAD\_CRC\_GLOBAL\_REGS registers. All register offset addresses not listed in Table 13-34 should be considered as reserved locations and the register contents should not be modified.

**Table 13-34. ERAD\_CRC\_GLOBAL\_REGS Registers**

| Offset | Acronym         | Register Name   | Write Protection | Section            |
|--------|-----------------|-----------------|------------------|--------------------|
| 0h     | CRC_GLOBAL_CTRL | CRC_GLOBAL_CTRL |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 13-35 shows the codes that are used for access types in this section.

**Table 13-35. ERAD\_CRC\_GLOBAL\_REGS Access Type Codes**

| Access Type              | Code    | Description  |
|--------------------------|---------|--|
| Read Type                |         |  |
| R                        | R       | Read   |
| R-0                      | R<br>-0 | Read<br>Returns 0s   |
| Write Type               |         |  |
| W                        | W       | Write  |

| 1   | CRC2_INIT | R-0/W | 0h    | 0 = No action.<br>1 = Initialize the CRC Module (Module registers/statemachine gets cleared for a fresh start)<br>Reads of this bit position always returns zero<br>Reset type: SYSRSn |
| 0   | CRC1_INIT | R-0/W | 0h    | 0 = No action.<br>1 = Initialize the CRC Module (Module registers/statemachine gets cleared for a fresh start)<br>Reads of this bit position always returns zero<br>Reset type: SYSRSn |

### 13.7.6 ERAD\_CRC\_REGS Registers

Table 13-37 lists the memory-mapped registers for the ERAD\_CRC\_REGS registers. All register offset addresses not listed in Table 13-37 should be considered as reserved locations and the register contents should not be modified.

**Table 13-37. ERAD\_CRC\_REGS Registers**

| Offset | Acronym       | Register Name  | Write Protection | Section            |
|--------|---------------|----------------|------------------|--------------------|
| 0h     | CRC_CURRENT   | CRC_CURRENT    |                  | <a href="#">Go</a> |
| 2h     | CRC_SEED      | CRC SEED value |                  | <a href="#">Go</a> |
| 4h     | CRC_QUALIFIER | CRC_QUALIFIER  |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 13-38 shows the codes that are used for access types in this section.

**Table 13-38. ERAD\_CRC\_REGS Access Type Codes**

| Access Type              | Code | Description  |
|--------------------------|------|--|
| Read Type                |      |  |
| R                        | R    | Read   |
| Write Type               |      |  |
| W                        | W    | Write  |
| Reset or Default Value   |      |  |
| -n                       |      | Value after reset or the default value   |
| Register Array Variables |      |  |
| i,j,k,l,m,n              |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                        |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 13.7.6.1 CRC\_CURRENT Register (Offset = 0h) [Reset = 0h]

CRC\_CURRENT is shown in [Figure 13-30](#) and described in [Table 13-39](#).

Return to the [Summary Table](#).

Current computed CRC value

**Figure 13-30. CRC\_CURRENT Register**

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

## 14.1 Overview

The HIC module allows an external host controller to directly access resources of the device by emulating the ASRAM protocol. It has two modes of operation: direct access and mailbox access. In direct access mode, device resources are written to and read from directly by the external host. In mailbox access mode, external host and device write to and read from a buffer and notify each other when the buffer write/read is complete. For security reasons, the HIC has to be enabled by the device before the external host can access it by using the HICGCR.HICEN and HICMODECR.EN\_DEVACC registers.

### 14.1.1 HIC Related Collateral

#### Getting Started Materials

- [Design Guide for Enabling Peripheral Expansion Applications Using the HIC Application Report](#)

### 14.1.2 Features

The HIC module has the following features:

- Configurable I/O data lines of 8 and 16 bit
- Direct and mailbox access modes
- 8 address lines and 8 configurable base addresses for a total of 2048 possible addressable regions
- Two 64-byte buffers for external host and device when using mailbox access mode
- Interrupt generation on buffer full/empty
- High throughput
- Trigger HIC activity from other peripherals
- Error indicators to the system or interface
- Commit feature that blocks writes to configuration registers

---

#### Note

The C28x processor is not byte addressable. The minimum addressable region in memory is 16-bits.

---

### 14.1.3 Block Diagram

[Figure 14-1](#) shows the block diagram of the HIC.

Figure 14-1. HIC Block Diagram

## 14.2 Functional Description

The HIC consists of 3 main components:

- **I/O Interface:** The Input and Output (I/O) Interface emulates the ASRAM protocol to perform read and write operations between the external host and the device.
- **Configuration Interface:** The configuration interface consists of the registers that make up the HIC module. These registers include the control, data and status registers of the HIC and are accessible by both the external host and processors within the device.
- **Bus Initiator Interface:** The bus initiator interface is the port that accesses the device memory and peripheral registers. Reads from and writes to the device from the external host are handled by the bus initiator interface.

### 14.2.1 Memory Map

Figure 14-2 shows the memory and peripherals accessible by the HIC module and by extension, the external host.

Figure 14-2. HIC Memory Map

### 14.2.2 Connections

Figure 14-3 shows the possible connections that can be made between the external host and the HIC module. Not all connections are available on all devices. Check the device specific data manual to see the connections supported on your device.

Table 14-1 is a brief description of what each connection means.

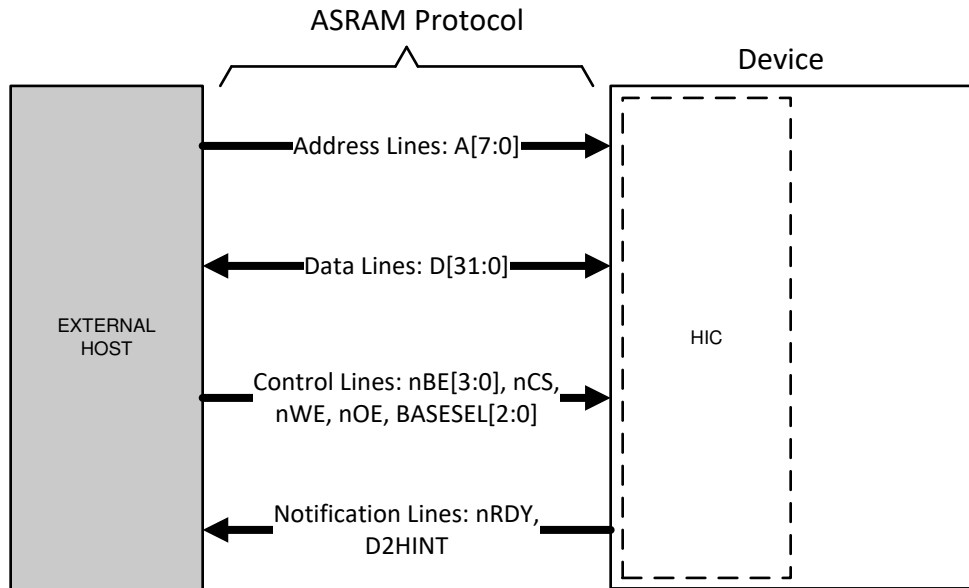

Figure 14-3. HIC Connections

Table 14-1. HIC Connections Table

| Connection Group   | Connection Name | Direction    | Description                  |
|--------------------|-----------------|--------------|------------------------------|
| Address Lines      | A[7:0]          | Input        | Address Lines Bit0 to Bit7   |
| Data Lines         | D[31:0]         | Input/Output | Data Lines Bit0 to Bit31     |
| Control Lines      | nBE[3:0]        | Input        | Byte Enable Bit0 to Bit3     |
|                    | nCS             | Input        | Chip Select                  |
|                    | nWE             | Input        | Write Enable                 |
|                    | nOE/RnW         | Input        | Output Enable/Read not Write |
|                    | BASESEL[2:0]    | Input        | Base Select Bit0 to Bit2     |
| Notification Lines | nRDY            | Output       | Ready/Wait                   |
|                    | D2HINT          | Output       | Device to Host Interrupt     |

### 14.2.2.1 Functions of the Connections

- **Address Lines:** The address lines are part of the signals the external hosts uses to select which region of the device to read from or write to.
- **Data Lines:** The data lines carry the actual data read from or written to the device.
- **Control Lines**
  - **nBE:** The HIC supports 8-bit and 16-bit data transfers. The Byte Enable signal is used to select which of these modes data transfer will happen in.
  - **nCS:** The Chip Select signal enables or disables the HIC interface.
  - **nWE:** The Write Enable signal enables or disables writes from the external host to the device.
  - **nOE:** The Output Enable signal enables or disables reads from the device to the external host.
  - **BASESEL:** The HIC supports access to device memory and peripherals or the HIC registers. The Base Select signal is used to select which region the external host will access.
- **Notification Lines**
  - **nRDY:** The Ready signal is used by the HIC to indicate to the external host that it is ready for a new read or write access.
  - **D2HINT:** The Device to Host Interrupt signal is used by the HIC to indicate to the external host that data transaction is complete.

#### Note

By default, nBE, nCS, nWE, nOE and nRDY are active-low signals. Their polarity can be changed by configuring the HICPINPOLCR register.

### 14.2.3 Interrupts and Triggers

The external host interrupts the device using H2DINT that goes to the PIE. A write to the HICH2DTOKEN register triggers H2DINT. The H2DINT sources are shown in Figure 14-4.

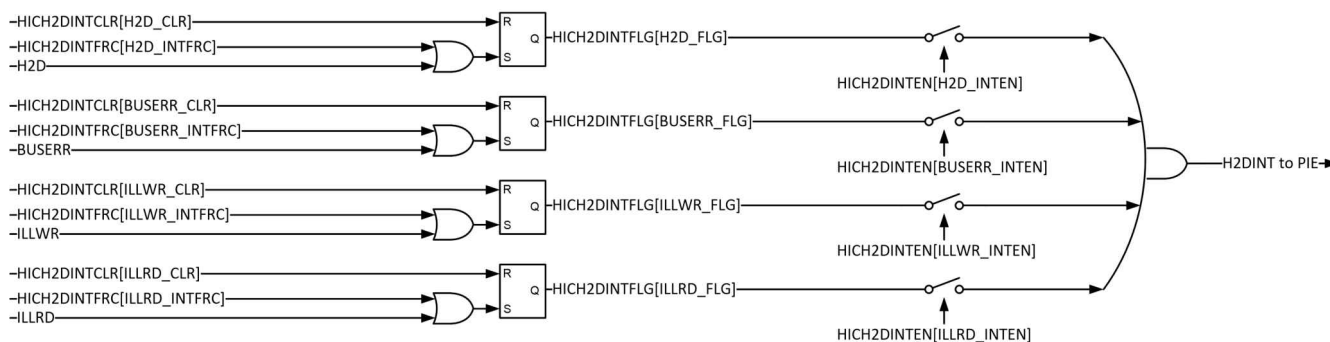

Figure 14-4. HIC Host to Device Interrupt Sources

The device interrupts the external host using D2HINT that comes out on a pin. A write to the HICD2HTOKEN register triggers D2HINT. The D2HINT sources are shown in Figure 14-5.

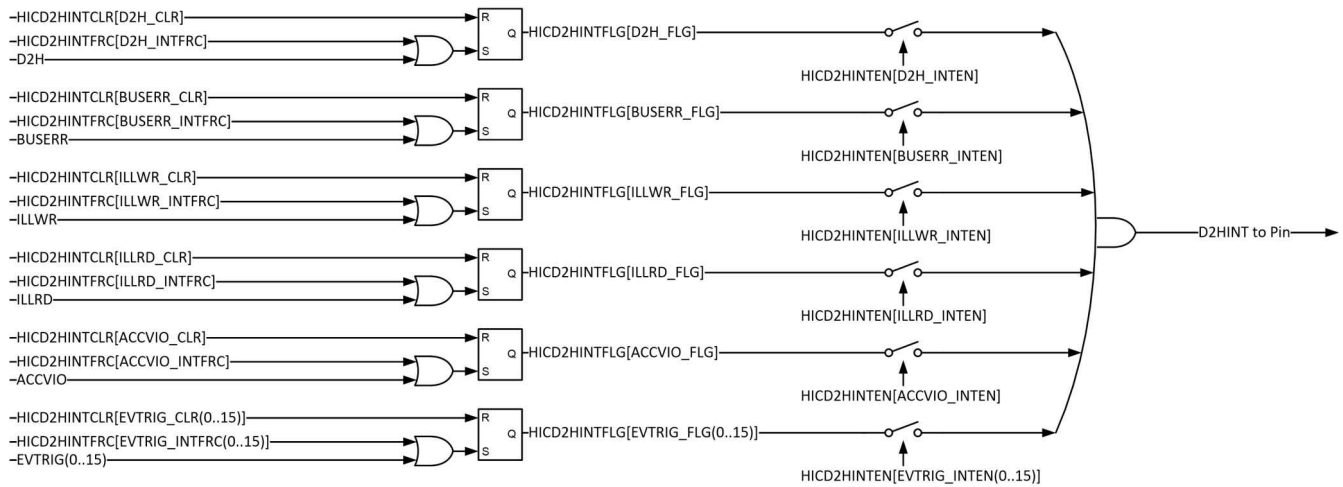

Figure 14-5. HIC Device to Host Interrupt Sources

D2HINT can also be triggered by peripherals in the device (EVTRIG) as indicated in Figure 14-5. The sources for EVTRIG are listed in Table 14-2.

Table 14-2. Event Trigger (EVTRIG) Sources

| Event Trigger  | Peripheral Interrupt Source |
|----------------|-----------------------------|
| EVTRIG[0]      | FSIRX_INT1, FSIRX_INT2      |
| EVTRIG[1]      | FSITX_INT1, FSITX_INT2      |
| EVTRIG[2]      | SPIB_TX, SPIB_RX            |
| EVTRIG[3]      | SPIA_TX, SPIA_RX            |
| EVTRIG[4]      | EPWM2, EPWM2_TZ             |
| EVTRIG[5]      | EPWM1, EPWM1_TZ             |
| EVTRIG[6]      | CLB2                        |
| EVTRIG[7]      | CLB1                        |
| EVTRIG[8]      | CLB4                        |
| EVTRIG[9]      | CLB3                        |
| EVTRIG[10]     | DMA Transfer                |
| EVTRIG[11..15] | Reserved                    |

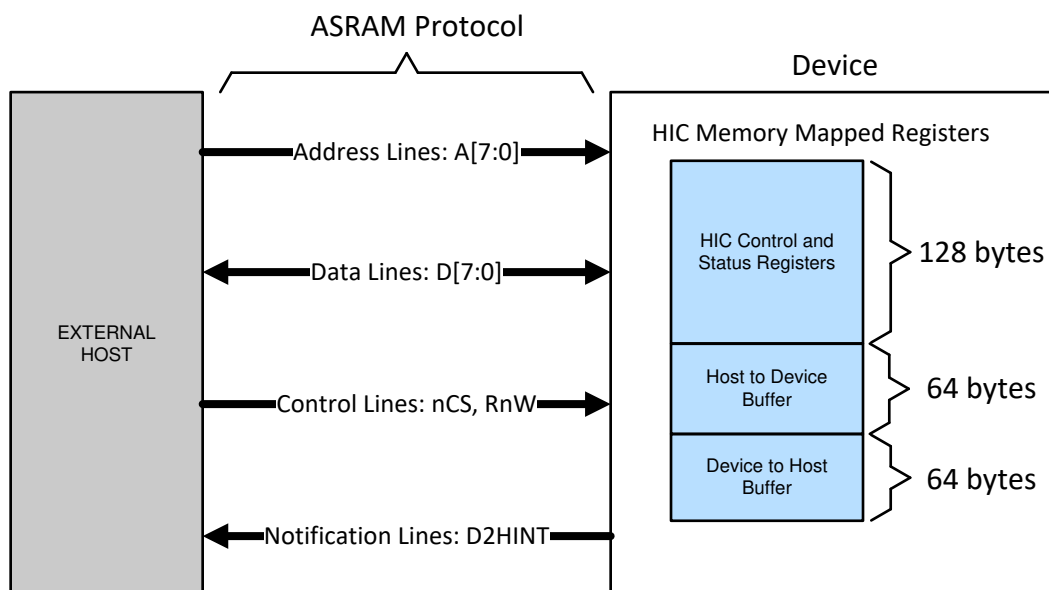

## 14.3 Operation

### 14.3.1 Mailbox Access Mode Overview

In Mailbox Access Mode, the external host only sees the HIC memory mapped region and not the device resources and peripherals. This memory mapped region of the HIC includes the HIC control, status and data registers.

128 bytes of this region is reserved for HIC control and status registers. The remaining 128 bytes is used as a data/buffer space and is split 64 bytes each as Host to Device (H2D) buffer and Device to Host (D2H) buffer. Note that this distinction between H2D and D2H buffer is only in name. Device and external host can each access the combined H2D and D2H buffers of 128 bytes by configuring the H2DBUF\_DEVWREN and D2HBUF\_HOSTWREN fields in the HICMODECR register. Figure 14-6 shows the Mailbox Access Mode and the minimum external connections required for this mode.

**Figure 14-6. HIC Mailbox Access Mode Diagram**

#### 14.3.1.1 Mailbox Access Mode Operation

To place the HIC in Mailbox Access Mode, BASESEL[2:0] pins should be set to '000'. Address lines A[7:0] can then be used to select which of the 256 bytes of the HIC memory mapped registers to access.

#### 14.3.1.2 Configuring HIC Registers With External Host

The external host can only configure the HIC registers and read its status in Mailbox Access Mode. As mentioned in the prior section, the HIC control and status registers reside in the first 128 bytes of the HIC memory mapped region.

### 14.3.1.3 Mailbox Access Mode Read/Write

The remaining 128 bytes of the HIC memory-mapped region can be used as a general-purpose buffer. To write to or read from this region:

- The device enables the HIC by writing 0xA to the HICGCR.HICEN register
- The device configures the availability and polarity of the HIC pins using the HICMODECR.RW\_MODE, HICMODECR.BEN\_PRESENT, HICMODECR.RDY\_PRESENT, and HICPINPOLCR registers

To write data to the device:

- The external host writes to the H2D buffer, that is, H2D\_BUF register
- After completing the write, the external host triggers an interrupt (H2DINT) to the device by writing a pattern to the HICH2DTOKEN register. This pattern can be any value and a useful value to write to the HICH2DTOKEN register is the number of bytes written by the external host. Any write to the HICH2DTOKEN register will trigger H2DINT.
- The device acknowledges this interrupt by transferring the data from the H2D buffer (H2D\_BUF register) to the required location.

To read data from the device:

- The device writes to the D2H buffer i.e D2H\_BUF register
- After completing the write, the device triggers an interrupt (D2HINT) to the external host by writing a pattern to the HICD2HTOKEN register. This pattern can be any value and a useful value to write to the HICD2HTOKEN register is the number of bytes written by the device.
- The external host acknowledges this interrupt by reading the contents of the D2H buffer (D2H\_BUF register).

---

#### Note

An error will not be generated if writes to the D2H\_BUF and H2D\_BUF exceed their memory region, that is, 128 bytes. Application needs to make sure writes to the above regions are appropriately bounded.

---

### 14.3.2 Direct Access Mode Overview

In Direct Access Mode, the external host through the HIC can directly read from and write to device locations specified in the memory map. The device location to read is a combination of the 8-bit address lines A[7:0] and the 24-bit HICDBADDR{#} register.

These two address pieces are concatenated as:

$$\text{Full 32-bit Address} = \{\text{HICDBADDR}\{\#\}, \text{BASE\_ADDR}[31:8], \text{A}[7:0]\}$$

There are 8 HICDBADDR{#} registers for a total of 2048 address locations in combination with A[7:0] address lines. Which HICDBADDR{#} register to concatenate with A[7:0] is selectable by the HICBASESEL register or BASESEL[2:0] pins. Figure 14-7 shows the Direct Access Mode and the minimum external connections required for this mode.

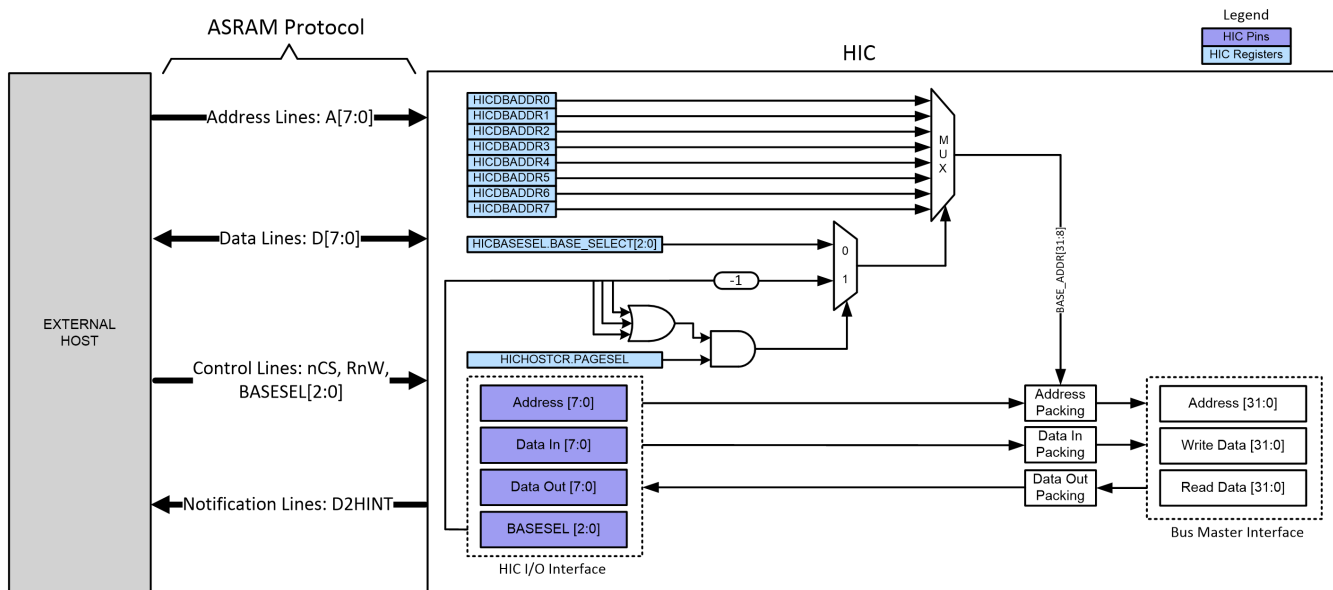

Figure 14-7. HIC Direct Access Mode Diagram

### 14.3.2.1 Direct Access Mode Operation

To place the HIC in Direct Access Mode, BASESEL[2:0] pins should be greater than '000'. Address lines A[7:0] are used in conjunction with the HICDBADDR{#} register to read from or write to a location in the device. [Table 14-3](#) shows the device address space view for the external host.

#### Note

BASESEL[2:0] pins cannot select HICDBADDR7 register, BASESEL[2:0] pins can only select HICDBADDR0-6 registers. HICDBADDR7 can only be selected through software using the HICBASESEL.BASE\_SELECT[2:0] register.

**Table 14-3. Address Space View for External Host**

| BASESEL[2:0] Pins <sup>(1)</sup> | HICBASESEL.BASE_SELECT[2:0] Register <sup>(1)</sup> | HICHOSTCR.PAGESEL Register <sup>(1)</sup> | Address Space  | Comment  |
|----------------------------------|---|---|--|--|
| 000                              | x   | x   | HIC Memory Map Registers - 256 Bytes                 | HIC Control, Status, D2H_BUF and H2D_BUF Registers |

(1) "x" indicates don't care.

### 14.3.2.2 Direct Access Mode Read/Write

The steps below assume all HIC pins are available. To write to or read from the device:

- The device enables the HIC by writing 0xA to the HICGCR.HICEN register
- The device enables direct access mode using HICMODECR.EN\_DEVACC register
- The device configures the availability and polarity of the HIC pins using the HICMODECR.RW\_MODE, HICMODECR.BEN\_PRESENT, HICMODECR.RDY\_PRESENT and HICPINPOLCR registers
- The device configures the HICDBADDR{#} registers
- To write data to the device, the external host selects a HICDBADDR{#} using the BASESEL[2:0] pins, drives the 8-bit portion of the address on the address lines A[7:0] and the data to write on the data lines D[15:0]
- To read data from the device, the external host selects a HICDBADDR{#} using the BASESEL[2:0] pins, drives the 8-bit portion of the address on the address lines A[7:0] and reads the data on the data lines D[15:0]

### 14.3.3 Controlling Reads and Writes

The HIC has two modes of controlling reads and writes: single-pin mode and dual-pin mode.

#### 14.3.3.1 Single-Pin Read/Write Mode (nOE/RnW Pin)

In single-pin read/write access (Figure 14-8), nOE(RnW) determines whether the transaction being performed is a read or a write. If nOE is low, data is written from the host to the device; when nOE is high, data is read from the device by the host.

**Figure 14-8. Read/Write Access in Single-Pin Mode**

### 14.3.3.2 Dual-Pin Read/Write Mode (nOE and nWE Pins)

In dual-pin read/write access (Figure 14-9), nOE and nWE pins determine whether the transaction being performed is a read or a write. In the default polarity state, nOE going low indicates a data read from the device to the host and nWE going low indicates a data write to the device by the host.

**Figure 14-9. Read/Write Access in Dual-Pin Mode**

### 14.3.4 Data Lines, Data Width, Data Packing and Unpacking

The HIC supports 8 and 16 data lines and host data transfers can be made in 8-bit and 16-bit modes. The host data transfer mode is selected using the byte enable (nBE) pins. In the absence of the nBE pins, host data transfer mode can be selected using the HICMODECR.DW\_MODE register.

At the initiator port level, the HIC internal access is restricted to 16-bit and 32-bit modes selectable using the HICHOSTCR.ACCSIZE register. If there is a mismatch between host access mode and initiator port access mode, the HIC will internally pack and unpack the data automatically as needed.

For instance, if host access mode is set to 16-bit using the nBE pins or the HICMODECR.DW\_MODE register and initiator port access mode is set to 16-bit using the HICHOSTCR.ACCSIZE register, no data packing/unpacking will be done. If host access mode is set to 8-bit and initiator port access mode is set to 16-bit, a single 8-bit access will wait for another 8-bit access to pack the two 8-bit accesses into one 16-bit access.

Table 14-4 shows the combinations for write access.

**Table 14-4. Data Packing and Unpacking for Writes**

| HICMODECR.<br>DW_MODE | Host Port Write |  |          | Initiator Port Write<br>(16-bit Aligned) |              | Error | Comment  |
|-----------------------|-----------------|--|----------|--|--------------|-------|--|
|                       | A[7:0]          | D[7:0] for 8-bit<br>DW_MODE<br>D[15:0] for 16-bit<br>DW_MODE | nBE[1:0] | DWAB[31:0]                               | DWDB[31:0]   |       |  |
| 8-bit ("0")           | 0x0             | B0   | -        |  |              | No    | 8-bit write to even address, waits for packing.                                      |
|                       | 0x1             | B1   | -        | BADDRx + 0x0                             | [15:0]=B1B0  | No    | 8-bit write to odd address, packed into 16-bit.                                      |
|                       | 0x2             | B2   | -        |  |              | No    | 8-bit write to even address, waits for packing.                                      |
|                       | 0x3             | B3   | -        | BADDRx + 0x1                             | [31:16]=B3B2 | No    | 8-bit write to odd address, packed into 16-bit.                                      |
|                       | 0x1             | B1   | -        | BADDRx + 0x0                             | [15:0]=B1B0  | No    | 8-bit write to odd address, packed into 16-bit with previous even byte data.         |
|                       | 0x3             | B3   | -        | BADDRx + 0x1                             | [31:16]=B3XX | No    | 8-bit write to odd address, packed into 16-bit with previous even byte data.         |
|                       | 0xA             | B0   | -        |  |              | No    | 8-bit write to even address, waits for packing.                                      |
|                       | 0xA+n (n > 1)   | XX   | -        |  |              | Yes   | Consecutive byte writes beyond 16-bit boundary are illegal, previous byte discarded. |

**Table 14-4. Data Packing and Unpacking for Writes (continued)**

|                       | 0x1             | XXB2   | 2'b10    |  |              | No    | 8-bit write to even address, waits for packing.                                      |
|                       | 0x1             | B3XX   | 2'b01    | BADDRx + 0x1                             | [31:16]=B3B2 | No    | 8-bit write to odd address, packed into 16-bit.                                      |
|                       | 0x0             | B1XX   | 2'b01    | BADDRx + 0x0                             | [15:0]=B1BXX | No    | Any odd 8-bit write triggers 16-bit write packed with previous even byte data.       |
|                       | 0x1             | B3XX   | 2'b01    | BADDRx + 0x1                             | [31:16]=B3XX | No    | Any odd 8-bit write triggers 16-bit write packed with previous even byte data.       |
|                       | 0xA             | XXB0   | 2'b10    |  |              | No    | 8-bit write to even address, waits for packing.                                      |
|                       | 0xA+n (n > 1)   | XXB0   | 2'b10    |  |              | Yes   | Consecutive byte writes beyond 16-bit boundary are illegal, previous byte discarded. |

Table 14-5 shows the combinations for read access.

**Table 14-5. Data Packing and Unpacking for Reads**

| HICMODECR.<br>DW_MODE | Host Port Read |  | Initiator Port Read |                 | Comment  |
|-----------------------|----------------|--|---------------------|-----------------|--|
|                       | A[7:0]         | D[7:0] for 8-bit<br>DW_MODE<br>D[15:0] for 16-bit<br>DW_MODE | DRAB[31:0]          | DRDB[31:0]      |  |
| 8-bit ("0")           | 0x0            | B0   | BADDRx + 0x0        | [31:0]=B3B2B1B0 | A random read from the host will trigger a 32-bit read on the initiator port.                                    |
|                       | 0x1            | B1   |                     |                 | A sequential byte read within the aligned 32-bit word will be returned from the internal data buffer.            |
|                       | 0x2            | B2   |                     |                 |  |
|                       | 0x3            | B3   |                     |                 |  |
|                       | 0x4            | B4   | BADDRx + 0x2        | [31:0]=B7B6B5B4 | A byte read outside of an aligned 32-bit word boundary will trigger a 32-bit read on the initiator port.         |
| 16-bit ("1")          | 0x0            | B1B0   | BADDRx + 0x0        | [31:0]=B7B6B5B4 | A random read from the host will trigger a 32-bit read on the initiator port.                                    |
|                       | 0x1            | B3B2   |                     |                 | A sequential 16-bit read within an aligned 32-bit word will be returned from the internal data buffer.           |
|                       | 0x2            | B5B4   | BADDRx + 0x2        | [31:0]=B3B2B1B0 | A 16-bit read from the host port outside of an aligned 32-bit word triggers a 32-bit read on the initiator port. |
|                       | 0x3            | B7B6   |                     |                 | A sequential 16-bit read within an aligned 32-bit word will be returned from the internal data buffer.           |

### 14.3.5 Address Translation

Since the initiator port uses 16-bit aligned addressing while the host port can operate in 8 and 16-bit modes, address translation is needed for correct operation. [Table 14-6](#) shows an example of address translation performed in 8-bit data width mode while [Table 14-7](#) shows the same for 16-bit data width mode.

**Table 14-6. Address Translation for 8-bit Data Width Mode**

| HICMODECR.<br>DW_MODE | Host Port Address | Initiator Port Address<br>{HICDBADDR.BASE_ADDR[31:7],A[6:1]} |
|-----------------------|-------------------|--|
| 8-bit ("0")           | 0x0               | 0x0  |
|                       | 0x1               | 0x0  |
|                       | 0x2               | 0x1  |
|                       | 0x3               | 0x1  |
|                       | 0x4               | 0x2  |
|                       | 0x5               | 0x2  |
|                       | 0x6               | 0x3  |
|                       | 0x7               | 0x3  |
|                       | 0x7F              | 0x3F   |
|                       | 0x80              | 0x40   |
|                       | 0x81              | 0x40   |
|                       | 0xFE              | 0x7F   |
|                       | 0xFF              | 0x7F   |

**Table 14-7. Address Translation for 16-bit Data Width Mode**

| HICMODECR.<br>DW_MODE | Host Port Address | Initiator Port<br>Address{HICDBADDR.BASE_ADDR[31 :8],A[7:0]} |
|-----------------------|-------------------|--|
| 16-bit ("1")          | 0x0               | 0x0  |
|                       | 0x1               | 0x1  |
|                       | 0x2               | 0x2  |
|                       | 0x7F              | 0x7F   |
|                       | 0x80              | 0x80   |
|                       | 0x81              | 0x81   |
|                       | 0xFE              | 0xFE   |
|                       | 0xFF              | 0xFF   |

### 14.3.6 Access Errors

The HIC has the HICH2DINTFLG, HICD2HINTFLG, HICERRADDR and HICACCVIOADDR registers that capture the state of the HIC when an access error occurs. The errors captured are:

#### Illegal Write Error

This error occurs during a write when host mode bit size is greater than initiator port bit size. For instance if the host is configured in 32-bit mode using either nBE or HICMODECR.DW\_MODE, a write error will occur if HICHOSTCR.ACCSIZE is set to 16-bit. This error will also occur if incorrect address range is specified for write access.

See [Table 14-4](#).

### Illegal Read Error

This error occurs during a read when host mode bit size is greater than initiator port bit size. For instance if the host is configured in 32-bit mode using either nBE or HICMODECR.DW\_MODE, a read error will occur if HICHOSTCR.ACCSIZE is set to 16-bit. This error will also occur if a read is made from a location which was incompletely written in a previous transaction. For instance, the HIC is waiting on another byte to complete a 16-bit write transaction but gets a read access before this second byte.

### Bus Error

This error occurs when a memory location is simultaneously written by both host and device. The host data will be discarded and device data retained.

### Initiator Port Access Violation Error

This error occurs when the host tries to access a memory region that has access protection enabled, is reserved or a Parity/ECC occurred while performing a read access.

### Other Errors

The previous errors do not capture all the possible errors that can occur with the HIC. The following errors either hang the HIC module or fail silently:

- The HIC module or device is under reset and an access is initiated.
- The HIC clock is disabled or the device is in a low-power mode and an access is initiated.
- The HIC clock is disabled in the middle of a transaction by the host.

It is recommended that the application perform data integrity checks, for instance, read back written data in order to catch these silent errors.

#### 14.3.7 Security

There are multiple security levels implemented in the device and HIC module to prevent unauthorized access:

- **Level 1:** The device must turn on the clock for HIC and enable the HIC using HICGCR.HICEN before any access to the device region can be made. The configuration registers are read-only by the host.
- **Level 2:** MEM\_CFG\_REGS.GSxACCPROT0.HICWRPROT\_GSy enables and disables write access to the GSRAM by the HIC.
- **Level 3:** HICMODECR.EN\_HOSTWREALLOW, HICMODECR.EN\_DEVACC, and HICHOSTCR.EALLOW\_EN further restricts access by enabling/disabling EALLOW and device region access by host.
- **Level 4:** HICLOCK register can be used to lock the configuration registers from further writes. This register is read-only by the host.
- **Level 5:** The state of the lock register can be committed with the HICCOMMIT register which will prevent further changes until device is reset.

#### 14.3.8 HIC Usage

To get started using the HIC, it is recommend to first map out the pins needed for the application. See the device data sheet as it lists the set of HIC pins available on the device.

In addition, it is recommend to read the [Enabling Peripheral Expansion Applications Using the HIC Application Report](#) before getting started with using the HIC in an application. The application report contains examples of use-cases and it is written from an application point of view. Some of the content in this chapter is repeated in the application report. This is done to ensure the application report is a standalone document.

## 14.4 Usage Scenarios for Reduced Number of Pins

The HIC does not require all pins for operation. The following describes use-cases for a reduced set of pins.

### Read/Write Control Pins

Controlling read/write can be achieved using just one pin, nOE/RnW pin, instead of the traditional two pins: nOE and nWE pins. Configuration is achieved through the HICMODECR.RW\_MODE register. See [Section 14.3.3](#) for details.

### BASESEL Pins

If no BASESEL pins are available, the HIC is restricted to mailbox access mode where the external host can only access the HIC memory mapped registers. However to access device registers through direct access mode, only one BASESEL pin is required.

In this configuration, BASESEL0 pin determines whether the access being made is mailbox access or direct access. BASESEL0 set to 0 will be a mailbox access and BASESEL0 set to 1 will be direct access. This configuration restricts base address selection to only HICDBADDR0. Configuration is achieved through the HICHOSTCR.PAGESEL register. See [Section 14.3.2.1](#) for details.

### Data Pins

The HIC supports 8-bit and 16-bit transfers. 16-bit data transfers can still be achieved with 8 data lines. This is handled internally by the HIC through data packing and unpacking. See [Section 14.3.4](#) for details.

---

#### Note

8 data lines is the minimum supported.

---

### Byte-Enable Pins

If no byte-enable pins are available, the HIC defaults to 16-bit data transfers but can be re-configured using the HICMODECR.DW\_MODE register. Configuration is achieved through the HICMODECR.BEN\_PRESENT register. See [Section 14.3.4](#) for details.

### Ready Pin

If no nRDY pin is available, the host must add sufficiently large setup/hold times during data transmission to prevent clashes. Configuration is achieved through the HICMODECR.RDY\_PRESENT register.

## 14.5 Software

### 14.5.1 HIC Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/f28003x/examples/hic

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

#### 14.5.1.1 HIC 16-bit Memory Access Example

FILE: hic\_ex1\_config\_16bit.c

Example sets up Host Interface Controller Module in 16-bit mode the data memory of device is accessed by the *External Host*.

This example is validated on an TI Internal Validation Platform will not run in F28002x Control Card The example initializes the GPIOs for 16 bit Memory access mode with separate Read and Write Control Pins, Extended Wait, and nRDY pin The example demonstrates the following sequences

1. Sending a message to the Host using Device to Host buffer, Passing a token which triggers an interrupt at the Host.
2. Waits for the Host to clear the interrupt.
3. Then waits for a message from Host which contains the code 0x1 in buffer index 0 and index 1 contains the Base address to be configured
4. Configures the base address for Page 0
5. Sends a message to Host after that is configured
6. After this step the external host can use the address 0-0xFF to access the Base address region in System memory

#### *External Connections*

This is tested on TI Internal validation platform hence no connection needed on Control card. This has been tested with F2838x EMIF interface.

#### *Watch Variables*

None

#### 14.5.1.2 HIC 8-bit Memory Access Example

FILE: hic\_ex2\_config\_8bit\_adc.c

Example sets up Host Interface Controller Module in 8-bit mode the data memory of device is accessed by the External Host.

- This follows example configuration for pin constrained applications described in the [Design Guide for Enabling Peripheral Expansion Applications Using the HIC Application Report](#).

This example is validated on an TI Internal Validation Platform will not run in F28002x Control Card. This is to be run with a corresponding Host side code emif\_ex8\_8bit\_asram\_hic\_adc is run on F2838x based host first and then this example is run.

- The example initializes the HIC for 8 bit Memory access mode with Single Read and Write Control Pin
- DMA is configured to do transfer of the ADC result from ADCRESULT0-15 to HIC D2H buffer.
- The example configures CPUTIMER0 to generate an event every second on which the ADC SOC0-15 start conversion.
- The timer is enabled on receiving HIC\_START\_TOKEN on the H2D Token from the host.
- The end of ADC\_SOC15 will generate a DMA event
- The DMA ISR signals the host with HIC\_DATA\_TOKEN to signal data write.
- The Host is interrupted with HIC\_INT on ADC End of conversion event
- The DMA Channel is stopped after HIC\_TEST\_NUM\_SAMPLES samples are collected This example can be used as a reference to implement Communication between Host and HIC with minimal number of pins. Refer to the [Design Guide for Enabling Peripheral Expansion Applications Using the HIC Application Report](#) for further details about Host interface Controller applications.

### External Connections

This is tested on TI Internal validation platform hence no connection needed on Control card. This has been tested with F2838x EMIF interface with emif\_ex8\_8bit\_asram\_hic\_adc example Analog channel A7 has been used as Analog Input to Sample

#### Watch Variables

- numDMAInterrupts

#### 14.5.1.3 HIC 16-bit Memory Access FSI Example

FILE: hic\_ex3\_config\_16bit\_fsi.c

Example sets up Host Interface Controller Module in 16-bit mode the FSI Memory region of device is accessed by the External Host. This follows example configuration for performance critical applications described in the Application note titled "Application guide for peripheral expansion using HIC"(SPRACR2).

emif\_ex7\_16bit\_asram\_hic\_fsi is to be run on the host before running this example on F28002x side.

This example is validated on an TI Internal Validation Platform will not run in F28002x Control Card

1. The example initializes the GPIOs for 16 bit HIC Memory access mode with separate Read and Write Control Pins, Extended Wait, and nRDY pin
2. Configures the base address for Region 0 to access FSI Tx Memory region
3. Sets up the FSI module in Loopback mode
4. The EVTTRIG interface of HIC is enabled to route FSI Rx events to the Host through the HIC\_INT
5. Sending a message to the Host using Device to Host buffer, Passing a token
6. This sets up the FSI direct bridge over HIC. The host can then access the FSI registers over HIC

### External Connections

This is tested on TI Internal validation platform hence no connection needed on Control card. This has been tested with F2838x EMIF interface.

#### Watch Variables

None - Use the Host to access FSI region

## 14.6 HIC Registers

This section describes the Host Interface Controller Registers.

### 14.6.1 HIC Base Address Table

**Table 14-8. HIC Base Address Table**

| Bit Field Name |              | DriverLib Name | Base Address | CPU1 | DMA | HIC | CLA | Pipeline Protected |
|----------------|--------------|----------------|--------------|------|-----|-----|-----|--------------------|
| Instance       | Structure    |                |              |      |     |     |     |                    |
| HicRegs        | HIC_CFG_REGS | HIC_BASE       | 0x0000_6500  | YES  | YES | -   | -   | YES                |

## 14.6.2 HIC\_CFG\_REGS Registers

Table 14-9 lists the memory-mapped registers for the HIC\_CFG\_REGS registers. All register offset addresses not listed in Table 14-9 should be considered as reserved locations and the register contents should not be modified.

**Table 14-9. HIC\_CFG\_REGS Registers**

| Offset | Acronym       | Register Name                  | Write Protection | Section            |
|--------|---------------|--------------------------------|------------------|--------------------|
| 0h     | HICREV        | Module Revision Register       | No               | <a href="#">Go</a> |
| 2h     | HICGCR        | Global Control Register        | EALLOW           | <a href="#">Go</a> |
| 4h     | HICLOCK       | Lock Register                  | EALLOW           | <a href="#">Go</a> |
| 6h     | HICMODECR     | Mode Control Register          | EALLOW and LOCK  | <a href="#">Go</a> |
| 8h     | HICPINPOLCR   | Pin Polarity Control Register  | EALLOW and LOCK  | <a href="#">Go</a> |
| Ah     | HICBASESEL    | Base Select Register           | No               | <a href="#">Go</a> |
| Ch     | HICHOSTCR     | HIC Host Control Register      | No               | <a href="#">Go</a> |
| Eh     | HICERRADDR    | Host Error Address register    | No               | <a href="#">Go</a> |
| 10h    | HICH2DTOKEN   | Host to Device Token Register  | No               | <a href="#">Go</a> |
| 12h    | HICD2HTOKEN   | Devie to Host Token Register   | No               | <a href="#">Go</a> |
| 14h    | HICDBADDR0    | Device Base Address Register 0 | EALLOW and LOCK  | <a href="#">Go</a> |
| 16h    | HICDBADDR1    | Device Base Address Register 1 | EALLOW and LOCK  | <a href="#">Go</a> |
| 18h    | HICDBADDR2    | Device Base Address Register 2 | EALLOW and LOCK  | <a href="#">Go</a> |

| 7Ah    | D2H_BUF13 | Device to Host Buffer 13 | No               | <a href="#">Go</a> |
| 7Ch    | D2H_BUF14 | Device to Host Buffer 14 | No               | <a href="#">Go</a> |
| 7Eh    | D2H_BUF15 | Device to Host Buffer 15 | No               | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. [Table 14-10](#) shows the codes that are used for access types in this section.

**Table 14-10. HIC\_CFG\_REGS Access Type Codes**

| Access Type              | Code  | Description                            |
|--------------------------|-------|--|
| Read Type                |       |  |
| R                        | R     | Read                                   |
| R-0                      | R-0   | Read Returns 0s                        |
| Write Type               |       |  |
| W                        | W     | Write                                  |
| W1C                      | W1C   | Write 1 to clear                       |
| W1S                      | W1S   | Write 1 to set                         |
| WOnce                    | WOnce | Write Set once                         |
| Reset or Default Value   |       |  |
| -n                       |       | Value after reset or the default value |
| Register Array Variables |       |  |

**Table 14-10. HIC\_CFG\_REGS Access Type Codes  
(continued)**

| Access Type | Code | Description  |
|-------------|------|--|
| i,j,k,l,m,n |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y           |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.  |

### 14.6.2.1 HICREV Register (Offset = 0h) [Reset = 4000001h]

HICREV is shown in [Figure 14-10](#) and described in [Table 14-11](#).

Return to the [Summary Table](#).

Module Revision Register

**Figure 14-10. HICREV Register**

| 23               | 22 | 21 | 20 | 19 | 18 | 17 | 16     |
| WRITE_ENABLE_KEY |    |    |    |    |    |    |        |
| W-0h             |    |    |    |    |    |    |        |
| 15               | 14 | 13 | 12 | 11 | 10 | 9  | 8      |
| RESERVED         |    |    |    |    |    |    |        |
| R-0h             |    |    |    |    |    |    |        |
| 7                | 6  | 5  | 4  | 3  | 2  | 1  | 0      |
| RESERVED         |    |    |    |    |    |    | LOCK   |
| R-0h             |    |    |    |    |    |    | R/W-0h |

**Table 14-13. HICLOCK Register Field Descriptions**

| Bit   | Field            | Type | Reset | Description   |
|-------|------------------|------|-------|---|
| 31-16 | WRITE_ENABLE_KEY | W    | 0h    | These 16 bits act as a key to enable writes to Bit 0 of this register. The only time a '1' can be written to Bit 0 is by a single 32-bit write where bits 31:16 equal 0x5a5a. All other writes are ignored including separate 16-bit writes. Read returns 0 for this field always. Read-only for Host<br>Reset type: SYSRSn   |
| 15-1  | RESERVED         | R    | 0h    | Reserved  |
| 0     | LOCK             | R/W  | 0h    | Enable for LOCK feature that blocks writes to certain config registers. Writing '1' to this field along with a valid WRITE_ENABLE_KEY value while HICCOMMIT.COMMIT=0 will set this bit to '1' and enables the LOCK feature. Writing '0' to this field along with a valid WRITE_ENABLE_KEY value while HICCOMMIT.COMMIT=0 will set this bit to '0' and disables the LOCK feature.<br>0 : LOCK is disabled<br>1 : LOCK is enabled<br>Read-only for Host<br>Reset type: SYSRSn |

#### 14.6.2.4 HICMODECR Register (Offset = 6h) [Reset = 0h]

HICMODECR is shown in [Figure 14-13](#) and described in [Table 14-14](#).

Return to the [Summary Table](#).

Mode Control Register

**Figure 14-13. HICMODECR Register**

### 14.6.2.9 HICH2DTOKEN Register (Offset = 10h) [Reset = 0h]

HICH2DTOKEN is shown in [Figure 14-18](#) and described in [Table 14-19](#).

Return to the [Summary Table](#).

Host to Device Token Register

**Figure 14-18. HICH2DTOKEN Register**

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| H2D_TOKEN |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/W-0h    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

**Table 14-19. HICH2DTOKEN Register Field Descriptions**

| Bit  | Field     | Type | Reset | Description   |
|------|-----------|------|-------|---|
| 31-0 | H2D_TOKEN | R/W  | 0h    | Host To Device Token is a general purpose register that can be used to send any information from Host to the Device software. Typical usage is to send the Buffer Count of the H2DBUF region. Any write to the lower half-word of this register will automatically trigger an interrupt to H2DINT<br>Read-Write for Host.<br>Reset type: SYSRSn |

#### 14.6.2.10 HICD2HTOKEN Register (Offset = 12h) [Reset = 0h]

HICD2HTOKEN is shown in [Figure 14-19](#) and described in [Table 14-20](#).

Return to the [Summary Table](#).

Devie to Host Token Register

**Figure 14-19. HICD2HTOKEN Register**

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| R-0h             |    |    |    |    |    |    | R/WOnce-0h |

**Table 14-38. HICCOMMIT Register Field Descriptions**

| Bit   | Field            | Type    | Reset | Description   |
|-------|------------------|---------|-------|---|
| 31-16 | WRITE_ENABLE_KEY | W       | 0h    | These 16 bits act as a key to enable writes to Bit 0 of this register. The only time a '1' can be written to Bit 0 is by a single 32-bit write where bits 31:16 equal 0x5a5a. All other writes are ignored including separate 16-bit writes. Read returns 0 for this field always. Read-only for Host<br>Reset type: SYSRSn   |
| 15-1  | RESERVED         | R       | 0h    | Reserved  |
| 0     | COMMIT           | R/WOnce | 0h    | Enable for COMMIT feature that blocks writes to certain config registers. This field can be written as '1' only along with a valid WRITE_ENABLE_KEY value.<br>0: Register lock configuration is not committed.<br>1: Register lock configuration is committed. Once configuration is committed, only reset can change the configuration. Read-only for Host<br>Reset type: SYSRSn |

### 14.6.2.29 H2D\_BUF0 Register (Offset = 40h) [Reset = 0h]

H2D\_BUF0 is shown in [Figure 14-38](#) and described in [Table 14-39](#).

Return to the [Summary Table](#).

Host to Device Buffer 0

**Figure 14-38. H2D\_BUF0 Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

|--|-------------|
| <b>15.1 Introduction</b> .....               | <b>1752</b> |
| <b>15.2 Analog Subsystem Registers</b> ..... | <b>1762</b> |

## 15.1 Introduction

The analog modules on this device include the Analog-to-Digital Converter (ADC), Temperature Sensor, Buffered Digital-to-Analog Converter (DAC), and Comparator Subsystem (CMPSS).

### 15.1.1 Features

The analog subsystem has the following features:

- Flexible voltage references
  - The ADCs are referenced to VREFH<sub>ix</sub> and VSSA pins
    - VREFH<sub>ix</sub> pin voltage can be driven in externally or can be generated by an internal bandgap voltage reference
    - The internal voltage reference range can be selected to be 0V to 3.3V or 0V to 2.5V
  - The buffered DACs are referenced to VREFH<sub>ix</sub> and VSSA
    - Alternately, these DACs can be referenced to the VDAC pin and VSSA
  - The comparator DACs are referenced to VDDA and VSSA
    - Alternately, these DACs can be referenced to the VDAC pin and VSSA
- Flexible pin usage
  - Buffered DAC outputs, comparator subsystem inputs, and digital inputs (AIOs)/outputs (AGPIOs) are multiplexed with ADC inputs
  - Internal connection to V<sub>REFLO</sub> on all ADCs for offset self-calibration

### 15.1.2 Block Diagram

The following analog subsystem block diagrams show the connections between the different integrated analog modules to the device pins. These pins fall into two categories: analog module inputs/outputs and reference pins.

The analog pins are organized into analog groups around the CMPSS module. The block diagram shows which pins connect to each group. The pins which connect to CMPSS inputs can be used for the CMPSS without further action and without preventing use as an ADC input simultaneously.

The VDAC reference pin can be used to set an alternate range for DAC A, DAC B and for the DACs inside the CMPSS modules (the CMPSS DACs are referenced to VDDA and VSSA by default). Using this pin as a reference prevents the channel from being used as an ADC input (but the ADC can be used to sample the VDAC voltage, if desired). The choice of reference is configurable per-module for each CMPSS or buffered DAC, and the selection is made via the module's configuration registers.

Some analog pins support digital functionality through muxed AIOs and AGPIOs. AIOs support only digital input functionality while AGPIOs support full digital input and output functionality.

The following notes apply to all packages:

- Not all analog pins are available on all devices. See your device-specific datasheet to determine which pins are available.
- See your device-specific datasheet to determine the allowable voltage range for VREFHI and VREFLO
- An external capacitor is required on the VREFHI pins. See your device-specific datasheet for the specific value required.
- For buffered DAC modules, VSSA will be the low reference whether VREFH<sub>ix</sub> or VDAC is selected as the high reference.
- For CMPSS modules, VSSA will be the low reference whether VDAC or VDDA is selected as the high reference.

The following figures show how each analog group is structured. [Table 15-2](#) lists the analog pins and internal connections.

Figure 15-1. Analog Subsystem Block Diagram (100-Pin QFP)

Figure 15-2. Analog Subsystem Block Diagram (80-Pin QFP)

Figure 15-3. Analog Subsystem Block Diagram (64-Pin QFP)

Figure 15-4. Analog Subsystem Block Diagram (48-Pin QFP)

Note: AIOs support digital input mode only.

Figure 15-5. Analog Group Connections

### 15.1.3 Digital Inputs on ADC Pins (AIOs)

GPIOs on port H (GPIO224–GPIO253) are multiplexed with analog pins. These are also referred to as AIOs. These pins can only function in input mode. By default, these pins will function as analog pins and the GPIOs are in a high-Z state. The GPHAMSEL register is used to configure these pins for digital or analog operation.

#### Note

If digital signals with sharp edges (high dv/dt) are connected to the AIOs, cross-talk can occur with adjacent analog signals. The user should therefore limit the edge rate of signals connected to AIOs if adjacent channels are being used for analog functions.

### 15.1.4 Digital Inputs and Outputs on ADC Pins (AGPIOs)

Some GPIOs on this device are multiplexed with analog pins. These are also referred to as AGPIOs. Unlike AIOs, AGPIOs have full input and output capability. This device has two GPIOs (GPIO20 and GPIO21) that offer this feature on the 100-pin PZ and 80-pin PN packages.

**100-Pin PZ:** On this package, there are dedicated pins for B5 (pin 32) and B11 (pin 30) that also have AIO252 and AIO251 functionality, respectively. In addition, GPIO20 (pin 48) and GPIO21 (pin 49) are also available as B5 and B11, respectively. Since B5 and B11 are dedicated pins on this package, it is recommended to use them instead of the pins on GPIO20/21.

**80-Pin PN:** On this package, GPIO20 (pin 33) and GPIO21 (pin 34) are also available as B5 and B11, respectively. There are no dedicated pin for B5 and B11.

By default, the AGPIOs are not connected and have to be configured. [Table 15-1](#) shows how to configure the AGPIOs using B5 (pin 32) and GPIO20 (pin 48) on the 100-pin PZ as an example.

**Table 15-1. AGPIO Configuration**

| AGPIOTRLA.bit.<br>GPIO20 | GPAAMSEL.bit.<br>GPIO20 | GPHAMSEL.bit.<br>GPIO252 | B5 Connected To |        |        | GPIO20 Connected To |        |        |
|--------------------------|-------------------------|--------------------------|-----------------|--------|--------|---------------------|--------|--------|
|                          |                         |                          | ADC             | GPIO20 | AIO252 | ADC                 | GPIO20 | AIO252 |
| 0                        | 0                       | 1                        | Yes             | -      | -      | -                   | Yes    | -      |
| 0                        | 1                       | 1                        | Yes             | -      | -      | -                   | -      | -      |
| 1                        | 0                       | 1                        | Yes             | -      | -      | -                   | Yes    | -      |

| 0                        | 0                       | 0                        | Yes             | -      | Yes    | -                   | Yes    | -      |
| 0                        | 1                       | 0                        | Yes             | -      | Yes    | -                   | -      | -      |
| 1                        | 0                       | 0                        | Yes             | -      | Yes    | -                   | Yes    | -      |
| 1                        | 1                       | 0                        | -               | -      | Yes    | Yes                 | -      | -      |

#### Note

If digital signals with sharp edges (high dv/dt) are connected to the AGPIOs, cross-talk can occur with adjacent analog signals. The user should therefore limit the edge rate of signals connected to AGPIOs if adjacent channels are being used for analog functions.

### 15.1.5 Analog Pins and Internal Connections

**Table 15-2. Analog Pins and Internal Connections**

| Pin Name                         | Package Pin |       |       |                  | ADC |     |     | Comparator Subsystem (MUX) |                  |                  |                  | AIO Input        |                  |
|----------------------------------|-------------|-------|-------|------------------|-----|-----|-----|----------------------------|------------------|------------------|------------------|------------------|------------------|
