

Single-Phase PWM Controller with Light-Load Efficiency Optimization

FEATURES

- 1.5-V to 19-V Conversion Voltage Range
- 4.5-V to 14-V Supply Voltage Range
- Voltage Mode Control
- Skip Mode at Light Load for Efficiency Optimization
- High Precision 0.5% Internal 0.8-V Reference
- Adjustable Output Voltage from 0.8 V to $0.7 \times V_{IN}$
- Internal Soft-Start
- Supports Pre-biased Startup
- Supports Soft-Stop
- Programmable Switching Frequency from 250 kHz to 1 MHz
- Overcurrent Protection
- Inductor DCR Sensing for Overcurrent
- $R_{DS(on)}$ Sensing for Zero Current Detection
- Overvoltage and Undervoltage Protection
- Open Drain Power Good Indication
- Internal Bootstrap Switch
- Integrated High-Current Drivers Powered by VCCDR
- Small 3 mm x 3 mm, 16-Pin QFN Package

APPLICATIONS

- Server and Desktop Computer Subsystem Power Supplies
- DDR Memory and Termination Supply
- Distributed Power Supply
- General DC/DC Converter

DESCRIPTION

TPS53211 is a single phase PWM controller with integrated high-current drivers. It is used for 1.5 V up to 19 V conversion voltage.

TPS53211 features a skip mode solution that optimizes the efficiency at light load condition without compromising the output voltage ripple. The device provides pre-biased startup, soft-stop, integrated bootstrap switch, power good function, EN/Input UVLO protection. It supports conversion voltages up to 19 V, and output voltages adjustable from 0.8 V to $0.7 \times V_{IN}$.

The TPS53211 is available in the 3 mm x 3 mm, 16-pin, QFN package (Green RoHs compliant and Pb free) and is specified from -40°C to 85°C .

UDG-11173

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

DETAILED DESCRIPTION

Introduction

The TPS53211 is a single-channel synchronous buck controller with integrated high-current drivers. The TPS53211 is used for 1.5 V up to 19 V conversion voltage, and provides output voltage from 0.8 V to 0.7 V_{IN}. It operates with programmable switching frequency ranging from 250 kHz to 1 MHz.

This device employs a skip mode solution that optimizes the efficiency at light-load condition without compromising the output voltage ripple. The device provides pre-bias startup, integrated bootstrap switch, power good function, EN/Input UVLO protection. The TPS53211 is available in the 3 mm by 3mm 16-pin QFN package and is specified from –40°C to 85°C.

Switching Frequency Setting

The clock frequency is programmed by the value of the resistor connected from the OSC pin to ground. The switching frequency is programmable from 250 kHz to 1 MHz. The relation between the frequency and the OSC resistance is given by [Equation 1](#).

$$f_{SW} = 200 + \frac{10^6}{(R_{OSC} \times 78.5) + 150}$$

where

- R_{OSC} is the resistor connected from the OSC pin to ground in kΩ
- f_{SW} is the desired switching frequency in kHz

(1)

Soft-Start Function

The soft-start function reduces the inrush current during the start-up. A slow rising reference voltage is generated by the soft-start circuitry and sent to the input of the error amplifier. When the soft-start ramp voltage is less than 800 mV, the error amplifier uses this ramp voltage as the reference. When the ramp voltage reaches 800 mV, a fixed 800 mV reference voltage is utilized for the error amplifier. The soft-start function is implemented only when VCC and VCCDR are above the respective UVLO thresholds and the EN pin is released.

When the soft-start begins, the device initially waits for 1024 clock cycles and then starts to ramp up the reference. After the reference voltage begins to rise, the PGOOD signal goes high after a 1560 clock-cycle delay.

UVLO Function

The TPS53211 provides UVLO protection for the input supply (VCC) and driver supply (VCCDR). If the supply voltage is lower than UVLO threshold voltage minus the hysteresis, the device shuts off. When the voltage rises above the threshold voltage, the device restarts. The typical UVLO rising threshold is 4.25 V for VCC and 3.32 V for VCCDR. Hysteresis of 200 mV for VCC and 220 mV for VCCDR are also provided to prevent glitch.

Overcurrent Protection

The TPS53211 continuously monitors the current flowing through the inductor. The inductor DCR current sense is implemented by comparing and monitoring the difference between the CSP and CSN pins. DCR current sensing requires time constant matching between the inductor and the sensing network:

$$\frac{L}{DCR} = R \times C$$

(2)

TPS53211 has two level OC thresholds: 20 mV and 30 mV for the voltage between the CSP and CSN pins.

If the voltage between the CSP and CSN pins exceeds the 20 mV current limit threshold, an OC counter starts to increment to count the occurrence of the overcurrent events. The converter shuts down immediately when the OC counter reaches four (4). The OC counter resets if the detected current is lower than the OC threshold after an OC event. Normal operation can only be restored by cycling the VCC voltage.

If the voltage between the CSP and CSN pins is higher than 30 mV, the device latches off immediately. Normal operation can be restored only by cycling the VCC voltage.

TPS53211

SLUSAA9A – SEPTEMBER 2011 – REVISED NOVEMBER 2012

www.ti.com

The TPS53211 has thermal compensation to adjust the OCP threshold in order to reduce the influence of inductor DCR variation due to temperature change. The OCP level has a change rate of 0.35%/°C.

Overvoltage and Undervoltage Protection

The TPS53211 monitors the VSEN pin voltage to detect the overvoltage and undervoltage conditions. A resistor divider with the same ratio as on the FB input is recommended for the VSEN input. The overvoltage and undervoltage thresholds are set to $\pm 13\%$ of V_{OUT} .

When the VSEN voltage is greater than 113% of the reference, the overvoltage protection is activated. The high-side MOSFET turns off and the low-side MOSFET turns on. Normal operation can be restored only by cycling the VCC pin voltage.

When the VSEN voltage is lower than 87% of the reference voltage, the undervoltage protection is triggered and the PGOOD signal goes low. After 80 μ s, the controller is latched off with both the upper and lower MOSFETs turned off.

After both the undervoltage and overvoltage events, the device is latched off. Normal operation can be restored only by cycling the VCC pin voltage.

Power Good

The TPS53211 monitors the output voltage through the VSEN. During start up, the power good signal delay after the reference begins to rise is 1560 clock cycles. After this delay, if the output voltage is within $\pm 9.5\%$ of the target value, PGOOD signal goes high.

At steady state, if the VSEN voltage is within 113% and 87% of the reference voltage, the power good signal remains high. If VSEN voltage is outside of this limit, PGOOD pin is pulled low by the internal open drain output. The PGOOD output is an open drain and requires an external pull-up resistor.

Over-Temperature Protection

The TPS53211 continuously monitors the die temperature. If the die temperature exceeds the threshold value (140°C typical), the device shuts off. When the device temperature lowers to 40°C below the over-temperature threshold, it restarts and return to normal operation.

The following example illustrates the design process and component selection for a single output synchronous buck converter using TPS53211. The schematic of a design example is shown in [Figure 5](#). The specifications of the converter are listed in [Table 1](#).

PARAMETER		TEST CONDITION	MIN	TYP	MAX	UNIT
V _{IN}	Input voltage		10.8	12	13.2	V
V _{OUT}	Output voltage			1.05		V
V _{RIPPLE}	Output ripple	I _{OUT} = 20 A		1% of V _{OUT}		V
I _{OUT}	Output current			20		A
f _{SW}	Switching frequency			400		kHz

Output Inductor Selection

Determine an inductance value that yields a ripple current of approximately 20% to 40% of maximum output current. The inductor ripple current is determined by [Equation 3](#):

$$I_{L(\text{ripple})} = \frac{1}{L \times f_{SW}} \times \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{V_{IN}} \quad (3)$$

The inductor requires a low DCR to achieve good efficiency, as well as enough room above peak inductor current before saturation.

Output Capacitor Selection

The output capacitor selection is determined by output ripple and transient requirement. When operating in CCM, the output ripple has three components:

$$V_{\text{RIPPLE}} = V_{\text{RIPPLE(C)}} + V_{\text{RIPPLE(ESR)}} + V_{\text{RIPPLE(ESL)}} \quad (4)$$

$$V_{\text{RIPPLE(C)}} = \frac{I_{\text{L(ripple)}}}{8 \times C_{\text{OUT}} \times f_{\text{SW}}} \quad (5)$$

$$V_{\text{RIPPLE(ESR)}} = I_{\text{L(ripple)}} \times \text{ESR} \quad (6)$$

$$V_{\text{RIPPLE(ESL)}} = \frac{V_{\text{IN}} \times \text{ESL}}{L} \quad (7)$$

When a ceramic output capacitor is chosen, the ESL component is usually negligible. In the case when multiple output capacitors are used, the total ESR and ESL should be the equivalent of the all output capacitors in parallel.

When operating in DCM, the output ripple is dominated by the component determined by capacitance. It also varies with load current and can be expressed as shown in Equation 8.

$$V_{\text{RIPPLE(DCM)}} = \frac{(\alpha \times I_{\text{L(ripple)}} - I_{\text{OUT}})^2}{2 \times f_{\text{SW}} \times C_{\text{OUT}} \times I_{\text{L(ripple)}}$$

where

$$\alpha = \frac{t_{\text{ON(dcm)}}}{t_{\text{ON(ccm)}}} \quad (8)$$

• α is the DCM On-Time coefficient and can be expressed as

UDG-11174

Figure 6. DCM V_{OUT} Ripple Calculation

Input Capacitor Selection

The selection of input capacitor should be determined by the ripple current requirement. The ripple current generated by the converter needs to be absorbed by the input capacitors as well as the input source. The RMS ripple current from the converter can be expressed as:

$$I_{IN(ripple)} = I_{OUT} \times \sqrt{D \times (1-D)}$$

where

$$D = \frac{V_{OUT}}{V_{IN}} \quad (9)$$

- D is the duty cycle and can be expressed as

To minimize the ripple current drawn from the input source, sufficient input decoupling capacitors should be placed close to the device. The ceramic capacitor is recommended due to the inherent low ESR and low ESL. The input voltage ripple can be calculated as below when the total input capacitance is determined:

$$V_{IN(ripple)} = \frac{I_{OUT} \times D}{f_{SW} \times C_{IN}} \quad (10)$$

Output Voltage Setting Resistors Selection

The output voltage is programmed by the voltage-divider resistor, R1 and R2 shown in [Figure 7](#). R1 is connected between FB pin and the output, and R2 is connected between the FB pin and FBG. The recommended value for R1 is between 1 kΩ and 5 kΩ. Determine R2 using [Equation 11](#).

$$R1 = \left(\frac{0.8}{(V_{OUT} - 0.8)} \right) \times R2 \quad (11)$$

Compensation Design

The TPS53211 employs voltage mode control. To effectively compensation the power stage and ensures fast transient response, Type III compensation is typically used.

The control to output transfer function can be described in [Equation 12](#).

$$G_{CO} = 4 \times \frac{1 + s \times C_{OUT} \times ESR}{1 + s \times \left(\frac{L}{DCR + R_{LOAD}} + C_{OUT} \times (ESR + DCR) \right) + s^2 \times L \times C_{OUT}} \quad (12)$$

The output LC filter introduces a double pole, calculated in [Equation 13](#).

$$f_{DP} = \frac{1}{2 \times \pi \times \sqrt{L \times C_{OUT}}} \quad (13)$$

The ESR zero of can be calculated calculated in [Equation 14](#)

$$f_{ESR} = \frac{1}{2 \times \pi \times ESR \times C_{OUT}} \quad (14)$$

TPS53211

SLUSAA9A – SEPTEMBER 2011 – REVISED NOVEMBER 2012

www.ti.com

Figure 7 shows the configuration of Type III compensation and typical pole and zero locations. Equation 15 through Equation 17 describe the compensator transfer function and poles and zeros of the Type III network.

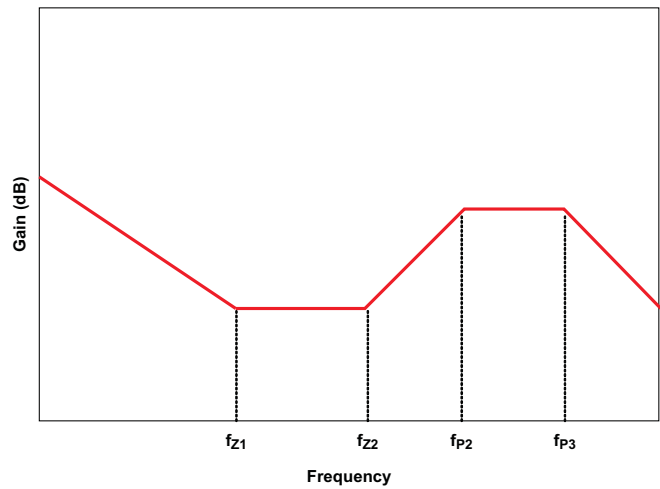

$$G_{EA} = \frac{(1 + s \times C_1 \times (R_1 + R_3))(1 + s \times R_4 \times C_2)}{(s \times R_1 \times (C_2 + C_3)) \times (1 + s \times C_1 \times R_3) \times \left(1 + s \times R_4 \times \frac{C_2 \times C_3}{C_2 + C_3}\right)} \quad (15)$$

$$f_{z1} = \frac{1}{2 \times \pi \times R_4 \times C_2} \quad (16)$$

$$f_{z2} = \frac{1}{2 \times \pi \times (R_1 + R_3) \times C_1} \cong \frac{1}{2 \times \pi \times R_1 \times C_1} \quad (17)$$

UGD-11176

UDG-11175

Figure 7. Type III Compensation Network Configuration

Figure 8. Type III Compensation Network Waveform

$$f_{p1} = 0 \quad (18)$$

$$f_{p2} = \frac{1}{2 \times \pi \times R_3 \times C_1} \quad (19)$$

$$f_{p3} = \frac{1}{2 \times \pi \times R_4 \times \left(\frac{C_2 \times C_3}{C_2 + C_3}\right)} \cong \frac{1}{2 \times \pi \times R_4 \times C_3} \quad (20)$$

The two zeros can be placed near the double pole frequency to cancel the response from the double pole. One pole can be used to cancel ESR zero, and the other non-zero pole can be placed at half switching frequency to attenuate the high frequency noise and switching ripple. Suitable values can be selected to achieve a compromise between high phase margin and fast response. A phase margin higher than 45° is required for stable operation.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS53211RGTR	VQFN	RGT	16	3000	330.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2
TPS53211RGTT	VQFN	RGT	16	250	180.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2

TAPE AND REEL BOX DIMENSIONS

0.1	0.2

4222419/D 04/2022

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slue271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
